CURRENT REGULATOR DIODES

A CRD is a diode which supplies constant current to an electronic circuit, even when power supply voltage fluctuations or load impedance fluctuations occur. A CRD is used for current stabilization and current limiting.

I_p = Pinch-Off Current: measured by pulse at 25 °C
V_k = Voltage which produces 0.81 I_p or greater current
Z_t = Minimum AC Impedance when small AC signal voltage of 10 KHz is added to 25 Volt DC bias.
Z_k = Minimum knee Impedance when the small AC signal voltage is added to V_k.

This line of devices is available in surface mount MELF package. Change prefix from "E" to "F".

NJ Semi-Conductors reserves the right to change test conditions, parameter limits and package dimensions without notice. Information furnished by NJ Semi-Conductors is believed to be both accurate and reliable at the time of going to press. However, NJ Semi-Conductors assumes no responsibility for any errors or omissions discovered in its use. NJ Semi-Conductors encourages customers to verify that datasheets are current before placing orders.

Quality Semi-Conductors

CURRENT REGULATOR DIODES

Maximum ratings

Type	E type	F type
Rating power	300mW	400mW
Thermal resistance	300°C/W	150°C/W
Maximum rating voltage	100V	
Reverse current	50mA	
Operating temp.	-30°C~+150°C	

Basic characteristics

CRD in parallel

The use of CRD in parallel increases their current handling capabilities.

Increasing the voltage range using a zener diode
 Connecting zener diodes in series with the line ensures that the current is constant in high-voltage area.

The compensation of current reduction due to self heating

Placing resistors in parallel with CRD can correct any current decrease when the applied voltage increases. The following values are typical for correction resistors.

102	1 MΩ
152	390 kΩ
202	240 kΩ
272	120 kΩ
352	82 kΩ

Compensative resistor is not necessary if the current value is less than 1 mA.

Dynamic characteristics (saturation characteristics)

Power derating

Pinch-off current-Temperature
