HYB 514265BJ-400/40/-45/-50 HYB 314265BJ(L)-45/-50

Preliminary Information

- 262 144 words by 16-bit organization
- 0 to 70 °C operating temperature
- EDO - Hyper Page Mode
- Performance:

	-400	-40	-45	-50

t_{hpc}	12,5	15	18	20	ns
t_{hpc}	80	66	55	50	MHz

- Low Power dissipation
 - Active(max.):
120mA / 120mA / 105mA / 95 mA
 - Standby : TTL Inputs (max.) 2.0 mA
 - Standby: CMOS Inputs (max.) 1.0 mA
 - Standby (L-version) 200 μ A

- Power Supply:

- Read, write, read-modify-write, \overline{CAS} -before \overline{RAS} refresh, \overline{RAS} only refresh, hidden refresh mode
- Low Power Version (L) with Self Refresh and 250 μ A self refresh current
- 2 \overline{CAS} / 1 \overline{WE} control
- All inputs and outputs TTL-compatible
- 512 refresh cycles / 16 ms
512 refresh cycles / 128 ms (L-version)
- Plastic Packages: P-SOJ-40-3 400 mil width

The HYB 5(3)14265BJ(L) is the new generation dynamic RAM organized as 262 144 words by 16-bit. The HYB 5(3)14265BJ(L) utilizes the SIEMENS 16M-CMOS submicron silicon gate process as well as advanced circuit techniques to provide wide operation margins, both internally and for the system user. Multiplexed address inputs permit the HYB 5(3)14265BJ(L) to be packed in a standard plastic 400mil wide P-SOJ-40-3 package. This package size provides high system bit densities and is compatible with commonly used automatic testing and insertion equipment.

The HYB314265BJL parts have a very low power "sleep mode" supported by Self Refresh.

Notes:

- 1) All voltages are referenced to V_{SS} .
- 2) I_{CC1} , I_{CC3} , I_{CC4} and I_{CC6} depend on cycle rate.
- 3) I_{CC1} and I_{CC4} depend on output loading. Specified values are obtained with the output open.
- 4) Address can be changed once or less while $\text{RAS} = V_{IL}$. In case of I_{CC4} it can be changed once or less during a hyper page mode (EDO) cycle
- 5) An initial pause of 200 μs is required after power-up followed by 8 $\overline{\text{RAS}}$ cycles of which at least one cycle has to be a refresh cycle, before proper device operation is achieved. In case of using the internal refresh counter, a minimum of 8 $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$ initialization cycles instead of 8 $\overline{\text{RAS}}$ cycles are required.
- 6) AC measurements assume $t_T = 2$ ns.

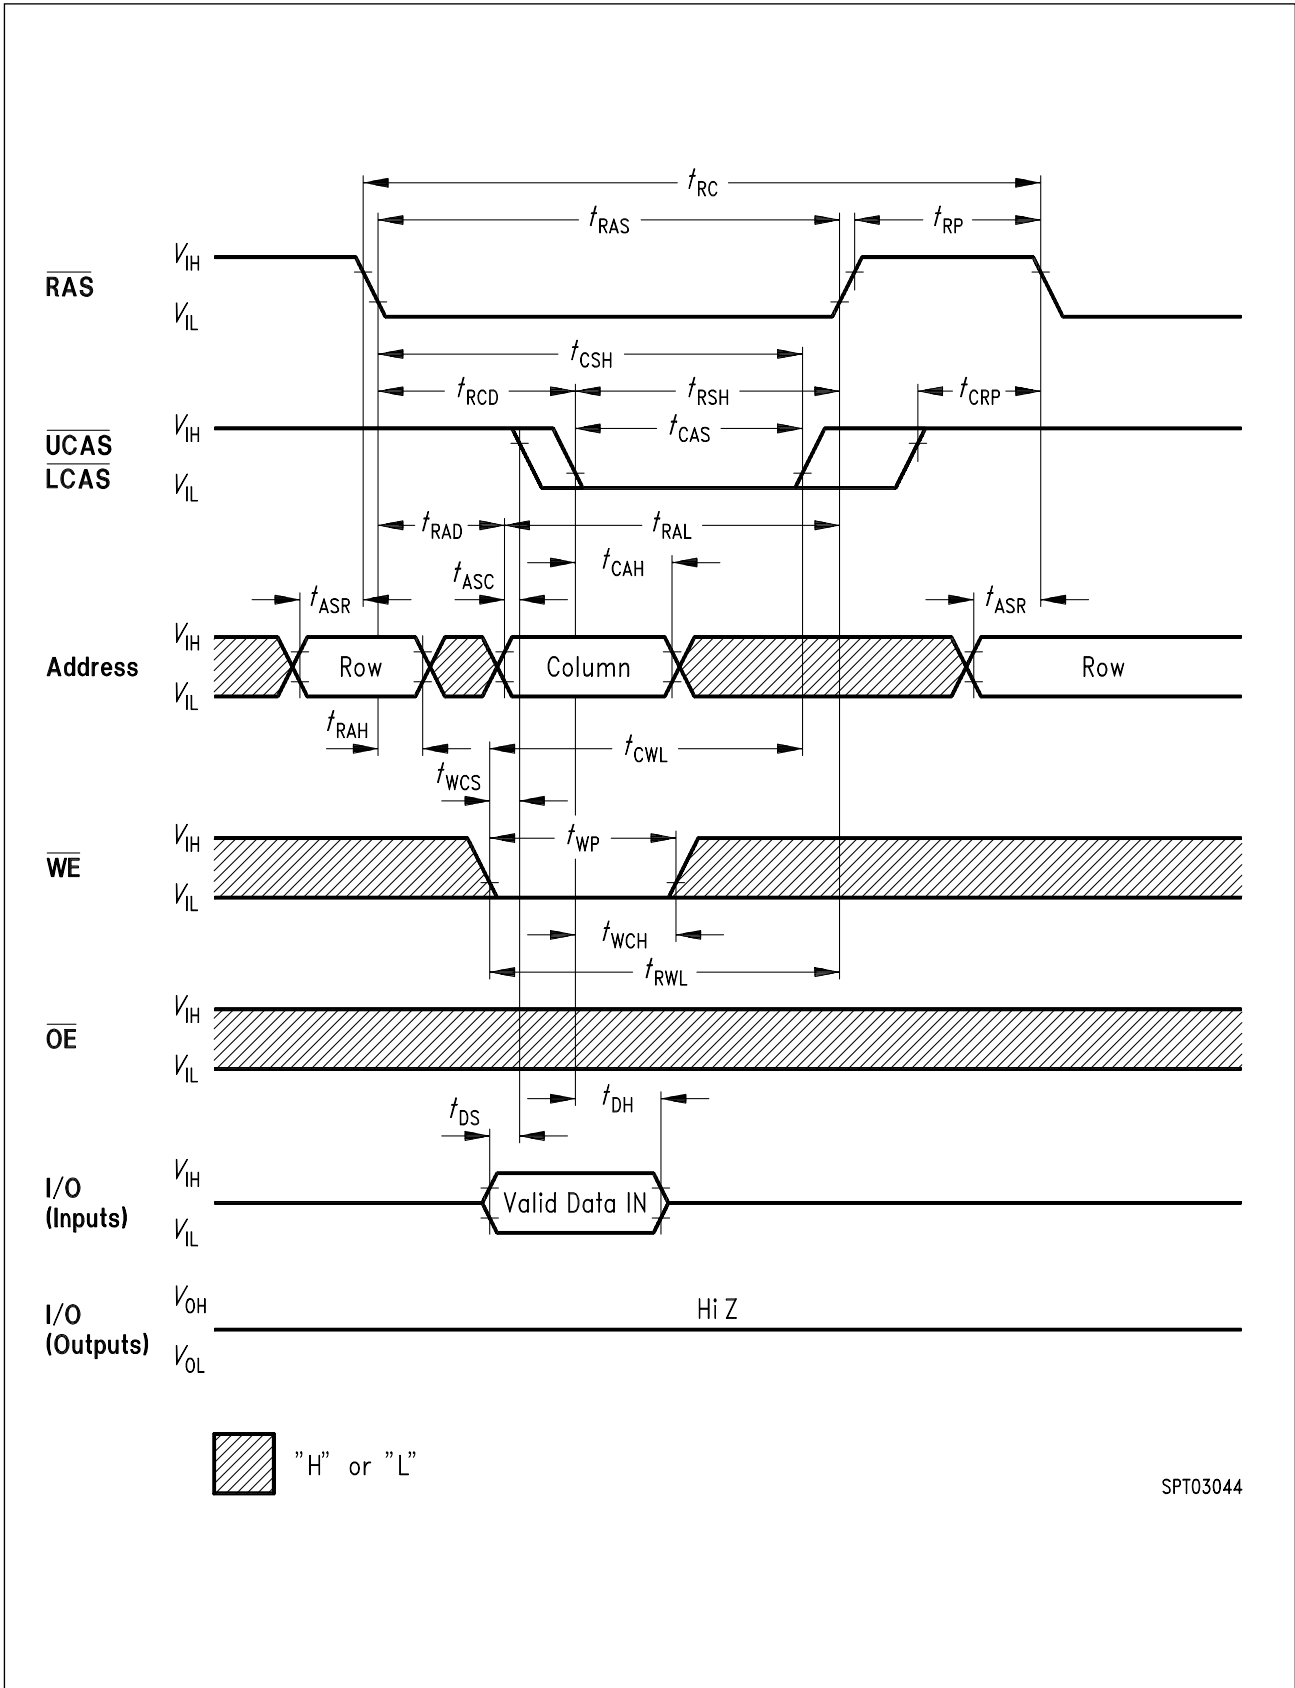

- 7) $V_{IH (min.)}$ and $V_{IL (max.)}$ are reference levels for measuring timing of input signals. Transition times are also measured between V_{IH} and V_{IL} .
- 8) Measured with the specified current load and 50 pF at $V_{OL} = 0.8 V$ and $V_{OH} = 2.0 V$. Access time is determined by the latter of t_{RAC} , t_{CAC} , t_{AA} , t_{CPA} , t_{OEA} . t_{CAC} is measured from tristate

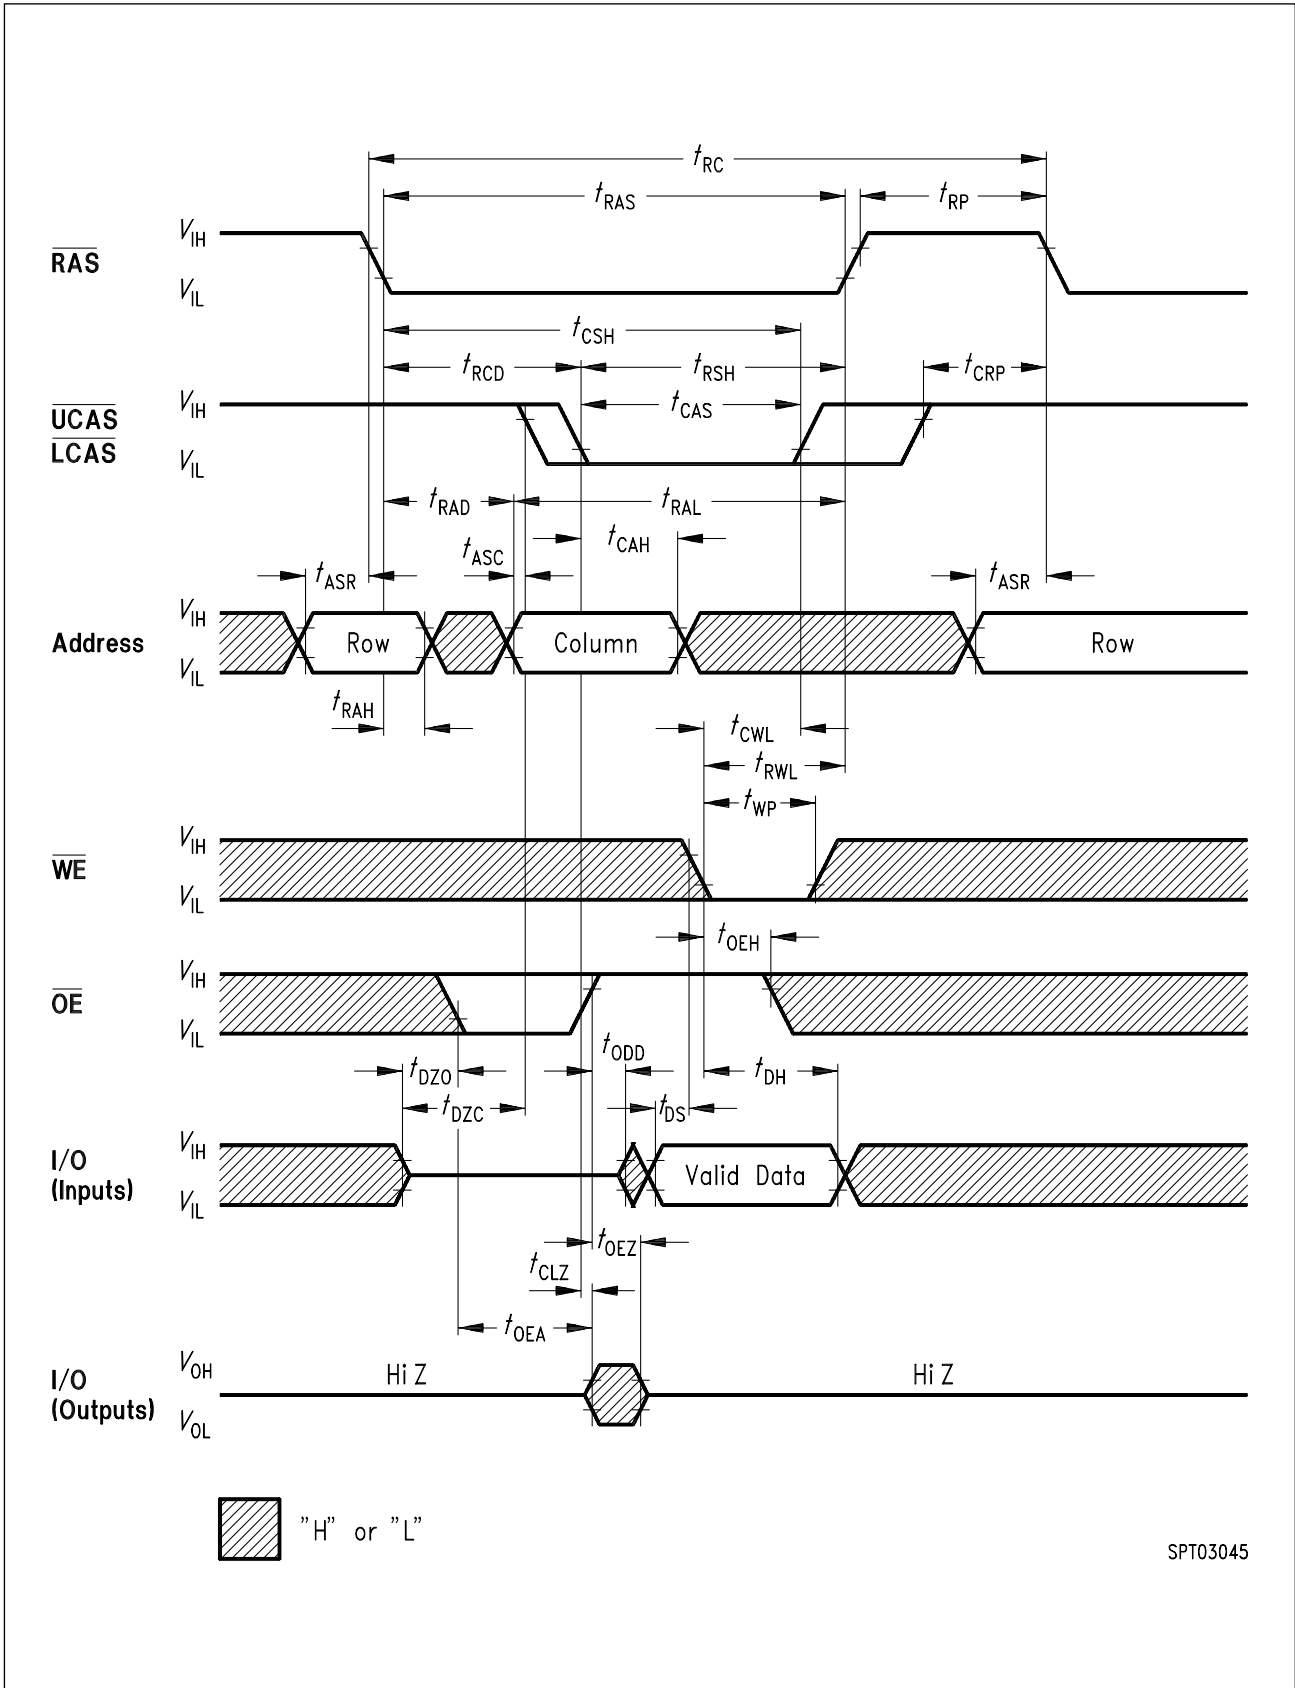

- 9) Operation within the $t_{RCD (max.)}$ limit ensures that $t_{RAC (max.)}$ can be met. $t_{RCD (max.)}$ is specified as a reference point only. If t_{RCD} is greater than the specified $t_{RCD (max.)}$ limit, then access time is controlled by t_{CAC} .
- 10) Operation within the $t_{RAD (max.)}$ limit ensures that $t_{RAC (max.)}$ can be met. $t_{RAD (max.)}$ is specified as a reference point only. If t_{RAD} is greater than the specified $t_{RAD (max.)}$ limit, then access time is controlled by t_{AA} .
- 11) Either t_{RCH} or t_{RRH} must be satisfied for a read cycle.
- 12) $t_{OFF (max.)}$, $t_{OEZ (max.)}$ define the time at which the output achieves the open-circuit conditions and are not referenced to output voltage levels. t_{OFF} is referenced from the rising edge of \overline{RAS} or \overline{CAS} , whichever occurs last.
- 13) Either t_{DZC} or t_{DZO} must be satisfied.
- 14) Either t_{CDD} or t_{ODD} must be satisfied.
- 15) t_{WCS} , t_{RWD} , t_{CWD} and t_{AWD} are not restrictive operating parameters. They are included in the data sheet as electrical characteristics only. If $t_{WCS} > t_{WCS (min.)}$, the cycle is an early write cycle and data out pin will remain open-circuit (high impedance) through the entire cycle; if $t_{RWD} > t_{RWD (min.)}$, $t_{CWD} > t_{CWD (min.)}$ and $t_{AWD} > t_{AWD (min.)}$, the cycle is a read-write cycle and I/O will contain data read from the selected cells. If neither of the above sets of conditions is satisfied, the condition of I/O (at access time) is indeterminate.
- 16) These parameters are referenced to the \overline{CAS} leading edge in early write cycles and to the \overline{WE} leading edge in read-write cycles.
- 17) When using Self Refresh mode, the following refresh operations must be performed to ensure proper DRAM operation:
- If row addresses are being refreshed on an evenly distributed manner over the refresh interval using CBR refresh cycles, then only one CBR cycle must be performed immediately after exit from Self Refresh.
- If row addresses are being refreshed in any other manner (ROR - Distributed/Burst; or CBR-Burst) over the refresh interval, then a full set of row refreshes must be performed immediately before entry to and immediately after exit from Self Refresh.
