The HYB 5(3)116(7)400 are 16 MBit dynamic RAMs based on die revisions “G” & “F” and organized as 4 194 304 words by 4-bits. The HYB 5(3)116(7)400BJ/BT utilizes a submicron CMOS silicon gate process technology, as well as advanced circuit techniques to provide wide operating margins, both internally and for the system user. Multiplexed address inputs permit the HYB 5(3)116(7)400 to be packaged in a standard SOJ-26/24 and TSOPII-26/24 plastic package with 300 mil width. These packages provide high system bit densities and are compatible with commonly used automatic testing and insertion equipment.

Absolute Maximum Ratings

Operating temperature range ..... 0 to 70 °C
Storage temperature range..... – 55 to 150 °C
Input/output voltage (5 V versions) ..... – 0.5 to min (V_{CC} + 0.5, 7.0) V
Input/output voltage (3.3 V versions) ..... – 0.5 to min (V_{CC} + 0.5, 4.6) V
Power supply voltage (5 V versions) ..... – 1.0 V to 7.0 V
Power supply voltage (3.3 V versions) ..... – 1.0 V to 4.6 V
Power dissipation(5 V versions) ..... 1.0 W
Power dissipation (3.3 V versions) ..... 0.5 W
Data out current (short circuit) ..... 50 mA

Note: Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage of the device. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Notes

1. All voltages are referenced to V_{SS}.
2. I_{CC1}, I_{CC3}, I_{CC4} and I_{CC6} depend on cycle rate.
3. I_{CC1} and I_{CC4} depend on output loading. Specified values are measured with the output open.
4. Address can be changed once or less while $\overline{RAS}$ = V_{IL}. In the case of I_{CC4} it can be changed once or less during a fast page mode cycle (t_{PC}).
5. An initial pause of 200 µs is required after power-up followed by 8 $\overline{RAS}$ cycles of which at least one cycle has to be a refresh cycle, before proper device operation is achieved. In case of using internal refresh counter, a minimum of 8 $\overline{CAS}$-before-$\overline{RAS}$ initialization cycles instead of 8 $\overline{RAS}$ cycles are required.
6. AC measurements assume t_T = 5 ns.
7. $V_{IH\ (MIN.)}$ and $V_{IL\ (MAX.)}$ are reference levels for measuring timing of input signals. Transition times are also measured between V_{IH} and V_{IL}.
8. Measured with a load equivalent to 2 TTL loads and 100 pF.
9. Operation within the $t_{RCD\ (MAX.)}$ limit ensures that $t_{RAC\ (MAX.)}$ can be met. $t_{RCD\ (MAX.)}$ is specified as a reference point only: If t_{RCD} is greater than the specified $t_{RCD\ (MAX.)}$ limit, then access time is controlled by t_{CAC}.
10. Operation within the $t_{RAD\ (MAX.)}$ limit ensures that $t_{RAC\ (MAX.)}$ can be met. $t_{RAD\ (MAX.)}$ is specified as a reference point only: If t_{RAD} is greater than the specified $t_{RAD\ (MAX.)}$ limit, then access time is controlled by t_{AA}.
11. Either t_{RCH} or t_{RRH} must be satisfied for a read cycle.
12. $t_{OFF\ (MAX.)}$ and $t_{OEZ\ (MAX.)}$ define the time at which the outputs achieve the open-circuit condition and are not referenced to output voltage levels.
13. Either t_{DZC} or t_{DZO} must be satisfied.
14. Either t_{CDD} or t_{ODD} must be satisfied.
15. t_{WCS}, t_{RWD}, t_{CWD}, t_{AWD} and t_{CPWD} are not restrictive operating parameters. They are included in the data sheet as electrical characteristics only. If $t_{WCS} > t_{WCS\ (MIN.)}$, the cycle is an early write cycle and the I/O pin will remain open-circuit (high impedance) through the entire cycle; if $t_{RWD} > t_{RWD\ (MIN.)}$, $t_{CWD} > t_{CWD\ (MIN.)}$, $t_{AWD} > t_{AWD\ (MIN.)}$ and $t_{CPWD} > t_{CPWD\ (MIN.)}$, the cycle is a read-write cycle and I/O pins will contain data read from the selected cells. If neither of the above sets of conditions is satisfied, the condition of the I/O pins (at access time) is indeterminate.
16. These parameters are referenced to the $\overline{CAS}$ leading edge in early write cycles and to the $\overline{WE}$ leading edge in read-write cycles.
