

TAS5414C Four-Channel Aftermarket Automotive Class-D Amplifier

1 Features

- Four-Channel Single-Ended Analog Input Class-D Audio Amplifier
- Typical Output Power at 10% THD+N
 - 28 W/Ch Into 4 Ω at 14.4 V
 - 50 W/Ch Into 2 Ω at 14.4 V
 - 79 W/Ch Into 4 Ω at 24 V
 - 150 W/Ch Into 2 Ω at 24 V (PBTl)
- Channels Can Be Paralleled (PBTl) for High-Current Applications
- THD+N < 0.02%, 1 kHz, 1 W Into 4 Ω
- Patented Pop- and Click-Reduction Technology
 - Soft Muting With Gain Ramp Control
 - Common-Mode Ramping
- Patented AM Interference Avoidance
- Patented Cycle-by-Cycle Current Limit
- 75-dB PSRR
- Four-Address I²C Serial Interface for Device Configuration and Control
- Channel Gains: 12-dB, 20-dB, 26-dB, 32-dB
- Load Diagnostic Functions:
 - Output Open and Shorted Load
 - Output-to-Power and -to-Ground Shorts
 - Patented Tweeter Detection
- Protection and Monitoring Functions:
 - Short-Circuit Protection
 - Load-Dump Protection to 50 V
 - Fortuitous Open-Ground and -Power Tolerant
 - Patented Output DC Level Detection While Music Playing
 - Overtemperature Protection
 - Over- and Undervoltage Conditions
 - Clip Detection
- 64-Pin QFP (PHD) Power Package With Heat Slug Up
- –20°C to 105°C Ambient Temperature Range

2 Applications

- Aftermarket Headunit
- Aftermarket External Audio Amplifier

3 Description

The TAS5414C is a four-channel Class-D audio amplifier designed for use in automotive head units and external amplifier modules. It provides four channels at 23 W continuously into 4 Ω at less than 1% THD+N from a 14.4-V supply. Each channel can also deliver 38 W into 2 Ω at 1% THD+N. The TAS5414C uses single-ended analog inputs. The class-D PWM topology of the device provides dramatic improvements in efficiency over traditional linear amplifier solutions. This reduces the power dissipated by the amplifier by a factor of ten under typical music playback conditions. The device has a built-in load diagnostic functions for detecting and diagnosing misconnected outputs to help to reduce test time during the manufacturing process.

Device Information⁽¹⁾

PART NUMBER	PACKAGE	BODY SIZE (NOM)
TAS5414C	HTQFP (64)	14.00 mm x 14.00 mm

(1) For all available packages, see the orderable addendum at the end of the datasheet.

DATE	REVISION	NOTES
December 2016	*	Initial release.

5 Pin Configuration and Functions

The pin assignments are shown as follows.

Pin Functions

PIN		TYPE ⁽¹⁾	DESCRIPTION
NAME	TAS5414C PHD Package NO.		
A_BYP	11	PBY	Bypass pin for the AVDD analog regulator
$\overline{\text{CLIP_OTW}}$	6	DO	Reports CLIP, OTW, or both. It also reports tweeter detection during tweeter mode. Open-drain
CP	41	CP	Top of main storage capacitor for charge pump (bottom goes to PVDD)
CPC_BOT	40	CP	Bottom of flying capacitor for charge pump
CPC_TOP	42	CP	Top of flying capacitor for charge pump
D_BYP	5	PBY	Bypass pin for DVDD regulator output
FAULT	1	DO	Global fault output (open drain): UV, OV, OTSD, OCSD, DC
GND	3, 7, 8, 9, 12, 14, 16, 17, 21, 22, 23, 24, 25, 26, 30, 31, 32, 35, 38, 39, 43, 46, 49, 50, 51, 55, 56, 57, 58, 59, 60	GND	Ground
I2C_ADDR	62	AI	I ² C address bit
IN1_P	13	AI	Non-inverting analog input for channel 1
IN2_P	15	AI	Non-inverting analog input for channel 2
IN3_P	19	AI	Non-inverting analog input for channel 3
IN4_P	20	AI	Non-inverting analog input for channel 4
IN_M	18	ARTN	Signal return for the four analog channel inputs (TAS5414C only)
$\overline{\text{MUTE}}$	2	AI	Gain ramp control: mute (low), play (high)
OSC_SYNC	61	DI/DO	Oscillator input from master or output to slave amplifiers
OUT1_M	48	PO	– polarity output for bridge 1
OUT1_P	47	PO	+ polarity output for bridge 1
OUT2_M	45	PO	– polarity output for bridge 2
OUT2_P	44	PO	+ polarity output for bridge 2
OUT3_M	37	PO	– polarity output for bridge 3
OUT3_P	36	PO	+ polarity output for bridge 3
OUT4_M	34	PO	– polarity output for bridge 4
OUT4_P	33	PO	+ polarity output for bridge 4
PVDD	27, 28, 29, 52, 53, 54	PWR	PVDD supply
REXT	10	AI	Precision resistor pin to set analog reference
SCL	64	DI	I ² C clock input from system I ² C master
SDA	63	DI/DO	I ² C data I/O for communication with system I ² C master
$\overline{\text{STANDBY}}$	4	DI	Active-low STANDBY pin. Standby (low), power up (high)

(1) DI = digital input, DO = digital output, AI = analog input, ARTN = analog signal return, PWR = power supply, PBY = power bypass, PO = power output, GND = ground, CP = charge pump.

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)

			MIN	MAX	UNIT
PVDD	DC supply voltage range	Relative to GND	−0.3	30	V
PVDD _{MAX}	Pulsed supply voltage range	t ≤ 100 ms exposure	−1	50	V
PVDD _{RAMP}	Supply voltage ramp rate			15	V/ms
I _{PVDD}	Externally imposed dc supply current per PVDD or GND pin			±12	A
I _{PVDD_MAX}	Pulsed supply current per PVDD pin (one shot)	t < 100 ms		17	A
I _O	Maximum allowed dc current per output pin			±13.5	A
I _{O_MAX} ⁽¹⁾	Pulsed output current per output pin (single pulse)	t < 100 ms		±17	A
I _{IN_MAX}	Maximum current, all digital and analog input pins ⁽²⁾	DC or pulsed		±1	mA
I _{MUTE_MAX}	Maximum current on $\overline{\text{MUTE}}$ pin	DC or pulsed		±20	mA
I _{IN_ODMAX}	Maximum sink current for open-drain pins			7	mA
V _{LOGIC}	Input voltage range for pin relative to GND (SCL, SDA, I2C_ADDR pins)	Supply voltage range: 6 V < PVDD < 24 V	−0.3	6	V
V _{MUTE}	Voltage range for $\overline{\text{MUTE}}$ pin relative to GND	Supply voltage range: 6 V < PVDD < 24 V	−0.3	7.5	V
V _{STANDBY}	Input voltage range for $\overline{\text{STANDBY}}$ pin	Supply voltage range: 6 V < PVDD < 24 V	−0.3	5.5	V
V _{OSC_SYNC}	Input voltage range for OSC_SYNC pin relative to GND	Supply voltage range: 6 V < PVDD < 24 V	−0.3	3.6	V
V _{GND}	Maximum voltage between GND pins			±0.3	V
V _{AIN_AC_MAX}	Maximum ac-coupled input voltage for TAS5414C ⁽²⁾ , analog input pins	Supply voltage range: 6 V < PVDD < 24 V		1.9	V _{rms}
T _J	Maximum operating junction temperature range		−55	150	°C
T _{stg}	Storage temperature		−55	150	°C

(1) Pulsed current ratings are maximum survivable currents externally applied to the device. The device may encounter high currents during reverse-battery, fortuitous open-ground, and fortuitous open-supply fault conditions.

(2) See the [Application Information](#) section for information on analog input voltage and ac coupling.

6.2 ESD Ratings

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human body model (HBM), per AEC Q100-002 ⁽¹⁾	±2500	V
		Charged device model (CDM), per AEC Q100-011 PHD Package	Corner pins excluding SCL	±750
			All pins (including SCL) except CP and CP_Top	±600
			CP and CP_Top pins	±400

(1) AEC Q100-002 indicates HBM stressing is done in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

6.3 Recommended Operating Conditions ⁽¹⁾

			MIN	TYP	MAX	UNIT
PVDD _{OP}	DC supply voltage range relative to GND		6	14.4	24	V
V _{AIN} ⁽²⁾	Analog audio input signal level	AC-coupled input voltage	0		0.25–1 ⁽³⁾	V _{rms}
T _A	Ambient temperature		−20		105	°C
T _J	Junction temperature	An adequate heat sink is required to keep T _J within specified range.	−40		115	°C
R _L	Nominal speaker load impedance		2	4		Ω

(1) The *Recommended Operating Conditions* table specifies only that the device is functional in the given range. See the *Electrical Characteristics* table for specified performance limits.

(2) Signal input for full unclipped output with gains of 32 dB, 26 dB, 20 dB, and 12 dB

(3) Maximum recommended input voltage is determined by the gain setting.

Recommended Operating Conditions⁽¹⁾ (continued)

			MIN	TYP	MAX	UNIT
V _{PU}	Pullup voltage supply (for open-drain logic outputs)		3	3.3 or 5	5.5	V
R _{PU_EXT}	External pullup resistor on open-drain logic outputs	Resistor connected between open-drain logic output and V _{PU} supply	10		50	kΩ
R _{PU_I2C}	I ² C pullup resistance on SDA and SCL pins		1	4.7	10	kΩ
R _{I2C_ADD}	Total resistance of voltage divider for I ² C address slave 1 or slave 2, connected between D_BYP and GND pins		10		50	kΩ
R _{REXT}	External resistance on REXT pin	1% tolerance required	19.8	20	20.2	kΩ
C _{D_BYP} , C _{A_BYP}	External capacitance on D_BYP and A_BYP pins		10		120	nF
C _{OUT}	External capacitance to GND on OUT_X pins			150	680	nF
C _{IN}	External capacitance to analog input pin in series with input signal			0.47		μF
C _{FLY}	Flying capacitor on charge pump		0.47	1	1.5	μF
C _P	Charge pump capacitor	50V needed for Load Dump	0.47	1	1.5	μF
C _{MUTE}	MUTE pin capacitor		100	220	1000	nF
C _{OSCSYNC_MAX}	Allowed loading capacitance on OSC_SYNC pin			75		pF

6.4 Thermal Information

PARAMETER	VALUE (Typical)	UNIT
R _{θJC} Junction-to-case (heat slug) thermal resistance, PHD package	1.2	°C/W
R _{θJA} Junction-to-ambient thermal resistance	This device is not intended to be used without a heatsink. Therefore, R _{θJA} is not specified. Refer to the Thermal Information section.	°C/W

6.5 Electrical Characteristics

Test conditions (unless otherwise noted): T_{Case} = 25°C, PVDD = 14.4 V, R_L = 4 Ω, f_S = 417 kHz, P_{out} = 1 W/ch, R_{ext} = 20 kΩ, AES17 filter, default I²C settings, master-mode operation (see [Figure 36](#))

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
OPERATING CURRENT						
I _{PVDD_IDLE}	PVDD idle current	All four channels in MUTE mode	170	220		mA
I _{PVDD_HI-Z}		All four channels in Hi-Z mode	93			mA
I _{PVDD_STBY}	PVDD standby current	STANDBY mode, T _J ≤ 85°C	2	10		μA
OUTPUT POWER						
P _{OUT}	Output power per channel	4 Ω, PVDD = 14.4 V, THD+N ≤ 1%, 1 kHz, T _c = 75°C	23			W
		4 Ω, PVDD = 14.4 V, THD+N = 10%, 1 kHz, T _c = 75°C	25	28		
		4 Ω, PVDD = 24 V, THD+N = 10%, 1 kHz, T _c = 75°C	63	79		
		2 Ω, PVDD = 14.4 V, THD+N = 1%, 1 kHz, T _c = 75°C	38			
		2 Ω, PVDD = 14.4 V, THD+N = 10%, 1 kHz, T _c = 75°C	40	50		
		PBTL 2-Ω operation, PVDD = 24 V, THD+N = 10%, 1 kHz, T _c = 75°C	150			
		PBTL 1-Ω operation, PVDD = 14.4 V, THD+N = 10%, 1 kHz, T _c = 75°C	90			
EFF _P	Power efficiency	4 channels operating, 23-W output power/ch, L = 10 μH, T _J ≤ 85°C	90%			
AUDIO PERFORMANCE						
V _{NOISE}	Noise voltage at output	Zero input, and A-weighting	60	100		μV
	Channel crosstalk	P = 1 W, f = 1 kHz, enhanced crosstalk enabled via I ² C (reg. 0x10)	70	85		dB
PSRR	Power-supply rejection ratio	PVDD = 14.4 Vdc + 1 Vrms, f = 1 kHz	60	75		dB
THD+N	Total harmonic distortion + noise	P = 1 W, f = 1 kHz	0.02%	0.1%		
f _S	Switching frequency	Switching frequency selectable for AM interference avoidance	336	357	378	kHz
			392	417	442	
			470	500	530	

Electrical Characteristics (continued)

Test conditions (unless otherwise noted): $T_{Case} = 25^{\circ}C$, $PVDD = 14.4\text{ V}$, $R_L = 4\ \Omega$, $f_S = 417\text{ kHz}$, $P_{out} = 1\text{ W/ch}$, $R_{ext} = 20\text{ k}\Omega$, AES17 filter, default I²C settings, master-mode operation (see [Figure 36](#))

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT	
R _{AIN}	Analog input resistance	Internal shunt resistance on each input pin	63	85	106	kΩ	
V _{IN_CM}	Common-mode input voltage	AC-coupled common-mode input voltage (zero differential input)	1.3			V _{rms}	
V _{CM_INT}	Internal common-mode input bias voltage	Internal bias applied to IN_M pin	3.3			V	
G	Voltage gain (V _O /V _{IN})	Source impedance = 0 Ω, gain measurement taken at 1 W of power per channel	11	12	13	dB	
			19	20	21		
			25	26	27		
			31	32	33		
G _{CH}	Channel-to-channel variation	Any gain commanded	−1	0	1	dB	
PWM OUTPUT STAGE							
R _{DS(on)}	FET drain-to-source resistance	Not including bond wire resistance, T _J = 25°C	65			mΩ	
V _{O_OFFSET}	Output offset voltage	Zero input signal, G = 26 dB	±10			±50	mV
PVDD OVERVOLTAGE (OV) PROTECTION							
V _{OV_SET}	PVDD overvoltage shutdown set		24.6	26.4	28.2	V	
V _{OV_CLEAR}	PVDD overvoltage shutdown clear		24.4	25.9	27.4	V	
PVDD UNDERVOLTAGE (UV) PROTECTION							
V _{UV_SET}	PVDD undervoltage shutdown set		4.9	5.3	5.6	V	
V _{UV_CLEAR}	PVDD undervoltage shutdown clear		6.2	6.6	7	V	
AVDD							
V _{A_BYP}	A_BYP pin voltage		6.5			V	
V _{A_BYP_UV_SET}	A_BYP UV voltage		4.8			V	
V _{A_BYP_UV_CLEAR}	Recovery voltage A_BYP UV		5.3			V	
DVDD							
V _{D_BYP}	D_BYP pin voltage		3.3			V	
POWER-ON RESET (POR)							
V _{POR}	PVDD voltage for POR	I ² C active above this voltage	4			V	
V _{POR_HY}	PVDD recovery hysteresis voltage for POR		0.1			V	
REXT							
V _{REXT}	Rext pin voltage		1.27			V	
CHARGE PUMP (CP)							
V _{CPUV_SET}	CP undervoltage		4.8			V	
V _{CPUV_CLEAR}	Recovery voltage for CP UV		4.9			V	
OVERTEMPERATURE (OT) PROTECTION							
T _{OTW1_CLEAR}	Junction temperature for overtemperature warning		96	112	128	°C	
T _{OTW1_SET} / T _{OTW2_CLEAR}			106	122	138	°C	
T _{OTW2_SET} / T _{OTW3_CLEAR}			116	132	148	°C	
T _{OTW3_SET} / T _{OTSD_CLEAR}			126	142	158	°C	
T _{OTSD}	Junction temperature for overtemperature shutdown		136	152	168	°C	
T _{FB}	Junction temperature for overtemperature foldback	Per channel	130	150	170	°C	
CURRENT LIMITING PROTECTION							
I _{LIM}	Current limit (load current)	Level 1	5.5	7.3	9	A	
		Level 2 (default)	10.6	12.7	15		
OVERCURRENT (OC) SHUTDOWN PROTECTION							
I _{MAX}	Maximum current (peak output current)	Level 1	7.8	9.8	12.2	A	
		Level 2 (default), Any short to supply, ground, or other channels	11.9	14.8	17.7		

Electrical Characteristics (continued)

Test conditions (unless otherwise noted): $T_{Case} = 25^{\circ}C$, $PVDD = 14.4\text{ V}$, $R_L = 4\ \Omega$, $f_S = 417\text{ kHz}$, $P_{out} = 1\text{ W/ch}$, $R_{ext} = 20\text{ k}\Omega$, AES17 filter, default I²C settings, master-mode operation (see [Figure 36](#))

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
TWEETER DETECT						
I _{TH_TW}	Load-current threshold for tweeter detect		330	445	560	mA
I _{LIM_TW}	Load-current limit for tweeter detect			2.1		A
STANDBY MODE						
V _{IH}	$\overline{\text{STANDBY}}$ input voltage for logic-level high		2			V

I _{STBY}	$\overline{\text{STANDBY}}$ pin current			0.1	0.2	μA
MUTE MODE						
G _{MUTE}	Output attenuation	$\overline{\text{MUTE}}$ pin ≤ 0.5 V for 200ms or I ² C Mute Enabled		100		dB
DC DETECT						
V _{TH_DC_TOL}	DC detect threshold tolerance			25%		
t _{DCD}	DC detect step-response time for four channels				5.3	s
CLIP_OTW REPORT						
V _{OH_CLIPOTW}	$\overline{\text{CLIP_OTW}}$ pin output voltage for logic level high (open-drain logic output)	External 47-kΩ pullup resistor to 3 V–5.5 V	2.4			V
V _{OL_CLIPOTW}	$\overline{\text{CLIP_OTW}}$ pin output voltage for logic level low (open-drain logic output)				0.5	V
t _{DELAY_CLIPDET}	$\overline{\text{CLIP_OTW}}$ signal delay when output clipping detected				20	μs
FAULT REPORT						
V _{OH_FAULT}	$\overline{\text{FAULT}}$ pin output voltage for logic-level high (open-drain logic output)	External 47-kΩ pullup resistor to 3 V–5.5 V	2.4			V
V _{OL_FAULT}	$\overline{\text{FAULT}}$ pin output voltage for logic-level low (open-drain logic output)				0.5	

Electrical Characteristics (continued)

Test conditions (unless otherwise noted): $T_{Case} = 25^{\circ}C$, $PVDD = 14.4\text{ V}$, $R_L = 4\ \Omega$, $f_S = 417\text{ kHz}$, $P_{out} = 1\text{ W/ch}$, $R_{ext} = 20\text{ k}\Omega$, AES17 filter, default I²C settings, master-mode operation (see [Figure 36](#))

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
OPEN, SHORT DIAGNOSTICS						
R _{S2P} , R _{S2G}	Maximum resistance to detect a short from OUT pin(s) to PVDD or ground				200	Ω
R _{OPEN_LOAD}	Minimum load resistance to detect open circuit	Including speaker wires	300	740	1300	Ω
R _{SHORTED_LOAD}	Maximum load resistance to detect short circuit	Including speaker wires	0.5	1	1.5	Ω
I ² C ADDRESS DECODER						
t _{LATCH_I2CADDR}	Time delay to latch I ² C address after POR			300		μs
V _{I2C_ADDR}	Voltage on I2C_ADDR pin for address 0	Connect to GND	0%	0%	15%	V _{D_BYP}
	Voltage on I2C_ADDR pin for address 1	External resistors in series between D_BYP and GND as a voltage divider	25%	35%	45%	
	Voltage on I2C_ADDR pin for address 2		55%	65%	75%	
	Voltage on I2C_ADDR pin for address 3	Connect to D_BYP	85%	100%	100%	
I ² C						
t _{HOLD_I2C}	Power-on hold time before I ² C communication	<u>STANDBY</u> high		1		ms
f _{SCL}	SCL clock frequency				400	kHz
V _{IH}	SCL pin input voltage for logic-level high	R _{PU_I2C} = 5-kΩ pullup, supply voltage = 3.3 V or 5 V	2.1		5.5	V
V _{IL}	SCL pin input voltage for logic-level low		–0.5		1.1	V
V _{OH}	SDA pin output voltage for logic-level high	I ² C read, R _{I2C} = 5-kΩ pullup, supply voltage = 3.3 V or 5 V	2.4			V
V _O	SDA pin output voltage for logic-level low	I ² C read, 3-mA sink current			0.4	V
V _{IH}	SDA pin input voltage for logic-level high	I ² C write, R _{I2C} = 5-kΩ pullup, supply voltage = 3.3 V or 5 V	2.1		5.5	V
V _{IL}	SDA pin input voltage for logic-level low	I ² C write, R _{I2C} = 5-kΩ pullup, supply voltage = 3.3 V or 5 V	–0.5		1.1	V
C _I	Capacitance for SCL and SDA pins				10	pF
OSCILLATOR						
V _{OH}	OSC_SYNC pin output voltage for logic-level high	I2C_ADDR pin set to MASTER mode	2.4			V
V _{OL}	OSC_SYNC pin output voltage for logic-level low				0.5	V
V _{IH}	OSC_SYNC pin input voltage for logic-level high	I2C_ADDR pin set to SLAVE mode	2			V
V _{IL}	OSC_SYNC pin input voltage for logic-level low				0.8	V
f _{OSC_SYNC}	OSC_SYNC pin clock frequency	I2C_ADDR pin set to MASTER mode, f _S = 500 kHz	3.76	4	4.24	MHz
		I2C_ADDR pin set to MASTER mode, f _S = 417 kHz	3.13	3.33	3.63	
		I2C_ADDR pin set to MASTER mode, f _S = 357 kHz	2.68	2.85	3.0	

6.6 Timing Requirements for I²C Interface Signals

over recommended operating conditions (unless otherwise noted)

		MIN	TYP	MAX	UNIT
t_r	Rise time for both SDA and SCL signals			300	ns
t_f	Fall time for both SDA and SCL signals			300	ns
$t_{w(H)}$	SCL pulse duration, high	0.6			μ s
$t_{w(L)}$	SCL pulse duration, low	1.3			μ s
t_{su2}	Setup time for START condition	0.6			μ s
t_{h2}	START condition hold time until generation of first clock pulse	0.6			μ s
t_{su1}	Data setup time	100			ns
t_{h1}	Data hold time	0 ⁽¹⁾			ns
t_{su3}	Setup time for STOP condition	0.6			μ s
C_B	Load capacitance for each bus line			400	pF

- (1) A device must internally provide a hold time of at least 300 ns for the SDA signal to bridge the undefined region of the falling edge of SCL.

7 Detailed Description

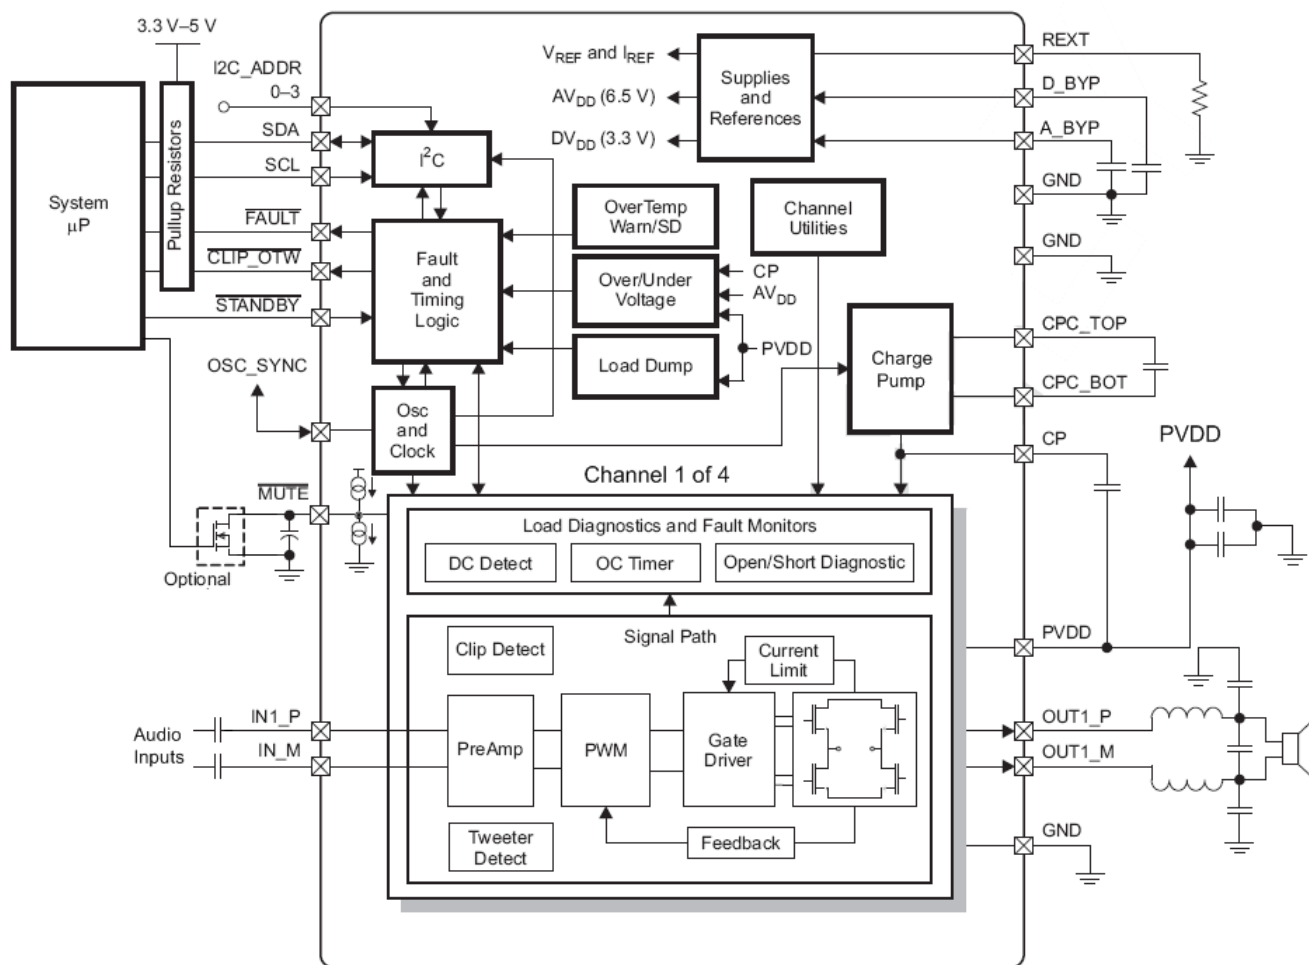

7.1 Overview

The TAS5414C is a single-chip, four-channel, analog-input audio amplifier. The design uses an ultra-efficient class-D technology developed by Texas Instruments. This technology allows for reduced power consumption, reduced heat, and reduced peak currents in the electrical system. The device realizes an audio sound system design with smaller size and lower weight than traditional class-AB solutions.

There are eight core design blocks:

- Preamplifier
- PWM
- Gate drive
- Power FETs
- Diagnostics
- Protection
- Power supply
- I²C serial communication bus

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 Preamplifier

The preamplifier is a high-input-impedance, low-noise, low-offset-voltage input stage with adjustable gain. The high input impedance allows the use of low-cost input capacitors while still achieving extended low-frequency response. A dedicated, internally regulated supply powers the preamplifier, giving it excellent noise immunity and channel separation. The preamplifier also includes:

1. **Mute Pop-and-Click Control** — The device ramps the gain gradually when receiving a mute or play command. The start or stopping of switching in a class-D amplifier can cause another form of click and pop. The TAS5414C incorporates a patented method to reduce the pop energy during the switching startup and shutdown sequence. Fault conditions require rapid protection response by the TAS5414C, which does not have time to ramp the gain down in a pop-free manner. The device transitions into Hi-Z mode when encountering an OV, UV, OC, OT, or dc fault. Also, activation of the **STANDBY** pin may not be pop-free.
2. **Gain Control** — Setting of gains for the four channels occurs in the preamplifier via I²C control registers, outside of the global feedback resistors of the device, thus allowing for stability of the system at all gain settings with properly loaded conditions.

7.3.2 Pulse-Width Modulator (PWM)

The PWM converts the analog signal from the preamplifier into a switched signal of varying duty cycle. This is the critical stage that defines the class-D architecture. In the TAS5414C, the modulator is an advanced design with high bandwidth, low noise, low distortion, excellent stability, and full 0–100% modulation capability. The patented PWM uses clipping recovery circuitry to eliminate the deep saturation characteristic of PWMs when the input signal exceeds the modulator waveform.

7.3.3 Gate Drive

The gate driver accepts the low-voltage PWM signal and level-shifts it to drive a high-current, full-bridge, power FET stage. The device uses proprietary techniques to optimize EMI and audio performance.

7.3.4 Power FETs

The BTL output for each channel comprises four rugged N-channel 30-V 65-mΩ FETs for high efficiency and maximum power transfer to the load. These FETs can handle large voltage transients during load dump.

7.3.5 Load Diagnostics

The device incorporates load diagnostic circuitry designed to help pinpoint the nature of output misconnections during installation. The TAS5414C includes functions for detecting and determining the status of output connections. The device supports the following diagnostics:

- Short to GND
- Short to PVDD
- Short across load
- Open load
- Tweeter detection

Reporting to the system of the presence of any of the short or open conditions occurs via I²C register read. One can read the tweeter-detect status from the **CLIP_OTW** pin when properly configured.

1. **Output Short and Open Diagnostics** — The device contains circuitry designed to detect shorts and open conditions on the outputs. Invocation of the load diagnostic function can only occur when the output is in the Hi-Z mode. There are four phases of test during load diagnostics and two levels of test. In the full level, all channels must be in the Hi-Z state. Testing covers all four phases on each channel, all four channels at the same time. When fewer than four channels are in Hi-Z, the reduced level of test is the only available option. In the reduced level, the only tests available are short to PVDD and short to GND. Load diagnostics can occur at power up before moving the amplifier out of Hi-Z mode. If the amplifier is already in play mode, it must *Mute* and then *Hi-Z* before performing the load diagnostic. By performing the mute function, the normal pop- and click-free transitions occur before the diagnostics begin. Performance of the diagnostics is as shown in [Figure 10](#). [Figure 11](#) shows the impedance ranges for the open-load and shorted-load diagnostics. Reading the results of the diagnostics is from the diagnostic register via I²C for each channel. With the default settings and **MUTE** capacitor, the S2G and S2P phase take approximately 20 ms each, the OL phase

Feature Description (continued)

takes approximately 100 ms, and the SL takes approximately 230 ms. In I²C register 0x10, bit D4 can extend the test time for S2P and S2G to 80 ms each. To prevent false S2G and S2P faults, this time extension is necessary if the output pins have a capacitance higher than 680 nF to ground.

Figure 10. Load Diagnostics Sequence of Events

Figure 11. Open- and Shorted-Load Detection

2. **Tweeter Detection** — Tweeter detection is an alternate operating mode used to determine the proper connection of a frequency-dependent load (such as a speaker with a crossover). Invoking of tweeter detection is via I²C, with individual testing of all four channels recommended. Tweeter detection uses the average cycle-by-cycle current limit circuit (see [CBC](#) section) to measure the current delivered to the load. The proper implementation of this diagnostic function depends on the amplitude of a user-supplied test signal and on the impedance-versus-frequency curve of the acoustic load. The system (external to the TAS5414C) must generate a signal to which the load responds. The frequency and amplitude of this signal must be calibrated by the user to result in a current draw that is greater than the tweeter detection threshold when the load

Feature Description (continued)

under test is present, and less than the detection threshold if the load is unconnected. The current level for the tweeter detection threshold, as well as the maximum current that can safely be delivered to a load when in tweeter-detection mode, is in the [Electrical Characteristics](#) section of the data sheet. Reporting of the tweeter-detection results is on the CLIP_OTW pin during the application of the test signal. With tweeter detection activated (indicating that the tested load is present), pulses on the CLIP_OTW pin begin to toggle. The pulses on the CLIP_OTW pins report low whenever the current exceeds the detection threshold, and the pin remains low until the current no longer exceeds the threshold. The minimum low-pulse period that one can expect is equal to one period of the switching frequency. Having an input signal that increases the duration of detector activation (for example, increasing the amplitude of the input signal) increases the amount of time for which the pin reports low.

NOTE: Because tweeter detection is an alternate *operating mode*, place the channels to be tested in Play mode (via register 0x0C) after tweeter detection has been activated in order to commence the detection process. Additionally, set up the CLIP_OTW pin via register 0x0A to report the results of tweeter detection.

7.3.6 Protection and Monitoring

1. **Cycle-By-Cycle Current Limit (CBC)** — The CBC current-limiting circuit terminates each PWM pulse to limit the output current flow to the average current limit (I_{LIM}) threshold. The overall effect on the audio in the case of a current overload is quite similar to a voltage-clipping event, temporarily limiting power at the peaks of the musical signal and normal operation continues without disruption on removal of the overload. The TAS5414C does not prematurely shut down in this condition. All four channels continue in play mode and pass signal.
2. **Overcurrent Shutdown (OCS)** — Under severe short-circuit events, such as a short to PVDD or ground, the device uses a peak-current detector, and the affected channel shuts down in 200 μ s to 390 μ s if the conditions are severe enough. The shutdown speed depends on a number of factors, such as the impedance of the short circuit, supply voltage, and switching frequency. Only the shorted channels shut down in such a scenario. The user may restart the affected channel via I²C. An OCS event activates the fault pin, and the I²C fault register saves a record of the affected channels. If the supply or ground short is strong enough to exceed the peak current threshold but not severe enough to trigger the OCS, the peak current limiter prevents excess current from damaging the output FETs, and operation returns to normal after the short is removed.
3. **DC Detect**—This circuit detects a dc offset at the output of the amplifier continuously during normal operation. If the dc offset reaches the level defined in the I²C registers for the specified time period, the circuit triggers. By default, a dc detection event does not shut the output down. Disabling and enabling the shutdown function is via I²C. If enabled, the triggered channel shuts down, but the others remain playing, but with the FAULT pin asserted. The I²C registers define the dc level.
4. **Clip Detect**—The clip detect circuit alerts the user to the presence of a 100% duty-cycle PWM due to a clipped waveform. When this occurs, a signal passed to the CLIP_OTW pin asserts it until the 100% duty-cycle PWM signal is no longer present. All four channels connect to the same CLIP_OTW pin. Through I²C, one can change the CLIP_OTW signal clip-only, OTW-only, or both. A fourth mode, used only during diagnostics, is the option to report tweeter detection events on this pin (see the [Tweeter Detection](#) section). The microcontroller in the system can monitor the signal at the CLIP_OTW pin, and may have a configuration that reduces the volume to all four channels in an active clipping-prevention circuit.
5. **Overtemperature Warning (OTW), Overtemperature Shutdown (OTSD) and Thermal Foldback** — By default, the CLIP_OTW pin setting indicates an OTW. One can make changes via I²C commands. If selected to indicate a temperature warning, CLIP_OTW pin assertion occurs when the die temperature reaches warning level 1 as shown in the electrical specifications. The OTW has three temperature thresholds with a 10°C hysteresis. I²C register 0x04 indicates each threshold in bits 5, 6, and 7. The device still functions until the temperature reaches the OTSD threshold, at which time the outputs go into Hi-Z mode and the device asserts the FAULT pin. I²C is still active in the event of an OTSD, and one can read the registers for faults, but all audio ceases abruptly. After the OTSD resets, one can turn the device back on through I²C. The OTW indication remains until the temperature drops below warning level 1. The thermal foldback decreases the channel gain.
6. **Undervoltage (UV) and Power-on-Reset (POR)** — The undervoltage (UV) protection detects low voltages on PVDD, AVDD, and CP. In the event of an undervoltage, the device asserts the FAULT pin and updates the I²C register, depending on which voltage caused the event. Power-on reset (POR) occurs when PVDD drops low enough. A POR event causes the I²C to go into a high-impedance state. After the device recovers from the POR event, the device re-initialization occur via I²C.

Feature Description (continued)

7. **Overvoltage (OV) and Load Dump** — The OV protection detects high voltages on PVDD. If PVDD reaches the overvoltage threshold, the device asserts the $\overline{\text{FAULT}}$ pin and updates the I²C register. The device can withstand 50-V load-dump voltage spikes.

7.3.7 I²C Serial Communication Bus

The device communicates with the system processor via the I²C serial communication bus as an I²C slave-only device. The processor can poll the device via I²C to determine the operating status. All reports of fault conditions and detections are via I²C. There are also numerous features and operating conditions that one can set via I²C.

The I²C bus allows control of the following configurations:

- Independent gain control of each channel. The gain can be set to 12 dB, 20 dB, 26 dB, and 32 dB.
- Select the AM non-interference switching frequency
- Select the functionality of the OTW_CLIP pin
- Enable or disable the dc-detect function with selectable threshold
- Place a channel in Hi-Z (switching stopped) mode (mute)
- Select tweeter detect, set the detection threshold, and initiate the function
- Initiate the open- and shorted-load diagnostic
- Reset faults and return to normal switching operation from Hi-Z mode (unmute)

In addition to the standard SDA and SCL pins for the I²C bus, the TAS5414C includes a single pin that allows up to four devices to work together in a system with no additional hardware required for communication or synchronization. The I2C_ADDR pin sets the device in master or slave mode and selects the I²C address for that device. Tie I2C_ADDR to DGND for master, to 1.2 Vdc for slave 1, to 2.4 Vdc for slave 2, and to D_BYP for slave 3. The OSC_SYNC pin is for synchronizing the internal clock oscillators, thereby avoid beat frequencies. One can apply an external oscillator to this pin for external control of the switching frequency.

Table 1. Table 7. I2C_ADDR Pin Connection

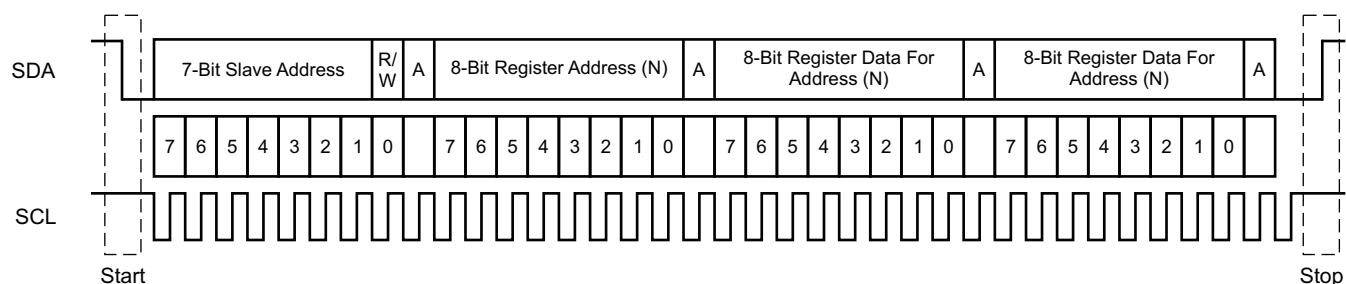

I2C_ADDR VALUE	I2C_ADDR PIN CONNECTION	I ² C ADDRESSES
0 (OSC MASTER)	To SGND pin	0xD8/D9
1 (OSC SLAVE1)	35% DVDD (resistive voltage divider between D_BYP pin and SGND pin) ⁽¹⁾	0xDA/DB
2 (OSC SLAVE2)	65% DVDD (resistive voltage divider between D_BYP pin and SGND pin) ⁽¹⁾	0xDC/DD
3 (OSC SLAVE3)	To D_BYP pin	0xDE/DF

(1) TI recommends R_{I2C_ADDR} resistors with 5% or better tolerance.

7.3.8 I²C Bus Protocol

The TAS5414C has a bidirectional serial control interface that is compatible with the Inter IC (I²C) bus protocol and supports 400-kbps data transfer rates for random and sequential write and read operations. This is a slave-only device that does not support a multimaster bus environment or wait-state insertion. The control interface programs the registers of the device and reads device status.

The I²C bus employs two signals, SDA (data) and SCL (clock), to communicate between integrated circuits in a system. Data transfer on the bus is serial, one bit at a time. The transfer of address and data is in byte (8-bit) format with the most-significant bit (MSB) transferred first. In addition, the receiving device acknowledges each byte transferred on the bus with an acknowledge bit. Each transfer operation begins with the master device driving a start condition on the bus and ends with the master device driving a stop condition on the bus. The bus uses transitions on the data terminal (SDA) while the clock is HIGH to indicate a start and stop conditions. A HIGH-to-LOW transition on SDA indicates a start, and a LOW-to-HIGH transition indicates a stop. Normal data-bit transitions must occur within the low time of the clock period. Figure 12 shows these conditions. The master generates the 7-bit slave address and the read/write bit to open communication with another device and then wait for an acknowledge condition. The TAS5414C holds SDA LOW during the acknowledge-clock period to indicate an acknowledgment. When this occurs, the master transmits the next byte of the sequence. Each device is addressed by a unique 7-bit slave address plus R/W bit (1 byte). All compatible devices share the same signals via a bidirectional bus using a wired-AND connection. There must be an external pullup resistor for the SDA and SCL signals to set the HIGH level for the bus. There is no limit on the number of bytes that one can transmit between start and stop conditions. When the last word transfers, the master generates a stop condition to release the bus.

T0035-01

Figure 12. Typical I²C Sequence

Use the I2C_ADDR pin (pin 2) to program the device for one of four addresses. These four addresses are licensed I²C addresses and do not conflict with other licensed I²C audio devices. To communicate with the TAS5414C, the I²C master uses addresses shown in Figure 12. Transmission of read and write data can be via single-byte or multiple-byte data transfers.

7.3.9 Hardware Control Pins

There are four discrete hardware pins for real-time control and indication of device status.

1. **FAULT** pin: This active-low open-drain output pin indicates the presence of a fault condition that requires the device to go into the Hi-Z mode or standby mode. On assertion of this pin, the device has protected itself and the system from potential damage. One can read the exact nature of the fault via I²C with the exception of PVDD undervoltage faults below POR, in which case the I²C bus is no longer operational. However, the fault is still indicated due to FAULT pin assertion.
2. **CLIP_OTW** pin: Configured via I²C, this active-low open-drain pin\ indicates one of the following conditions: overtemperature warning, the detection of clipping, or the logical OR of both of these conditions. During tweeter detect diagnostics, assertion of this pin also occurs when a tweeter is present. If overtemperature warning is set, the device can also indicate thermal foldback on this pin.
3. **MUTE** pin: This active-low pin is used for hardware control of the mute-unmute function for all four channels. Capacitor C_{MUTE} controls the time constant for the gain ramp needed to produce a pop- and click-free mute function. For pop- and click-free operation, implementation of the mute function should be through I²C commands. The use of a hard mute with an external transistor does not ensure pop- and click-free operation, and TI does not recommended it except as an *emergency hard mute* function in case of a loss of I²C control. Sharing the C_{MUTE} capacitor between multiple devices is disallowed.
4. **STANDBY** pin: On assertion of this active-low pin, the device goes into a complete shutdown, and the typical current-draw limit is 2 μ A, typical. STANDBY can be used to shut down the device rapidly. If all channels are in Hi-Z, the device enters standby in approximately 1 ms. All I²C register content is lost and the I²C bus goes into the high-impedance state on assertion of the STANDBY pin.

7.3.10 AM Radio Avoidance

To reduce interference in the AM radio band, the device has the ability to change the switching frequency via I²C commands. Table 2 lists the recommended frequencies. The fundamental frequency and its second harmonic straddle the AM radio band listed. This eliminates the tones that can be present due to demodulation of the switching frequency by the AM radio.

Table 2. Recommended Switching Frequencies for AM Mode Operation

US		EUROPEAN	
AM FREQUENCY (kHz)	SWITCHING FREQUENCY (kHz)	AM FREQUENCY (kHz)	SWITCHING FREQUENCY (kHz)
540–670	417	522–675	417
680–980	500	676–945	500
990–1180	417	946–1188	417
1190–1420	500	1189–1422	500
1430–1580	417	1423–1584	417
1590–1700	500	1585–1701	500

7.4 Device Functional Modes

Table 3 through Table 5 depict the operating modes and faults.

Table 3. Operating Modes

STATE NAME	OUTPUT FETS	CHARGE PUMP	OSCILLATOR	I ² C	AVDD and DVDD
STANDBY	Hi-Z, floating	Stopped	Stopped	Stopped	OFF
Hi-Z	Hi-Z, weak pulldown	Active	Active	Active	ON
Mute	Switching at 50%	Active	Active	Active	ON
Normal operation	Switching with audio	Active	Active	Active	ON

Table 4. Global Faults and Actions

FAULT OR EVENT	FAULT OR EVENT CATEGORY	MONITORING MODES	REPORTING METHOD	ACTION TYPE	ACTION RESULT	LATCHED OR SELF-CLEARING
POR	Voltage fault	All	$\overline{\text{FAULT}}$ pin	Hard mute (no ramp)	Standby	Self-clearing
UV		Hi-Z, mute, normal	$\text{I}^2\text{C} + \overline{\text{FAULT}}$ pin		Hi-Z	Latched
CP UV						
OV						
Load dump		All	$\overline{\text{FAULT}}$ pin		Standby	Self-clearing
OTW	Thermal warning	Hi-Z, mute, normal	$\text{I}^2\text{C} + \overline{\text{CLIP_OTW}}$ pin	None	None	Self-clearing
OTSD	Thermal fault	Hi-Z, mute, normal	$\text{I}^2\text{C} + \overline{\text{FAULT}}$ pin	Hard mute (no ramp)	Standby	Latched

Table 5. Channel Faults and Actions

FAULT/ EVENT	FAULT OR EVENT CATEGORY	MONITORING MODES	REPORTING METHOD	ACTION TYPE	ACTION RESULT	LATCHED OR SELF- CLEARING
Open-short diagnostic	Diagnostic	Hi-Z (I ² C activated)	I ² C	None	None	Latched
Clipping	Warning	Mute / Play	$\overline{\text{CLIP_OTW}}$ pin	None	None	Self-clearing
CBC load current limit	Online protection			Current Limit	Start OC timer	Self-clearing
OC fault	Output channel fault		I ² C + $\overline{\text{FAULT}}$ pin	Hard mute	Hi-Z	Latched
DC detect				Hard mute	Hi-Z	Latched
OT Foldback	Warning		I ² C + $\overline{\text{CLIP_OTW}}$ pin	Reduce Gain	None	Self-clearing

7.4.1 Audio Shutdown and Restart Sequence

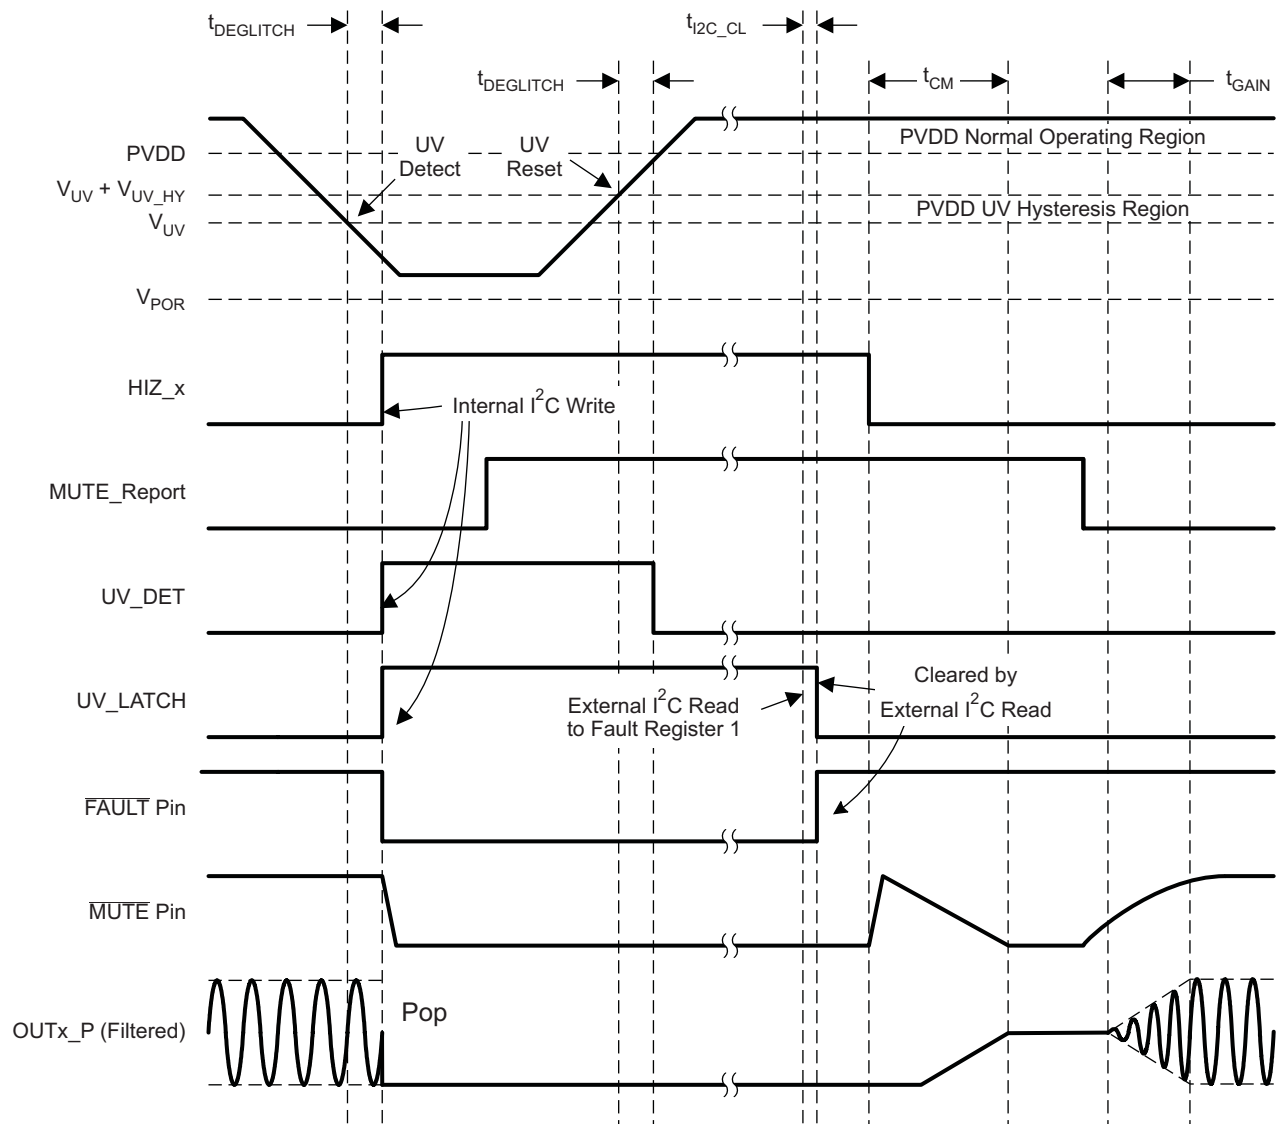

The gain ramp of the filtered output signal and the updating of the I²C registers correspond to the MUTE pin voltage during the ramping process. The value of the external capacitor on the MUTE pin dictates the length of time that the MUTE pin takes to complete its ramp. With the default 220-nF capacitor, the turnon common-mode ramp takes approximately 26 ms and the gain ramp takes approximately 76 ms.

7.5 Programming

7.5.1 Random Write

As shown in [Figure 16](#), a random write or single-byte write transfer begins with the master device transmitting a start condition followed by the I²C device address and the read/write bit. The read/write bit determines the direction of the data transfer. For a single-byte write data transfer, the read/write bit is a 0. After receiving the correct I²C device address and the read/write bit, the device responds with an acknowledge bit. Next, the master transmits the address byte or bytes corresponding to the internal memory address being accessed. After receiving the address byte, the device again responds with an acknowledge bit. Next, the master device transmits the data byte to be written to the memory address being accessed. After receiving the data byte, the TAS5414C again responds with an acknowledge bit. Finally, the master device transmits a stop condition to complete the single-byte write transfer.

Figure 16. Random-Write Transfer

7.5.2 Sequential Write

A sequential write transfer is identical to a single-byte data-write transfer except for the transmission of multiple data bytes by the master device to TAS5414C as shown in [Figure 17](#). After receiving each data byte, the device responds with an acknowledge bit and automatically increments the I²C subaddress by one.

Figure 17. Sequential Write Transfer

Programming (continued)

7.5.3 Random Read

As shown in Figure 18, a random read or single-byte read transfer begins with the master device transmitting a start condition followed by the I²C device address and the read/write bit. For the single-byte read transfer, the master device transmits both a write followed by a read. Initially, a write transfers the address byte or bytes of the internal memory address to be read. Thus, the read/write bit is a 0. After receiving the address and the read/write bit, the TAS5414C responds with an acknowledge bit. In addition, after sending the internal memory address byte or bytes, the master device transmits another start condition followed by the device address and the read/write bit again. This time the read/write bit is a 1, indicating a read transfer. After receiving the address and the read/write bit, the device again responds with an acknowledge bit. Next, the TAS5414C transmits the data byte from the memory address being read. After receiving the data byte, the master device transmits a not-acknowledge followed by a stop condition to complete the single-byte read transfer.

Figure 18. Random Read Transfer

7.5.4 Sequential Read

A sequential read transfer is identical to a single-byte read transfer except for the transmission of multiple data bytes by the TAS5414C to the master device as shown in Figure 19. Except for the last data byte, the master device responds with an acknowledge bit after receiving each data byte and automatically increments the I²C subaddress by one. After receiving the last data byte, the master device transmits a not-acknowledge followed by a stop condition to complete the transfer.

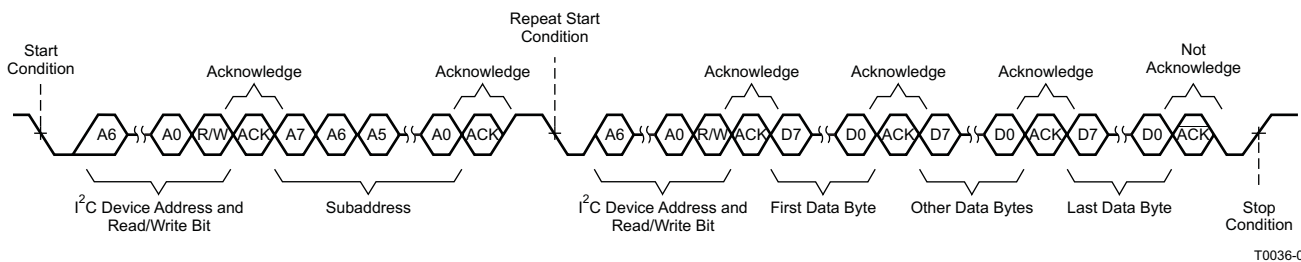

Figure 19. Sequential Read Transfer

7.6 Register Maps

7.6.1 Register Summary

Table 6. TAS5414C I²C Addresses

I ² C_ADDR VALUE		FIXED ADDRESS					SELECTABLE WITH ADDRESS PIN		READ/WRITE BIT	I ² C ADDRESS
		MSB	6	5	4	3	2	1	LSB	
0 (OSC MASTER)	I ² C WRITE	1	1	0	1	1	0	0	0	0xD8

8 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

The TAS5414C is a four-channel Class-D audio amplifier designed for use in head units and external amplifier modules. The device incorporates all the functionality needed to perform in the demanding OEM applications area.

8.2 Typical Application

Figure 36 shows a typical application circuit for the TAS5414C.

Figure 36. TAS5414C Typical Application Schematic

Typical Application (continued)

8.2.1 Design Requirements

- Power Supplies
The device needs only a single power supply compliant with the recommended operation range. The device is designed to work with either a vehicle battery or regulated boost power supply.
- Communication
The device communicates with the system controller with both discrete hardware control pins and with I²C. The device is an I²C slave and thus requires a master. If a master I²C-compliant device is not present in the system, it is still possible to use the device, but only with the default settings. Diagnostic information is limited to the discrete reporting **FAULT** pin.
- External Components
[Table 24](#) lists the components required for the device.

Table 24. Supporting Components

EVM Designator	Quantity	Value	Size	Description	Use in Application
C37, C39, C48, C52	4	0.47 μ F \pm 10%	1206	Film, 16-V	Analog audio input filter, bypass

R8, R10, R12, R14, R17, R19, R26, R29	8	5.6 Ω \pm 5%	0805	Resistors, 0.125-W	Output snubbers
R16	1	20.0 k Ω \pm 1%	0805	Resistors, 0.125-W	Power supply

8.2.2 Detailed Design Procedure

8.2.2.1 Hardware and Software Design

- Step 1: Hardware Schematic Design: Using the Typical Application Schematic as a guide, integrate the hardware into the system schematic.
- Step 2: Following the recommended layout guidelines, integrate the device and its supporting components into the system PCB file.
- Step 3: Thermal Design: The device has an exposed thermal pad which requires proper soldering. For more information, see the *Semiconductor and IC Package Thermal Metrics*, [SPRA953](#), and the *PowerPAD Thermally Enhanced Package*, [SLMA002G](#), application reports.
- Step 4: Develop software: The EVM User's Guide has detailed instructions for how to set up the device, interpret diagnostic information, and so forth. For information about control registers, see the [Table 7](#) section.
- For questions and support go to the [E2E forums](#).

8.2.2.2 Parallel Operation (PBTL)

The device can drive more current by paralleling BTL channels on the load side of the LC output filter. Parallel operation requires identical I²C settings for any two paralleled channels in order to have reliable system performance and even power dissipation on multiple channels. For smooth power up, power down, and mute operation, the same control commands (such as mute, play, Hi-Z, and so on) should be sent to the paralleled channels at the same time. The device also supports load diagnostics for parallel connection. There is no support for paralleling on the device side of the LC output filter, which can result in device failure. When paralleling channels, use the parallel BTL I²C control bits in register 0x0D. Parallel channels 1 and 2, and/or channels 3 and 4. Setting these bits allows the thermal foldback to react on both channels equally. Provide the audio input to channel 2 if paralleling channels 1 and 2, and channel 3 if paralleling channels 3 and 4.

8.2.2.3 Input Filter Design

For the TAS5414C device, the IN_M pin should have an impedance to GND that is equivalent to the parallel combination of the input impedances of all IN_P channels combined, including any source impedance from the previous stage in the system design. For example, if each of the four IN_P channels have a 1-μF dc blocking capacitor, 1 kΩ of series resistance due to an input RC filter, and 1 kΩ of source resistance from the DAC supplying the audio signal, then the IN_M channel should have a 4-μF capacitor in series with a 500-Ω resistor to GND ($4 \times 1 \mu\text{F}$ in parallel = 4 μF; $4 \times 2 \text{ k}\Omega$ in parallel = 500 Ω).

8.2.2.4 Amplifier Output Filtering

The output FETs drive the amplifier outputs in an H-bridge configuration. These transistors are either fully off or on. The result is a square-wave output signal with a duty cycle that is proportional to the amplitude of the audio signal. The amplifier outputs require a low-pass filter to filter out the PWM modulation carrier frequency. People frequently call this filter the L-C filter, due to the presence of an inductive element L and a capacitive element C to make up the 2-pole low-pass filter. The L-C filter attenuates the carrier frequency, reducing electromagnetic emissions and smoothing the current waveform which the load draws from the power supply. See the *Class-D LC Filter Design* application report, [SLOA119](#), for a detailed description on proper component selection and design of an L-C filter based upon the desired load and response.

8.2.2.5 Line Driver Applications

In many audio applications, the end user would like to use the same head unit to drive either a speaker (with several ohms of impedance) or an external amplifier (with several kilohms of impedance). The design is capable of supporting both applications; however, the one must design the output filter and system to handle the expected output load conditions.

8.2.3 Application Curves

9 Power Supply Recommendations

A car battery that can have a large voltage range most commonly provides the power for the device. PVDD is a filtered battery voltage, and it is the supply for the output FETS and the low-side FET gate driver. The supply for the high-side FET gate driver comes from a charge pump (CP). The charge pump supplies the gate-drive voltage for all four channels. AVDD, provided by an internal linear regulator powers the analog circuitry. This supply requires 0.1- μ F, 10-V external bypass capacitor at the A_BYP pin. TI recommends not connecting any external components except the bypass capacitor to this pin. DVDD, which comes from an internal linear regulator, powers the digital circuitry. The D_BYP pin requires a 0.1- μ F, 10-V external bypass capacitor. TI recommends not connecting any external components except the bypass capacitor to this pin.

The TAS5414C can withstand fortuitous open-ground and -power conditions. Fortuitous open ground usually occurs when a speaker wire shorts to ground, allowing for a second ground path through the body diode in the output FETs. The diagnostic capability allows debugging of the speakers and speaker wires, eliminating the need to remove the amplifier to diagnose the problem.

10 Layout

10.1 Layout Guidelines

- The EVM layout optimizes for low noise and EMC performance.
- The TAS5414C device has a thermal pad up, therefore a the layout must take into account an external heatsink.
- Layout also affects EMC performance.
- The EVM PCB illustrations form the basis for the layout discussions.

10.2 Layout Example

The areas indicated by the label "A", are critical to proper operation and EMC layout. The PVDD and ground decoupling capacitors should be close to the device. These decoupling capacitors must be on both groups of PVDD pins to ground. The ground connections of the snubber circuits must also be close to the grounds of the device. The grounds of the decoupling caps and the snubber circuits do not pass through vias before connecting to the device ground. This reduces the ground impedance for EMC mitigation.

Figure 39. Top Layer

Layout Example (continued)

The area referenced as "B" are nets in the PCB layout that have large high frequency switching signals. These should be buried on an inner layer with ground planes on layers above and below to mitigate EMC.

Figure 40. A Mid Layer

Layout Example (continued)

The bottom layer in the EVM is almost all ground plane. It can be seen that the other layers have ground planes that fill unused areas. All these ground planes need to be connected together through many vias to reduce the impedance between the ground layers. This allows for reduced EMI.

Figure 41. Bottom Layer

EMI Considerations (continued)

The design has minimal parasitic inductances due to the short leads on the package. This dramatically reduces the EMI that results from current passing from the die to the system PCB. Each channel also operates at a different phase. The phase between channels is I²C selectable to either 45° or 180°, to reduce EMI caused by high-current switching. The design also incorporates circuitry that optimizes output transitions that cause EMI.

11.3 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

TI E2E™ Online Community *TI's Engineer-to-Engineer (E2E) Community*. Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

Design Support *TI's Design Support* Quickly find helpful E2E forums along with design support tools and contact information for technical support.

11.4 Trademarks

E2E is a trademark of Texas Instruments.
All other trademarks are the property of their respective owners.

11.5 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

11.6 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TAS5414CTPHD	ACTIVE	HTQFP	PHD	64	90	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-3-260C-168 HR	-40 to 105	TAS5414C	Samples
TAS5414CTPHDR	ACTIVE	HTQFP	PHD	64	1000	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-3-260C-168 HR	-40 to 105	TAS5414C	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

MECHANICAL DATA

PHD (S-PQFP-G64) PowerPAD™ PLASTIC QUAD FLATPACK (DIE DOWN)

NOTES:

- A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
B. This drawing is subject to change without notice.
C. Body dimensions do not include mold flash or protrusion
D. This package is designed to be attached directly to an external heatsink. Refer to Technical Brief, PowerPad Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 for information regarding recommended board layout. This document is available at www.ti.com <<http://www.ti.com>>.
See the product data sheet for details regarding the exposed thermal pad dimensions.
E. Falls within JEDEC MS-026

PowerPAD is a trademark of Texas Instruments.

THERMAL PAD MECHANICAL DATA

PHD (S-PQFP-G64) PowerPAD™ PLASTIC QUAD FLATPACK (DIE DOWN)

THERMAL INFORMATION

This PowerPAD™ package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. This design optimizes the heat transfer from the integrated circuit (IC).

For additional information on the PowerPAD package and how to take advantage of its heat dissipating abilities, refer to Technical Brief, PowerPAD Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 and Application Brief, PowerPAD Made Easy, Texas Instruments Literature No. SLMA004. Both documents are available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

Exposed Thermal Pad Dimensions

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
