32-MBIT HIGH-TEMPERATURE FLASH MEMORY WITH SERIAL PERIPHERAL INTERFACE (SPI) BUS

Check for Samples: SM28VLT32-HT

FEATURES

- **32-Megabit Flash for High-Temperature Applications**
- **Serial Peripheral Interface (SPI) Compatible (Mode 0 and 3)**
- **3.3-V Supply for IO, 1.9 V for Core**
- **2-M x 16-Bit Word Access**
- **Asynchronous Read, Write, and Erase Operations**
- **Erase Operation Supported Only for -55°C to 125°C**
- **12-MHz Maximum Clock Frequency**
- **Endurance: 1000 Program and Erase Cycles**
- **Data Retention: 1000 hrs**
- **ESD Protection: 2-kV HBM, 500-V CDM**
- **8-mm x 20-mm 14-Pin Ceramic HKN Package and KGD (Bare Die) Package**

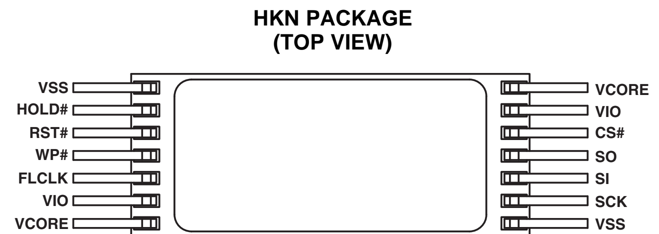
SUPPORTS EXTREME TEMPERATURE APPLICATIONS

- **Controlled Baseline**
- **One Assembly and Test Site**
- **One Fabrication Site**
- **Available in Extreme (–55°C to 210°C) Temperature Range** [(1)]
- **Extended Product Life Cycle**
- **Extended Product-Change Notification**
- **Product Traceability**
- **Texas Instruments high temperature products utilize highly optimized silicon (die) solutions with design and process enhancements to maximize performance over extended temperatures. All devices are characterized and qualified for 1000 hours continuous operating life at maximum rated temperature.**

APPLICATIONS

- **Down-Hole Energy Drilling**
- **Test and Measurement Equipment**
- **Seismic Data Collection at Extreme Temperatures**
- **General Data Collection Applications at Extreme High- and Low-Temperatures**

HKN PACKAGE (TOP VIEW)



(1) Custom temperature ranges available

DESCRIPTION

SM28VLT32 is a 32-Megabit Flash Memory designed to store program code and/or data from acquisition. The wide temperature rating of this device makes it ideal for applications that need to perform reliably in harsh environments. SM28VLT32 with its serial peripheral interface (SPI) offers low pin count for additional reliability and easy assembly in these applications.

The memory is partitioned as sectors to provide addressing of 2-M words of 16 bits each. Thus, the memory address is 21 bits wide.

SM28VLT32 supports serial peripheral interface to read/write/erase data in the flash memory. The interface is compliant with mode 0 (CPOL = 0, CPHA = 0) and 3 (CPOL = 1, CPHA = 1). Asserting CS# enables the device to enter communication mode. With CS# de-asserted, the device ignores all activity on the SPI pins. As shown in Figure 1, multiple SM28VLT32 devices can be controlled from a single Master by independently controlling CS# pins in order to realize larger memory in the application. Asserting the HOLD# pin (while CS# is also asserted) will let the device ignore activity on the other SPI input pins (SCK and SI).

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

PRODUCTION DATA information is current as of publication date. Products conform to specifications per the terms of the Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

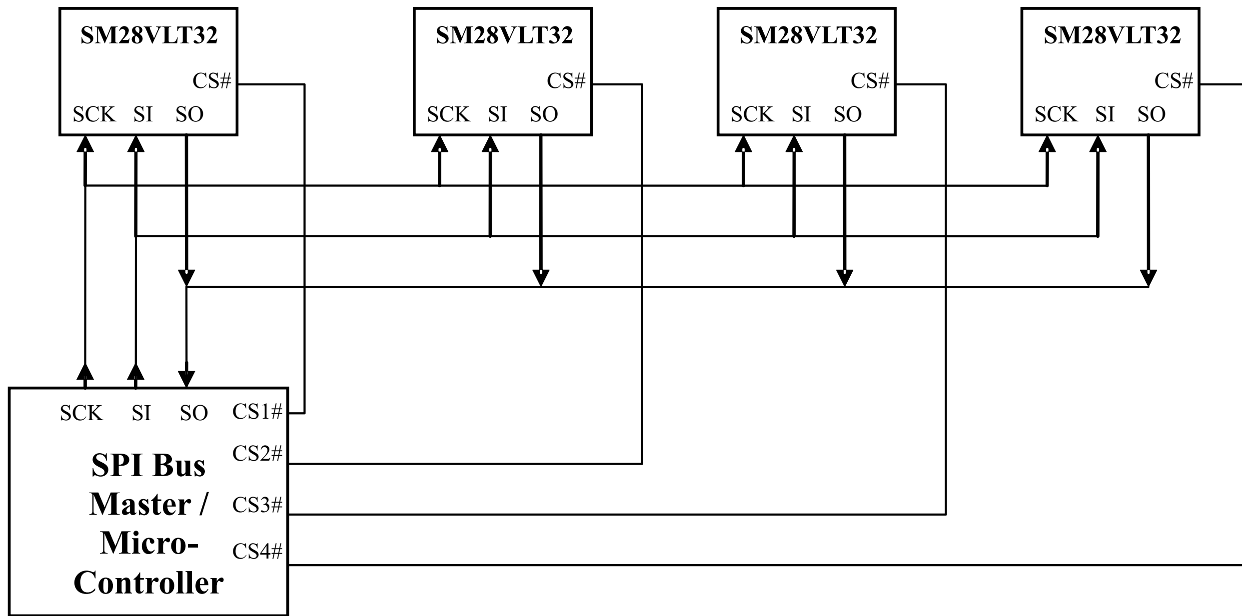

Figure 1. System Block Diagram That Shows Configuration to Use Multiple SM28VLT32 Devices to Realize Larger Memory

The SM28LVT32 supports a hardware data protection scheme using the WP# pin. Erase and program operations are inhibited if WP# is low.

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

ORDERING INFORMATION(1)

T_J	PACKAGE	ORDERABLE PART NUMBER	TOP-SIDE MARKING
–55°C to 210°C	14-Pin HKN	SM28VLT32SHKN	28VLT32SHKN
	KGD (Bare Die)	SM28LVT32SKGD3	N/A

(1) For the most current package and ordering information, see the Package Option Addendum at the end of this document, or see the TI web site at www.ti.com.

ABSOLUTE MAXIMUM RATINGS(1)

over operating free-air temperature range (unless otherwise noted)

		UNIT
VIO	Supply voltage range (for IO)	–0.3 V to 4.5 V
VCORE	Supply voltage range (for Core)	–0.3 V to 2.5 V
V_I	Input voltage range	–0.2 V to (V_{IO} + 0.2)
V_O	Output voltage range	–0.2 V to (V_{IO} + 0.2)
ESD	Electrostatic discharge (HBM, 1.5 kΩ, 100 pF)	> 2000 V
T_J	Operating junction temperature range	–55°C to 215°C

(1) Stresses beyond those listed under *absolute maximum ratings* may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under *recommended operating conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

PACKAGE DISSIPATION RATINGS

PACKAGE	θ_{JA} THERMAL IMPEDANCE JUNCTION TO AMBIENT	θ_{JC} THERMAL IMPEDANCE JUNCTION TO CASE (THERMAL PAD)	θ_{JB} THERMAL IMPEDANCE JUNCTION TO BOARD
HKN	63°C/W	0.84°C/W	55°C/W

RECOMMENDED OPERATING CONDITIONS

		MIN	TYP	MAX	UNIT
VIO	Device supply voltage for IO	3.1	3.3	3.6	V
VCORE	Device supply voltage for Core	1.8	1.9	1.98	V
T_J	Junction temperature	–55		210	°C

ELECTRICAL CHARACTERISTICS: IO

V_{IO} = 3.1 V to 3.6 V, V_{Core} = 1.8 V to 1.98 V, T_J = –55°C to 210°C (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT

ELECTRICAL CHARACTERISTICS: MEMORY

V_{IO} = 3.1 V to 3.6 V, V_{Core} = 1.8 V to 1.98 V, T_J = –55°C to 210°C (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
t_{Life}	Continuous operating life		1000			hrs
$I_{DDVCORE}$				127	160	mA
I_{DDVIO}				14	22	mA
	Erase current	-55°C to 125°C		76		mA
	Program current			85		mA
	Sector erase time	-55°C to 125°C		2	3	s
	Program time 1 16-bit word			30	300	µs
N_f	Flash endurance for the array (write/erase cycles)	T_J = 30°C		1000		cycles

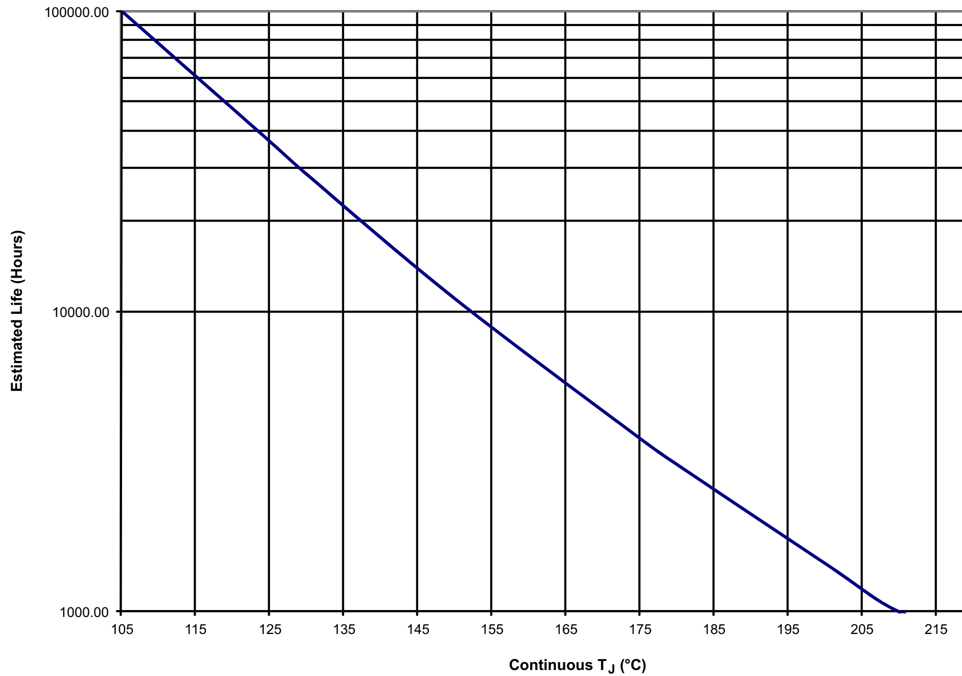
ELECTRICAL CHARACTERISTICS: SPI[(1)(2)]

V_{IO} = 3.1 V to 3.6 V, V_{Core} = 1.8 V to 1.98 V, T_J = –55°C to 210°C (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
f_{SCK}	SPI input clock frequency[(3)]				10	MHz
f_{CLK}	Flash clock[(3)]				12	MHz
t_{WH}	Clock high time		25			ns
t_{WL}	Clock low time		25			ns
t_{SU1}	CS# setup time before SCK		15			ns
t_{SU2}	SI setup time before SCK		10			ns
t_{OEN}	CS# to SO enabled	CL = 16 pF	5		16.5	ns
t_{DIS}	CS# to SO disabled[(4)]	CL = 16 pF	5		16.5	ns
t_{HD}	Data hold time after SCK		5			ns
t_r/t_f		10% to 90% on all input pins			20	ns
t_V	Clock low to data valid	CL = 50 pF		15	30	ns

(1) See Figure 3.
(2) AC parameters apply to t_r/t_f of 5 ns.
(3) The ratio of f_{CLK}/f_{SCK} must be 6/5 or higher to insure proper asynchronous operation. Operation below 12 MHz is acceptable, however, some configuration changes are required to set proper internal timing. See Provisions for Operating With f_{CLK} Frequencies Less than 12 MHz for details if planned f_{CLK} usage is below 12 MHz.
(4) Disable parameters are specified when the outputs are no longer driven.

Copyright © 2012–2013, Texas Instruments Incorporated



(1) See datasheet for absolute maximum and minimum recommended operating conditions.
(2) Silicon operating life design goal is 10 years at 105°C junction temperature (does not include package interconnect life).
(3) The predicted operating lifetime vs. junction temperature is based on reliability modeling and available qualification data.

DETAILED DESCRIPTION

SERIAL COMMUNICATION

SM28VLT32 supports mode 0 and mode 3 SPI protocols. In mode 0, the inactive state of SCK is 0 whereas, in mode 3, the state is 1. The input data on SI is always latched on rising edge of SCK and data on SO is output on falling edge of SCK in both modes. CS# is brought low to start a new SPI data frame. The SPI data frame consists of an 8-bit command byte followed by a variable number of bytes of input data as shown in Table 3. The first 8 bits of SO always output the quick status bits. These bits define error conditions and status of the FLASH (see Table 4). These bits should be evaluated after each command is executed to determine if the preceding command completed successfully. This can be implemented as part of the SPI communication protocol with the host device. For more information see the Application Information section. The output data on SO follows after the complete data is provided to the device on SI pin. Invalid command bytes are ignored. Also, any additional SCK clock cycles and additional data on SI beyond the depicted frame size are ignored. CS# going high delineates the end of current data frame.

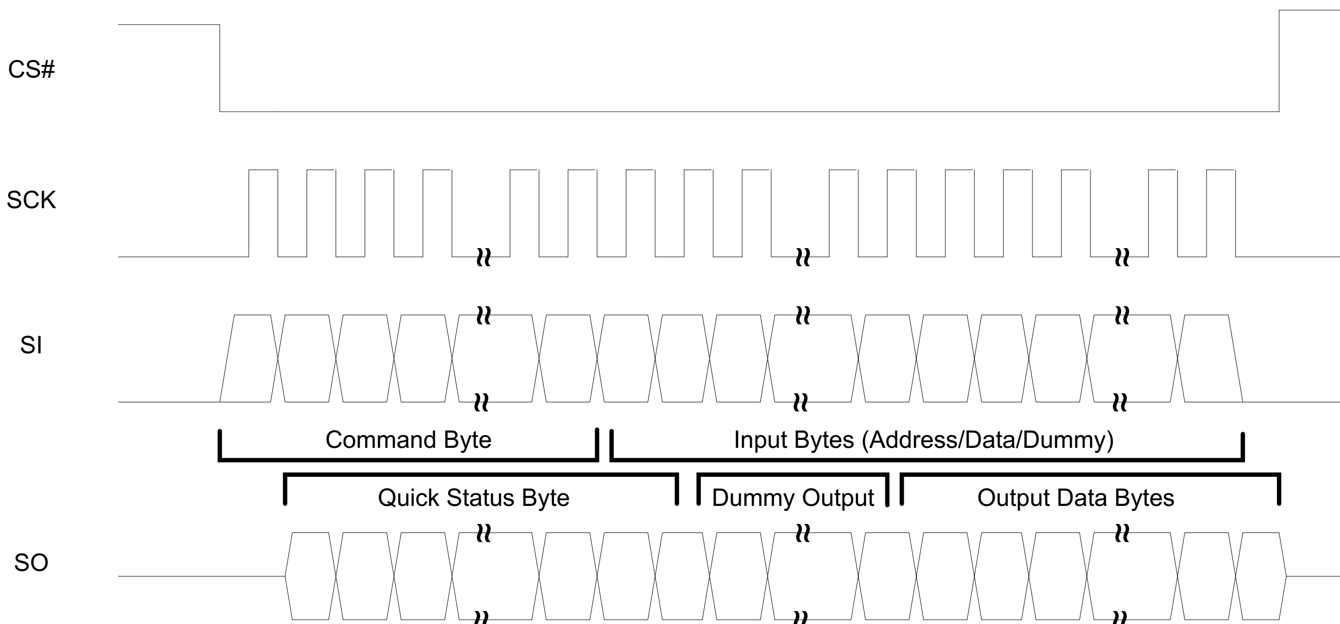

Figure 5. SPI Data Frame to Read, Write, Erase Memory Data and to Access Config/Status Registers

Table 3. Serial Peripheral Interface (SPI) Data Frame[(1)]

COMMAND NAME	COMMAND BYTE ON SI	ADDRESS BYTES ON SI	DATA BYTES ON SI	DUMMY BYTES ON SI[(2)]	DATA BYTES ON SO	TOTAL BYTES IN FRAME	DESCRIPTION
Read Word	15h	3	0	1 (3)	2	7	Read word at given address
Read Word with auto addressing	16h	0	0	1 (3)	2	4	Burst read from previous address
Write Word	17h	3	2	1 (1)	0	7	Write word at given address
Write Word with auto addressing	18h	0	2	1 (1)	0	4	Burst write from previous address
Erase Segment[(3)]	19h	3	0	1 (1)	0	5	Erase addressed segment
Read Status Register	22	0	0	0 (2)	2	3	Read SPI status register
Validate Segment	1A	3	0	1 (1)	0	5	Validates addressed segment
Write Register	1D	3	2	1 (1)	0	7	Writes to address in configuration register
Read Register	1E	3	0	1 (3)	2	7	Reads from address in configuration register
Write Command	1F	0	2	1 (1)	0	4	Flash controller command interface for special functions. See Application Information section.

(1) Multi-byte inputs and results are MSB first, LSB last.
(2) (#) indicates total number of dummy SI bytes including overlap with SO output.
(3) Permanent damage to flash array may occur if erase is executed when T_J exceeds 125°C.

REGISTER DEFINITIONS

Table 4. Quick Status Register

BITS	DEFAULT VALUE	TYPE	DESCRIPTION
7	0	R	Unused
6	0	R	SPI Frame error: indicates frame ended with less than required bytes to complete
5	0	R	Write Busy: indicates that a program operation is in progress
4	0	R	Erase Busy: indicates that a sector is being erased
3	0	R	Device Busy
2	0	R	Invalid Data: indicates that an attempt was made to set a bit to 1 that has already been programmed to 0
1	0	R	Read error: indicates that read was attempted on address when data was not available
0	0	R	Command error: indicates that a prior command failed. Must be cleared.

Table 5. Status Register (Command 22h)

BITS	DEFAULT VALUE	TYPE	DESCRIPTION
15:12	0	R	Reserved
11:08	RevID	R	Revision ID (current revision 1001)
7	0	R	Unused
6	0	R	Read Busy
5	0	R	Write Busy
4	0	R	Erase Busy
3	0	R	Write Suspend
2	0	R	Erase Suspend
1	0	R	Flash Pump Ready
0	0	R	SPI Frame error

Copyright © 2012–2013, Texas Instruments Incorporated

APPLICATION INFORMATION

The quick status register is intended to be used as feedback of device and command status. The host should evaluate the quick status results at each command execution to determine device status. Additionally, two of the error fields in the quick status are sticky. They will need to be intentionally cleared by the host once detected. The Command and Invalid Data error flags will not self clear. The command error bit indicates that a command failed. This can be either an erase or program command. If this was a program attempt, then the data written may not be valid. The host may decide to re-write this data or pursue some other error recovery path. The Invalid data bit will get set if an attempt to write a bit to a logical 1 (erased state) in a word that has that bit already programmed to a 0. This would likely be the first error seen when writing to an array that contains data. To clear a Command error or Invalid Data error, the host must execute the following SPI command sequence: 1F 00 40 xx. xx is a dummy byte and values are don't care. This SPI command is a special command that is sent to the internal flash controller to clear errors.

It is important to note that the quick status capture of the internal setting of the Command error and the Invalid Data flags are delayed by one transaction. Similarly, the Device Busy flag does not get cleared until a second transaction. For example, in the case of polling after a write. If this write generated an Invalid Data error, the sequence would be as follows.

SPI WRITE	SPI READ	DESCRIPTION
0x17_0000_FFFF	00_xxxx_xxxx	Write to address 0 with erased value This will cause Invalid Data error if word has been programmed.
0xFF	08	Execute quick status. This result is Device Busy.
0xFF	04	Execute quick status with Invalid Data error.

Similarly, if a write or program fails, then the Command error status will show on the second transaction after the failed command. To effectively deal with this in a protocol, the best method is to poll the quick status twice to validate no error occurred. For applications that this method is too costly for SPI bandwidth, the error can be trapped on execution of the following commands with the knowledge that the error belonged to the command 2 transactions earlier.

The SPI Frame error and the Read error are errors that return correct status on the next quick status. These two errors are not sticky and only apply to the prior transaction.

Provisions for Operating With f_{CLK} Frequencies Less than 12 MHz

The SM28VLT32 uses a state machine and registers to implement the correct algorithms for programing, erasure and validation. The register values define counters and loops that determine appropriate setup and hold times, maximum attempts, pulse widths, and other critical parameters. The default values of these registers are defined for f_{CLK} operation in the 10 MHz to 12 MHz range. Operating below 10 MHhz requires changing key registers to properly implement the algorithm. See Table 6 for register settings for specific f_{CLK} ranges. Note, the 10 MHz to 12 MHz values are provided, but are not required to be written as they are the reset defaults. Additionally, the SPI S_{CLK} frequency must be 5/6ths of f_{CLK} or slower for reliable operation.

The values below represent the address and value that should be written using the 1D command. Note that first line is a write to F004. This must be first, as it unlocks the test control register and allows modification of the memory mapped registers. Without this write, the contents of the register would not change. It is recommended to follow the register writes with a read to verify that change was properly implemented. The last line is a write back to the test control register to relock it preventing accidental modification of the registers.

F004	03C0	03C0	03C0	03C0	03C0	Lock TCR

(1) f_{CLK} cannot be operated lower than 2 MHz.

Initialization of the register values must be repeated on power cycle or RST assertion.

Power Supply Sequencing

The ideal power supply sequence is VCORE coming up before VIO (VCORE > 1.65 V before V_{IO} greater than 0.8 V).

For powerdown, the reverse is also true. VIO should be below 0.8 V before VCORE is < 1.65 V.

Alternatively, VIO can come up first or simultaneously with VCORE if RST is asserted low until both supplies are within recommended operating range. Similarly if device is active, it is necessary to assert RST prior to powering down to minimize chance of corrupting the flash array.

Power Saving Features

The device has power saving capabilities that allow it to be put into either standby or sleep states for the banks and flash pump when periods of inactivity are detected. When an access is initiated during sleep or standby, the pump and banks will transition to the active state automatically. Use of these features does not have protocol impact on programming (other than additional time required to wake up), as the device will report Write Busy. However, during read operations, the device will report Read error on next quick status read. This is due to the fact that a read transaction is immediate, while a write is queued. The value read from an address that is in standby or sleep will be 00 00. Reference Application Note: "Using the SM28VLT32-HT With Power Saving Features" (SLVA550).

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
SM28VLT32SHKN	ACTIVE	CFP	HKN	14	10	TBD	AU	N / A for Pkg Type	-55 to 210	28VLT32S HKN	Samples
SM28VLT32SKGD3	ACTIVE	XCEPT	KGD	0	12	TBD	Call TI	N / A for Pkg Type	-55 to 210		Samples

[1] The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

[2] Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.
TBD: The Pb-Free/Green conversion plan has not been defined.
Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.
Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.
Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

[3] MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

[4] There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

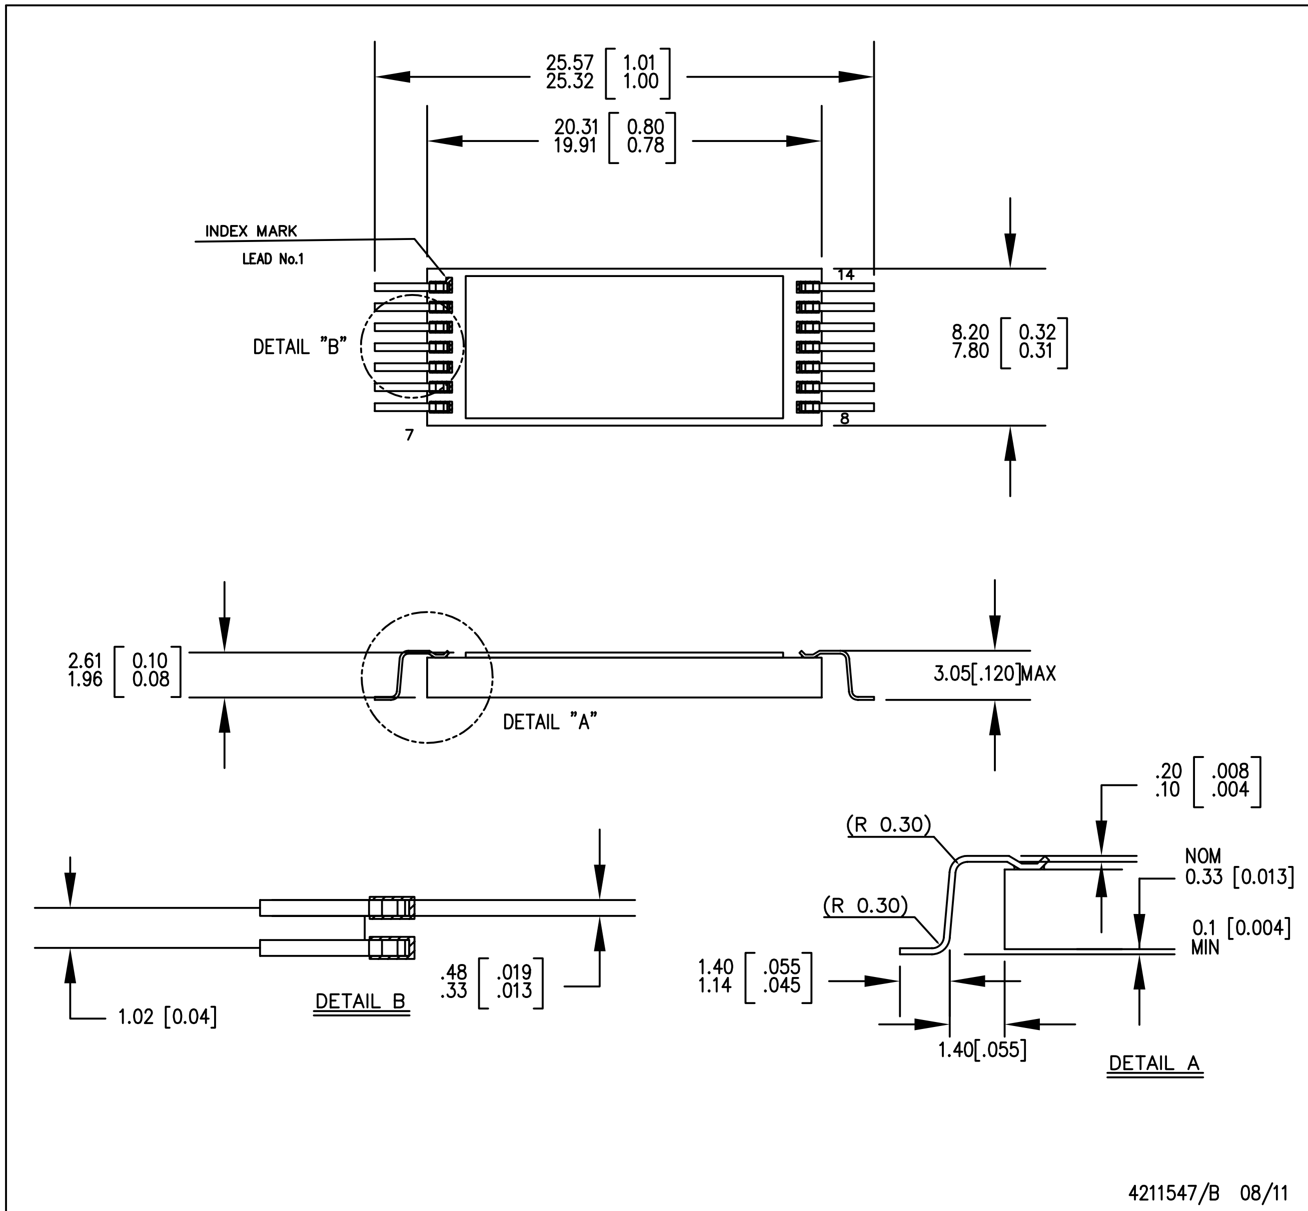
[5] Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

[6] Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

HKN (S-CDFP-G14) CERAMIC GULL WING



NOTES:
- A. All linear dimensions are in millimeters [inches].
- B. This drawing is subject to change without notice.
- C. Ceramic with gull formed leads.
- D. This package is hermetically sealed with a metal lid.
- E. The leads are gold plated and can be solderdipped.
- F. Lid is not connected to any lead.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as “components”) are sold subject to TI’s terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI’s terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers’ products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers’ products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI’s goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or “enhanced plastic” are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have ***not*** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
