

PE9354

Product Description

The PE9354 SPDT High Power UltraCMOS™ RF Switch is designed to cover a broad range of applications from near DC to 3000 MHz. This single-supply reflective switch integrates on-board CMOS control logic driven by a simple, single-pin CMOS and TTL compatible control input. Using a nominal +3-volt power supply, a typical input 1 dB compression point of +31 dBm can be achieved. The PE9354 also exhibits input-output isolation of better than 30 dB at 2000 MHz and is offered in a small 8-lead ceramic SOIC package.

The PE9354 is optimized for commercial space applications. Single Event Latch up (SEL) is physically impossible and Single Event Upset (SEU) is better than 10⁻⁹ errors per bit/day. Fabricated in Peregrine's UltraCMOS™ technology, the PE9354 offers excellent RF performance and intrinsic radiation tolerance.

Figure 1. Functional Schematic Diagram

SPDT High Power UltraCMOS™ RF Switch Rad hard for Space Applications

Features

- Single 3-volt power supply
- Low insertion loss: 0.55 dB at 2000 MHz
- High isolation of 30 dB at 2000 MHz
- Typical input 1 dB compression point of +31 dBm
- 100 Krad total dose
- Single-pin CMOS or TTL logic control
- Low cost

8-lead CSOIC

Table 1. A/C Electrical Specifications -55 °C to +125 °C, V_{DD} = 3.0 V (Z_s = Z_L = 50 Ω)

Parameter	Conditions	Minimum	Typical	Maximum	Units
Operation Frequency ¹		DC		3000	MHz
Insertion Loss	2000 MHz		0.55	0.80	dB
Isolation – RFC to RF1/RF2	2000 MHz	28	32		dB
Isolation – RF1 to RF2	2000 MHz	24	28		dB
Return Loss ²	2000 MHz		22		dB
Input 1 dB Compression	2000 MHz	28	31		dBm

Note: 1. Device linearity will begin to degrade below 10 MHz.

Note: 2. Return loss not measured in production due to equipment limitations

Figure 3. Pin Configuration

Table 2. Pin Descriptions

Pin No.	Pin Name	Description
1	V _{DD}	Nominal +3V supply connection.
2	CTRL	CMOS or TTL logic level: High = RFC to RF1 signal path Low = RFC to RF2 signal path
3	GND	Ground connection. Traces should be physically short and connected to ground plane for best performance.
4	RFC	Common RF port for switch. ¹
5	RF2	RF2 port. ¹
6	GND	Ground Connection. Traces should be physically short and connected to ground plane for best performance.
7	GND	Ground Connection. Traces should be physically short and connected to ground plane for best performance.
8	RF1	RF1 port. ¹

Note 1: All RF pins must be DC blocked with an external series capacitor or held at 0 V_{DC}.

Table 4. DC Electrical Specifications

Parameter	Min	Typ	Max	Units
V _{DD} Power Supply Voltage	2.7	3.0	3.3	V
Input Leakage	-1		1	μA
I _{DD} Power Supply Current (V _{DD} = 3V, V _{CTRL} = 3V)		28	100	μA
Control Voltage High	0.7xV _{DD}			V
Control Voltage Low			0.3xV _{DD}	V

Table 3. Absolute Maximum Ratings

Symbol	Parameter/Conditions	Min	Max	Units
V _{DD}	Power supply voltage	-0.3	4.0	V
V _I	Voltage on any input except for the CTRL input	-0.3	V _{DD} +0.3	V
V _{CTRL}	Voltage on CTRL input		5.0	V
T _{ST}	Storage temperature range	-65	150	°C
T _{OP}	Operating temperature range	-55	125	°C
P _{IN}	Input power (50 Ω)		32	dBm
V _{ESD}	ESD voltage (Human Body Model)		200	V
Total Dose	Total Cumulative Exposure to Ionizing Radiation		100k	Rads (Si)

Absolute Maximum Ratings are those values listed in the above table. Exceeding these values may cause permanent device damage. Functional operation should be restricted to the limits in the DC Electrical Specifications table. Exposure to absolute maximum ratings for extended periods may affect device reliability.

Electrostatic Discharge (ESD) Precautions

When handling this UltraCMOS™ device, observe the same precautions that you would use with other ESD-sensitive devices. Although this device contains circuitry to protect it from damage due to ESD, precautions should be taken to avoid exceeding the rating specified in Table 3.

Latch-Up Avoidance

Unlike conventional CMOS devices, UltraCMOS™ devices are immune to latch-up.

Table 5. Control Logic Truth Table

Control Voltage	Signal Path
CTRL = CMOS or TTL High	RFC to RF1
CTRL = CMOS or TTL Low	RFC to RF2

The control logic input pin (CTRL) is typically driven by a 3-volt CMOS logic level signal, and has a threshold of 50% of V_{DD}. For flexibility to support systems that have 5-volt control logic drivers, the control logic input has been designed to handle a 5-volt logic HIGH signal. (A minimal current will be sourced out of the V_{DD} pin when the control logic input voltage level exceeds V_{DD}.)

Evaluation Kit Information

Evaluation Kit

The SPDT Switch Evaluation Kit board was designed to ease customer evaluation of the PE9354 SPDT switch. The RF common port is connected through a 50 Ω transmission line to the top left SMA connector, J1. Port 1 and Port 2 are connected through 50 Ω transmission lines to the top two SMA connectors on the right side of the board, J2 and J3. A through transmission line connects SMA connectors J4 and J5. This transmission line can be used to estimate the loss of the PCB over the environmental conditions being evaluated.

The board is constructed of a two metal layer FR4 material with a total thickness of 0.031". The bottom layer provides ground for the RF transmission lines. The transmission lines were designed using a coplanar waveguide with ground plane model using a trace width of 0.030", trace gaps of 0.007", dielectric thickness of 0.028", metal thickness of 0.0014" and ϵ_r of 4.4.

J6 provides a means for controlling DC and digital inputs to the device. Starting from the lower left pin, the second pin to the right (J2-3) is connected to the device CNTL input. The fourth pin to the right (J2-7) is connected to the device V_{DD} input. A decoupling capacitor (100 pF) is provided on both CTRL and V_{DD} traces. It is the responsibility of the customer to determine proper supply decoupling for their design application. Removing these components from the evaluation board has not been shown to degrade RF performance.

The ground plane has been removed from beneath the device for performance issues. It was found that insertion loss dips (suck-outs) were experienced due to the capacitive effect of the metal package sitting insulated by the solder-mask on the ground plane. All

Figure 12. Evaluation Board Layouts

data specified and shown on this datasheet was taken using this evaluation board configuration. For optimal performance, the package may be soldered directly to the ground plane, but the reliability issues associated with this mounting must be addressed by the customer.

Data Sheet Identification

Advance Information

The product is in a formative or design stage. The data sheet contains design target specifications for product development. Specifications and features may change in any manner without notice.

Preliminary Specification

The data sheet contains preliminary data. Additional data may be added at a later date. Peregrine reserves the right to change specifications at any time without notice in order to supply the best possible product.

Product Specification

The data sheet contains final data. In the event Peregrine decides to change the specifications, Peregrine will notify customers of the intended changes by issuing a DCN (Document Change Notice).

The information in this data sheet is believed to be reliable. However, Peregrine assumes no liability for the use of this information. Use shall be entirely at the user's own risk.

No patent rights or licenses to any circuits described in this data sheet are implied or granted to any third party.

Peregrine's products are not designed or intended for use in devices or systems intended for surgical implant, or in other applications intended to support or sustain life, or in any application in which the failure of the Peregrine product could create a situation in which personal injury or death might occur. Peregrine assumes no liability for damages, including consequential or incidental damages, arising out of the use of its products in such applications.
