

pulsar

Pulse Burst Radar Level Transmitter

DESCRIPTION

The Pulsar® Radar transmitter is the latest generation of loop-powered, 24 VDC, level transmitters. It has lower power consumption, faster response time and is easier to use than most loop-powered radar transmitters.

This latest entry into the radar level measurement field is designed to provide unparalleled performance and ease of use. PULSAR non-contact radar is the perfect compliment to the Magnetrol® Eclipse® Guided Wave Radar. These transmitters offer the ultimate solution to the vast majority of process level applications.

TECHNOLOGY

The PULSAR Radar transmitter is based on pulse burst radar technology together with equivalent time sampling circuitry. Short bursts of 5.8 or 6.3 GHz microwave energy are emitted and subsequently reflected from the liquid level surface. Distance is calculated by the equation $D = \text{Transit time (round-trip)}/2$. Liquid level is then calculated by applying the tank height value.

APPLICATIONS

MEDIA: Liquids and slurries; hydrocarbons to water based media (dielectric 1.7–100)

VESSELS: Most process or storage vessels up to rated temperature and pressure. Pits and sumps as well as non-metallic tanks such as plastic, glass-lined and concrete.

CONDITIONS: Virtually all level measurement and control applications including process conditions exhibiting varying specific gravity and dielectric, visible vapors, high fill/empty rates, turbulence, low to moderate foam and buildup.

FEATURES

- Two-wire, 24 VDC loop-powered level transmitter
- PACTware™ PC Program using HART® communication for advanced configuration and troubleshooting. (see bulletin 59-101)
- Performance not process dependent (changing specific gravity and dielectric have no effect)
- 5.8/6.3 GHz operating frequency offers superior performance in the tougher applications of turbulence, foam, and heavy vapors
- False Target setup is simple, intuitive and effective
- Will reliably track extremely rapid rate of change up to 180 inches (450 cm)/minute
- Antenna designs to +400° F (+204° C), -14.7 to 750 psig (-1.0 to 51.7 bar)
- Range up to 65 feet (20 meters)
- Quick connect/disconnect antenna coupling allows vessel to remain sealed (patent pending)
- Extremely low output at antenna: < .01 mW (avg), < 2 mW (max); hundreds of times less than a cell phone
- Safety Integrity Level (SIL) value of 1 (SFF 73.7%)

PROBLEMATIC APPLICATIONS

GUIDED WAVE RADAR ALTERNATIVE

Some applications can be problematic for Pulse Burst Radar. The following are examples of when Guided Wave Radar is recommended.

- Extremely low dielectric media ($\epsilon_r < 2.0$)
- Very weak reflections from the liquid surface—particularly during turbulence can cause poor performance.
- Tanks heavily cluttered with false targets (mixers, pumps, ladders, pipes, etc.)
- During times of very low liquid levels of low dielectric media, the metal tank bottom may be detected deteriorating performance.
- Foam can either absorb or reflect the microwave energy depending upon the depth, dielectric, density and wall thickness of the bubbles. Due to typical variations in the amount (depth) of foam, it is impossible to quantify performance. It may be possible to receive most, some or none of the transmitted energy.
- Extremely high liquid level (Overflow) conditions when liquid very near the antenna can cause erroneous readings and measurement failure.

Refer to ECLIPSE Guided Wave Radar bulletin 57-101.

TECHNOLOGY

PULSE BURST RADAR

PULSAR is a top-mounted, downward-looking pulse burst radar operating at 5.8 GHz (Europe) or 6.3 GHz (North America). Unlike true pulse devices (ECLIPSE Guided Wave Radar) which transmit a single, sharp (fast rise-time) waveform of wide-band energy (Figure 1), PULSAR emits short bursts of 5.8 or 6.3 GHz energy (Figure 2) and measures the transit time of the signal reflected off the liquid surface.

Distance is calculated utilizing the equation Distance equals the Speed of light multiplied by the transit time divided by two ($Distance = C \times Transit\ Time / 2$), then developing the level value by factoring in tank height and sensor offset information (Figure 3). The exact reference point for distance and level calculations is the sensor reference point (bottom of an NPT thread, top of a BSP thread, or face of a flange).

The exact level measurement is extracted from false target reflections and other background noise via the use of sophisticated signal processing. The new PULSAR circuitry is extremely energy efficient so no duty cycling is necessary to accomplish effective measurement. For this reason PULSAR can track high rates of change (180 inches [450 cm] per minute) that were heretofore impossible with existing loop-powered radar transmitters.

EQUIVALENT TIME SAMPLING

ETS, or Equivalent Time Sampling, is used to measure the high speed, low power EM (electromagnetic) energy. ETS is a critical key in the application of Radar to vessel level measurement technology. The high speed EM energy (1000 ft/ μ s) is difficult to measure over short distances and at the resolution required in the process industry. ETS captures the EM signals in real time (nanoseconds) and reconstructs them in equivalent time (milliseconds), which is much easier to measure with today's technology.

ETS is accomplished by scanning the vessel to collect thousands of samples. The round-trip event on a 65-foot (20 meter) tank takes only 133 nanoseconds in real time. After it is reconstructed in equivalent time it measures 200 milliseconds.

Figure 1

Figure 2

OPERATIONAL CONSIDERATIONS

Radar applications are characterized by three basic conditions:

- Dielectric
- Distance (measuring range)
- Disturbances (turbulence, foam, false targets, multiple reflections and rate of change)

The PULSAR Radar transmitter is offered with four antenna configurations:

- Polypropylene Dielectric Rod
- TFE Dielectric Rod
- All-Plastic Dielectric Rod: Polypropylene or Halar®
- 4" (100 mm) Horn
- 6" (150 mm) Horn

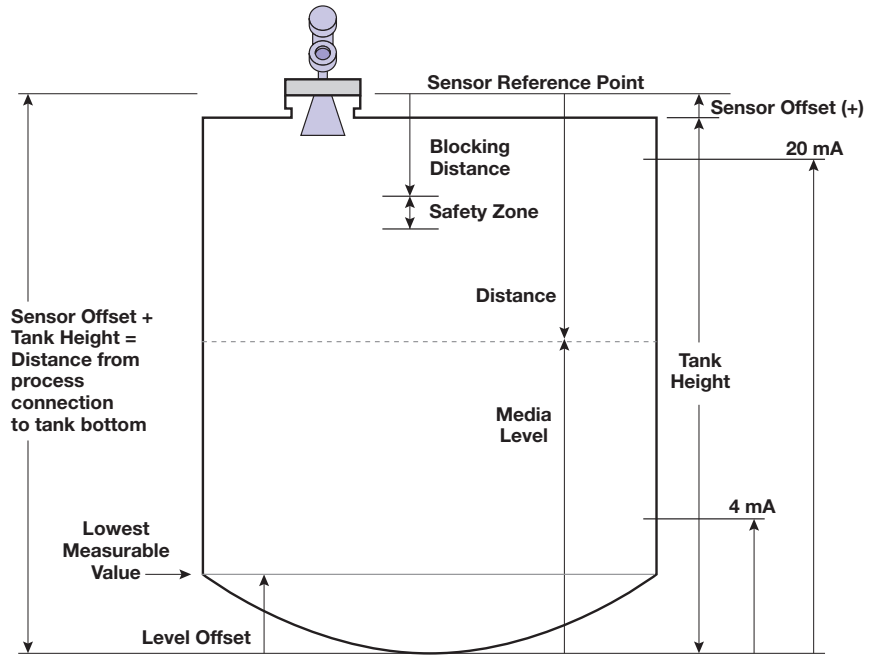

Figure 3

Maximum measuring range (distance) is calculated as Tank Height + Sensor Offset. Refer to Figure 3. It is measured from the sensor reference point (bottom of NPT thread, top of BSP thread, or face of flange).

Ideally the 6" (150 mm) horn antenna should be used to ensure the best possible performance in all operational conditions. Since that is impractical, other antennas are available. The chart shows the maximum measuring range of each antenna based on dielectric and turbulence. Refer to Figure 4.

Noise and media buildup drastically decrease reliable measurement; although, it is theoretically possible to measure a liquid level on the antenna. Liquid should not be allowed closer than 2 inches (50 mm) from the bottom of the antenna due to the decrease in accuracy when liquid level is present on the antenna. Refer to Figure 5.

Figure 5

MAXIMUM DISTANCE feet (meters)

① Minimum dielectric = 2.0

Figure 4

MOUNTING

The PULSAR Radar transmitter can be mounted to a vessel using a variety of process connections. Generally either a threaded or flanged connection is used.

LOCATION

Ideally the Radar transmitter should be mounted $\frac{1}{2}$ radius from center providing an unobstructed signal path to the liquid surface where it should illuminate (with microwave energy) the largest possible surface area. Do not install in center of tank top or within 18 inches (45 cm) of tank wall. Tank walls may produce reflections that must be minimized during field configuration (Orientation). Refer to Figure 6.

BEAM ANGLE

The various antenna designs exhibit different beam patterns. Figure 8 shows the beam angles for all PULSAR antennas. Ideally the beam pattern should illuminate the maximum liquid surface with a minimum striking other objects in the vessel including the tank wall. Use these drawings to determine the optimum installation location.

OBSTRUCTIONS

Almost any object that falls within the beam pattern will cause reflections that may be misinterpreted as a false liquid level. Although PULSAR has a powerful False Target Rejection routine, all possible precautions should be taken to minimize false target reflections with proper installation and orientation. Refer to Figures 7 & 8.

Figure 7

Figure 6

Antenna	Beam Spread, W @-3dB; ft (m)		
	Dielectric Rod	4" Horn	6" Horn

65 (20)	28.9 (8.81)	28.9 (8.81)	19.5 (5.95)

Figure 8

MOUNTING

NOZZLES

Improper installation in a nozzle creates “ringing” which will adversely affect measurement. The antenna should always be mounted so the active section of the antenna is a minimum of 0.5" (12 mm) below the nozzle (be sure to include any nozzle dimension *inside* the vessel). Refer to Figure 9. Antenna extensions are offered to allow the PULSAR transmitter to work reliably in nozzles with “L” dimensions of 1" (25 mm), 4" (100 mm), 8" (200 mm) or 12" (300 mm). Standard antennas are shown below for reference.

DIELECTRIC RODS

Model #	Antenna Extension (maximum "L" dimension)	All	All	BSP
8th Digit		Dim A	Dim B	Dim C
0	1" (25 mm)	2.2 (56)	11.1 (282)	3.0 (76)
1	4" (100 mm)	5.1 (130)	14.0 (356)	5.9 (150)
2	8" (200 mm)	9.1 (231)	18.0 (457)	9.9 (251)
3	12" (300 mm)	13.1 (333)	22.0 (559)	13.9 (353)

Antenna Extension O.D. Dimension D	
TFE Rod	Ø 1.625 (41)
PP Rod	Ø 1.50 (38)
All-Plastic Rod	Ø 1.625 (41)

Aperture		2.95" (75 mm)	3.75" (95 mm)	5.75" (146 mm)

Figure 9

STANDPIPES AND STILLWELLS

PULSAR can be mounted in a standpipe or stillwell but certain considerations should be given:

- Metal stillwells only: Sizes 3–8 inches (80–200 mm).
- Diameter must be consistent throughout length; no reducers.
- Use only horn antennas sized to pipe ID; 3–6" (80–150mm); 8" pipe can use a 6" horn.
- Stillwell length must cover complete range of measurement (i.e., liquid must be in stillwell).
- Welds should be smooth.
- Vents: holes <0.5" diameter, slots <0.5" width.
- If an isolation valve is used, it must be a full port ball valve with an I.D. equal to the pipe diameter.
- Bridles/Bypass Installations: The launcher (index mark) should be rotated 90° from process connections.
- Configuration must include an entry for PIPE I.D.
- There will be some increased dielectric sensitivity; system GAIN will be reduced when PIPE ID >0.
- There will be a slight reduction in Maximum Range based on the table at right.

Maximum Range

PIPE I.D.		Propagation Speed Factor	Maximum Range	
inch	mm		feet	meters
3	80	0.915	60.0	18.3
4	100	0.955	62.7	19.1
6	150	0.98	64.3	19.6
8	200	0.99	65.0	19.8

Figure 10

MOUNTING

ORIENTATION

The PULSAR transmitter utilizes a linearly polarized, microwave beam that can be rotated to improve its performance. Proper orientation can minimize unwanted target reflections, decrease sidewall reflections (multipath) and maximize direct reflections from the liquid surface. The index mark located on the side of the launcher is oriented in the same direction as the polarization. Refer to Figure 11.

The index mark is also present for reference (1 dot: GP/IS or 2 dots: XP). The launcher is considered to be at 0° when the index mark is closest to the tank wall.

① Measured media inside vessel must be non-flammable only.

② The antenna complies with Canadian Electrical Code requirements of ANSI/ISA 12.27.01-2003 as a single seal device.

Special conditions for safe use:

③ Ex ia

When an insulated probe is used in a potentially explosive atmosphere caused by gas, damp or a non-conducting liquid, precautions must be taken to avoid ignition due to hazardous electrostatic charges.

④ Ex d

When the transmitter enclosure that is made of aluminum alloy is installed in a potentially explosive atmosphere, requiring the use of apparatus of equipment category 1G, it shall be installed so that in the event of rare incidents, an ignition source due to impact or friction between the enclosure and iron/steel is excluded.

The transmitter's antenna shall be installed so that electrostatic discharges are prevented.

 These units have been tested to EN 61326: 1997+A1+A2 and are in compliance with the EMC Directive 2004/108/EC.

5P	3" Triclover type, 16 AMP	7P	6" Triclover type, 16 AMP

① Metal flanges welded to antenna; Plastic flanges and metal flanges with threaded antenna connection ordered separately. Refer to Optional Flanges chart on page 15.

O-RINGS ②

0	Viton® GFLT
1	EPDM
2	Kalrez 4079
8	Simriz SZ485 (formerly Aegis PF128)

② All-Polypropylene and All-Halar antennas (Materials of Construction Codes G and L) use Viton® GFLT O-rings

ANTENNA EXTENSION

0	For nozzle height ≤ 1" (25 mm) (For threaded process connection only)
1	For nozzle height ≤ 4" (100 mm)
2	For nozzle height ≤ 8" (200 mm) (ESP designation for TFE rod only)
3	For nozzle height ≤ 12" (300 mm)

RADAR ANTENNAS

HORN MODEL NUMBER

TECHNOLOGY / OPERATING FREQUENCY

RA	PULSAR radar antennas / 5.8/6.3 GHz
----	-------------------------------------

CONFIGURATION / STYLE

3	3" horn (for Standpipe/Stillwell use only; Materials of Construction codes A & K only)
4	4" horn
6	6" horn

MATERIAL OF CONSTRUCTION

A	316/316L stainless steel
B	Hastelloy C
K	316/316L SS; ASME B31.1 and ASME B31.3 (meets CRN specifications)

PROCESS CONNECTION - SIZE/TYPE (metal flanges welded to antenna)

53	3" 150# ANSI raised face flange	EA	DN 80, PN 16	DIN 2527 Form B
54	3" 300# ANSI raised face flange	EB	DN 80, PN 25/40	DIN 2527 Form B
55	3" 600# ANSI raised face flange	ED	DN 80, PN 64	DIN 2527 Form E
63	4" 150# ANSI raised face flange	FA	DN 100, PN 16	DIN 2527 Form B
64	4" 300# ANSI raised face flange	FB	DN 100, PN 25/40	DIN 2527 Form B
65	4" 600# ANSI raised face flange	FD	DN 100, PN 64	DIN 2527 Form E
73	6" 150# ANSI raised face flange	GA	DN 150, PN 16	DIN 2527 Form B
74	6" 300# ANSI raised face flange	GB	DN 150, PN 25/40	DIN 2527 Form B
75	6" 600# ANSI raised face flange	GD	DN 150, PN 64	DIN 2527 Form E

HYGIENIC PROCESS CONNECTIONS

6P	4" Triclover type, 16 AMP Hygienic Flange
7P	6" Triclover type, 16 AMP Hygienic Flange

O-RINGS

0	Viton® GFLT
1	EPDM
2	Kalrez 4079
8	Simriz SZ485 (formerly Aegis PF128)

ANTENNA EXTENSION

0	For 3" Horn in standpipes/stillwells only
1	For nozzle height ≤ 4" (100 mm) - Configuration Style code 4 only
2	For nozzle height ≤ 8" (200 mm)
3	For nozzle height ≤ 12" (300 mm)

OPTIONAL FLANGES

(for use with Dielectric Rod Antennas; Extension Codes 1-3 only)

QUALITY

The quality assurance system in place at MAGNETROL guarantees the highest level of quality throughout the company. MAGNETROL is committed to providing full customer satisfaction both in quality products and quality service.

The MAGNETROL quality assurance system is registered to ISO 9001 affirming its commitment to known international quality standards providing the strongest assurance of product/service quality available.

ESP

Expedite **S**hip **P**lan

Several PULSAR Through-Air Radar Level Transmitters are available for quick shipment, usually within one week after factory receipt of a complete purchase order, through the Expedite Ship Plan (ESP). Models covered by ESP service are color coded in the selection data charts.

To take advantage of ESP, simply match the color coded model number codes (standard dimensions apply). ESP service may not apply to orders of ten units or more. Contact your local representative for lead times on larger volume orders, as well as other products and options.

WARRANTY

All MAGNETROL electronic level and flow controls are warranted free of defects in materials or workmanship for one full year from the date of original factory shipment. If returned within the warranty period; and, upon factory inspection of the control, the cause of the claim is determined to be covered under the warranty; then, MAGNETROL will repair or replace the control at no cost

to the purchaser (or owner) other than transportation. MAGNETROL shall not be liable for misapplication, labor claims, direct or consequential damage or expense arising from the installation or use of equipment. There are no other warranties expressed or implied, except special written warranties covering some MAGNETROL products.

For additional information, see Instruction Manual 58-601.

PULSAR Pulse Burst Radar transmitters may be protected by one or more of the following U.S. Patent Nos.: US 6,062,095; US 6,980,174; US 7,102,584; US 7,106,248; US 7,271,646
