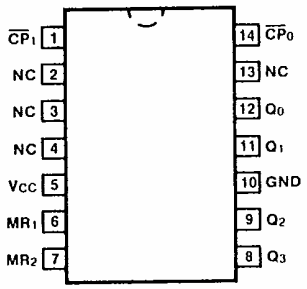
DIVIDE-BY-TWELVE COUNTER

CONNECTION DIAGRAM
PINOUT A



DESCRIPTION — The '92 is a 4-stage ripple counter containing a high speed flip-flop acting as a divide-by-two and three flip-flops connected as a divide-by-six. HIGH signals on the Master Reset (MR) inputs override the clocks and force all outputs to the LOW state.

*The Q_0 output is guaranteed to drive the full rated fan-out plus the $\overline{CP}_1$ input.

FUNCTIONAL DESCRIPTION — The '92 is a 4-bit ripple type divide-by-twelve counter. Each device consists of four master/slave flip-flops which are internally connected to provide a divide-by-two section and a divideby-six section. Each section has a separate clock input which initiates state changes of the counter on the HIGH-to-LOW clock transition. State changes of the Q outputs do not occur simultaneously because of internal ripple delays. Therefore, decoded output signals are subject to decoding spikes and should not be used for clocks or strobes. The Q_0 output of each device is designed and specified to drive the rated fan-out plus the $\overline{CP}_1$ input of the device. A gated AND asynchronous Master Reset (MR_1, MR_2) is provided which overrides the clocks and resets (clears) all the flip-flops. Since the output from the divide-by-two section is not internally connected to the succeeding stages, the devices may be operated in various counting modes:

A. Modulo 12, Divide-By-Twelve Counter — The $\overline{CP}_1$ input must be externally connected to the Q_0 output. The $\overline{CP}_0$ input receives the incoming count and Q_3 produces a symmetrical divide-by-twelve square wave output.

B. Divide-By-Two and Divide-By-Six Counter — No external interconnections are required. The first flip-flop is used as a binary element for the divide-by-two function. The $\overline{CP}_1$ input is used to obtain divide-by-three operation at the Q_1 and Q_2 outputs and divide-by-six operation at the Q_3 output.
