

MB39C605

Phase Dimmable PSR LED Driver IC for LED Lighting

Description

MB39C605 is a Primary Side Regulation (PSR) LED driver IC for LED lighting. Using the information of the primary peak current and the transformer-energy-zero time, it is able to deliver a well regulated current to the secondary side without using an opto-coupler in an isolated flyback topology. Operating in critical conduction mode, a smaller transformer is required. In addition, MB39C605 has a built-in phase dimmable circuit and can constitute the lighting system for phase dimming.

It is most suitable for the general lighting applications, for example replacement of commercial and residential incandescent lamps.

Features

- PSR topology in an isolated flyback circuit
- High efficiency (>80% : without dimmer) and low EMI by detecting transformer zero energy
- TRAIC Dimmable LED lighting
- Highly reliable protection functions
 - Under voltage lock out (UVLO)
 - Over voltage protection (OVP)
 - Over current protection (OCP)
 - Short circuit protection (SCP)
 - Over temperature protection (OTP)
- Switching frequency setting : 30 kHz to 133 kHz
- Input voltage range VDD : 9V to 20V
- Input voltage for LED lighting applications : AC110V_{RMS}, AC230V_{RMS}
- Output power range for LED lighting applications : 5 W to 10 W
- Small Package : SOP-8 (3.9 mm × 5.05 mm × 1.75 mm [Max])

Applications

- Phase dimmable (Leading/Trailing) LED lighting
- LED lighting

Note: This product supports the web-based design simulation tool, Easy DesignSim.

It can easily select external components and can display useful information.

VDD pin Capacitance	C _{BP}	Set between VDD pin and GND pin	-	4.7	-	μF
Operating Junction Temperature	T _j	-	-40	-	+125	°C

WARNING:

1. The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated under these conditions.
2. Any use of semiconductor devices will be under their recommended operating condition.
3. Operation under any conditions other than these conditions may adversely affect reliability of device and could result in device failure.
4. No warranty is made with respect to any use, operating conditions or combinations not represented on this data sheet. If you are considering application under any conditions other than listed herein, please contact sales representatives beforehand.

7. Standard Characteristics

Figure 7-1. Standard Characteristics

8. Function Explanations

8.1 LED Current Control by PSR (Primary Side Regulation)

MB39C605 regulates the average LED current (I_{LED}) by feeding back the information based on Primary Winding peak current (I_{P_PEAK}) and Secondary Winding energy discharge time (T_{DIS}) and switching period (T_{SW}). Figure 8-1 shows the operating waveform in steady state. I_P is Primary Winding current and I_S is Secondary Winding current. I_{LED} as an average current of the Secondary Winding is described by the following equation.

$$I_{LED} = \frac{1}{2} \times I_{S_PEAK} \times \frac{T_{DIS}}{T_{SW}}$$

Using I_{P_PEAK} and the transformer Secondary to Primary turns ratio (N_P/N_S), Secondary Winding peak current (I_{S_PEAK}) is described by the following equation.

$$I_{S_PEAK} = \frac{N_P}{N_S} \times I_{P_PEAK}$$

Therefore,

$$I_{LED} = \frac{1}{2} \times \frac{N_P}{N_S} \times I_{P_PEAK} \times \frac{T_{DIS}}{T_{SW}}$$

MB39C605 detects T_{DIS} by monitoring TZE pin and I_{P_PEAK} by monitoring CS pin. An internal Err Amp sinks gm current proportional to I_{P_PEAK} from COMP pin during T_{DIS} period. In steady state, since the average of the gm current is equal to internal reference current (I_{SO}), the voltage on COMP pin (V_{COMP}) is nearly constant.

$$I_{P_PEAK} \times R_{CS} \times gm \times T_{DIS} = I_{SO} \times T_{SW}$$

In above equation, gm is transconductance of the Err Amp and R_{CS} is a sense resistance. Eventually, I_{LED} can be calculated by the following equation.

$$I_{LED} = \frac{1}{2} \times \frac{N_P}{N_S} \times \frac{I_{SO}}{gm} \times \frac{1}{R_{CS}}$$

Figure 8-1. LED Current Control Waveform

8.2 Dimming Function

MB39C605 has the built-in Phase dimmable circuit to control I_{LED} by changing a reference of Err Amp based on the input dimming control level on the VAC pin and realizes dimming. Figure 8-2 shows the input circuit to the VAC pin for phase dimming. V_{BULK0} is divided and filtered into an analog voltage with RC network. It is possible to configure phase dimmable system by inputting the voltage to the VAC pin.

Figure 8-2. VAC Pin Input Circuit

8.3 Power-On Sequence

When the AC line voltage is supplied, V_{BULK} is powered from the AC line through a diode bridge and a diode (D1) with charging a capacitor (C_{BULK}), and the VDD pin is charged from V_{BULK} through a start-up resistance (Rst). (Figure 8-3 red path)

When the VDD pin is charged up and the voltage on the VDD pin (V_{VDD}) rises above the UVLO threshold voltage, an internal Bias circuit starts operating, and MB39C605 starts the dimming control. After the UVLO is released, this device enables switching and is operating in a forced switching mode ($T_{ON} = 1.5 \mu s$, $T_{OFF} = 78 \mu s$ to $320 \mu s$). When the voltage on the TZE pin reaches the Zero energy threshold voltage ($V_{TZEth} = 0.7V$), MB39C605 enters normal operation mode. After the switching begins, the VDD pin is also charged from Auxiliary Winding through an external diode (DBIAS). (Figure 8-3 blue path)

During start-up period V_{VDD} is not supplied from Auxiliary Winding, because the LED voltage is low. V_{VDD} decreases gradually until the LED voltage rises above enough high that the Auxiliary Winding voltage can exceed V_{VDD} . In this period, if V_{VDD} falls below the UVLO threshold voltage, the switching stops. When the VDD pin is charged up again and V_{VDD} rises above the UVLO threshold voltage, MB39C605 restarts the switching. This device repeats above operation until the LED voltage rises above enough high. V_{VDD} becomes stable after that.

Figure 8-3. VDD Supply Path at Power-On

Figure 8-4. Power-On Waveform

8.4 Power-Off Sequence

After the AC line voltage is removed, V_{BULK} is discharged by switching operation. Since any Secondary Winding current does not flow, I_{LED} is supplied only from output capacitors and decreases gradually. V_{VDD} also decreases because there is no current supply from both Auxiliary Winding and V_{BULK} . When V_{VDD} falls below the UVLO threshold voltage, MB39C605 shuts down.

Figure 8-5. Power-Off Waveform

8.5 I_{P_PEAK} Detection Function

MB39C605 detects Primary Winding peak current (I_{P_PEAK}) of Transformer. I_{LED} is set by connecting a sense resistance (R_{CS}) between CS pin and GND pin. Maximum I_{P_PEAK} ($I_{P_PEAKMAX}$) limited by Over Current Protection (OCP) can also be set with the resistance.

Using the Secondary to Primary turns ratio (N_P/N_S) and I_{LED} , R_{CS} is set as the following equation (refer to 8.1)

$$R_{CS} = \frac{N_P}{N_S} \times \frac{0.14}{I_{LED}}$$

In addition, using the OCP threshold voltage (V_{OCPH}) and R_{CS} , $I_{P_PEAKMAX}$ is calculated with the following equation.

$$I_{P_PEAKMAX} = \frac{V_{OCPH}}{R_{CS}}$$

8.6 Zero Voltage Switching Function

MB39C605 has built-in zero voltage switching function to minimize switching loss of the external switching MOSFET. This device detects a zero crossing point through a resistor divider connected from TZE pin to Auxiliary Winding. A zero energy detection circuit detects a negative crossing point of the voltage on TZE pin to Zero energy threshold voltage (V_{TZETL}). On-timing of switching MOSFET is decided with waiting an adjustment time (t_{ADJ}) after the negative crossing occurs.

t_{ADJ} is set by connecting an external resistance (R_{ADJ}) between ADJ pin and GND pin. Using Primary Winding inductance (L_P) and the parasitic drain capacitor of switching MOSFET (C_D), t_{ADJ} is calculated with the following equation.

$$t_{ADJ} = \frac{\pi \sqrt{L_P \times C_D}}{2}$$

Using t_{ADJ} , R_{ADJ} is expressed by the following calculation.

$$R_{ADJ} [k\Omega] = 0.0927 \times t_{ADJ} [ns]$$

8.7 Protection Functions

Under Voltage Lockout Protection (UVLO)

The under voltage lockout protection (UVLO) prevents IC from a malfunction in the transient state during V_{DD} startup and a malfunction caused by a momentary drop of V_{DD} , and protects the system from destruction/deterioration. An UVLO comparator detects the voltage decrease below the UVLO threshold voltage on VDD pin, and then DRV pin is turned to “L” and the switching stops. MB39C605 automatically returns to normal operation mode when V_{DD} increases above the UVLO threshold voltage.

Over Voltage Protection (OVP)

The over voltage protection (OVP) protects Secondary side components from an excessive voltage stress. If the LED is disconnected, the output voltage of Secondary Winding rises up. The output overvoltage can be detected by monitoring TZE pin. During Secondary Winding energy discharge time, V_{TZE} is proportional to V_{AUX} and the voltage of Secondary Winding (refer to 8.1). When V_{TZE} rises higher than the OVP threshold voltage for 3 continues switching cycles, DRV pin is turned to “L”, and the switching stops (latch off). When V_{DD} drops below the UVLO threshold voltage, the latch is removed.

Over Current Protection (OCP)

The over current protection (OCP) prevents inductor or transformer from saturation. The drain current of the external switching MOSFET is limited by OCP. When the voltage on CS pin reaches the OCP threshold voltage, DRV pin is turned to “L” and the switching cycle ends. After zero crossing is detected on TZE pin again, DRV pin is turned to “H” and the next switching cycle begins.

Short Circuit Protection (SCP)

The short circuit protection (SCP) protects the transformer and the Secondary side diode from an excessive current stress. When the short circuit between LED terminals occurs, output voltage decreases. If the voltage on TZE pin falls below SCP threshold voltage, V_{COMP} is discharged and fixed at 1.5V and then the switching enters a low frequency mode. ($T_{ON} = 1.5 \mu s$ / $T_{OFF} = 78 \mu s$ to $320 \mu s$)

Over Temperature Protection (OTP)

The over temperature protection (OTP) protects IC from thermal destruction. When the junction temperature reaches $+150^{\circ}C$, DRV pin is turned to “L”, and the switching stops. It automatically returns to normal operation mode if the junction temperature falls back below $+125^{\circ}C$.

Table 8-1. Protection Functions Table

Function	PIN Operation			Detection Condition	Return Condition	Remarks
	DRV	COMP	ADJ			
Normal Operation	Active	Active	Active	-	-	-
Under Voltage Lockout Protection (UVLO)	L	L	L	$V_{DD} < 7.9V$	$V_{DD} > 13V$	Auto Restart
Over Voltage Protection (OVP)	L	1.5V fixed	Active	$TZE > 4.3V$	$V_{DD} < 7.9V$ → $V_{DD} > 13V$	Latch off
Over Current Protection (OCP)	L	Active	Active	$CS > 2V$	Cycle by cycle	Auto Restart
Short Circuit Protection (SCP)	Active	1.5V fixed	Active	$TZE (peak) < 0.7V$	$TZE (peak) > 0.7V$	Auto Restart
Over Temperature Protection (OTP)	L	1.5V fixed	Active	$T_j > +150^{\circ}C$	$T_j < +125^{\circ}C$	Auto Restart

11. Usage Precautions

Do not configure the IC over the maximum ratings.

If the IC is used over the maximum ratings, the LSI may be permanently damaged.

It is preferable for the device to normally operate within the recommended usage conditions. Usage outside of these conditions can have an adverse effect on the reliability of the LSI.

Use the device within the recommended operating conditions.

The recommended values guarantee the normal LSI operation under the recommended operating conditions.

The electrical ratings are guaranteed when the device is used within the recommended operating conditions and under the conditions stated for each item.

Printed circuit board ground lines should be set up with consideration for common impedance.

Take appropriate measures against static electricity.

- Containers for semiconductor materials should have anti-static protection or be made of conductive material.
- After mounting, printed circuit boards should be stored and shipped in conductive bags or containers.
- Work platforms, tools, and instruments should be properly grounded.
- Working personnel should be grounded with resistance of 250 kΩ to 1 MΩ in serial between body and ground.

Do not apply negative voltages.

The use of negative voltages below - 0.3 V may make the parasitic transistor activated to the LSI, and can cause malfunctions.

12. RoHS Compliance Information

This product has observed the standard of lead, cadmium, mercury, Hexavalent chromium, polybrominated biphenyls (PBB), and polybrominated diphenyl ethers (PBDE).

13. Ordering Information

Table 13-1. Ordering Information

Part Number	Package	Shipping Form
MB39C605PNF-G-JNEFE1	8-pin plastic SOP (SOB008)	Emboss
MB39C605PNF-G-JNE1		Tube

14. Package Dimensions

Package Code: SOB008

SYMBOL	DIMENSIONS		
	MIN.	NOM.	MAX.
A	—	—	1.75
A1	0.05	—	0.25
A2	1.30	1.40	1.50
D	5.05 BSC.		
E	6.00 BSC.		
E1	3.90 BSC.		
θ	0°	—	8°
c	0.15	—	0.25
b	0.36	0.44	0.52
L	0.45	0.60	0.75
L 1	1.05 REF		
L 2	0.25 BSC		
e	1.27 BSC.		
h	0.40 BSC.		

NOTES

- ALL DIMENSIONS ARE IN MILLIMETER.
- DIMENSIONING AND TOLERANCING PER ASME Y14.5M-1994.
- DIMENSIONING D INCLUDE MOLD FLASH, DIMENSIONING E1 DOES NOT INCLUDE INTERLEAD FLASH OR PROTRUSION. INTERLEAD FLASH OR PROTRUSIONS SHALL NOT EXCEED 0.025 mm PER SIDE. D and E1 DIMENSION ARE DETERMINED AT DATUM H.
- THE PACKAGE TOP MAY BE SMALLER THAN THE PACKAGE BOTTOM. DIMENSIONING D and E1 ARE DETERMINED AT THE OUTERMOST EXTREMES OF THE PLASTIC BODY EXCLUSIVE OF MOLD FLASH, THE BAR BURRS, GATE BURRS AND INTERLEAD FLASH, BUT INCLUDING ANY MISMATCH BETWEEN THE TOP AND BOTTOM OF THE PLASTIC BODY.
- DATUMS A & B TO BE DETERMINED AT DATUM H.
- "N" IS THE MAXIMUM NUMBER OF TERMINAL POSITIONS FOR THE SPECIFIED PACKAGE LENGTH.
- THE DIMENSION APPLY TO THE FLAT SECTION OF THE LEAD BETWEEN 0.10 mm TO 0.25mm FROM THE LEAD TIP.
- DIMENSION "b" DOES NOT INCLUDE THE DAMBAR PROTRUSION. ALLOWABLE DAMBAR PROTRUSION SHALL BE 0.10mm TOTAL IN EXCESS OF THE "b" DIMENSION AT MAXIMUM MATERIAL CONDITION. THE DAMBAR MAY NOT BE LOCATED ON THE LOWER RADIUS OF THE FOOT.
- THIS CHAMFER FEATURE IS OPTIONAL. IF IT IS NOT PRESENT, THEN A PIN 1 IDENTIFIER MUST BE LOCATED WITHIN THE INDEX AREA INDICATED
- "A1" IS DEFINED AS THE VERTICAL DISTANCE FROM THE SEATING PLANE TO THE LOWEST POINT ON THE PACKAGE BODY EXCLUDING THE LID AND OR THERMAL ENHANCEMENT ON CAVITY DOWN PACKAGE CONFIGURATIONS.
- JEDEC SPECIFICATION NO. REF : N/A

002-15856 Rev. **

15. Major Changes

Spancion Publication Number: MB39C605-DS405-00017

Page	Section	Descriptions
Revision 1.0		
-	-	Initial release
Revision 2.0		
16	11.6 Zero Voltage Switching Function	Corrected the R_{ADJ} formula
20	13. Application Examples	Added Application Examples
26	15. Ordering Information	Added Shipping in Table 15-1
-	-	Rewrote entire document for improving the ease of understanding (the original intentions are remained unchanged).
Revision 3.0		
8	7. Absolute Maximum Ratings	Removed ESD Voltage (Machine Model) from Table 7-1
-	Labeling Sample	Removed section of Labeling Sample
28	17. Recommended mounting condition [JEDEC Level3] Lead Free	Changed Recommended Condition from three conditions to one condition "JEDEC LEVEL3"

NOTE: Please see "Document History" about later revised information.

Document History

Document Title: MB39C605 Phase Dimmable PSR LED Driver IC for LED Lighting

Document Number: 002-08444

Revision	ECN	Orig. of Change	Submission Date	Description of Change
**	—	TOYO	02/20/2015	Migrated to Cypress and assigned document number 002-08444. No change to document contents or format.
*A	5211375	TOYO	04/12/2016	Updated to Cypress format.
*B	5742349	HIXT	05/22/2017	Updated Pin Assignment : Change the package name from FPT-8P-M02 to SOB008 Added RoHS Compliance Information Updated Ordering Information : Change the package name from FPT-8P-M02 to SOB008 Deleted "Marking Format" Deleted "Recommended Mounting Condition [JEDEC Level3] Lead Free" Updated Package Dimensions : Updated to Cypress format
