## Description

The AT60142F is a very low power CMOS static RAM organized as 524 288 x 8 bits.

Atmel brings the solution to applications where fast computing is as mandatory as low consumption, such as aerospace electronics, portable instruments, or embarked systems.

Utilizing an array of six transistors (6T) memory cells, the AT60142F combines an extremely low standby supply current (Typical value = 1 mA) with a fast access time at 15 ns or better over the full military temperature range. The high stability of the 6T cell provides excellent protection against soft errors due to noise.

The AT60142F is processed according to the methods of the latest revision of the MIL PRF 38535 or ESCC 9000.

It is produced on a radiation hardened 0.25 µm CMOS process.

## Data Retention Mode

Atmel CMOS RAM's are designed with battery backup in mind. Data retention voltage and supply current are guaranteed over temperature. The following rules insure data retention:

1. During data retention chip select  $\overline{CS}$  must be held high within  $V_{CC}$  to  $V_{CC} - 0.2V$ .
2. Output Enable ( $\overline{OE}$ ) should be held high to keep the RAM outputs high impedance, minimizing power dissipation.
3. During power-up and power-down transitions  $\overline{CS}$  and  $\overline{OE}$  must be kept between  $V_{CC} + 0.3V$  and 70% of  $V_{CC}$ .
4. The RAM can begin operation  $> t_R$  ns after  $V_{CC}$  reaches the minimum operation voltages (3V).

Note: The internal write time of the memory is defined by the overlap of  $\overline{CS}$  Low and  $\overline{W}$  LOW. Both signals must be activated to initiate a write and either signal can terminate a write by going in active mode. The data input setup and hold timing should be referenced to the active edge of the signal that terminates the write. Data out is high impedance if  $\overline{OE} = V_{IH}$ .
