

Low Noise, Regulated Charge Pump DC/DC Converter

Description

The SD6214A is a low noise switched capacitor voltage doubler. It produces a regulated output voltage from a 2.7V to 4.5V input. Low external parts count (one flying capacitor and two small bypass capacitors at VIN and VOUT) make the SD6214A ideally suited for small, battery-powered applications.

The SD6214A have thermal shutdown capability and can survive a continuous short circuit from VOUT to GND. A low current shutdown feature disconnects the load from VIN and reduces quiescent current to <math><1\mu\text{A}</math>.

The SD6214A is available in the industry standard SOT-23-6L power packages.

Features

- Fixed 4.94V±3% Output
- VIN Range: 2.7V to 4.5V
- Output Current: Up to 110mA (VIN≥3V)
Up to 230mA (VIN≥3.6V)
- Low Noise Constant Frequency (360kHz) Operation
- Shutdown Current <math><1\mu\text{A}</math>
- No Inductors
- Available in Low Profile 6-Lead SOT23-6L Package

Applications

- White LED Backlighting
- Li-Ion Battery Backup Supplies
- Smart Card Readers
- PCMCIA Local 5V Supplies

Typical Application

Figure 1: Regulated 4.94V Output

Pin Assignment and Description

TOP VIEW		PIN	NAME	DESCRIPTION
		1	VOUT	Output
		2	GND	Ground
		3	EN	ON/OFF Control (High Enable)
		4	C-	Flying Capacitor Negative Terminal.
		5	VIN	Input
		6	C+	Flying Capacitor Positive Terminal.

Absolute Maximum Ratings (Note 1)

- V_{IN} -0.3V ~ 6V
- V_{OUT} -0.3V ~ 5.5V
- V_{EN} -0.3V ~ 6V
- I_{OUT} (Note 2) 300mA
- Operating Temperature Range (Note 3) -40°C ~ +85°C
- Lead Temperature (Soldering 10, sec.) +265°C
- Storage Temperature Range -65°C ~ +125°C

Note 1: Stresses listed as the above “Absolute Maximum Ratings” may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may remain possibility to affect device reliability.

Note 2: Based on long term current density limitations.

Note 3: The SD6214A are guaranteed to meet performance specifications from 0 °C to 70 °C. Specifications over the -40 °C to 85 °C operating temperature range are assured by design, characterization and correlation with statistical process controls.

Electrical Characteristics

Operating Conditions: $T_A = 25\text{ °C}$, $V_{EN} = V_{IN}$, $C_{IN} = C_{OUT} = C_{FLY} = 10\mu\text{F}$, unless otherwise noted.

SYMBOL	PARAMETER	CONDITIONS	MIN	TYP	MAX	UNITS
V_{IN}	Input Voltage Range		2.7		4.5	V
V_{OUT}	Output Voltage Range	$2.7\text{V} < V_{IN} < 5.5\text{V}$, $I_{OUT} < 65\text{mA}$	4.8	4.94	5.1	V
I_{SHDN}	Shutdown Current	$V_{EN} = 0\text{V}$, $V_{OUT} = 0\text{V}$		0.2		μA
$I_{NO-LOAD}$	No Load Input Current	$I_{OUT} = 0\text{mA}$, $V_{IN} = 3\text{V}$		0.17		mA
V_{RIPPLE}	Output Ripple	$V_{IN} = 3.6\text{V}$, $I_{OUT} = 100\text{mA}$		20		mVP-P
EFFI	Efficiency	$V_{IN} = 3\text{V}$, $I_{OUT} = 100\text{mA}$		78		%
f_{OSC}	Switching Frequency	$V_{IN} = 3.6\text{V}$, $I_{OUT} = 100\text{mA}$		360		kHz
V_{EN}	EN Voltage	High Enable		$V_{IN}/2$		V

Typical Performance Characteristics

Operating Conditions: $T_A=25^{\circ}\text{C}$, $V_{\text{EN}} = V_{\text{IN}}$, $C_{\text{IN}} = C_{\text{OUT}} = C_{\text{FLY}} = 10\mu\text{F}$, unless otherwise noted.

Oscillator Frequency vs. Supply Voltage
(I_{LOAD}=100mA)

Output Noise (V_{IN}=3.6V, I_{LOAD}=100mA)

SW Noise (V_{IN}=3.6V, I_{LOAD}=100mA)

Output Noise (V_{IN}=4.2V, I_{LOAD}=100mA)

SW Noise (V_{IN}=4.2V, I_{LOAD}=100mA)

Pin Functions

VOUT (Pin 1): Regulated Output Voltage. VOUT should be bypassed with a low ESR ceramic capacitor providing at least 2.2 μ F of capacitance as close to the pin as possible for best performance.

GND (Pin 2): Ground. These pins should be tied to a ground plane for best performance.

EN (Pin 3): Active Low Shutdown Input. This pin must not be allowed to float.

C- (Pin 4): Flying Capacitor Negative Terminal.

VIN (Pin 5): Input Supply Voltage. VIN should be bypassed with a low ESR ceramic capacitor providing at least 2.2 μ F of capacitance as close to the pin as possible for best performance.

C+ (Pin 6): Flying Capacitor Positive Terminal.

Block Diagram

Application Information

Operation

The SD6214A use a switched capacitor charge pump to boost VIN to a regulated output voltage. Regulation is achieved by sensing the output voltage through an internal resistor divider and modulating the charge pump output current based on the error signal. A 2-phase nonoverlapping clock activates the charge pump switches. The flying capacitor is charged from VIN on the first phase of the clock. On the second phase of the clock it is stacked in series with VIN and connected to VOUT. This sequence of charging and discharging the flying capacitor continues at a free running frequency of 360kHz (typ).

In shutdown mode all circuitry is turned off and the SD6214A draw only leakage current from the VIN supply. Furthermore, VOUT is disconnected from VIN. The EN pin is a CMOS input with a threshold voltage of approximately 0.8V. The SD6214A is in shutdown when a logic low is applied to the EN pin. Since the EN pin is high impedance CMOS input it should never be allowed to float. To ensure that its state is defined it must always be driven with a valid logic level.

VIN, VOUT Capacitor Selection

The style and value of capacitors used with the SD6214A determine several important parameters such as regulator control loop stability, output ripple, charge pump strength and minimum start-up time.

To reduce noise and ripple, it is recommended that low ESR ($< 0.1\Omega$) ceramic capacitors be used for both C_{IN} and C_{OUT} . These capacitors should be greater than $2.2\mu\text{F}$. Tantalum and aluminum capacitors are not recommended because of their high ESR.

Flying Capacitor Selection

Warning: A polarized capacitor such as tantalum or aluminum should never be used for the flying capacitor since its voltage can reverse upon start-up of the SD6214A. Low ESR ceramic capacitors should always be used for the flying capacitor.

The flying capacitor controls the strength of the charge pump. In order to achieve the rated output current it is necessary to have more than $2.2\mu\text{F}$ of capacitance for the flying capacitor.

Layout Considerations

Due to its high switching frequency and the high transient currents produced by the SD6214A, careful board layout is necessary. A true ground plane and short connections to all capacitors will improve performance and ensure proper regulation under all conditions. Figure 2 shows an example layout for the SD6214A.

Figure 2: Recommended Layout

Packaging Information

SOT-23-6L Package Outline Dimension
