

VN5016AJ-E

Single channel high side driver with analog current sense for automotive applications

Features

Max supply voltage	V_{CC}	41V
Operating voltage range	V_{CC}	4.5 to 36V
Max On-State resistance (per ch.)	R_{ON}	16 m Ω
Current limitation (typ)	I_{LIMH}	65A
Off state supply current	I_S	2 μ A

- Main features
 - Inrush current active management by power limitation
 - Very low stand-by current
 - 3.0V CMOS compatible input
 - Optimized electromagnetic emission
 - Very low electromagnetic susceptibility
 - In compliance with the 2002/95/EC european directive
- Diagnostic functions
 - Proportional load current sense
 - High current sense precision for wide range currents
 - Current sense disable
 - Thermal shutdown indication
 - Very low current sense leakage
- Protection
 - Undervoltage shut-down
 - Overvoltage clamp
 - Load current limitation
 - Self limiting of fast thermal transients
 - Protection against loss of ground and loss of V_{CC}
 - Thermal shut down
 - Reverse battery protection
 - Electrostatic discharge protection

PowerSSO-12

Application

- All types of resistive, inductive and capacitive loads

Description

The VN5016AJ-E is a monolithic device made using STMicroelectronics VIPower M0-5 technology. It is intended for driving resistive or inductive loads with one side connected to ground. Active V_{CC} pin voltage clamp protects the device against low energy spikes (see ISO7637 transient compatibility table). This device integrates an analog current sense which delivers a current proportional to the load current (according to a known ratio) when CS_DIS is driven low or left open.

When CS_DIS is driven high, the CURRENT SENSE pin is in a high impedance condition.

Output current limitation protects the device in overload condition. In case of long overload duration, the device limits the dissipated power to safe level up to thermal shut-down intervention. Thermal shut-down with automatic restart allows the device to recover normal operation as soon as fault condition disappears.

2.1 Absolute maximum ratings

Stressing the device above the ratings listed in the “Absolute maximum ratings” tables may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the Operating sections of this specification is not implied. Exposure to the conditions in this section for extended periods may affect device reliability. Refer also to the STMicroelectronics SURE Program and other relevant quality documents.

(1) To ensure long term reliability under heavy overload or short circuit conditions, protection and related diagnostic signals must be used together with a proper software strategy. If the device is subjected to abnormal conditions, this software must limit the duration and number of activation cycles.

3 Application Information

Figure 26. Application schematic

3.1 GND protection network against reverse battery

3.1.1 Solution 1 : resistor in the ground line (R_{GND} only)

This can be used with any type of load.

The following is an indication on how to dimension the R_{GND} resistor.

1. $R_{GND} \leq 600\text{mV} / (I_{S(on)max})$.
2. $R_{GND} \geq (-V_{CC}) / (-I_{GND})$

where $-I_{GND}$ is the DC reverse ground pin current and can be found in the absolute maximum rating section of the device datasheet.

Power Dissipation in R_{GND} (when $V_{CC} < 0$: during reverse battery situations) is:

$$P_D = (-V_{CC})^2 / R_{GND}$$

This resistor can be shared amongst several different HSDs. Please note that the value of this resistor should be calculated with formula (1) where $I_{S(on)max}$ becomes the sum of the maximum on-state currents of the different devices.

Please note that if the microprocessor ground is not shared by the device ground then the R_{GND} will produce a shift ($I_{S(on)max} * R_{GND}$) in the input thresholds and the status output values. This shift will vary depending on how many devices are ON in the case of several high side drivers sharing the same R_{GND} .

If the calculated power dissipation leads to a large resistor or several devices have to share the same resistor then ST suggests to utilize Solution 2 (see below).

3.1.2 Solution 2 : diode (D_{GND}) in the ground line

A resistor ($R_{GND}=1k\Omega$) should be inserted in parallel to D_{GND} if the device drives an inductive load.

This small signal diode can be safely shared amongst several different HSDs. Also in this case, the presence of the ground network will produce a shift ($\approx 600mV$) in the input threshold and in the status output values if the microprocessor ground is not common to the device ground. This shift will not vary if more than one HSD shares the same diode/resistor network.

3.2 Load dump protection

D_{ld} is necessary (Voltage Transient Suppressor) if the load dump peak voltage exceeds the V_{CC} max DC rating. The same applies if the device is subject to transients on the V_{CC} line that are greater than the ones shown in the ISO 7637-2: 2004(E) table.

3.3 MCU I/Os protection

If a ground protection network is used and negative transient are present on the V_{CC} line, the control pins will be pulled negative. ST suggests to insert a resistor (R_{prot}) in line to prevent the μC I/Os pins to latch-up.

The value of these resistors is a compromise between the leakage current of μC and the current required by the HSD I/Os (Input levels compatibility) with the latch-up limit of μC I/Os.

$$-V_{CCpeak}/I_{latchup} \leq R_{prot} \leq (V_{OH\mu C} - V_{IH} - V_{GND}) / I_{IHmax}$$

Calculation example:

For $V_{CCpeak} = -100V$ and $I_{latchup} \geq 20mA$; $V_{OH\mu C} \geq 4.5V$

$$5k\Omega \leq R_{prot} \leq 180k\Omega$$

Recommended values: $R_{prot}=10k\Omega$, $C_{EXT}=10nF$.

3.4 Maximum demagnetization energy ($V_{CC} = 13.5V$)

Figure 27. Maximum turn Off current versus load inductance

Note: Values are generated with $R_L = 0 \Omega$.

In case of repetitive pulses, T_{jstart} (at beginning of each demagnetization) of every pulse must not exceed the temperature specified above for curves B and C.

(a) The fitting model is a simplified thermal tool and is valid for transient evolutions where the embedded protections (power limitation or thermal cycling during thermal shutdown) are not triggered.

5 Package information

5.1 ECOPACK® packages

In order to meet environmental requirements, ST offers these devices in ECOPACK® packages. These packages have a Lead-free second-level interconnect. The category of Second-Level Interconnect is marked on the package and on the inner box label, in compliance with JEDEC Standard JESD97. The maximum ratings related to soldering conditions are also marked on the inner box label. ECOPACK is an ST trademark. ECOPACK specifications are available at: www.st.com.

6 Revision history

Table 15. Document revision history

Date	Revision	Changes
30-Oct-2004	1	Initial release.
15-Jan-2005	2	Minor text changes.
11-May-2006	3	Document changed from Advance Data to maturity.
02-Feb-2007	4	Changes minor formatting. Added Figure 27: Maximum turn Off current versus load inductance . Added new disclaimer.
02-Jul-2007	5	Table 4 : updated E_{MAX} entries. Table 10 : added $dk1/k1$, $dk2/k2$, $dk3/k3$, $\Delta t_{DSENSE2H}$. Added Figure 5 . Updated Figure 6 . Added Figure 7 . Table 12 : updated test level values III and IV for test pulse 5b and notes. Added Section 3.4: Maximum demagnetization energy ($V_{CC} = 13.5V$) . Figure 31: Thermal fitting model of a single channel HSD in PowerSSO-12™ : added notes.
09-Jan-2007	6	Updated Table 10: Current sense ($8V < V_{CC} < 16V$) : – Changed $dk3/k3$ values from ± 2 to ± 3 %. – Added I_{OL} parameter. – Changed $\Delta t_{DSENSE2H}$ max value from 120 to 280 μs . Updated Figure 7: Maximum current sense ratio drift vs load current with new dk/K values. Updated Section 4.1: PowerSSO-12™ thermal data : – Changed Figure 29: $R_{thj-amb}$ vs. PCB copper area in open box free air condition . – Changed Figure 30: PowerSSO-12™ thermal impedance junction ambient single pulse . – Updated Table 13: Thermal parameter : R3 value changed from 7 to 4 $^{\circ}C/W$. R4 values changed from 10 /10 /10 to 8 /8 /7 $^{\circ}C/W$.
12-Feb-2008	7	Corrected typing error in Table 10: Current sense ($8V < V_{CC} < 16V$) : changed I_{OL} test condition from $V_{IN} = 0V$ to $V_{IN} = 5V$.
25-Sep-2013	8	Updated disclaimer.
