

FEATURES

- Amplitude settling time: 200 ns
- Wideband rejection: ≥ 20 dB
- Single-chip implementation
- 24-lead, 4 mm \times 4 mm, RoHS-compliant LFCSP

APPLICATIONS

- Test and measurement equipment
- Military radar and electronic warfare systems
- Very small aperture terminal (VSAT) communications

GENERAL DESCRIPTION

The ADMV8420 is a monolithic microwave integrated circuit (MMIC), tunable band-pass filter that features a user-selectable pass band frequency. The 3 dB filter bandwidth is approximately 20%, and the 20 dB filter bandwidth is approximately 40%. Additionally, the center frequency (f_{CENTER}) varies between 11.1 GHz to 19.6 GHz by applying a center frequency control

voltage between 0 V to 15 V. The usable pass band corner frequencies (f_{CORNER}) span from 10 GHz to 21.7 GHz. This tunable filter is a smaller alternative to switched filter banks and cavity tuned filters. The ADMV8420 has minimal microphonics due to the monolithic design and provides a dynamically adjustable solution in advanced communications applications.

SPECIFICATIONS

$T_A = 25^\circ\text{C}$ and center frequency control voltage (V_{FCTL}) is swept from 0 V to 15 V.

Table 1.

Parameter	Min	Typ	Max	Unit	Test Conditions/Comments
FREQUENCY RANGE					
f_{CENTER}	11.1		19.6	GHz	
3 dB f_{CORNER}	10		21.7	GHz	
BANDWIDTH					
3 dB		20		%	
REJECTION					
Low-Side		$0.8 \times f_{\text{CENTER}}$		GHz	≥ 20 dB
High-Side		$1.2 \times f_{\text{CENTER}}$		GHz	≥ 20 dB
Reentry		$2.3 \times f_{\text{CENTER}}$		GHz	≤ 30 dB
LOSS					
Insertion Loss		5		dB	
Return Loss		8.5		dB	
DYNAMIC PERFORMANCE					
Input Power at 5° Shift in Insertion Phase ($V_{\text{FCTL}} = 0$ V)		10		dBm	
Input Third-Order Intercept (IP3)		31		dBm	
Group Delay		0.5		ns	
Phase Sensitivity		1.3		Rad/V	
Amplitude Settling		200		ns	
Drift Rate		-1.1		MHz/ $^\circ\text{C}$	
RESIDUAL PHASE NOISE					
1 MHz Offset		-161		dBc/Hz	
TUNING					
V_{FCTL}	0		15	V	
Center Frequency Control Current (I_{FCTL})			± 1	mA	

ABSOLUTE MAXIMUM RATINGS

Table 2.

Parameter	Rating
Tuning	
V_{FCTL}	-0.5 V to +15 V
I_{FCTL}	±1 mA
RF Input Power	27 dBm
Operating Temperature Range	-40°C to +85°C
Storage Temperature Range	-65°C to +150°C
Junction Temperature for 1 Million Mean Time to Failure (MTTF)	150°C
Nominal Junction Temperature (Temperature at Ground Pad = 85°C, Input Power (P_{IN}) = 27 dBm)	108°C
Electrostatic Discharge (ESD) Rating	
Human Body Model (HBM)	1000 V
Field Induced Charge Device Model (FICDM)	1250 V
Moisture Sensitivity Level (MSL) Rating	MSL3

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

- NOTES**
1. NIC = NOT INTERNALLY CONNECTED. THESE PINS ARE NOT CONNECTED INTERNALLY. HOWEVER, ALL DATA SHOWN HEREIN WAS MEASURED WITH THESE CONNECTED TO RF AND DC GROUND.
 2. EXPOSED PAD. THE EXPOSED PAD MUST BE CONNECTED TO RF AND DC GROUND.

Figure 2. Pin Configuration

Table 3. Pin Function Descriptions

Pin No.	Mnemonic	Description
1, 5 to 8, 10 to 14, and 18 to 24	NIC	Not Internally Connected. These pins are not connected internally. All data shown is measured with these pins connected to the RF and dc ground.
2, 4, 15, and 17	GND	Ground. These pins must be connected to the radio frequency (RF) and dc ground.
3	RFIN	RF Input. This pin is dc-coupled and matched to 50 Ω. Do not apply an external voltage to this pin.
9	V _{FCTL}	Center Frequency Control Voltage. This pin controls the f _{CENTER} of the device.
16	RFOUT	RF Output. This pin is dc-coupled and matched to 50 Ω. Do not apply an external voltage to this pin.
	EPAD	Exposed Pad. The exposed pad must be connected to RF and dc ground.

THEORY OF OPERATION

The ADMV8420 is a MMIC band-pass filter that features a user-selectable pass band frequency. Varying the applied analog tuning voltage between 0 V and 15 V at V_{FCTL} varies the f_{CENTER} between 11.1 GHz and 19.6 GHz.

APPLICATIONS INFORMATION

TYPICAL APPLICATION CIRCUIT

Figure 26 shows the typical application circuit for the ADMV8420. The RFIN and RFOUT pins are dc-coupled and external voltage must not be applied. It is recommended to install 100 pF series capacitors (C1 and C2) on the RF traces to prevent any prestage or poststage interaction with the filter.

On the V_{FCTL} control port, the C3 decoupling capacitor is shown with 100 pF as the typical value. However, the selection of the C3 capacitor is determined based on the system design criteria for phase noise and tuning speed. That is, there is a baseband noise characteristic for a particular control voltage, which can translate into additive phase noise within the filter. Minimizing baseband noise on the control voltage can be done by capacitive means at the expense of voltage rise time, which impacts the tuning speed of the filter. Carefully consider the control voltage baseband noise and rise time performance to ensure that system performance metrics are met.

EVALUATION PRINTED CIRCUIT BOARD (PCB)

All RF traces are routed on Layer 1 (primary side). The remaining three layers are ground planes that provide a solid ground for RF transmission lines, as shown in Figure 27. The top dielectric material is Rogers 4350, which offers low loss performance. The prepreg material in Layer 2 attaches the Isola 370HR core layer to copper traces layers. Both the prepreg material and the Isola 370HR core layer achieve the required board finish thickness.

The circuit board in this application uses RF circuit design techniques. Signal lines must have 50 Ω impedance. The package ground leads and exposed pad must connect directly to the ground plane (see Figure 27). A sufficient number of via holes connect the top and bottom ground planes. The evaluation circuit board shown in Figure 28 is available from Analog Devices, Inc. upon request.
