

256Kx32 SSRAM/4Mx32 SDRAM EXTERNAL MEMORY SOLUTION FOR TEXAS INSTRUMENTS TMS320C6000 DSP

FEATURES

- Clock speeds:
 - SSRAM: 200, 166,150, and 133 MHz
 - SDRAMs: 125 and 100 MHz
- DSP Memory Solution
 - Texas Instruments TMS320C6201
 - Texas Instruments TMS320C6701
- Packaging:
 - 153 pin BGA, JEDEC MO 163
- 3.3V Operating supply voltage
- Direct control interface to both the SSRAM and SDRAM ports on the "C6x"
- Common address and databus
- 65% space savings vs. monolithic solution
- Reduced system inductance and capacitance

DESCRIPTION

The WED9LC6816V is a 3.3V, 256K x 32 Synchronous Pipeline SRAM and a 4Mx32 Synchronous DRAM array constructed with one 256K x 32 SBSRAM and two 4Mx16 SDRAM die mounted on a multilayer laminate substrate. The device is packaged in a 153 lead, 14mm x 22mm, BGA.

The WED9LC6816V provides a total memory solution for the Texas Instruments TMS320C6201 and the TMS320C6701 DSPs. The Synchronous Pipeline SRAM is available with clock speeds of 200, 166,150, and 133 MHz, allowing the user to develop a fast external memory for the SSRAM interface port.

The SDRAM is available in clock speeds of 125 and 100 MHz, allowing the user to develop a fast external memory for the SDRAM interface port.

The WED9LC6816V is available in both commercial and industrial temperature ranges.

This product is subject to change without notice.

Output Functional Descriptions

Symbol	Type	Signal	Polarity	Function
SSCK#	Input	Pulse	Positive Edge	The system clock input. All of the SSRAM inputs are sampled on the rising edge of the clock.
SSADS# SSOE# SSWE#	Input	Pulse	Active Low	When sampled at the positive rising edge of the clock, SSADS#, SSOE#, and SSWE# define the operation to be executed by the SSRAM.
SSCE#	Input	Pulse	Active Low	SSCE# disable or enable SSRAM device operation.
SDCK#	Input	Pulse	Positive Edge	The system clock input. All of the SDRAM inputs are sampled on the rising edge of the clock.
SDCE	Input	Pulse	Active Low	SDCE disable or enable device operation by masking or enabling all inputs except SDCK# and BWE0-3.
SDRAS# SDCAS# SDWE#	Input	Pulse	Active Low	When sampled at the positive rising edge of the clock, SDCAS#, SDRAS#, and SDWE# define the operation to be executed by the SDRAM.
A0-17 SDA10	Input	Level	—	Address bus for SSRAM and SDRAM A0 and A1 are the burst address inputs for the SSRAM During a Bank Active command cycle, A0-11, SDA10 defines the row address (RA0-10) when sampled at the rising clock edge. During a Read or Write command cycle, A0-7 defines the column address (CA0-7) when sampled at the rising clock edge. In addition to the row address, SDA10 is used to invoke Autoprecharge operation at the end of the Burst Read or Write Cycle. If SDA10 is high, autoprecharge is selected and A12 and A13 define the bank to be precharged. If SDA10 is low, autoprecharge is disabled. During a Precharge command cycle, SDA10 is used in conjunction with A12 and A13 to control which bank(s) to precharge. If SDA10 is high, all banks will be precharged regardless of the state of A12 and A13. If SDA10 is low, then A12 and A13 are used to define which bank to precharge.
DQ0-31	Input Output	Level	—	Data Input/Output are multiplexed on the same pins.
BWE0-3	Input	Pulse		BWE0-3 perform the byte write enable function for the SSRAM and DQM function for the SDRAM BWE0 is associated with DQ0-7, BWE1 with DQ8-15, BWE2 with DQ16-23 and BWE3 with DQ24-31.
Vcc, Vss	Supply			Power and ground for the input buffers and the core logic.
Vccq	Supply			Data base power supply pins, 3.3V (2.5V future).

**Absolute Maximum Ratings**

Voltage on Vcc Relative to Vss	-0.5V to +4.6V
V _{IN} (DQx)	-0.5V to V _{CC} +0.5V
Storage Temperature (BGA)	-55°C to +125°C
Junction Temperature	+150°C
Short Circuit Output Current	100 mA

*Stress greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions greater than those indicated in operational sections of this specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

Recommended DC Operating Conditions

(V_{CC} = 3.3V -5% / +10% unless otherwise noted;
0°C ≤ Ta ≤ 70°C, Commercial; -40°C ≤ Ta ≤ 85°C, Industrial)

Parameter	Symbol	Min	Max	Units
Supply Voltage (1)	V _{CC}	3.135	3.6	V
Input High Voltage (1,2)	V _{IH}	2.0	V _{CC} +0.3	V
Input Low Voltage (1,2)	V _{IL}	-0.3	0.8	V
Input Leakage Current 0 ≤ V _{IN} ≤ V _{CC}	I _{LI}	-10	10	A
Output Leakage (Output Disabled) 0 ≤ V _{IN} ≤ V _{CC}	I _{LO}	-10	10	A
SSRAM Output High (I _{OH} = -4mA) (1)	V _{OH}	2.4	—	V
SSRAM Output Low (I _{OL} = 8mA) (1)	V _{OL}	—	0.4	V
SDRAM Output High (I _{OH} = -2mA)	V _{OH}	2.4	—	V
SDRAM Output Low (I _{OL} = 2mA)	V _{OL}	—	0.4	V

NOTES:

1. All voltages referenced to V_{SS} (GND).
2. Overshoot: V_{IH} ≤ +6.0V for t ≤ t_{KC}/2 Underershoot: V_{IL} ≥ -2.0V for t ≤ t_{KC}/2

DC Electrical Characteristics

(V_{CC} = 3.3V -5% / +10% unless otherwise noted; 0°C ≤ Ta ≤ 70°C, Commercial; -40°C ≤ Ta ≤ 85°C, Industrial)

Description	Conditions	Symbol	Frequency	Typ	Max	Units
Power Supply Current Operating (1, 2, 3)	SSRAM Active / DRAM Auto Refresh	I _{CC1}	133MHz	500	625	mA
			150MHz	500	650	
			166MHz	550	700	
			200MHz	600	800	
Power Supply Current Operating (1, 2, 3)	SSRAM Active / DRAM Idle	I _{CC2}	133MHz	325	425	mA
			150MHz	350	450	
			166MHz	400	495	
			200MHz	450	585	
Power Supply Current Operating (1, 2, 3)	SSRAM Active / SSRAM Idle	I _{CC3}	83MHz	500	625	mA
			100MHz	500	650	
			125MHz	550	700	
CMOS Standby	SSCE# and SDCE# ≤ V _{CC} -0.2V, All other inputs at V _{SS} +0.2 ≤ V _{IN} or V _{IN} ≤ V _{CC} -0.2V, Clk frequency = 0	I _{SB1}		20.0	40.0	mA
TTL Standby	SSCE# and SDCE# ≤ V _{IH} min All other inputs at V _{IL} max ≤ V _{IN} or V _{IN} ≤ V _{CC} -0.2V, CK# frequency = 0	I _{SB2}		30.0	55.0	mA
Auto Refresh		I _{CC5}		250	300	mA

NOTES:

1. I_{CC} (operating) is specified with no output current. I_{CC} (operating) increases with faster cycle times and greater output loading.
2. "Device idle" means device is deselected (CE# = V_{IH}) Clock is running at max frequency and Addresses are switching each cycle.
3. Typical values are measured at 3.3V, 25°C. I_{CC} (operating) is specified at specified frequency.

SSRAM Operation Truth Table

Operation	Address Used	SSCE#	SSADS#	SSWE#	SSOE#	DQ
Deselected Cycle, Power Down	None	H	L	X	X	High-Z
WRITE Cycle, Begin Burst	External	L	L	L	X	D
READ Cycle, Begin Burst	External	L	L	H	L	Q
READ Cycle, Begin Burst	External	L	L	H	H	High-Z
READ Cycle, Suspend Burst	Current	X	H	H	L	Q
READ Cycle, Suspend Burst	Current	X	H	H	H	High-Z
READ Cycle, Suspend Burst	Current	H	H	H	L	Q
READ Cycle, Suspend Burst	Current	H	H	H	H	High-Z
WRITE Cycle, Suspend Burst	Current	X	H	L	X	D
WRITE Cycle, Suspend Burst	Current	H	H	L	X	D

NOTE:

1. X means "don't care", H means logic HIGH. L means logic LOW.
2. All inputs except SSOE# must meet setup and hold times around the rising edge (LOW to HIGH) of SSCK.
3. Suspending burst generates wait cycle
4. For a write operation following a read operation, SSOE# must be HIGH before the input data required setup time plus High-Z time for SSOE# and staying HIGH through out the input data hold time.
5. This device contains circuitry that will ensure the outputs will be in High-Z during power-up.

Row Cycle Time - Auto Refresh (4,8)		tRFC	70		80		90		ns
Last Data in to New Column Address Delay (5)		tCDL	1		1		1		CK#
Last Data in to Row Precharge (5)		tRDL	1		1		1		CK#
Last Data in to Burst Stop (5)		tBDL	1		1		1		CK#
Column Address to Column Address Delay (6)		tCCD	1.5		1.5		1.5		CK#
Number of Valid Output Data (7)			2		2		2		ea
			1		2		1		

NOTES:

- Parameters depend on programmed CAS latency.
- If clock rise time is longer than 1ns (trise/2 -0.5)ns should be added to the parameter.
- Assumed input rise and fall time = 1ns. If trise or tfall are longer than 1ns. [(trise + tfall)/2] - 1ns should be added to the parameter.
- The minimum number of clock cycles required is determined by dividing the minimum time required by the clock cycle time and then rounding up to the next higher integer.
- Minimum delay is required to complete write.
- All devices allow every cycle column address changes.
- In case of row precharge interrupt, auto precharge and read burst stop.
- A new command may be given tRFC after self-refresh exit.

Burst Termination		L	H	H	L	X	X	X	3
No Operation		L	H	H	H	X	X	X	
Device Deselect		H	X	X	X	X	X	X	
Data Write/Output Disable		X	X	X	X	L	X	X	4
Data Mask/Output Disable		X	X	X	X	H	X	X	4

NOTES:

- All of the SDRAM operations are defined by states of SDCE#, SDWE#, SDRAS#, SDCAS#, and BWE0-3# at the positive rising edge of the clock.
- Bank Select (BA), A12 (BA0) and A13 (BA1) select between different banks.
- During a Burst Write cycle there is a zero clock delay, for a Burst Read cycle the delay is equal to the CAS latency.
- The BWE# has two functions for the data DQ Read and Write operations. During a Read cycle, when BWE# goes high at a clock timing the data outputs are disabled and become high impedance after a two clock delay. BWE# also provides a data mask function for Write cycles. When it activates, the Write operation at the clock is prohibited (zero clock latency).

SDRAM Current State Truth Table (cont.)

Current State	Command							Action	Notes
	SDCE#	SDRAS #	SDCAS#	SDWE#	A12 & A13 (BA)	A11-A0	Description		
Refreshing	L	L	L	L	OP Code		Mode Register Set	ILLEGAL	
	L	L	L	H	X	X	Auto or Self Refresh	ILLEGAL	
	L	L	H	L	X	X	Precharge	ILLEGAL	
	L	L	H	H	BA	Row Address	Bank Activate	ILLEGAL	
	L	H	L	L	BA	Column	Write	ILLEGAL	
	L	H	L	H	BA	Column	Read	ILLEGAL	
	L	H	H	L	X	X	Burst Termination	No Operation; Idle after t _{RC}	
	L	H	H	H	X	X	No Operation	No Operation; Idle after t _{RC}	
Mode Register Accessing	H	X	X	X	X	X	Device Deselect	No Operation; Idle after t _{RC}	
	L	L	L	L	OP Code		Mode Register Set	ILLEGAL	
	L	L	L	H	X	X	Auto or Self Refresh	ILLEGAL	
	L	L	H	L	X	X	Precharge	ILLEGAL	
	L	L	H	H	BA	Row Address	Bank Activate	ILLEGAL	
	L	H	L	L	BA	Column	Write	ILLEGAL	
	L	H	L	H	BA	Column	Read	ILLEGAL	
	L	H	H	L	X	X	Burst Termination	ILLEGAL	
	L	H	H	H	X	X	No Operation	No Operation; Idle after two clock cycles	
	H	X	X	X	X	X	Device Deselect	No Operation; Idle after two clock cycles	

NOTES:

- Both Banks must be idle otherwise it is an illegal action.
 - The Current State refers only refers to one of the banks, if BA selects this bank then the action is illegal. If BA selects the bank not being referenced by the Current State then the action may be legal depending on the state of that bank.
 - The minimum and maximum Active time (t_{RAS}) must be satisfied.
 - The RAS# to CAS# Delay (t_{RCB}) must occur before the command is given.
 - Address SDA10 is used to determine if the Auto Precharge function is activated.
 - The command must satisfy any bus contention, bus turn around, and/or write recovery requirements.
- The command is illegal if the minimum bank to bank delay time (t_{RBD}) is not satisfied.

Rev. 1

FIG. 7 SDRAM READ & WRITE CYCLE AT SAME BANK @ BURST LENGTH = 4

NOTES:

1. Minimum row cycle times are required to complete internal DRAM operation.
2. Row precharge can interrupt burst on any cycle. (CAS# Latency - 1) number of valid output data is available after Row precharge. Last valid output will be Hi-Z (t_{sH2}) after the clock.
3. Access time from Row active command. $t_{cc} * (t_{rCD} + CAS\# \text{ Latency} - 1) + t_{sAC}$.
4. Output will be Hi-Z after the end of burst. (1, 2, 4, 8 & Full page bit burst)

White Electronic Designs Corp. reserves the right to change products or specifications without notice.

September, 2003
Rev. 1

**FIG. 8 SDRAM PAGE READ & WRITE CYCLE AT SAME BANK @ BURST LENGTH = 4****NOTES:**

1. To write data before burst read ends. BWE# should be asserted three cycle prior to write command to avoid bus contention.
2. Row precharge will interrupt writing. Last data input, t_{RDL} before Row precharge will be written.
3. BWE# should mask invalid input data on precharge command cycle when asserting precharge before end of burst. Input data after Row precharge cycle will be masked internally.

September, 2003
Rev. 1

**FIG. 9 SDRAM PAGE READ CYCLE AT DIFFERENT BANK @ BURST LENGTH = 4****NOTES:**

1. SDCE# can be "don't care" when SDRAS#, SDCAS# and SDWE# are high at the clock going high edge.
2. To interrupt a burst read by Row precharge, both the read and the precharge banks must be the same.

Contact factory for ordering information.

White Electronic Designs Corp. reserves the right to change products or specifications without notice.

September, 2003
Rev. 1

**FIG. 10 SDRAM PAGE WRITE CYCLE AT DIFFERENT BANK @
BURST LENGTH = 4****NOTES:**

1. To interrupt burst write by Row precharge, BWE# should be asserted to mask invalid input data.
2. To interrupt a burst read by Row precharge, both the read and the precharge banks must be the same.

Contact factory for ordering information.

White Electronic Designs Corp. reserves the right to change products or specifications without notice.

September, 2003
Rev. 1

**FIG. 11 SDRAM READ & WRITE CYCLE AT DIFFERENT BANK @ BURST LENGTH = 4****NOTES:**

1. t_{CDL} should be met to complete write.

Contact factory for ordering information.

White Electronic Designs Corp. reserves the right to change products or specifications without notice.

September, 2003
Rev. 1

**FIG. 12 SDRAM READ & WRITE CYCLE WITH AUTO PRECHARGE @ BURST LENGTH = 4****NOTES:**

1. t_{CDL} should be controlled to meet minimum t_{RAS} before internal precharge start.
(In the case of Burst Length = 1 & 2 and BRSW mode)

Contact factory for ordering information.

White Electronic Designs Corp. reserves the right to change products or specifications without notice.

September, 2003
Rev. 1

**FIG. 13 SDRAM READ INTERRUPTED BY PRECHARGE COMMAND & READ BURST STOP @ BURST LENGTH = FULL PAGE****NOTES:**

1. At full page mode, burst is end at the end of burst. So auto precharge is possible.
2. About the valid DQs after burst stop, it is the same as the case of SDRAS# interrupt. Both cases are illustrated in the above timing diagram. See the label 1, 2 on each of them. But at burst write, burst stop and SDRAS# interrupt should be compared carefully. Refer to the timing diagram of "Full page write burst stop cycle".
3. Burst stop is valid at every burst length.

September, 2003
Rev. 1

**FIG. 14 SDRAM WRITE INTERRUPTED BY PRECHARGE COMMAND & WRITE BURST STOP @ BURST LENGTH = FULL PAGE****NOTES:**

1. At full page mode, burst is end at the end of burst. So auto precharge is possible.
2. Data-in at the cycle of interrupted by precharge can not be written into the corresponding memory cell. It is defined by AC parameter of t_{BDL} . BWE# at write interrupt by precharge command is needed to prevent invalid write. BWE# should mask invalid input data on precharge command cycle when asserting precharge before end of burst. Input data after Row precharge cycle will be masked internally.
3. Burst stop is valid at every burst length.

Contact factory for ordering information.

White Electronic Designs Corp. reserves the right to change products or specifications without notice.

September, 2003
Rev. 1

**FIG. 15 SDRAM BURST READ SINGLE BIT WRITE CYCLE @ BURST LENGTH = 2****NOTES:**

1. BRSW modes enabled by setting A9 "High" at MRS (Mode Register Set).
At the BRSW Mode, the burst length at Write is fixed to "1" regardless of programmed burst length.
2. When BRSW write command with auto precharge is executed, keep it in mind that t_{RAS} should not be violated. Auto precharge is executed at the burst-end cycle, so in the case of BRSW write command, the next cycle starts the precharge.

FIG. 16
SDRAM MODE REGISTER
SET CYCLE

SDRAM AUTO REFRESH CYCLE

*Both banks precharge should be completed before Mode Register Set cycle and Auto refresh cycle.

NOTES:

MODE REGISTER SET CYCLE

1. SDCE#, SDRAS#, SDCAS# & SDWE# activation at the same clock cycle with address key will set internal mode register.
2. Minimum 2 clock cycles should be met before new SDRAS# activation.
3. Please refer to Mode Register Set Table.

**PACKAGE DESCRIPTION: 153 LEAD BGA (17 X 9 BALL ARRAY)
JEDEC MP-163**

ALL LINEAR DIMENSIONS ARE MILLIMETERS AND PARENTHETICALLY IN INCHES

NOTE:

Ball attach pad for above BGA package is 480 microns in diameter. Pad is solder mask defined.
