

Wideband/Video "T" Switches

DESCRIPTION

The DG540, DG541, DG542 are high performance monolithic wideband/video switches designed for switching RF, video and digital signals. By utilizing a "T" switch configuration on each channel, these devices achieve exceptionally low crosstalk and high off-isolation. The crosstalk and off-isolation of the DG540 are further improved by the introduction of extra GND pins between signal pins. To achieve TTL compatibility, low channel capacitances and fast switching times, the DG540 family is built on the Vishay Siliconix proprietary D/CMOS process. Each switch conducts equally well in both directions when on.

FEATURES

- Halogen-free according to IEC 61249-2-21 Definition
- Wide Bandwidth: 500 MHz
- Low Crosstalk: - 85 dB
- High Off-Isolation: - 80 dB at 5 MHz
- "T" Switch Configuration
- TTL and CMOS Logic Compatible
- Fast Switching - t_{ON} : 45 ns
- Low $R_{DS(on)}$: 30 Ω
- Compliant to RoHS Directive 2002/95/EC

RoHS
COMPLIANT
HALOGEN
FREE

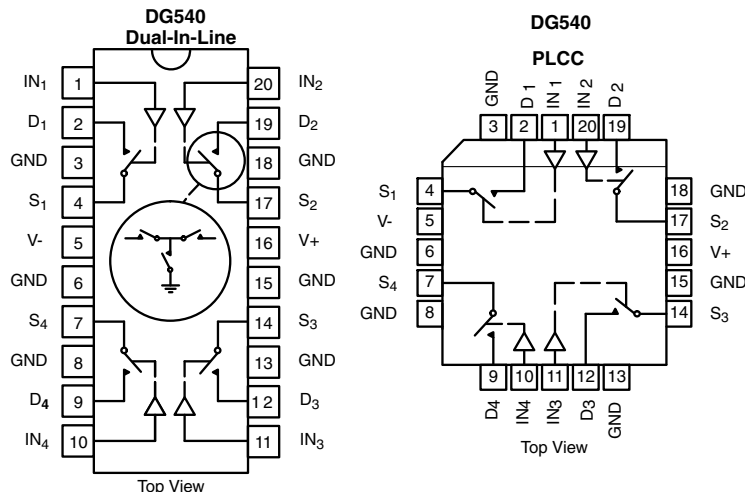

BENEFITS

- Flat Frequency Response
- High Color Fidelity
- Low Insertion Loss
- Improved System Performance
- Reduced Board Space
- Reduced Power Consumption
- Improved Data Throughput

APPLICATIONS

- RF and Video Switching
- RGB Switching
- Local and Wide Area Networks
- Video Routing
- Fast Data Acquisition
- ATE
- Radar/FLR Systems
- Video Multiplexing

Notes:

- a. Refer to PROCESS OPTION FLOWCHART .
- b. Room = 25 °C, full = as determined by the operating temperature suffix.
- c. Typical values are for DESIGN AID ONLY, not guaranteed nor subject to production testing.
- d. The algebraic convention whereby the most negative value is a minimum and the most positive a maximum, is used in this data sheet.
- e. Guaranteed by design, not subject to production test.
- f. V_{IN} = input voltage to perform proper function.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

APPLICATIONS

Device Description

The DG540, DG541, DG542 family of wideband switches offers true bidirectional switching of high frequency analog or digital signals with minimum signal crosstalk, low insertion loss, and negligible non-linearity distortion and group delay. Built on the Siliconix D/CMOS process, these "T" switches provide excellent off-isolation with a bandwidth of around 500 MHz (350 MHz for DG541). Silicon-gate D/CMOS processing also yields fast switching speeds.

An on-chip regulator circuit maintains TTL input compatibility over the whole operating supply voltage range, easing control logic interfacing.

Circuit layout is facilitated by the interchangeability of source and drain terminals.

Frequency Response

A single switch on-channel exhibits both resistance ($R_{\text{DS(on)}}$) and capacitance ($C_{\text{S(on)}}$). This RC combination has an attenuation effect on the analog signal – which is frequency dependent (like an RC low-pass filter). The -3-dB bandwidth of the DG540 is typically 500 MHz (into 50 Ω). This measured figure of 500 MHz illustrates that the switch channel can not be represented by a two stage RC combination. The on capacitance of the channel is distributed along the on-resistance, and hence becomes a more complex multi stage network of R's and C's making up the total $R_{\text{DS(on)}}$ and $C_{\text{S(on)}}$. See Application Note AN502 for more details.

Off-Isolation and Crosstalk

Off-isolation and crosstalk are affected by the load resistance and parasitic inter-electrode capacitances. Higher off-isolation is achieved with lower values of R_L . However, low values of R_L increase insertion loss requiring gain adjustments down the line. Stray capacitances, even a fraction of 1 pF, can cause a large crosstalk increase. Good layout and ground shielding techniques can considerably improve your ac circuit performance.

APPLICATIONS

Power Supplies

A useful feature of the DG54X family is its power supply flexibility. It can be operated from a single positive supply (V+) if required (V- connected to ground).

Note that the analog signal must not exceed V- by more than -0.3 V to prevent forward biasing the substrate p-n junction.

The use of a V- supply has a number of advantages:

1. It allows flexibility in analog signal handling, i.e., with $V_- = -5\text{ V}$ and $V_+ = 12\text{ V}$; up to $\pm 5\text{ V}$ ac signals can be controlled.
2. The value of on capacitance [$C_{S(on)}$] may be reduced. A property known as 'the body-effect' on the DMOS switch devices causes various parametric effects to occur. One of these effects is the reduction in $C_{S(on)}$ for an increasing V body-source. Note, however, that to increase V- normally requires V+ to be reduced (since $V_+ \text{ to } V_- = 21\text{ V max.}$). Reduction in V+ causes an increase in $R_{DS(on)}$, hence a compromise has to be achieved. It is also useful to note that optimum video linearity performance (e.g., differential phase and gain) occurs when V- is around -3 V.
3. V- eliminates the need to bias the analog signal using potential dividers and large coupling capacitors.

Decoupling

It is an established RF design practice to incorporate sufficient bypass capacitors in the circuit to decouple the power supplies to all active devices in the circuit. The dynamic performance of the DG54X is adversely affected by poor decoupling of power supply pins. Also, of even more significance, since the substrate of the device is connected to the negative supply, adequate decoupling of this pin is essential.

Rules:

1. Decoupling capacitors should be incorporated on all power supply pins (V+, V-). (See Figure 7.)
2. They should be mounted as close as possible to the device pins.
3. Capacitors should have good high frequency characteristics - tantalum bead and/or monolithic ceramic types are adequate. Suitable decoupling capacitors are 1- to 10 μF tantalum bead, plus 10- to 100 nF ceramic.

Figure 7. Supply Decoupling

Board Layout

PCB layout rules for good high frequency performance must be observed to achieve the performance boasted by the DG540. Some tips for minimizing stray effects are:

1. Use extensive ground planes on double sided PCB, separating adjacent signal paths. Multilayer PCB is even better.
2. Keep signal paths as short as practically possible, with all channel paths of near equal length.
3. Careful arrangement of ground connections is also very important. Star connected system grounds eliminate signal current flowing through ground path parasitic resistance from coupling between channels.

APPLICATIONS
