Note: With the number of bits set to 14 (or 12, 10, 8) with ITEM 07, Pin No. 1 – 14 (or 1 – 12, 1 – 10, 1 – 8) are valid.

TIMING CHART

• Example: TTL Level Input (setting)

The unit reads data upon detecting a change of LOAD input status.
DO NOT change LOAD input setting when the data input logic is changed.

Note: Even if LOAD signal is entered, the unit does not convert into analog and hold previous value until entering next normal data, when error is detected by parity check.

INPUT-OUTPUT RELATION EXAMPLES

• **FS**
-FS stands for -15 % of the input range (0 to 100 %), which is configured by ITEM 08, display range scaling 0 % and ITEM 09, display range scaling 100 %. +FS stands for +115 % of the input range.

• **OR**
When one of the following conditions is true, the digital input overflows (OR).

- 1) When the input signal is out of the range between -FS and +FS.
- 2) When the display value (= input signal) exceeds the display range.

The display range differs according to input code. For example, in case of BCD with polarity, it is -9999 to 9999. Please refer to the instruction manual for detail.
