

# KSZ8081RNA/RND

## 10BASE-T/100BASE-TX PHY with RMII Support

### Features

- Single-Chip 10BASE-T/100BASE-TX IEEE 802.3 Compliant Ethernet Transceiver
- RMII v1.2 Interface Support with a 50 MHz Reference Clock Output to MAC, and an Option to Input a 50 MHz Reference Clock
- RMII Back-to-Back Mode Support for a 100 Mbps Copper Repeater
- MDC/MDIO Management Interface for PHY Register Configuration
- Programmable Interrupt Output
- LED Outputs for Link and Activity Status Indication
- On-Chip Termination Resistors for the Differential Pairs
- Baseline Wander Correction
- HP Auto MDI/MDI-X to Reliably Detect and Correct Straight-Through and Crossover Cable Connections with Disable and Enable Option
- Auto-Negotiation to Automatically Select the Highest Link-Up Speed (10/100 Mbps) and Duplex (Half/Full)
- Power-Down and Power-Saving Modes
- LinkMD<sup>®</sup> TDR-Based Cable Diagnostics to Identify Faulty Copper Cabling
- Parametric NAND Tree Support for Fault Detection Between Chip I/Os and the Board
- HBM ESD Rating (6 kV)
- Loopback Modes for Diagnostics
- Single 3.3V Power Supply with V<sub>DD</sub> I/O Options for 1.8V, 2.5V, or 3.3V
- Built-In 1.2V Regulator for Core
- Available in 24-pin 4 mm x 4 mm QFN Package

### Target Applications

- Game Consoles
- IP Phones
- IP Set-Top Boxes
- IP TVs
- LOM
- Printers

## TO OUR VALUED CUSTOMERS

It is our intention to provide our valued customers with the best documentation possible to ensure successful use of your Microchip products. To this end, we will continue to improve our publications to better suit your needs. Our publications will be refined and enhanced as new volumes and updates are introduced.

If you have any questions or comments regarding this publication, please contact the Marketing Communications Department via E-mail at [docerrors@microchip.com](mailto:docerrors@microchip.com). We welcome your feedback.

### Most Current Data Sheet

To obtain the most up-to-date version of this data sheet, please register at our Worldwide Web site at:

<http://www.microchip.com>

You can determine the version of a data sheet by examining its literature number found on the bottom outside corner of any page. The last character of the literature number is the version number, (e.g., DS30000000A is version A of document DS30000000).

### Errata

An errata sheet, describing minor operational differences from the data sheet and recommended workarounds, may exist for current devices. As device/documentation issues become known to us, we will publish an errata sheet. The errata will specify the revision of silicon and revision of document to which it applies.

To determine if an errata sheet exists for a particular device, please check with one of the following:

- Microchip's Worldwide Web site; <http://www.microchip.com>
- Your local Microchip sales office (see last page)

When contacting a sales office, please specify which device, revision of silicon and data sheet (include -literature number) you are using.

### Customer Notification System

Register on our web site at [www.microchip.com](http://www.microchip.com) to receive the most current information on all of our products.

# KSZ8081RNA/RND

## 1.0 INTRODUCTION

### 1.1 General Description

The KSZ8081RNA/RND is a single-supply 10BASE-T/100BASE-TX Ethernet physical-layer transceiver for transmission and reception of data over standard CAT-5 unshielded twisted pair (UTP) cable.

The KSZ8081RNA/RND is a highly-integrated PHY solution. It reduces board cost and simplifies board layout by using on-chip termination resistors for the differential pairs and by integrating a low-noise regulator to supply the 1.2V core, and by offering 1.8/2.5/3.3V digital I/O interface support.

The KSZ8081RNA/RND offers the Reduced Media Independent Interface (RMII) for direct connection to RMII-compliant MACs in Ethernet processors and switches.

As the power-up default, the KSZ8081RNA uses a 25 MHz crystal to generate all required clocks, including the 50 MHz RMII reference clock output for the MAC. The KSZ8081RND is the version that takes in the 50 MHz RMII reference clock as the power-up default.

To facilitate system bring-up and debugging in production testing and in product deployment, parametric NAND tree support enables fault detection between KSZ8081RNA/RND I/Os and the board. LinkMD<sup>®</sup> TDR-based cable diagnostics identify faulty copper cabling.

The KSZ8081RNA and KSZ8081RND are available in 24-pin, lead-free QFN packages.

|            |                     |                  | Link                                                                                                                                                                                                                                                                                                                       | Low       | ON             |
|            |                     |                  | LED Mode = [10], [11]: Reserved                                                                                                                                                                                                                                                                                            |           |                |
|            |                     |                  | 24                                                                                                                                                                                                                                                                                                                         | RST#      | Ipu            |
| Paddle     | GND                 | GND              | Ground.                                                                                                                                                                                                                                                                                                                    |           |                |

- Note 2-1** P = power supply  
GND = ground  
I = input  
O = output  
I/O = bi-directional  
Ipu = Input with internal pull-up (see [Section 6.0, "Electrical Characteristics"](#) for value).  
Ipu/O = Input with internal pull-up (see [Section 6.0, "Electrical Characteristics"](#) for value) during power-up/reset; output pin otherwise.  
Ipd/O = Input with internal pull-down (see [Electrical Characteristics](#) for value) during power-up/reset; output pin otherwise.  
Ipu/Opu = Input with internal pull-up (see [Electrical Characteristics](#) for value) and output with internal pull-up (see [Electrical Characteristics](#) for value).
- Note 2-2** RMII RX Mode: The RXD[1:0] bits are synchronous with the 50 MHz RMII Reference Clock. For each clock period in which CRS\_DV is asserted, two bits of recovered data are sent by the PHY to the MAC.
- Note 2-3** RMII TX Mode: The TXD[1:0] bits are synchronous with the 50 MHz RMII Reference Clock. For each clock period in which TXEN is asserted, two bits of data are received by the PHY from the MAC.

The PHYAD [2:0] strap-in pins are latched at the de-assertion of reset. In some systems, the RMII MAC receive input pins may drive high/low during power-up or reset, and consequently cause the PHYAD [2:0] strap-in pins, which are shared with the RMII CRS\_DV and REF\_CLK signals, to be latched to unintended states. In this case an external pull-up (4.7 kΩ) and/or pull-down resistors (1.0 kΩ) should be added on the PHYAD [2:0] pins to ensure that the intended values are strapped in correctly.

# KSZ8081RNA/RND

---

## 3.0 FUNCTIONAL DESCRIPTION

The KSZ8081RNA is an integrated, single 3.3V supply, fast Ethernet transceiver. It is fully compliant with the IEEE 802.3 Specification, and reduces board cost and simplifies board layout by using on-chip termination resistors for the two differential pairs and by integrating the regulator to supply the 1.2V core.

On the copper media side, the KSZ8081RNA supports 10BASE-T and 100BASE-TX for transmission and reception of data over a standard CAT-5 unshielded twisted pair (UTP) cable, and HP Auto MDI/MDI-X for reliable detection of and correction for straight-through and crossover cables.

On the MAC processor side, the KSZ8081RNA offers the Reduced Media Independent Interface (RMII) for direct connection with RMII-compliant Ethernet MAC processors and switches

The MII management bus option gives the MAC processor complete access to the KSZ8081RNA control and status registers. Additionally, an interrupt pin eliminates the need for the processor to poll for PHY status change.

As the power-up default, the KSZ8081RNA uses a 25 MHz crystal to generate all required clocks, including the 50 MHz RMII reference clock output for the MAC. The KSZ8081RND version uses the 50 MHz RMII reference clock input as the power-up default.

The KSZ8081RNA is used to refer to both KSZ8081RNA and KSZ8081RND versions in this data sheet.

## 3.1 10BASE-T/100BASE-TX Transceiver

### 3.1.1 100BASE-TX TRANSMIT

The 100BASE-TX transmit function performs parallel-to-serial conversion, 4B/5B encoding, scrambling, NRZ-to-NRZI conversion, and MLT3 encoding and transmission.

The circuitry starts with a parallel-to-serial conversion, which converts the MII data from the MAC into a 125 MHz serial bit stream. The data and control stream is then converted into 4B/5B coding and followed by a scrambler. The serialized data is further converted from NRZ-to-NRZI format, and then transmitted in MLT3 current output. The output current is set by an external 6.49 k $\Omega$  1% resistor for the 1:1 transformer ratio.

The output signal has a typical rise/fall time of 4 ns and complies with the ANSI TP-PMD standard regarding amplitude balance, overshoot, and timing jitter. The wave-shaped 10BASE-T output is also incorporated into the 100BASE-TX transmitter.

### 3.1.2 100BASE-TX RECEIVE

The 100BASE-TX receiver function performs adaptive equalization, DC restoration, MLT3-to-NRZI conversion, data and clock recovery, NRZI-to-NRZ conversion, de-scrambling, 4B/5B decoding, and serial-to-parallel conversion.

The receiving side starts with the equalization filter to compensate for inter-symbol interference (ISI) over the twisted pair cable. Because the amplitude loss and phase distortion is a function of the cable length, the equalizer must adjust its characteristics to optimize performance. In this design, the variable equalizer makes an initial estimation based on comparisons of incoming signal strength against some known cable characteristics, then tunes itself for optimization. This is an ongoing process and self-adjusts against environmental changes such as temperature variations.

Next, the equalized signal goes through a DC-restoration and data-conversion block. The DC-restoration circuit compensates for the effect of baseline wander and improves the dynamic range. The differential data-conversion circuit converts MLT3 format back to NRZI. The slicing threshold is also adaptive.

The clock-recovery circuit extracts the 125 MHz clock from the edges of the NRZI signal. This recovered clock is then used to convert the NRZI signal to NRZ format. This signal is sent through the de-scrambler, then the 4B/5B decoder. Finally, the NRZ serial data is converted to MII format and provided as the input data to the MAC.

### 3.1.3 SCRAMBLER/DE-SCRAMBLER (100BASE-TX ONLY)

The scrambler spreads the power spectrum of the transmitted signal to reduce electromagnetic interference (EMI) and baseline wander. The de-scrambler recovers the scrambled signal.

### 3.1.4 10BASE-T TRANSMIT

The 10BASE-T drivers are incorporated with the 100BASE-TX drivers to allow for transmission using the same magnetic. The drivers perform internal wave-shaping and pre-emphasis, and output 10BASE-T signals with typical amplitude of 2.5V peak. The 10BASE-T signals have harmonic contents that are at least 27 dB below the fundamental frequency when driven by an all-ones Manchester-encoded signal.

## 3.1.5 10BASE-T RECEIVE

On the receive side, input buffer and level detecting squelch circuits are used. A differential input receiver circuit and a phase-locked loop (PLL) performs the decoding function. The Manchester-encoded data stream is separated into clock signal and NRZ data. A squelch circuit rejects signals with levels less than 400 mV, or with short pulse widths, to prevent noise at the RXP and RXM inputs from falsely triggering the decoder. When the input exceeds the squelch limit, the PLL locks onto the incoming signal and the KSZ8081RNA/RND decodes a data frame. The receive clock is kept active during idle periods between data receptions.

## 3.1.6 PLL CLOCK SYNTHESIZER

The KSZ8081RNA/RND in RMII – 25 MHz Clock mode generates all internal clocks and all external clocks for system timing from an external 25 MHz crystal, oscillator, or reference clock. For the KSZ8081RNA/RND in RMII – 50 MHz clock mode, these clocks are generated from an external 50 MHz oscillator or system clock.

## 3.1.7 AUTO-NEGOTIATION

The KSZ8081RNA/RND conforms to the auto-negotiation protocol, defined in Clause 28 of the IEEE 802.3 Specification.

Auto-negotiation allows unshielded twisted pair (UTP) link partners to select the highest common mode of operation.

During auto-negotiation, link partners advertise capabilities across the UTP link to each other and then compare their own capabilities with those they received from their link partners. The highest speed and duplex setting that is common to the two link partners is selected as the mode of operation.

The following list shows the speed and duplex operation mode from highest to lowest priority.

- Priority 1: 100BASE-TX, full-duplex
- Priority 2: 100BASE-TX, half-duplex
- Priority 3: 10BASE-T, full-duplex
- Priority 4: 10BASE-T, half-duplex

If auto-negotiation is not supported or the KSZ8081RNA/RND link partner is forced to bypass auto-negotiation, then the KSZ8081RNA/RND sets its operating mode by observing the signal at its receiver. This is known as parallel detection, which allows the KSZ8081RNA/RND to establish a link by listening for a fixed signal protocol in the absence of the auto-negotiation advertisement protocol.

Auto-negotiation is enabled by either hardware pin strapping (ANEN\_SPEED, Pin 23) or software (Register 0h, Bit [12]).

By default, auto-negotiation is enabled after power-up or hardware reset. After that, auto-negotiation can be enabled or disabled by Register 0h, Bit [12]. If auto-negotiation is disabled, the speed is set by Register 0h, Bit [13], and the duplex is set by Register 0h, Bit [8].

The auto-negotiation link-up process is shown in [Figure 3-1](#).

**FIGURE 3-1: AUTO-NEGOTIATION FLOW CHART**

## 3.2 RMII Interface

The Reduced Media Independent Interface (RMII) specifies a low pin count Media Independent Interface (MII). It provides a common interface between physical layer and MAC layer devices, and has the following key characteristics:

- Pin count is 8 pins (3 pins for data transmission, 4 pins for data reception, and 1 pin for the 50 MHz reference clock).
- 10 Mbps and 100 Mbps data rates are supported at both half- and full-duplex.
- Data transmission and reception are independent and belong to separate signal groups.
- Transmit data and receive data are each 2 bits wide, a dibit.

### 3.2.1 RMII SIGNAL DEFINITION

[Table 3-1](#) describes the RMII signals. Refer to RMII Specification v1.2 for detailed information.

**TABLE 3-1: RMII SIGNAL DEFINITION**

| RMII Signal Name | Direction with Respect to PHY, KSZ8081 Signal                 | Direction with Respect to MAC | Description                                                                     |
|------------------|---------------------------------------------------------------|-------------------------------|---------------------------------------------------------------------------------|
| REF_CLK          | Output (25 MHz Clock Mode)/<br>No Connect (50 MHz Clock Mode) | Input/<br>Input or No Connect | Synchronous 50 MHz reference clock for receive, transmit, and control interface |
| TXEN             | Input                                                         | Output                        | Transmit Enable                                                                 |
| TXD[1:0]         | Input                                                         | Output                        | Transmit Data[1:0]                                                              |
| CRS_DV           | Output                                                        | Input                         | Carrier Sense/Receive Data Valid                                                |
| RXD[1:0]         | Output                                                        | Input                         | Receive Data[1:0]                                                               |
| RXER             | Output                                                        | Input or<br>Not Required      | Receive Error                                                                   |

## 3.2.1.1 Reference Clock (REF\_CLK)

REF\_CLK is a continuous 50 MHz clock that provides the timing reference for TXEN, TXD[1:0], CRS\_DV, RXD[1:0], and RX\_ER.

For RMII – 25 MHz Clock Mode, the KSZ8081RNA/RND generates and outputs the 50 MHz RMII REF\_CLK to the MAC at REF\_CLK (Pin 16).

For RMII – 50 MHz Clock Mode, the KSZ8081RNA/RND takes in the 50 MHz RMII REF\_CLK from the MAC or system board at XI (Pin 8) and leaves the REF\_CLK (Pin 16) as no connect.

## 3.2.1.2 Transmit Enable (TXEN)

TXEN indicates that the MAC is presenting dibits on TXD[1:0] for transmission. It is asserted synchronously with the first dibit of the preamble and remains asserted while all dibits to be transmitted are presented on the RMII. It is negated before the first REF\_CLK following the final dibit of a frame.

TXEN transitions synchronously with respect to REF\_CLK.

## 3.2.1.3 Transmit Data[1:0] (TXD[1:0])

TXD[1:0] transitions synchronously with respect to REF\_CLK. When TXEN is asserted, the PHY accepts TXD[1:0] for transmission.

TXD[1:0] is 00 to indicate idle when TXEN is de-asserted. The PHY ignores values other than 00 on TXD[1:0] while TXEN is de-asserted.

## 3.2.1.4 Carrier Sense/Receive Data Valid (CRS\_DV)

The PHY asserts CRS\_DV when the receive medium is non-idle. It is asserted asynchronously when a carrier is detected. This happens when squelch is passed in 10 Mbps mode, and when two non-contiguous 0s in 10 bits are detected in 100 Mbps mode. Loss of carrier results in the de-assertion of CRS\_DV.

While carrier detection criteria are met, CRS\_DV remains asserted continuously from the first recovered dibit of the frame through the final recovered dibit. It is negated before the first REF\_CLK that follows the final dibit. The data on RXD[1:0] is considered valid after CRS\_DV is asserted. However, because the assertion of CRS\_DV is asynchronous relative to REF\_CLK, the data on RXD[1:0] is 00 until receive signals are properly decoded.

## 3.2.1.5 Receive Data[1:0] (RXD[1:0])

RXD[1:0] transitions synchronously with respect to REF\_CLK. For each clock period in which CRS\_DV is asserted, RXD[1:0] transfers two bits of recovered data from the PHY.

RXD[1:0] is 00 to indicate idle when CRS\_DV is de-asserted. The MAC ignores values other than 00 on RXD[1:0] while CRS\_DV is de-asserted.

# KSZ8081RNA/RND

## 3.2.1.6 Receive Error (RXER)

RXER is asserted for one or more REF\_CLK periods to indicate that a symbol error (for example, a coding error that a PHY can detect that may otherwise be undetectable by the MAC sub-layer) was detected somewhere in the frame being transferred from the PHY.

RXER transitions synchronously with respect to REF\_CLK. While CRS\_DV is de-asserted, RXER has no effect on the MAC.

## 3.2.1.7 Collision Detection (COL)

The MAC regenerates the COL signal of the MII from TXEN and CRS\_DV.

## 3.2.2 RMII SIGNAL DIAGRAM – 25/50 MHZ CLOCK MODE

The KSZ8081RNA/RND RMII pin connections to the MAC for 25 MHz clock mode are shown in [Figure 3-2](#). The connections for 50 MHz clock mode are shown in [Figure 3-3](#).

### 3.2.2.1 RMII – 25 MHz Clock Mode

The KSZ8081RNA is configured to RMII – 25 MHz clock mode after it is powered up or hardware reset with the following:

- A 25 MHz crystal connected to XI, XO (Pins 8, 7), or an external 25 MHz clock source (oscillator) connected to XI

The KSZ8081RND can optionally be configured to RMII – 25 MHz clock mode after it is powered up or hardware reset and software programmed with the following:

- An external 25 MHz clock source (oscillator) connected to XI
- Note: The KSZ8081RND cannot be used with a crystal because the crystal drive circuit is disabled.
- Register 1Fh, Bit [7] programmed to '1' to select RMII – 25 MHz clock mode

**FIGURE 3-2: KSZ8081RNA RMII INTERFACE (RMII - 25 MHZ CLOCK MODE)**

## 3.2.2.2 RMII – 50 MHz Clock Mode

The KSZ8081RND is configured to RMII – 50 MHz clock mode after it is powered up or hardware reset with the following:

- An external 50 MHz clock source (oscillator) connected to XI (Pin 8)

The KSZ8081RNA can optionally be configured to RMII – 50 MHz clock mode after it is powered up or hardware reset and software programmed with the following:

- An external 50 MHz clock source (oscillator) connected to XI (Pin 8)
- Register 1Fh, Bit [7] programmed to '1' to select RMII – 50 MHz clock mode

**FIGURE 3-3: KSZ8081RNA/RND RMII INTERFACE (RMII - 50 MHz CLOCK MODE)**

# KSZ8081RNA/RND

## 3.3 Back-to-Back Mode – 100 Mbps Copper Repeater

Two KSZ8081RNA/RND devices can be connected back-to-back to form a managed 100BASE-TX copper repeater.

**FIGURE 3-4: KSZ8081RNA/RND AND KSZ8081RNA/RND RMII BACK-TO-BACK COPPER REPEATER**

### 3.3.1 RMII BACK-TO-BACK MODE

In RMII back-to-back mode, a KSZ8081RNA/RND interfaces with another KSZ8081RNA/RND to provide a 100 Mbps copper repeater solution.

The KSZ8081RNA/RND devices are configured to RMII back-to-back mode after power-up or reset, and software programming, with the following:

- A common 50 MHz reference clock connected to XI (Pin 8)
- Register 1Fh, Bit [7] programmed to '1' to select RMII – 50 MHz clock mode for KSZ8081RNA

KSZ8081RND is set to RMII – 50 MHz clock mode as the default after power up or hardware reset.

- Register 16h, Bits [6] and [1] programmed to '1' and '1', respectively, to enable RMII back-to-back mode.
- RMII signals connected as shown in [Table 3-2](#).

**TABLE 3-2: RMII SIGNAL CONNECTION FOR RMII BACK-TO-BACK MODE (100BASE-TX COPPER REPEATER)**

| KSZ8081RNA/RND (100BASE-TX Copper)<br>[Device 1] |            |          | KSZ8081RNA/RND (100BASE-TX Copper)<br>[Device 2] |            |          |
|--------------------------------------------------|------------|----------|--------------------------------------------------|------------|----------|
| Pin Name                                         | Pin Number | Pin Type | Pin Name                                         | Pin Number | Pin Type |
| CRS_DV                                           | 15         | Output   | TXEN                                             | 19         | Input    |
| RXD1                                             | 12         | Output   | TXD1                                             | 21         | Input    |
| RXD0                                             | 13         | Output   | TXD0                                             | 20         | Input    |
| TXEN                                             | 19         | Input    | CRS_DV                                           | 15         | Output   |
| TXD1                                             | 21         | Input    | RXD1                                             | 12         | Output   |
| TXD0                                             | 20         | Input    | RXD0                                             | 13         | Output   |

## 3.4 MII Management (MIIM) Interface

The KSZ8081RNA/RND supports the IEEE 802.3 MII management interface, also known as the Management Data Input/Output (MDIO) interface. This interface allows an upper-layer device, such as a MAC processor, to monitor and control the state of the KSZ8081RNA/RND. An external device with MIIM capability is used to read the PHY status and/or configure the PHY settings. More details about the MIIM interface can be found in Clause 22.2.4 of the IEEE 802.3 Specification.

The MIIM interface consists of the following:

- A physical connection that incorporates the clock line (MDC) and the data line (MDIO).
- A specific protocol that operates across the physical connection mentioned earlier, which allows the external controller to communicate with one or more PHY devices.
- A set of 16-bit MDIO registers. Registers [0:8] are standard registers, and their functions are defined in the IEEE 802.3 Specification. The additional registers are provided for expanded functionality. See the Register Map section for details.

The KSZ8081RNA/RND supports only four unique PHY addresses. The PHYAD[2:0] strapping pins are used to select either 0h, 3h, 4h or 7h as the PHY address for the KSZ8081RNA/RND device.

PHY address 0h is defined as the broadcast PHY address according to the IEEE 802.3 Specification, and can be used to read/write to a single PHY device, or write to multiple PHY devices simultaneously. For the KSZ8081RNA/RND, PHY address 0h defaults to the broadcast PHY address after power-up, but PHY address 0h can be disabled as the broadcast PHY address using software to assign it as a unique PHY address.

For applications that require two KSZ8081RNA/RND PHYs to share the same MDIO interface with one PHY set to address 0h and the other PHY set to address 3h, use PHY address 0h (defaults to broadcast after power-up) to set both PHYs' Register 16h, Bit [9] to '1' to assign PHY address 0h as a unique (non-broadcast) PHY address.

Table 3-3 shows the MII management frame format for the KSZ8081RNA/RND.

**TABLE 3-3: MII MANAGEMENT FRAME FORMAT FOR THE KSZ8081RNA/RND**

|              | Preamble | Start of Frame | Read/Write OP Code | PHY Address Bits[4:0] | REG Address Bits[4:0] | TA | Data Bits[15:0]   | Idle |
|--------------|----------|----------------|--------------------|-----------------------|-----------------------|----|-------------------|------|
| <b>Read</b>  | 32 1's   | 01             | 10                 | 000AA                 | RRRRR                 | Z0 | DDDDDDDD_DDDDDDDD | Z    |
| <b>Write</b> | 32 1's   | 01             | 01                 | 000AA                 | RRRRR                 | 10 | DDDDDDDD_DDDDDDDD | Z    |

## 3.5 Interrupt (INTRP)

INTRP (Pin 18) is an optional interrupt signal that is used to inform the external controller that there has been a status update to the KSZ8081RNA/RND PHY register. Bits [15:8] of Register 1Bh are the interrupt control bits to enable and disable the conditions for asserting the INTRP signal. Bits [7:0] of Register 1Bh are the interrupt status bits to indicate which interrupt conditions have occurred. The interrupt status bits are cleared after reading Register 1Bh.

Bit [9] of Register 1Fh sets the interrupt level to active high or active low. The default is active low.

The MII management bus option gives the MAC processor complete access to the KSZ8081RNA/RND control and status registers. Additionally, an interrupt pin eliminates the need for the processor to poll the PHY for status change.

## 3.6 HP Auto MDI/MDI-X

HP Auto MDI/MDI-X configuration eliminates the need to decide whether to use a straight cable or a crossover cable between the KSZ8081RNA/RND and its link partner. This feature allows the KSZ8081RNA/RND to use either type of cable to connect with a link partner that is in either MDI or MDI-X mode. The auto-sense function detects transmit and receive pairs from the link partner and assigns transmit and receive pairs to the KSZ8081RNA/RND accordingly.

HP Auto MDI/MDI-X is enabled by default. It is disabled by writing a '1' to Register 1Fh, Bit [13]. MDI and MDI-X mode is selected by Register 1Fh, Bit [14] if HP Auto MDI/MDI-X is disabled.

An isolation transformer with symmetrical transmit and receive data paths is recommended to support Auto MDI/MDI-X.

Table 3-4 shows how the IEEE 802.3 Standard defines MDI and MDI-X.

TABLE 3-4: MDI/MDI-X PIN DESCRIPTION

| MDI       |        | MDI-X     |        |
|-----------|--------|-----------|--------|
| RJ-45 Pin | Signal | RJ-45 Pin | Signal |
| 1         | TX+    | 1         | RX+    |
| 2         | TX-    | 2         | RX-    |
| 3         | RX+    | 3         | TX+    |
| 6         | RX-    | 6         | TX-    |

3.6.1 STRAIGHT CABLE

A straight cable connects an MDI device to an MDI-X device, or an MDI-X device to an MDI device. [Figure 3-5](#) shows a typical straight cable connection between a NIC card (MDI device) and a switch or hub (MDI-X device).

FIGURE 3-5: TYPICAL STRAIGHT CABLE CONNECTION

3.6.2 Crossover CABLE

A crossover cable connects an MDI device to another MDI device, or an MDI-X device to another MDI-X device. [Figure 3-6](#) shows a typical crossover cable connection between two switches or hubs (two MDI-X devices).

**FIGURE 3-6: TYPICAL CROSSOVER CABLE CONNECTION**

## 3.7 Loopback Mode

The KSZ8081RNA/RND supports the following loopback operations to verify analog and/or digital data paths.

- Local (digital) loopback
- Remote (analog) loopback

### 3.7.1 LOCAL (DIGITAL) LOOPBACK

This loopback mode checks the RMII transmit and receive data paths between the KSZ8081RNA/RND and the external MAC, and is supported for both speeds (10/100 Mbps) at full-duplex.

The loopback data path is shown in [Figure 3-7](#).

1. The RMII MAC transmits frames to the KSZ8081RNA/RND.
2. Frames are wrapped around inside the KSZ8081RNA/RND.
3. The KSZ8081RNA/RND transmits frames back to the RMII MAC.
4. Except the frames back to the RMII MAC, the transmit frames also go out from the copper port.

**FIGURE 3-7: LOCAL (DIGITAL) LOOPBACK**

# KSZ8081RNA/RND

The following programming action and register settings are used for local loopback mode:

For 10/100 Mbps loopback:

Set Register 0h,

Bit [14] = 1 // Enable local loopback mode

Bit [13] = 0/1 // Select 10 Mbps/100 Mbps speed

Bit [12] = 0 // Disable auto-negotiation

Bit [8] = 1 // Select full-duplex mode

Follow the steps below if you don't want the frames go out from the copper port in the local loopback.

1. Set register 1Fh bit [3] to '1' to disable the transmitter.
2. Run local loopback test as above.
3. Set register 1Fh bit [3] to '0' to enable the transmitter.

## 3.7.2 REMOTE (ANALOG) LOOPBACK

This loopback mode checks the line (differential pairs, transformer, RJ-45 connector, Ethernet cable) transmit and receive data paths between the KSZ8081RNA/RND and its link partner, and is supported for 100BASE-TX full-duplex mode only.

The loopback data path is shown in [Figure 3-8](#).

1. The Fast Ethernet (100BASE-TX) PHY link partner transmits frames to the KSZ8081RNA/RND.
2. Frames are wrapped around inside the KSZ8081RNA/RND.
3. The KSZ8081RNA/RND transmits frames back to the Fast Ethernet (100BASE-TX) PHY link partner.

**FIGURE 3-8: REMOTE (ANALOG) LOOPBACK**

The following programming steps and register settings are used for remote loopback mode:

1. Set Register 0h,

Bits [13] = 1 // Select 100Mbps speed

Bit [12] = 0 // Disable auto-negotiation

Bit [8] = 1 // Select full-duplex mode

Or just auto-negotiate and link up at 100BASE-TX full-duplex mode with the link partner.

2. Set Register 1Fh,

Bit [2] = 1 // Enable remote loopback mode

## 3.8 LinkMD® Cable Diagnostic

The LinkMD function uses time-domain reflectometry (TDR) to analyze the cabling plant for common cabling problems. These include open circuits, short circuits, and impedance mismatches.

LinkMD works by sending a pulse of known amplitude and duration down the MDI or MDI-X pair, then analyzing the shape of the reflected signal to determine the type of fault. The time duration for the reflected signal to return provides the approximate distance to the cabling fault. The LinkMD function processes this TDR information and presents it as a numerical value that can be translated to a cable distance.

LinkMD is initiated by accessing Register 1Dh, the LinkMD Control/Status register, in conjunction with Register 1Fh, the PHY Control 2 register. The latter register is used to disable Auto MDI/MDI-X and to select either MDI or MDI-X as the cable differential pair for testing.

### 3.8.1 USAGE

The following is a sample procedure for using LinkMD with Registers 1Dh and 1Fh:

1. Disable auto MDI/MDI-X by writing a '1' to Register 1Fh, bit [13].
2. Start cable diagnostic test by writing a '1' to Register 1Dh, bit [15]. This enable bit is self-clearing.
3. Wait (poll) for Register 1Dh, bit [15] to return a '0', and indicating cable diagnostic test is completed.
4. Read cable diagnostic test results in Register 1Dh, bits [14:13]. The results are as follows:
  - 00 = normal condition (valid test)
  - 01 = open condition detected in cable (valid test)
  - 10 = short condition detected in cable (valid test)
  - 11 = cable diagnostic test failed (invalid test)

The '11' case, invalid test, occurs when the device is unable to shut down the link partner. In this instance, the test is not run, since it would be impossible for the device to determine if the detected signal is a reflection of the signal generated or a signal from another source.

5. Get distance to fault by concatenating Register 1Dh, bits [8:0] and multiplying the result by a constant of 0.38. The distance to the cable fault can be determined by the following formula:

#### EQUATION 3-1:

$$D \text{ (Distance to cable fault in meters)} = 0.38 \times (\text{Register 1Dh, bits}[8:0])$$

Concatenated value of Registers 1Dh bits [8:0] should be converted to decimal before multiplying by 0.38.

The constant (0.38) may be calibrated for different cabling conditions, including cables with a velocity of propagation that varies significantly from the norm.

## 3.9 NAND Tree Support

The KSZ8081RNA/RND provides parametric NAND tree support for fault detection between chip I/Os and board. The NAND tree is a chain of nested NAND gates in which each KSZ8081RNA/RND digital I/O (NAND tree input) pin is an input to one NAND gate along the chain. At the end of the chain, the TXD1 pin provides the output for the nested NAND gates.

The NAND tree test process includes:

- Enabling NAND tree mode
- Pulling all NAND tree input pins high
- Driving each NAND tree input pin low, sequentially, according to the NAND tree pin order
- Checking the NAND tree output to make sure there is a toggle high-to-low or low-to-high for each NAND tree input driven low

Table 3-5 lists the NAND tree pin order.

# KSZ8081RNA/RND

**TABLE 3-5: NAND TREE TEST PIN ORDER FOR KSZ8081RNA/RND**

| Pin Number | Pin Name | NAND Tree Description |
|------------|----------|-----------------------|
| 10         | MDIO     | Input                 |
| 11         | MDC      | Input                 |
| 12         | RXD1     | Input                 |
| 13         | RXD0     | Input                 |
| 15         | CRS_DV   | Input                 |
| 16         | REF_CLK  | Input                 |
| 18         | INTRP    | Input                 |
| 19         | TXEN     | Input                 |
| 23         | LED0     | Input                 |
| 20         | TXD0     | Input                 |
| 21         | TXD1     | Output                |

## 3.9.1 NAND TREE I/O TESTING

Use the following procedure to check for faults on the KSZ8081RNA/RND digital I/O pin connections to the board:

1. Enable NAND tree mode by setting Register 16h, Bit [5] to '1'.
2. Use board logic to drive all KSZ8081RNA/RND NAND tree input pins high.
3. Use board logic to drive each NAND tree input pin, in KSZ8081RNA/RND tree pin order, as follows:
  - a) Toggle the first pin (MDIO) from high to low, and verify that the TXD1 pin switches from high to low to indicate that the first pin is connected properly.
  - b) Leave the first pin (MDIO) low.
  - c) Toggle the second pin (MDC) from high to low, and verify that the TXD1 pin switches from low to high to indicate that the second pin is connected properly.
  - d) Leave the first pin (MDIO) and the second pin (MDC) low.
  - e) Toggle the third pin from high to low, and verify that the TXD1 pin switches from high-to-low to indicate that the third pin is connected properly.
  - f) Continue with this sequence until all KSZ8081RNA/RND NAND tree input pins have been toggled.

Each KSZ8081RNA/RND NAND tree input pin must cause the TXD1 output pin to toggle high-to-low or low-to-high to indicate a good connection. If the TXD1 pin fails to toggle when the KSZ8081RNA/RND input pin toggles from high to low, the input pin has a fault.

## 3.10 Power Management

The KSZ8081RNA/RND incorporates a number of power-management modes and features that provide methods to consume less energy. These are discussed in the following sections.

### 3.10.1 POWER-SAVING MODE

Power-saving mode is used to reduce the transceiver power consumption when the cable is unplugged. It is enabled by writing a '1' to Register 1Fh, Bit [10], and is in effect when auto-negotiation mode is enabled and the cable is disconnected (no link).

In this mode, the KSZ8081RNA/RND shuts down all transceiver blocks except the transmitter, energy detect, and PLL circuits.

By default, power-saving mode is disabled after power-up.

### 3.10.2 ENERGY-DETECT POWER-DOWN MODE

Energy-detect power-down (EDPD) mode is used to further reduce transceiver power consumption when the cable is unplugged. It is enabled by writing a '0' to Register 18h, Bit [11], and is in effect when auto-negotiation mode is enabled and the cable is disconnected (no link).

EDPD mode works with the PLL off (set by writing a '1' to Register 10h, Bit [4] to automatically turn the PLL off in EDPD mode) to turn off all KSZ8081RNA/RND transceiver blocks except the transmitter and energy-detect circuits.

Power can be reduced further by extending the time interval between transmissions of link pulses to check for the presence of a link partner. The periodic transmission of link pulses is needed to ensure two link partners in the same low power state and with auto MDI/MDI-X disabled can wake up when the cable is connected between them.

By default, energy-detect power-down mode is disabled after power-up.

### 3.10.3 POWER-DOWN MODE

Power-down mode is used to power down the KSZ8081RNA/RND device when it is not in use after power-up. It is enabled by writing a '1' to Register 0h, Bit [11].

In this mode, the KSZ8081RNA/RND disables all internal functions except the MII management interface. The KSZ8081RNA/RND exits (disables) power-down mode after Register 0h, Bit [11] is set back to '0'.

### 3.10.4 SLOW-OSCILLATOR MODE

Slow-oscillator mode is used to disconnect the input reference crystal/clock on XI (Pin 8) and select the on-chip slow oscillator when the KSZ8081RNA/RND device is not in use after power-up. It is enabled by writing a '1' to Register 11h, Bit[5].

Slow-oscillator mode works in conjunction with power-down mode to put the KSZ8081RNA/RND device in the lowest power state, with all internal functions disabled except the MII management interface. To properly exit this mode and return to normal PHY operation, use the following programming sequence:

1. Disable slow-oscillator mode by writing a '0' to Register 11h, Bit [5].
2. Disable power-down mode by writing a '0' to Register 0h, Bit [11].
3. Initiate software reset by writing a '1' to Register 0h, Bit [15].

## 3.11 Reference Circuit for Power and Ground Connections

The KSZ8081RNA/RND is a single 3.3V supply device with a built-in regulator to supply the 1.2V core. The power and ground connections are shown in [Figure 3-9](#) and [Table 3-6](#) for 3.3V VDDIO.

**FIGURE 3-9: KSZ8081RNA/RND POWER AND GROUND CONNECTIONS**

# KSZ8081RNA/RND

**TABLE 3-6: KSZ8081RNA/RND POWER PIN DESCRIPTION**

| Power Pin | Pin Number | Description                                                                                                           |
|-----------|------------|-----------------------------------------------------------------------------------------------------------------------|
| VDD_1.2   | 1          | Decouple with 2.2 $\mu$ F and 0.1 $\mu$ F capacitors to ground.                                                       |
| VDDA_3.3  | 2          | Connect to board's 3.3V supply through a ferrite bead. Decouple with 22 $\mu$ F and 0.1 $\mu$ F capacitors to ground. |
| VDDIO     | 14         | Connect to board's 3.3V supply for 3.3V VDDIO. Decouple with 22 $\mu$ F and 0.1 $\mu$ F capacitors to ground.         |

## 3.12 Typical Current/Power Consumption

Table 3-7, Table 3-8, and Table 3-9 show typical values for current consumption by the transceiver (VDDA\_3.3) and digital I/O (VDDIO) power pins and typical values for power consumption by the KSZ8081RNA/RND device for the indicated nominal operating voltage combinations. These current and power consumption values include the transmit driver current and on-chip regulator current for the 1.2V core.

**TABLE 3-7: TYPICAL CURRENT/POWER CONSUMPTION (VDDA\_3.3 = 3.3V, VDDIO = 3.3V)**

| Condition                                                                                         | 3.3V Transceiver (VDDA_3.3) | 3.3V Digital I/Os (VDDIO) | Total Chip Power |
|---------------------------------------------------------------------------------------------------|-----------------------------|---------------------------|------------------|
| 100BASE-TX Link-up (no traffic)                                                                   | 34 mA                       | 12 mA                     | 152 mW           |
| 100BASE-TX Full-duplex @ 100% utilization                                                         | 34 mA                       | 13 mA                     | 155 mW           |

# KSZ8081RNA/RND

## 4.0 REGISTER DESCRIPTIONS

This chapter describes the various control and status registers (CSRs).

### 4.1 Register Map

TABLE 4-1: REGISTERS SUPPORTED BY KSZ8081RNA/RND

| Register Number (hex) | Description                           |
|-----------------------|---------------------------------------|
| 0h                    | Basic Control                         |
| 1h                    | Basic Status                          |
| 2h                    | PHY Identifier 1                      |
| 3h                    | PHY Identifier 2                      |
| 4h                    | Auto-Negotiation Advertisement        |
| 5h                    | Auto-Negotiation Link Partner Ability |
| 6h                    | Auto-Negotiation Expansion            |
| 7h                    | Auto-Negotiation Next Page            |
| 8h                    | Link Partner Next Page Ability        |
| 9h                    | Reserved                              |
| 10h                   | Digital Reserved Control              |
| 11h                   | AFE Control 1                         |
| 12h - 14h             | Reserved                              |
| 15h                   | RXER Counter                          |
| 16h                   | Operation Mode Strap Override         |
| 17h                   | Operation Mode Strap Status           |
| 18h                   | Expanded Control                      |
| 19h - 1Ah             | Reserved                              |
| 1Bh                   | Interrupt Control/Status              |
| 1Ch                   | Reserved                              |
| 1Dh                   | LinkMD Control/Status                 |
| 1Eh                   | PHY Control 1                         |
| 1Fh                   | PHY Control 2                         |

### 4.2 Register Descriptions

TABLE 4-2: REGISTER DESCRIPTIONS

| Address                            | Name         | Description                                                                                          | Mode<br><a href="#">Note 4-1</a> | Default                                                                                                                      |

## 5.0 OPERATIONAL CHARACTERISTICS

### 5.1 Absolute Maximum Ratings\*

|                                   |                 |
|-----------------------------------|-----------------|
| Supply Voltage ( $V_{IN}$ )       |                 |
| ( $V_{DD\_1.2}$ )                 | –0.5V to +1.8V  |
| ( $V_{DDIO}$ , $V_{DDA\_3.3}$ )   | –0.5V to +5.0V  |
| Input Voltage (all inputs)        | –0.5V to +5.0V  |
| Output Voltage (all outputs)      | –0.5V to +5.0V  |
| Lead Temperature (soldering, 10s) | +260°C          |
| Storage Temperature ( $T_S$ )     | –55°C to +150°C |

\*Exceeding the absolute maximum rating may damage the device. Stresses greater than the absolute maximum rating may cause permanent damage to the device. Operation of the device at these or any other conditions above those specified in the operating sections of this specification is not implied. Maximum conditions for extended periods may affect reliability.

### 5.2 Operating Ratings\*\*

|                                            |                    |
|--------------------------------------------|--------------------|
| Supply Voltage                             |                    |
| ( $V_{DDIO\_3.3}$ , $V_{DDA\_3.3}$ )       | +3.135V to +3.465V |
| ( $V_{DDIO\_2.5}$ )                        | +2.375V to +2.625V |
| ( $V_{DDIO\_1.8}$ )                        | +1.710V to +1.890V |
| Ambient Temperature                        |                    |
| ( $T_A$ Commercial)                        | 0°C to +70°C       |
| ( $T_A$ Industrial)                        | –40°C to +85°C     |
| Maximum Junction Temperature ( $T_J$ max.) | +125°C             |
| Thermal Resistance ( $\Theta_{JA}$ )       | +47.84°C/W         |
| Thermal Resistance ( $\Theta_{JC}$ )       | +14.71°C/W         |

\*\*The device is not guaranteed to function outside its operating ratings.

|                                                                               |
|-------------------------------------------------------------------------------|
| <b>Note:</b> Do not drive input signals without power supplied to the device. |
|-------------------------------------------------------------------------------|

## 6.0 ELECTRICAL CHARACTERISTICS

T<sub>A</sub> = 25°C. Specification is for packaged product only.

## 7.2 Auto-Negotiation Timing

**FIGURE 7-3: AUTO-NEGOTIATION FAST LINK PULSE (FLP) TIMING**

**TABLE 7-3: AUTO-NEGOTIATION FAST LINK PULSE TIMING PARAMETERS**

| Parameter  | Description                               | Min. | Typ. | Max. | Units   |
|------------|-------------------------------------------|------|------|------|---------|
| $t_{BTB}$  | FLP burst to FLP burst                    | 8    | 16   | 24   | ms      |
| $t_{FLPW}$ | FLP burst width                           | —    | 2    | —    | ms      |
| $t_{PW}$   | Clock/Data pulse width                    | —    | 100  | —    | ns      |
| $t_{CTD}$  | Clock pulse to data pulse                 | 55.5 | 64   | 69.5 | $\mu$ s |
| $t_{CTC}$  | Clock pulse to clock pulse                | 111  | 128  | 139  | $\mu$ s |
| —          | Number of clock/data pulses per FLP burst | 17   | —    | 33   | —       |

## 7.3 MDC/MDIO Timing

**FIGURE 7-4: MDC/MDIO TIMING**

**TABLE 7-4: MDC/MDIO TIMING PARAMETERS**

| Parameter | Description                                     | Min. | Typ. | Max. | Units |
|-----------|-------------------------------------------------|------|------|------|-------|
| $f_c$     | MDC Clock Frequency                             | —    | 2.5  | 10   | MHz   |
| $t_P$     | MDC period                                      | —    | 400  | —    | ns    |
| $t_{MD1}$ | MDIO (PHY input) setup to rising edge of MDC    | 10   | —    | —    | ns    |
| $t_{MD2}$ | MDIO (PHY input) hold from rising edge of MDC   | 4    | —    | —    | ns    |
| $t_{MD3}$ | MDIO (PHY output) delay from rising edge of MDC | 5    | 222  | —    | ns    |

# KSZ8081RNA/RND

## 7.4 Power-Up/Reset Timing

The KSZ8081RNA/RND reset timing requirement is summarized in [Figure 7-5](#) and [Table 7-5](#).

**FIGURE 7-5: POWER-UP/RESET TIMING**

**TABLE 7-5: POWER-UP/RESET TIMING PARAMETERS**

| Parameter | Description                                                         | Min. | Typ. | Max. | Units   |
|-----------|---------------------------------------------------------------------|------|------|------|---------|
| $t_{VR}$  | Supply voltage ( $V_{DDIO}$ , $V_{DDA\_3.3}$ ) rise time            | 300  | —    | —    | $\mu s$ |
| $t_{SR}$  | Stable supply voltage ( $V_{DDIO}$ , $V_{DDA\_3.3}$ ) to reset high | 10   | —    | —    | ms      |
| $t_{CS}$  | Configuration setup time                                            | 5    | —    | —    | ns      |
| $t_{CH}$  | Configuration hold time                                             | 5    | —    | —    | ns      |
| $t_{RC}$  | Reset to strap-in pin output                                        | 6    | —    | —    | ns      |

The supply voltage ( $V_{DDIO}$  and  $V_{DDA\_3.3}$ ) power-up waveform should be monotonic. The 300  $\mu s$  minimum rise time is from 10% to 90%.

For warm reset, the reset (RST#) pin should be asserted low for a minimum of 500  $\mu s$ . The strap-in pin values are read and updated at the de-assertion of reset.

After the de-assertion of reset, wait a minimum of 100  $\mu s$  before starting programming on the MIIM (MDC/MDIO) interface.

## 8.0 RESET CIRCUIT

Figure 8-1 shows a reset circuit recommended for powering up the KSZ8081RNA/RND if reset is triggered by the power supply.

**FIGURE 8-1: RECOMMENDED RESET CIRCUIT**

Figure 8-2 shows a reset circuit recommended for applications where reset is driven by another device (for example, the CPU or an FPGA). The reset out RST\_OUT\_n from CPU/FPGA provides the warm reset after power up reset. D2 is used if using different  $V_{DDIO}$  between the switch and CPU/FPGA, otherwise, the different  $V_{DDIO}$  will fight each other. If different  $V_{DDIO}$  have to use in a special case, a low  $V_F$  (<0.3V) diode is required (for example, Vishay's BAT54, MSS1P2L and so on), or a level shifter device can be used too. If Ethernet device and CPU/FPGA use same  $V_{DDIO}$  voltage, D2 can be removed to connect both devices directly. Usually, Ethernet device and CPU/FPGA should use same  $V_{DDIO}$  voltage.

**FIGURE 8-2: RECOMMENDED RESET CIRCUIT FOR CPU/FPGA RESET OUTPUT**

# KSZ8081RNA/RND

## 9.0 REFERENCE CIRCUITS — LED STRAP-IN PINS

The pull-up, float, and pull-down reference circuits for the LED0/ANEN\_SPEED strapping pin are shown in [Figure 9-1](#) for 3.3V and 2.5V  $V_{DDIO}$ .

**FIGURE 9-1: REFERENCE CIRCUITS FOR LED STRAPPING PINS**

For 1.8V  $V_{DDIO}$ , LED indication support is not recommended due to the low voltage. Without the LED indicator, the ANEN\_SPEED strapping pin is functional with a 4.7 kΩ pull-up to 1.8V  $V_{DDIO}$  or float for a value of '1', and with a 1.0 kΩ pull-down to ground for a value of '0'.

If using RJ45 jacks with integrated LEDs and 1.8V  $V_{DDIO}$ , a level shifting is required from LED 3.3V to 1.8V. For example, use a bipolar transistor or a level shift device.

## 10.0 REFERENCE CLOCK - CONNECTION AND SELECTION

A crystal or external clock source, such as an oscillator, is used to provide the reference clock for the KSZ8081RNA/RND. For the KSZ8081RNA in RMII – 25 MHz clock mode, the reference clock is 25 MHz. The reference clock connections to XI (Pin 8) and XO (Pin 7), and the reference clock selection criteria, are provided in [Figure 10-1](#) and [Table 10-1](#).

If the KSZ8081RND is to be configured to RMII – 25 MHz clock mode, the reference clock is 25 MHz and it must be driven from an oscillator or other external source. The KSZ8081RND cannot be used with a crystal because the crystal drive circuit is disabled.

**FIGURE 10-1: 25 MHZ CRYSTAL/OSCILLATOR REFERENCE CLOCK CONNECTION**

**TABLE 10-1: 25 MHZ CRYSTAL/REFERENCE CLOCK SELECTION CRITERIA**

| Characteristics                                       | Value   |
|-------------------------------------------------------|---------|
| Frequency                                             | 25 MHz  |
| Frequency Tolerance (max.); <a href="#">Note 10-1</a> | ±50 ppm |
| Crystal Series Resistance (typ.)                      | 40Ω     |
| Crystal Load Capacitance (typ.)                       | 16 pF   |

**Note 10-1** ±60 ppm for overtemperature crystal.

For the KSZ8081RNA/RND in RMII – 50 MHz clock mode, the reference clock is 50 MHz. The reference clock connection to XI (Pin 8), and the reference clock selection criteria are provided in [Figure 10-2](#) and [Table 10-2](#).

**FIGURE 10-2: 50 MHZ OSCILLATOR/REFERENCE CLOCK CONNECTION**

**TABLE 10-2: 50 MHZ OSCILLATOR/REFERENCE CLOCK SELECTION CRITERIA**

| Characteristics            | Value   |
|----------------------------|---------|
| Frequency                  | 50 MHz  |
| Frequency Tolerance (max.) | ±50 ppm |

# KSZ8081RNA/RND

## 11.0 MAGNETIC - CONNECTION AND SELECTION

A 1:1 isolation transformer is required at the line interface. Use one with integrated common-mode chokes for designs exceeding FCC requirements.

The KSZ8081RNA/RND incorporates voltage-mode transmit drivers and on-chip terminations.

With the voltage-mode implementation, the transmit drivers supply the common-mode voltages to the two differential pairs. Therefore, the two transformer center tap pins on the KSZ8081RNA/RND side should not be connected to any power supply source on the board; instead, the center tap pins should be separated from one another and connected through separate 0.1  $\mu$ F common-mode capacitors to ground. Separation of the two center taps facing the KSZ8081RNA/RND is required because the common-mode voltage is different between transmitting and receiving differential pairs.

Figure 11-1 shows the typical magnetic interface circuit for the KSZ8081RNA/RND.

**FIGURE 11-1: TYPICAL MAGNETIC INTERFACE CIRCUIT**

Table 11-1 lists recommended magnetic characteristics.

**TABLE 11-1: MAGNETICS SELECTION CRITERIA**

| Parameter                      | Value                 | Test Conditions       |
|--------------------------------|-----------------------|-----------------------|
| Turns Ratio                    | 1 CT : 1 CT           | —                     |
| Open-Circuit Inductance (min.) | 350 $\mu$ H           | 100 mV, 100 kHz, 8 mA |
| Insertion Loss (max.)          | -1.1 dB               | 100 kHz to 100 MHz    |
| HIPOT (min.)                   | 1500 V <sub>RMS</sub> | —                     |

Table 11-2 is a list of compatible single-port magnetics with separated transformer center tap pins on the PHY chip side that can be used with the KSZ8081RNA/RND.

**RECOMMENDED LAND PATTERN**  
NOTE: 4, 5

- NOTE:
1. MAX PACKAGE WARPAGE IS 0.05 MM
  2. MAX ALLOWABLE BURR IS 0.076MM IN ALL DIRECTIONS
  3. PIN #1 IS ON TOP WILL BE LASER MARKED
  4. RED CIRCLE IN LAND PATTERN INDICATE THERMAL VIA. SIZE SHOULD BE 0.30-0.35MM IN DIAMETER AND SHOULD BE CONNECTED TO GND FOR MAX THERMAL PERFORMANCE
  5. GREEN RECTANGLES (SHADED AREA) INDICATE SOLDER STENCIL OPENING ON EXPOSED PAD AREA. SIZE SHOULD BE 1.00x1.00 MM IN SIZE, 1.20 MM PITCH.

## APPENDIX A: DATA SHEET REVISION HISTORY

TABLE A-1: REVISION HISTORY

| Revision               | Section/Figure/Entry                                    | Correction                                                                                                                                                                                                                                                                                                                                                                       |
|------------------------|---------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DS00002199A (06-14-16) | —                                                       | Converted Micrel data sheet KSZ8081RNA/RND to Microchip DS00002199A. Minor text changes throughout.                                                                                                                                                                                                                                                                              |
| DS00002199B (04-22-19) | <a href="#">Section 6.0, Electrical Characteristics</a> | Corrected the CMOS Level Inputs section and added CMOS Level Outputs section in the EC table from KSZ8081MLX (DS00002264B).                                                                                                                                                                                                                                                      |
| DS00002199C (07-27-20) | <a href="#">Table 2-1</a> , <a href="#">Table 2-2</a>   | Updated Pin 16 with new name and description. Added a new row for Pin 16, revised the paragraph above <a href="#">Table 2-2</a> to reflect PHYAD [2:0] from [1:0] and revised the name and description for Pin 16 in <a href="#">Table 2-1</a> and updated <a href="#">Figure 2-1</a> .                                                                                          |
| DS00002199D (12-14-20) | <a href="#">Table 2-2</a>                               | Revised the paragraph above <a href="#">Table 2-2</a> to reflect PHYAD [2:0] from [1:0] and revised the description for Pin 15 and Pin 16 in <a href="#">Table 2-2</a> . Also, revised the description of Register 17h - Operation Mode Strap Status in <a href="#">Table 4-2</a> . Made some content changes in <a href="#">Section 3.4 “MII Management (MIIM) Interface”</a> . |
| DS00002199E (07-02-21) | Global                                                  | Updated data sheet metadata to reflect the correct contents of this document.                                                                                                                                                                                                                                                                                                    |
| DS00002199F (10-18-21) | <a href="#">Figure 1-1</a>                              | Updated figure to remove capacitor values.                                                                                                                                                                                                                                                                                                                                       |
|                        | <a href="#">Table 2-1</a>                               | Updated description of Pins 8 and 16 to indicate RND crystal limitation.                                                                                                                                                                                                                                                                                                         |
|                        | <a href="#">Section 3.0</a>                             | Updated 5th paragraph for clarity.                                                                                                                                                                                                                                                                                                                                               |
|                        | <a href="#">Section 3.2.2.1</a>                         | Updated bullet pointed text to indicate RND crystal limitation.                                                                                                                                                                                                                                                                                                                  |
|                        | <a href="#">Figure 3-2</a>                              | Updated figure to remove RND label and capacitor values.                                                                                                                                                                                                                                                                                                                         |
|                        | <a href="#">Table 4-2</a>                               | Added Bit 18.6 and added note to Bit 1F.7 for RND crystal limitation.                                                                                                                                                                                                                                                                                                            |
|                        | <a href="#">Section 10.0</a>                            | Updated introductory text for RND crystal limitation.                                                                                                                                                                                                                                                                                                                            |
|                        | <a href="#">Figure 10-1</a>                             | Updated figure to remove capacitor values.                                                                                                                                                                                                                                                                                                                                       |
|                        | <a href="#">Section 11.0</a>                            | Minor edits to introductory text for clarity.                                                                                                                                                                                                                                                                                                                                    |

## THE MICROCHIP WEB SITE

Microchip provides online support via our WWW site at [www.microchip.com](http://www.microchip.com). This web site is used as a means to make files and information easily available to customers. Accessible by using your favorite Internet browser, the web site contains the following information:

- **Product Support** – Data sheets and errata, application notes and sample programs, design resources, user's guides and hardware support documents, latest software releases and archived software
- **General Technical Support** – Frequently Asked Questions (FAQ), technical support requests, online discussion groups, Microchip consultant program member listing
- **Business of Microchip** – Product selector and ordering guides, latest Microchip press releases, listing of seminars and events, listings of Microchip sales offices, distributors and factory representatives

## CUSTOMER CHANGE NOTIFICATION SERVICE

Microchip's customer notification service helps keep customers current on Microchip products. Subscribers will receive e-mail notification whenever there are changes, updates, revisions or errata related to a specified product family or development tool of interest.

To register, access the Microchip web site at [www.microchip.com](http://www.microchip.com). Under "Support", click on "Customer Change Notification" and follow the registration instructions.

## CUSTOMER SUPPORT

Users of Microchip products can receive assistance through several channels:

- Distributor or Representative
- Local Sales Office
- Field Application Engineer (FAE)
- Technical Support

Customers should contact their distributor, representative or field application engineer (FAE) for support. Local sales offices are also available to help customers. A listing of sales offices and locations is included in the back of this document.

**Technical support is available through the web site at: <http://microchip.com/support>**

## PRODUCT IDENTIFICATION SYSTEM

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.

| <u>PART NO.</u>           | X                                                                  | X       | X                 | X           |
|---------------------------|--------------------------------------------------------------------|---------|-------------------|-------------|
| Device                    | Interface                                                          | Package | Special Attribute | Temperature |
| <b>Device:</b>            | KSZ8081                                                            |         |                   |             |
| <b>Interface:</b>         | R = RMII                                                           |         |                   |             |
| <b>Package:</b>           | N = 24-pin QFN                                                     |         |                   |             |
| <b>Special Attribute:</b> | A = 25 MHz Input/50 MHz Output Clocks<br>D = 50 MHz Input Clock    |         |                   |             |

**Examples:**

- a) KSZ8081RNACA  
RMII Interface  
24-pin QFN  
25 MHz Input/50 MHz Output  
Commercial Temperature
- b) KSZ8081RNAIA  
RMII Interface  
24-pin QFN  
25 MHz Input/50 MHz Output  
Industrial Temperature
- c) KSZ8081RNDCA  
RMII Interface  
24-pin QFN  
50 MHz Input  
Commercial Temperature
- d) KSZ8081RNDIA  
RMII Interface  
24-pin QFN  
50 MHz Input  
Industrial Temperature

NOTES:

---

**Note the following details of the code protection feature on Microchip products:**

- Microchip products meet the specifications contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is secure when used in the intended manner, within operating specifications, and under normal conditions.
- Microchip values and aggressively protects its intellectual property rights. Attempts to breach the code protection features of Microchip product is strictly prohibited and may violate the Digital Millennium Copyright Act.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of its code. Code protection does not mean that we are guaranteeing the product is “unbreakable”. Code protection is constantly evolving. Microchip is committed to continuously improving the code protection features of our products.

---

This publication and the information herein may be used only with Microchip products, including to design, test, and integrate Microchip products with your application. Use of this information in any other manner violates these terms. Information regarding device applications is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. Contact your local Microchip sales office for additional support or, obtain additional support at <https://www.microchip.com/en-us/support/design-help/client-support-services>.

THIS INFORMATION IS PROVIDED BY MICROCHIP “AS IS”. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION INCLUDING BUT NOT LIMITED TO ANY IMPLIED WARRANTIES OF NON-INFRINGEMENT, MERCHANTABILITY, AND FITNESS FOR A PARTICULAR PURPOSE, OR WARRANTIES RELATED TO ITS CONDITION, QUALITY, OR PERFORMANCE.

IN NO EVENT WILL MICROCHIP BE LIABLE FOR ANY INDIRECT, SPECIAL, PUNITIVE, INCIDENTAL, OR CONSEQUENTIAL LOSS, DAMAGE, COST, OR EXPENSE OF ANY KIND WHATSOEVER RELATED TO THE INFORMATION OR ITS USE, HOWEVER CAUSED, EVEN IF MICROCHIP HAS BEEN ADVISED OF THE POSSIBILITY OR THE DAMAGES ARE FORESEEABLE. TO THE FULLEST EXTENT ALLOWED BY LAW, MICROCHIP’S TOTAL LIABILITY ON ALL CLAIMS IN ANY WAY RELATED TO THE INFORMATION OR ITS USE WILL NOT EXCEED THE AMOUNT OF FEES, IF ANY, THAT YOU HAVE PAID DIRECTLY TO MICROCHIP FOR THE INFORMATION.

Use of Microchip devices in life support and/or safety applications is entirely at the buyer's risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights unless otherwise stated.

**Trademarks**

The Microchip name and logo, the Microchip logo, Adaptec, AnyRate, AVR, AVR logo, AVR Freaks, BesTime, BitCloud, CryptoMemory, CryptoRF, dsPIC, flexPWR, HELDO, IGLOO, JukeBlox, KeeLoq, Kleer, LANCheck, LinkMD, maXStylus, maXTouch, MediaLB, megaAVR, Microsemi, Microsemi logo, MOST, MOST logo, MPLAB, OptoLyzer, PIC, picoPower, PICSTART, PIC32 logo, PolarFire, Prochip Designer, QTouch, SAM-B, SenGenuity, SpyNIC, SST, SST Logo, SuperFlash, Symmetricom, SyncServer, Tachyon, TimeSource, tinyAVR, UNI/O, Vectron, and XMEGA are registered trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

AgileSwitch, APT, ClockWorks, The Embedded Control Solutions Company, EtherSynch, Flashtec, Hyper Speed Control, HyperLight Load, IntelliMOS, Libero, motorBench, mTouch, Powermite 3, Precision Edge, ProASIC, ProASIC Plus, ProASIC Plus logo, Quiet-Wire, SmartFusion, SyncWorld, Temux, TimeCesium, TimeHub, TimePictra, TimeProvider, TrueTime, WinPath, and ZL are registered trademarks of Microchip Technology Incorporated in the U.S.A.

Adjacent Key Suppression, AKS, Analog-for-the-Digital Age, Any Capacitor, AnyIn, AnyOut, Augmented Switching, BlueSky, BodyCom, CodeGuard, CryptoAuthentication, CryptoAutomotive, CryptoCompanion, CryptoController, dsPICDEM, dsPICDEM.net, Dynamic Average Matching, DAM, ECAN, Espresso T1S, EtherGREEN, GridTime, IdealBridge, In-Circuit Serial Programming, ICSP, INICnet, Intelligent Paralleling, Inter-Chip Connectivity, JitterBlocker, Knob-on-Display, maxCrypto, maxView, memBrain, Mindi, MiWi, MPASM, MPF, MPLAB Certified logo, MPLIB, MPLINK, MultiTRAK, NetDetach, NVM Express, NVMe, Omniscient Code Generation, PICDEM, PICDEM.net, PICkit, PICtail, PowerSmart, PureSilicon, QMatrix, REAL ICE, Ripple Blocker, RTAX, RTG4, SAM-ICE, Serial Quad I/O, simpleMAP, SimpliPHY, SmartBuffer, SmartHLS, SMART-I.S., storClad, SQI, SuperSwitcher, SuperSwitcher II, Switchtec, SynchroPHY, Total Endurance, TSHARC, USBCheck, Varisense, VectorBlox, VeriPHY, ViewSpan, WiperLock, XpressConnect, and ZENA are trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

SQTP is a service mark of Microchip Technology Incorporated in the U.S.A.

The Adaptec logo, Frequency on Demand, Silicon Storage Technology, Symmcom, and Trusted Time are registered trademarks of Microchip Technology Inc. in other countries.

GestIC is a registered trademark of Microchip Technology Germany II GmbH & Co. KG, a subsidiary of Microchip Technology Inc., in other countries.

All other trademarks mentioned herein are property of their respective companies.
