

All Band TV Tuner IC (VHF-CATV-UHF)

Description

The CXA3095N is a single chip TV tuner IC which performs as an oscillator, mixer for VHF-CATV and UHF bands. An IF amplifier is also provided.

This IC adopts a 24-pin SSOP package (0.8mm pitch) in response to the trend toward miniaturizing the tuner and automatic IC mounting.

This IC is the inverted product of the CXA3025N pin assignment.

Features

- Low noise figure
- Superior cross modulation
- Low spurious
- Stable oscillating characteristics
- Local oscillator output for PLL
- Double tune filter connectable to MIX output
- Low thermal resistance package

Absolute Maximum Ratings

• Supply voltage	V _{CC}	10.5	V
• Storage temperature	T _{stg}	-65 to +150	°C
• Allowable power dissipation	P _D	1200	mW
(when mounted on a board)			

Operating Conditions

• Supply voltage	V _{CC}	9.0 ± 0.9	V
• Operating temperature	T _{opr}	-20 to +75	°C

Structure

Bipolar silicon monolithic IC

Applications

- TV tuner
- CATV tuner
- VCR tuner

	CG2	VHF operation; f _{RF} = 360MHz; Input level -40dBm	18	21	24	dB
	CG3	UHF operation; f _{RF} = 360MHz; Input level -40dBm	23	26	29	dB
	CG4	UHF operation; f _{RF} = 800MHz; Input level -40dBm	23	26	29	dB
Noise figure*1 *2	NF1	VHF operation; f _{RF} = 55MHz		13	16	dB
	NF2	VHF operation; f _{RF} = 360MHz		12	15	dB
	NF3	UHF operation; f _{RF} = 360MHz		9	13	dB
	NF4	UHF operation; f _{RF} = 800MHz		9	13	dB
1% cross modulation*1 *3	CM1	VHF operation; f _D = 55MHz, f _{UD} = ±12MHz	99	102		dBμ
	CM2	VHF operation; f _D = 360MHz, f _{UD} = ±12MHz	97	100		dBμ
	CM3	UHF operation; f _D = 360MHz, f _{UD} = ±12MHz	91	94		dBμ
	CM4	UHF operation; f _D = 800MHz, f _{UD} = ±12MHz	89	92		dBμ
Max. output power	Pomax (sat)	50Ω load	+8	+10		dBm
Switch ON drift*4	Δfsw1	VHF operation; fosc = 100MHz			±200	kHz
	Δfsw2	VHF operation; fosc = 405MHz			±300	kHz
	Δfsw3	UHF operation; fosc = 405MHz			±300	kHz
	Δfsw4	UHF operation; fosc = 845MHz			±300	kHz
+B supply voltage drift*5	Δfst1	VHF operation; fosc = 100MHz			±100	kHz
	Δfst2	VHF operation; fosc = 405MHz			±200	kHz
	Δfst3	UHF operation; fosc = 405MHz			±150	kHz
	Δfst4	UHF operation; fosc = 845MHz			±150	kHz
PLL OUT output power	PoscV	VHF operation; 50Ω load	-20	-10		dBm
	PoscU	UHF operation; 50Ω load	-20	-10		dBm
Band switch voltage	VswV	VHF operation	0		0.5	V
	VswU	UHF operation	3		10.5	V

*1 Measured value for untuned inputs.

*2 Noise figure is the direct-reading value of NF meter in DSB.

*3 Desired signal (f_D) input level is -33dBm. Undesired signal (f_{UD}) is 100kHz, 30%AM at ±12MHz.

The measurement value is undesired signal level, it measured with a spectrum analyzer at S/I = 46dB.

*4 Frequency variation form 3 seconds to 3 minutes after switch ON.

*5 Frequency variation when Vcc = 9V ± 5% variation.

The schematic diagram illustrates the internal and external components of the CXA3095N IC. The IC is represented by a central block with pins 1 through 24. The internal components include various capacitors (e.g., 1n, 4.7μ, 51p, 10k, 47k, 15μ, 100, 1n, 51, 3.3k, 16p, 68p, 47k, 51, 51, 3.3k, 1n), resistors (e.g., 10k, 47k, 100, 1n, 51, 3.3k, 1n), and diodes (e.g., 1T362, 1T363). The external components include a +9V supply, a PLL OUT, a VHF/VL SW, and a VHF/VL SW. The diagram also shows the internal structure of the IC, including the IF OUT, BAND SW, PLL OUT, UOSCB2, UOSCE2, GND, UOSCE1, UOSCB1, VOSCC, NC, and VOSCB pins.

Description of Operation (See Electrical Characteristics Measurement Circuit.)**VHF oscillator circuit**

The differential oscillator circuit with an output at Pin 10 and an input at Pin 12.

Connect an LC resonance circuit comprising a varicap diode to Pin 10 through a coupling capacitor.

The positive feedback from the resonance circuit is applied to Pin 12 through a feedback capacitor to execute oscillation. Note that if a parasitic capacitance across Pins 10 and 12 is too large, it may cause undesired stray oscillation.

VHF mixer circuit

This is a common emitter type double-balanced mixer having small leakage of local oscillation signal. The RF signal is input to Pins 16 and 17. In normal use, the signal is input to one pin while the other pin is connected to GND by decoupling capacitor. The RF signal is converted to IF frequency with the signal supplied from oscillator. The converted RF is sent to the IF frequency and output to Pins 20 and 21.

UHF oscillator circuit

UHF oscillator is formed from two collector-grounded Colpitts oscillators, and oscillation is provided at the differential input through an LC resonator circuit comprising a varicap diode. LC resonator comprising a varicap diode is connected across Pins 4, 5, 8, and 9.

UHF mixer circuit

The double-balanced mixer like the VHF mixer is adopted. The RF signal is input to Pins 13 and 14. There is a balanced differential input from pre-stage double tune circuit, or an unbalanced input to Pin 14 with the capacitor connected at Pin 13 to GND. Otherwise, the conditions and usage are the same as those for the VHF mixer circuit.

IF amplifier circuit

The frequency converted signal at mixer is output from Pins 20 and 21, and input to IF input pins 23 and 24 through the external IF tune circuit. As an IF tune circuit, single tune circuit like the electrical characteristics measurement circuit or double tune circuit can be connected. The amplified signal at IF amplifier is output to Pin 1. The output impedance is approximately 75Ω .

Also, input block of the IF amplifier has a built-in coupling capacitor, and direct connection with the mixer output is possible.

UHF/VHF switch circuit

UHF operation is chosen by applying 3V or more voltage to Pin 2; VHF operation for 0V or OPEN.

PLL oscillator signal output circuit

Oscillation signal is output to PLLOUT through buffer amplifier. The resistance connected to the output pin is for current adjustment flowing to buffer amplifier. The resistance value is adjusted depending on the connected load, and output distortion can be minimized.

Notes on Usage

Care should be taken such as grounding in placing external parts because high frequencies are present. GND (Pins 6, 7, 18, and 19) are served both as heat dissipation pins, and adjust accordingly to prevent heat problems.

Please concern for damage by static electricity for high frequency input/output pins.
