

**Features :**

- \* 32K x 8-bit organization.
- \* Very high speed 12,15,20 ns.
- \* Low standby power.
- \* Fully static operation
- \* 5V±10% power supply.
- \* TTL compatible I/O.
- \* Three state output.
- \* Chip enable for simple memory expansion.
- \* Available 300 mil SOJ, 28 pin TSOP and 330 mil SOP Packages.
- \* Industrial Grade Available (-40°C ~ 85°C).

**Description :**

GLT725608 is high performance 256K bit static random access memory organized as 32K by 8 bits and operate at a single 5 volt supply. Fabricated with G-Link Technology's very advanced CMOS sub-micron technology, GLT725608 offer a combination of features: very high speed and very low stand-by current. In addition, this device also supports easy memory expansion with an active LOW chip enable ( $\overline{CE}$ ) as well as an active LOW output enable ( $\overline{OE}$ ) and three state outputs.

**Pin Descriptions:**

Name	Function
A <sub>0</sub> - A <sub>14</sub>	Address Inputs
$\overline{CE}$	Chip Enable Input
$\overline{OE}$	Output Enable Input
WE	Write Enable Input
I/O <sub>0</sub> - I/O <sub>7</sub>	Data Input and Data Output
V <sub>CC</sub>	+5V Power Supply
GND	Ground

**Truth Table:**

Mode	$\overline{WE}$	$\overline{CE}$	$\overline{OE}$	I/O Operation	V <sub>CC</sub> Current
Not Selected (Power Down)	X	H	X	High Z	I <sub>CCSB</sub> , I <sub>CCSB1</sub>
Output Disabled	H	L	H	High Z	I <sub>CC</sub>
Read	H	L	L	D <sub>OUT</sub>	I <sub>CC</sub>
Write	L	L	X	D <sub>IN</sub>	I <sub>CC</sub>

**Absolute Maximum Ratings:**

Ambient Temperature

Under Bias.....-10°C to +80°C

Storage Temperature(plastic)....-55°C to +125°C

Voltage Relative to GND.....-0.5V to +7.0V

Data Output Current.....50mA

Power Dissipation.....1.0W

1.Stresses greater than those listed under ABSOLUTE MAXIMUM RATING may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

**Note:**

1.  $\overline{WE}$  must be high during address transitions.
2. The internal write time of the memory is defined by the overlap  $\overline{CE}$  low and  $\overline{WE}$  low. All signals must be active to initiate a write and any one signal can terminate a write by going inactive. The data input setup and hold timing should be referenced to the second transition edge of the signal that terminates the write.
3.  $T_{WR}$  is measured from the earlier of  $\overline{CE}$  or  $\overline{WE}$  going high at the end of write cycle.
4. During this period, I/O pins are in the output state so that the input signals of opposite phase to the outputs must not be applied.
5. If the  $\overline{CE}$  low transition occurs simultaneously with the  $\overline{WE}$  low transitions or after the  $\overline{WE}$  transition, outputs remain in a high impedance state.
6.  $\overline{OE}$  is continuously low ( $\overline{OE} = V_{IL}$ ).
7.  $D_{OUT}$  is the same phase of write data of this write cycle.
8.  $D_{OUT}$  is the read data of next address.
9. If  $\overline{CE}$  is low during this period, I/O pins are in the output state. Then the data input signals of opposite phase to the outputs must not be applied to them.
10. Transition is measured  $\pm 200mV$  from steady state with  $C_L = 5pF$ .
11.  $t_{CW}$  is measured from  $\overline{CE}$  going low to the end of write.
