3.0A LOW DROPOUT LINEAR REGULATOR

TO-252-5

■ DESCRIPTION

The **LR3966** is a low-noise, low-dropout linear regulator operated from a 2.5V to 6V input voltage and is guaranteed to deliver 3A output current. Wide range of preset output voltage options are available. Built-in low on-resistance transistor provides low dropout voltage and large output current. The **LR3966** is designed and optimized for battery-powered systems to work with low noise.

The **LR3966** is developed on a CMOS process technology which allows low quiescent current operation independent of output load current. This CMOS process also allows the **LR3966** to operate under extremely low dropout conditions.

Notes: 1. Output voltage line regulation is defined as the change in output voltage from the nominal value resulting from a change in the input line voltage. Output voltage load regulation is defined as the change in output voltage from the nominal value as the load current increases from no load to full load.
2. Regulation is measured at constant junction temperature by using a 20ms current pulse. Devices are tested for load regulation in the load range from 10mA to 3.0A
3. Dropout voltage is defined as the voltage from the input to output when output is 2% below the nominal value. Dropout voltage specification applies only to output voltages of 2.5V and above.

■ TYPICAL APPLICATION CIRCUIT

* **LR3966** can deliver a continuous current of 3.0A over the full operating temperature. However, the output current is limited by the restriction of power dissipation which differs from packages. A heat sink may be required depending on the maximum power dissipation and maximum ambient temperature of application. With respect to the applied package, the maximum output current of 3.0A may be still undeliverable.

* When a Pull-Up resistor is connected between V_{EN} terminal and V_{EN} Signal (or V_{IN} line), the resistance of the Pull-Up resistor should be kept under 10kΩ.
