# 1 Functional Description

## 1.1 Overview

The TIM-LC is an ultra-low power OEM GPS module suitable for active antennas to run standard PVT applications. It provides two 3V (5V TTL input compatible) serial ports and easy-to-use boot time configuration pins. The combination of lowest power consumption, cost-optimized architecture (no Flash EPROM inside) and innovative packaging technology makes the TIM-LC suitable for high-volume applications where small size, low cost and simplicity are key issues.

The leading ANTARIS<sup>®</sup> GPS Engine, jointly developed by Atmel and u-blox, provides excellent navigation performance under dynamic conditions in areas with limited sky view like urban canyons, high sensitivity for weak signal operation without compromising accuracy, and support of DGPS and multiple SBAS systems like WAAS and EGNOS. The 16 parallel channels and 8192 search bins provide fast start-up times. The aiding functionality accelerates start-up times even further. The low power consumption and FixNow<sup>™</sup> power saving mode make this product suitable for handheld and battery-operated devices.

Innovative packaging technologies enable high integration of a GPS receiver in a small module measuring just 25.4 x 25.4 mm and allowing straightforward integration in particularly small end products and new application fields. The small form factor and the SMT pads allow a fully automatic assembly process with standard pick-and-place equipment and reflow soldering, enabling cost-efficient high-volume production.

## 1.3 Benefits

- High acquisition and tracking sensitivity
- Ultra-low power consumption
- Excellent GPS performance
  - Excellent navigation accuracy, even at low signal levels
  - Active multipath detection and removal
  - Fast Time-To-First-Fix (TTFF)
  - Accelerated TTFF with aiding functionality
- No Flash EPROM inside
  - Independence from memory market and price fluctuations
- Highly integrated GPS module
  - Automatic pick and place assembly
  - Reflow solderable
- Maximum flexibility
  - Extensively configurable
  - Boot-time configuration pins
- Fully EMI shielded
- Active antenna support

## 1.4 Features

- 16 channel GPS receiver
- 8192 simultaneous time-frequency search bins
- 4 Hz position update rate
- ANTARIS Positioning Engine
  - ATR0600 RF front-end IC
  - ATR0620 Baseband IC with ARM7TDMI inside
- DGPS and SBAS (WAAS, EGNOS) support
- FixNOW™ power saving mode
- Operating voltage 2.7 to 3.3 V
- Battery supply pin for internal backup memory and real time clock
- Industrial operating temperature range –40 to 85°C
- Small size
  - Size 25.4mm x 25.4mm
  - Height 3mm
  - Weight 3g

## 1.5 Operating Modes

The ANTARIS GPS Technology defines the following Operating Modes:

Operating Modes	Description
<b>Continuous Tracking Mode (CTM)</b>	The Continuous Tracking Mode is configured for optimal position accuracy. This mode is optimized for power consumption based on the ANTARIS Autonomous Power Management (APM) saving as parts of the receiver are switched off when they are not required; also the CPU clock speed is reduced when the CPU is not loaded. There is no need for a user to configure this mode as it is built into the architecture of the module.
<b>Power Saving Modes</b>	
<b>FixNOW™ (FXN)</b>	FixNOW™ Mode allows an application a navigation solution on request. It includes additional Power Saving Functions and is the best mode for any Mobile, Tracking Unit application where low power consumption requirements are primary consideration. This mode can be configured to meet application requirements.

**Table 1: Operating Modes**

For more information see the *ANTARIS System Integration Manual* [1].

## 1.6 Protocols

The TIM-LC supports different serial protocols.

Protocol	Type	Runs on
NMEA	Input/output, ASCII, 0183, 2.3 (compatible to 3.0)	All Serial ports
UBX	Input/output, binary, u-blox proprietary	All Serial ports
RTCM	Input, message 1,2,3,9	All Serial ports

**Table 2: Available Protocols**

For specification of the various protocols see the *Protocol Specification* [2].

## 1.7 Boot-Time GPSMODE Configuration

The TIM-LC provides seven GPSMODE pins which provide boot-time configuration capabilities. These configuration settings will be effective immediately after start-up. Once the TIM-LC has started, the configuration settings may be modified with UBX configuration messages. The modified settings remain effective until power-down or reset. If these settings have been stored in battery-backup RAM (with CFG-CFG message), then the modified configuration will be retained as long backup battery supply is not interrupted.

## 1.8 Antenna

This GPS receiver is designed for use with active antennas. An antenna supervisor is provided. If activated, the GPS receiver is capable of detecting short circuits to the active antenna by checking the bias voltage level and can shut down the voltage bias immediately. A series resistor is needed in front of the **V\_ANT** input. UBX and NMEA messages are provided to report the condition of the antenna supply. Open circuit detection can also be supported with an additional external circuit. For details, please refer to the *ANTARIS System Integration Manual* [1].

Parameter	Specification	
Antenna Type	Active only	
Active Antenna Recommendations	Minimum gain	25 dB
	Maximum noise figure	1.5 dB
	Maximum gain	60 dB
Antenna Supply	Using <b>VCC_RF</b> or external	
Antenna Supervisor	Short circuit detection	Built-in
	Open circuit detection	Enabled with external circuit

<sup>1</sup> Depends on accuracy of correction data of DGPS or SBAS service

<sup>2</sup> CEP = Circular Error Probability: The radius of a horizontal circle, centered at the antenna's true position, containing 50% of the fixes.

<sup>3</sup> SEP = Spherical Error Probability. The radius of the sphere, centered at the true position, contains 50% of the fixes.

<sup>4</sup> The different start-up modes like cold, warm and hot start are described in the System Integration Manual [1]

<sup>5</sup> Measured with good visibility and -125 dBm signal strength

<sup>6</sup> Time synch. signal from aiding source must be supplied to **EXTINT0** pin, having accuracy of better than 200 µs

<sup>7</sup> Demonstrated with a good active antenna

## 6 Product Lineup

### 6.1 Default Settings

Following default settings apply if the GPSPIN pins are left unconnected:

Interface	Settings
Serial Port 1 Output	9600 Baud, 8 bits, no parity bit, 1 stop bit Configured to transmit both NMEA and UBX protocols, but only following NMEA and no UBX messages have been activated at start-up: <b>GGA, GLL, GSA, GSV, RMC, VTG, ZDA, TXT</b> Additional messages can be activated with appropriate input messages or with GPSPIN pins.
Serial Port 1 Input	9600 Baud, 8 bits, no parity bit, 1 stop bit, Autobauding disabled Automatically accepts following protocols without need of explicit configuration: <b>UBX, NMEA, RTCM</b> The GPS receiver supports interleaved UBX and NMEA messages.
Serial Port 2 Output	38400 Baud, 8 bits, no parity bit, 1 stop bit Configured to transmit both NMEA and UBX protocols, but only following UBX and no NMEA messages have been activated at start-up: <b>NAV-POSLH, NAV-SOL, NAV-SVINFO, NAV-STATUS, NAV-POSECEF, NAV-DOP, NAV-VELECEF, NAV-VELNED, NAV-TIMEGPS, NAV-TIMEUTC, NAV-CLOCK</b> MON-IO, MON-SCHD, MON-IPC, INF-Warning, INF-Error, INF-Notice Additional messages can be activated with appropriate input messages.
Serial Port 2 Input	38400 Baud, 8 bits, no parity bit, 1 stop bit, Autobauding disabled Automatically accepts following protocols without need of explicit configuration: <b>UBX, NMEA, RTCM</b> The GPS receiver supports interleaved UBX and NMEA messages.
TIMEPULSE	1 pulse per second, synchronized at rising edge, pulse length 100ms
