

1GB Registered DDR SDRAM DIMM

EBD10RD4ABFA (128M words × 72 bits, 1 Rank)

Description

The EBD10RD4ABFA is 128M words × 72 bits, 1 rank Double Data Rate (DDR) SDRAM registered module, mounting 18 pieces of 512M bits DDR SDRAM sealed in TSOP package. Read and write operations are performed at the cross points of the CK and the /CK. This high-speed data transfer is realized by the 2-bit prefetch-pipelined architecture. Data strobe (DQS) both for read and write are available for high speed and reliable data bus design. By setting extended mode register, the on-chip Delay Locked Loop (DLL) can be set enable or disable. This module provides high density mounting without utilizing surface mount technology. Decoupling capacitors are mounted beside each TSOP on the module board.

Features

- 184-pin socket type dual in line memory module (DIMM)
 - PCB height: 30.48mm
 - Lead pitch: 1.27mm
- 2.5V power supply
- Data rate: 333Mbps/266Mbps (max.)
- 2.5 V (SSTL_2 compatible) I/O
- Double Data Rate architecture; two data transfers per clock cycle
- Bi-directional, data strobe (DQS) is transmitted /received with data, to be used in capturing data at the receiver
- Data inputs and outputs are synchronized with DQS
- 4 internal banks for concurrent operation (Component)
- DQS is edge aligned with data for READs; center aligned with data for WRITEs
- Differential clock inputs (CK and /CK)
- DLL aligns DQ and DQS transitions with CK transitions
- Commands entered on each positive CK edge; data referenced to both edges of DQS
- Auto precharge option for each burst access
- Programmable burst length: 2, 4, 8
- Programmable /CAS latency (CL): 2, 2.5
- Refresh cycles: (8192 refresh cycles /64ms)
 - 7.8μs maximum average periodic refresh interval
- 2 variations of refresh
 - Auto refresh
 - Self refresh
- 1 piece of PLL clock driver, 2 pieces of register driver and 1 piece of serial EEPROM (2k bits) for Presence Detect (SPD) on PCB.

Ordering Information

| Part number | Data rate Mbps (max.) | Component JEDEC speed bin* ¹ (CL-tRCD-tRP) | Package | Contact pad | Mounted devices |
|-----------------|-----------------------|---|--------------|-------------|--------------------------|
| EBD10RD4ABFA-6B | 333 | DDR333B (2.5-3-3) | 184-pin DIMM | Gold | EDD5104ABTA-6B |
| EBD10RD4ABFA-7A | 266 | DDR266A (2-3-3) | | | EDD5104ABTA-6B, -7A |
| EBD10RD4ABFA-7B | 266 | DDR266B (2.5-3-3) | | | EDD5104ABTA-6B, -7A, -7B |

Note: 1. Module /CAS latency = component CL + 1

Pin Description

| Pin name | Function |
|--------------------------|---|
| A0 to A12 | Address input Row address A0 to A12 Column address A0 to A9, A11, A12 |
| BA0, BA1 | Bank select address |
| DQ0 to DQ63 | Data input/output |
| CB0 to CB7 | Check bit (Data input/output) |
| /RAS | Row address strobe command |
| /CAS | Column address strobe command |
| /WE | Write enable |
| /CS0 | Chip select |
| CKE0 | Clock enable |
| CK0 | Clock input |
| /CK0 | Differential clock input |
| DQS0 to DQS8 | Input and output data strobe |
| DM0 to DM8/DQS9 to DQS17 | Input and output data strobe |
| SCL | Clock input for serial PD |
| SDA | Data input/output for serial PD |
| SA0 to SA2 | Serial address input |
| VDD | Power for internal circuit |
| VDD | Power for DQ circuit |
| VDDSPD | Power for serial EEPROM |
| VREF | Input reference voltage |
| VSS | Ground |
| VDDID | VDD identification flag |
| /RESET | Reset pin (forces register inputs low) |
| NC | No connection |

| 99 to 127 | Manufacturer specific data | | | | | | | | | | |

- Notes: 1. All serial PD data are not protected. 0: Serial data, "driven Low", 1: Serial data, "driven High".
 2. Bytes 95 through 98 are assembly serial number.
 3. These specifications are defined based on component specification, not module.

Block Diagram

Differential Clock Net Wiring (CK0, /CK0)

- Notes:
1. The clock delay from the input of the PLL clock to the input of any SDRAM or register will be set to 0 ns (nominal).
 2. Input, output and feedback clock lines are terminated from line to line as shown, and not from line to ground.
 3. Only one PLL output is shown per output type. Any additional PLL outputs will be wired in a similar manner.
 4. Termination resistors for feedback path clocks are located after the pins of the PLL.

Electrical Specifications

- All voltages are referenced to VSS (GND).

Absolute Maximum Ratings

| Parameter | Symbol | Value | Unit | Note |
|------------------------------------|--------|--------------|------|------|
| Voltage on any pin relative to VSS | VT | -1.0 to +3.6 | V | |
| Supply voltage relative to VSS | VDD | -1.0 to +3.6 | V | |
| Short circuit output current | IOUT | 50 | mA | |
| Power dissipation | PT | 18 | W | |
| Operating ambient temperature | TA | 0 to +70 | °C | 1 |
| Storage temperature | Tstg | -55 to +125 | °C | |

Note:1. DDR SDRAM component specification

Caution

Exposing the device to stress above those listed in Absolute Maximum Ratings could cause permanent damage. The device is not meant to be operated under conditions outside the limits described in the operational section of this specification. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability.

DC Operating Conditions (TA = 0 to +70°C) (DDR SDRAM Component Specification)

| Parameter | Symbol | Min | Typ | Max | Unit | Notes |
|---|----------|--------------------------|--------------------|--------------------------|------|-------|
| Supply voltage | VDD,VDDQ | 2.3 | 2.5 | 2.7 | V | 1 |
| | VSS | 0 | 0 | 0 | V | |
| Input reference voltage | VREF | $0.49 \times VDDQ$ | $0.50 \times VDDQ$ | $0.51 \times VDDQ$ | V | |
| Termination voltage | VTT | $VREF - 0.04$ | VREF | $VREF + 0.04$ | V | |
| Input high voltage | VIH (DC) | $VREF + 0.15$ | — | $VDDQ + 0.3$ | V | 2 |
| Input low voltage | VIL (DC) | -0.3 | — | $VREF - 0.15$ | V | 3 |
| Input voltage level, CK and /CK inputs | VIN (DC) | -0.3 | — | $VDDQ + 0.3$ | V | 4 |
| Input differential cross point voltage, CK and /CK inputs | VIX (DC) | $0.5 \times VDDQ - 0.2V$ | $0.5 \times VDDQ$ | $0.5 \times VDDQ + 0.2V$ | V | |
| Input differential voltage, CK and /CK inputs | VID (DC) | 0.36 | — | $VDDQ + 0.6$ | V | 5, 6 |

Notes: 1. VDDQ must be lower than or equal to VDD.

2. VIH is allowed to exceed VDD up to 3.6V for the period shorter than or equal to 5ns.
3. VIL is allowed to outreach below VSS down to -1.0V for the period shorter than or equal to 5ns.
4. VIN (DC) specifies the allowable DC execution of each differential input.
5. VID (DC) specifies the input differential voltage required for switching.
6. VIH (CK) min assumed over $VREF + 0.18V$, VIL (CK) max assumed under $VREF - 0.18V$ if measurement.

DC Characteristics 1 (TA = 0 to +70°C, VDD = 2.5V ± 0.2V, VSS = 0V)

| Parameter | Symbol | Grade | max. | Unit | Test condition | Notes |
|---|--------|-----------------|--------------|------|---|------------|
| Operating current (ACTV-PRE) | IDD0 | -6B -7A, -7B | 3165 2830 | mA | CKE ≥ VIH, tRC = tRC (min.) | 1, 2, 9 |
| Operating current (ACTV-READ-PRE) | IDD1 | -6B -7A, -7B | 3525 3190 | mA | CKE ≥ VIH, BL = 4, CL = 3.5, tRC = tRC (min.) | 1, 2, 5 |
| Idle power down standby current | IDD2P | -6B -7A, -7B | 520 454 | mA | CKE ≤ VIL | 4 |
| Floating idle standby current | IDD2F | -6B -7A, -7B | 1185 1030 | mA | CKE ≥ VIH, /CS ≥ VIH, DQ, DQS, DM = VREF | 4, 5 |
| Quiet idle standby current | IDD2Q | -6B -7A, -7B | 915 850 | mA | CKE ≥ VIH, /CS ≥ VIH, DQ, DQS, DM = VREF | 4, 10 |
| Active power down standby current | IDD3P | -6B -7A, -7B | 825 760 | mA | CKE ≤ VIL | 3 |
| Active standby current | IDD3N | -6B -7A, -7B | 1725 1480 | mA | CKE ≥ VIH, /CS ≥ VIH tRAS = tRAS (max.) | 3, 5, 6 |
| Operating current (Burst read operation) | IDD4R | -6B -7A, -7B | 4065 3460 | mA | CKE ≥ VIH, BL = 2, CL = 3.5 | 1, 2, 5, 6 |
| Operating current (Burst write operation) | IDD4W | -6B -7A, -7B | 4065 3460 | mA | CKE ≥ VIH, BL = 2, CL = 3.5 | 1, 2, 5, 6 |
| Auto refresh current | IDD5 | -6B -7A, -7B | 5685 5260 | mA | tRFC = tRFC (min.), Input ≤ VIL or ≥ VIH | |
| Self refresh current | IDD6 | -6B -7A, -7B | 538 472 | mA | Input ≥ VDD - 0.2 V Input ≤ 0.2 V | |
| Operating current (4 banks interleaving) | IDD7A | -6B -7A, -7B | 8025 6880 | mA | BL = 4 | 5, 6, 7 |

Notes. 1. These IDD data are measured under condition that DQ pins are not connected.

2. One bank operation.
3. One bank active.
4. All banks idle.
5. Command/Address transition once per one cycle.
6. Data/Data mask transition twice per one cycle.
7. 4 banks active. Only one bank is running at tRC = tRC (min.)
8. The IDD data on this table are measured with regard to tCK = tCK (min.) in general.
9. Command/Address transition once every two clock cycles.
10. Command/Address stable at ≥ VIH or ≤ VIL.

DC Characteristics 2 (TA = 0 to +70°C, VDD, VDDQ = 2.5V ± 0.2V, VSS = 0V)**(DDR SDRAM Component Specification)**

| Parameter | Symbol | min. | max. | Unit | Test condition | Notes |
|------------------------|--------|-------|------|------|-------------------|-------|
| Input leakage current | IL | -2 | 2 | μA | VDD ≥ VIN ≥ VSS | |
| Output leakage current | IOZ | -5 | 5 | μA | VDDQ ≥ VOUT ≥ VSS | |
| Output high current | IOH | -15.2 | — | mA | VOUT = 1.95V | |
| Output low current | IOL | 15.2 | — | mA | VOUT = 0.35V | |

Pin Capacitance (TA = +25°C, VDD = 2.5V ± 0.2V)

| Parameter | Symbol | Pins | max. | Unit | Notes |
|---------------------------------------|--------|-------------------------------------|------|------|---------|
| Input capacitance | CI1 | Address, /RAS, /CAS, /WE, /CS, /CKE | 12 | pF | 1, 3 |
| Input capacitance | CI2 | CK, /CK | 20 | pF | 1, 3 |
| Data and DQS input/output capacitance | CO | DQ, DQS, CB | 15 | pF | 1, 2, 3 |

- Notes: 1. These parameters are measured on conditions: f = 100MHz, VOUT = VDDQ/2, ΔVOUT = 0.2V.
 2. Dout circuits are disabled.
 3. This parameter is sampled and not 100% tested.

AC Characteristics (TA = 0 to +70°C, VDD, VDDQ = 2.5V ± 0.2V, VSS = 0V)

Notes: 1. All the AC parameters listed in this data sheet is component specifications. For AC testing conditions, refer to the corresponding component data sheet.

- This parameter defines the signal transition delay from the cross point of CK and /CK. The signal transition is defined to occur when the signal level crossing VTT.
- The timing reference level is VTT.
- Output valid window is defined to be the period between two successive transition of data out or DQS (read) signals. The signal transition is defined to occur when the signal level crossing VTT.
- tHZ is defined as DOUT transition delay from Low-Z to High-Z at the end of read burst operation. The timing reference is cross point of CK and /CK. This parameter is not referred to a specific DOUT voltage level, but specify when the device output stops driving.
- tLZ is defined as DOUT transition delay from High-Z to Low-Z at the beginning of read operation. This parameter is not referred to a specific DOUT voltage level, but specify when the device output begins driving.
- Input valid windows is defined to be the period between two successive transition of data input or DQS (write) signals. The signal transition is defined to occur when the signal level crossing VREF.
- The timing reference level is VREF.
- The transition from Low-Z to High-Z is defined to occur when the device output stops driving. A specific reference voltage to judge this transition is not given.
- tCK (max.) is determined by the lock range of the DLL. Beyond this lock range, the DLL operation is not assured.
- tCK = tCK (min.) when these parameters are measured. Otherwise, absolute minimum values of these values are 10% of tCK.
- VDD is assumed to be 2.5V ± 0.2V. VDD power supply variation per cycle expected to be less than 0.4V/400 cycle.
- tDAL = (tWR/tCK)+(tRP/tCK)

For each of the terms above, if not already an integer, round to the next highest integer.

Example: For -7A Speed at CL = 2.5, tCK = 7.5ns, tWR = 15ns and tRP= 20ns,

$$tDAL = (15ns/7.5ns) + (20ns/7.5ns) = (2) + (3)$$

$$tDAL = 5 \text{ clocks}$$

Timing Parameter Measured in Clock Cycle for Registered DIMM

| tCK | Parameter | Symbol | Number of clock cycle | | | | Unit |
|-----|---|--------|-----------------------|------|----------|------|------|
| | | | 6ns | | 7.5ns | | |
| | | | min. | max. | min. | max. | |
| | Write to pre-charge command delay (same bank) | tWPD | 4 + BL/2 | | 3 + BL/2 | | tCK |
| | Read to pre-charge command delay (same bank) | tRPD | BL/2 | | BL/2 | | tCK |

| | Power down exit to command input | tPDEX | 1 | | 1 | | tCK |

Pin Functions

CK, /CK (input pin)

The CK and the /CK are the master clock inputs. All inputs except DMs, DQSs and DQs are referred to the cross point of the CK rising edge and the VREF level. When a read operation, DQSs and DQs are referred to the cross point of the CK and the /CK. When a write operation, DMs and DQs are referred to the cross point of the DQS and the VREF level. DQSs for write operation are referred to the cross point of the CK and the /CK.

/CS (input pin)

When /CS is low, commands and data can be input. When /CS is high, all inputs are ignored. However, internal operations (bank active, burst operations, etc.) are held.

/RAS, /CAS, and /WE (input pins)

These pins define operating commands (read, write, etc.) depending on the combinations of their voltage levels. See "Command operation".

A0 to A12 (input pins)

Row address (AX0 to AX12) is determined by the A0 to the A12 level at the cross point of the CK rising edge and the VREF level in a bank active command cycle. Column address (AY0 to AY9, AY11, AY12) is loaded via the A0 to the A9, the A11 and the A12 at the cross point of the CK rising edge and the VREF level in a read or a write command cycle. This column address becomes the starting address of a burst operation.

A10 (AP) (input pin)

A10 defines the precharge mode when a precharge command, a read command or a write command is issued. If A10 = high when a precharge command is issued, all banks are precharged. If A10 = low when a precharge command is issued, only the bank that is selected by BA1, BA0 is precharged. If A10 = high when read or write command, auto-precharge function is enabled. While A10 = low, auto-precharge function is disabled.

BA0, BA1 (input pin)

BA0, BA1 are bank select signals (BA). The memory array is divided into bank 0, bank 1, bank 2 and bank 3. (See Bank Select Signal Table)

[Bank Select Signal Table]

| | BA0 | BA1 |
|--------|-----|-----|
| Bank 0 | L | L |
| Bank 1 | H | L |
| Bank 2 | L | H |
| Bank 3 | H | H |

Remark: H: VIH. L: VIL.

CKE (input pin)

CKE controls power down and self-refresh. The power down and the self-refresh commands are entered when the CKE is driven low and exited when it resumes to high.

The CKE level must be kept for 1 CK cycle at least, that is, if CKE changes at the cross point of the CK rising edge and the VREF level with proper setup time tIS, at the next CK rising edge CKE level must be kept with proper hold time tIH.

DQ, CB (input and output pins)

Data are input to and output from these pins.

DQS (input and output pin)

DQS provide the read data strobes (as output) and the write data strobes (as input).

VDD (power supply pins)

2.5V is applied. (VDD is for the internal circuit.)

VDDSPD (power supply pin)

2.5V is applied (For serial EEPROM).

VSS (power supply pin)

Ground is connected.

/RESET (input pin)

LVC MOS reset input. When /RESET is low, all registers are reset and all outputs are low.

Detailed Operation Part and Timing Waveforms

Refer to the EDD5104ABTA, EDD5108ABTA datasheet (E0237E). DM pins of component device fixed to VSS level on the module board. DIMM /CAS latency = component CL + 1 for registered type.

Physical Outline

Unit: mm

Note: Tolerance on all dimensions ± 0.13 unless otherwise specified.

ECA-TS2-0050-01

CAUTION FOR HANDLING MEMORY MODULES

When handling or inserting memory modules, be sure not to touch any components on the modules, such as the memory ICs, chip capacitors and chip resistors. It is necessary to avoid undue mechanical stress on these components to prevent damaging them.

In particular, do not push module cover or drop the modules in order to protect from mechanical defects, which would be electrical defects.

When re-packing memory modules, be sure the modules are not touching each other.

Modules in contact with other modules may cause excessive mechanical stress, which may damage the modules.

MDE0202

NOTES FOR CMOS DEVICES**① PRECAUTION AGAINST ESD FOR MOS DEVICES**

Exposing the MOS devices to a strong electric field can cause destruction of the gate oxide and ultimately degrade the MOS devices operation. Steps must be taken to stop generation of static electricity as much as possible, and quickly dissipate it, when once it has occurred. Environmental control must be adequate. When it is dry, humidifier should be used. It is recommended to avoid using insulators that easily build static electricity. MOS devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work bench and floor should be grounded. The operator should be grounded using wrist strap. MOS devices must not be touched with bare hands. Similar precautions need to be taken for PW boards with semiconductor MOS devices on it.

② HANDLING OF UNUSED INPUT PINS FOR CMOS DEVICES

No connection for CMOS devices input pins can be a cause of malfunction. If no connection is provided to the input pins, it is possible that an internal input level may be generated due to noise, etc., hence causing malfunction. CMOS devices behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using a pull-up or pull-down circuitry. Each unused pin should be connected to V_{DD} or GND with a resistor, if it is considered to have a possibility of being an output pin. The unused pins must be handled in accordance with the related specifications.

③ STATUS BEFORE INITIALIZATION OF MOS DEVICES

Power-on does not necessarily define initial status of MOS devices. Production process of MOS does not define the initial operation status of the device. Immediately after the power source is turned ON, the MOS devices with reset function have not yet been initialized. Hence, power-on does not guarantee output pin levels, I/O settings or contents of registers. MOS devices are not initialized until the reset signal is received. Reset operation must be executed immediately after power-on for MOS devices having reset function.

The information in this document is subject to change without notice. Before using this document, confirm that this is the latest version.

No part of this document may be copied or reproduced in any form or by any means without the prior written consent of Elpida Memory, Inc.

Elpida Memory, Inc. does not assume any liability for infringement of any intellectual property rights (including but not limited to patents, copyrights, and circuit layout licenses) of Elpida Memory, Inc. or third parties by or arising from the use of the products or information listed in this document. No license, express, implied or otherwise, is granted under any patents, copyrights or other intellectual property rights of Elpida Memory, Inc. or others.

Descriptions of circuits, software and other related information in this document are provided for illustrative purposes in semiconductor product operation and application examples. The incorporation of these circuits, software and information in the design of the customer's equipment shall be done under the full responsibility of the customer. Elpida Memory, Inc. assumes no responsibility for any losses incurred by customers or third parties arising from the use of these circuits, software and information.

[Product applications]

Elpida Memory, Inc. makes every attempt to ensure that its products are of high quality and reliability. However, users are instructed to contact Elpida Memory's sales office before using the product in aerospace, aeronautics, nuclear power, combustion control, transportation, traffic, safety equipment, medical equipment for life support, or other such application in which especially high quality and reliability is demanded or where its failure or malfunction may directly threaten human life or cause risk of bodily injury.

[Product usage]

Design your application so that the product is used within the ranges and conditions guaranteed by Elpida Memory, Inc., including the maximum ratings, operating supply voltage range, heat radiation characteristics, installation conditions and other related characteristics. Elpida Memory, Inc. bears no responsibility for failure or damage when the product is used beyond the guaranteed ranges and conditions. Even within the guaranteed ranges and conditions, consider normally foreseeable failure rates or failure modes in semiconductor devices and employ systemic measures such as fail-safes, so that the equipment incorporating Elpida Memory, Inc. products does not cause bodily injury, fire or other consequential damage due to the operation of the Elpida Memory, Inc. product.

[Usage environment]

This product is not designed to be resistant to electromagnetic waves or radiation. This product must be used in a non-condensing environment.

If you export the products or technology described in this document that are controlled by the Foreign Exchange and Foreign Trade Law of Japan, you must follow the necessary procedures in accordance with the relevant laws and regulations of Japan. Also, if you export products/technology controlled by U.S. export control regulations, or another country's export control laws or regulations, you must follow the necessary procedures in accordance with such laws or regulations.

If these products/technology are sold, leased, or transferred to a third party, or a third party is granted license to use these products, that third party must be made aware that they are responsible for compliance with the relevant laws and regulations.
