

## **bq769x0 3 节至 15 节串联电池监控系列**

### **用于锂离子和磷酸盐电池应用**

## **1 介绍**

### **1.1 特性**

- 模拟前端 (AFE) 监控特性
  - 纯数字接口
  - 内部模数转换器 (ADC) 测量电池电压、芯片温度和外部热敏电阻
  - 一个单独的、内部 ADC 测量电池组电流 (库伦电荷计数器)
  - 直接支持多达三个热敏电阻 (103AT)
- 硬件保护特性
  - 放电过流 (OCD)
  - 放电短路 (SCD)
  - 过压 (OV)
  - 欠压 (UV)
- 次级保护器故障检测
- 附加特性
  - 集成电池均衡场效应晶体管 (FET)
  - 充电、放电低侧 NCH FET 驱动器
  - 到主机微控制器的警报中断
  - 2.5V 或 3.3V 输出电压稳压器
  - 无需 EEPROM 编程
  - 高电源电压最大绝对值 (高达 108V)
  - 简单 I<sup>2</sup>C™ 兼容接口 (循环冗余校验 (CRC) 选项)
  - 随机电池连接耐受

### **1.2 应用范围**

- 轻型电动车辆 (LEV): 电动自行车 (eBike), 电动踏板车 (eScooter), 脚踏电动自行车 (Pedelec) 和踏板辅助自行车
- 电动和园艺工具
- 后备电池和不间断电源 (UPS) 系统
- 无线基站后备系统
- 12V, 18V, 24V, 36V 和 48V 电池组

### **1.3 说明**

bq769x0 系列的稳健耐用型模拟前端 (AFE) 器件通常用作针对下一代高功率系统 (例如, 轻型电动车辆、电动工具和不间断电源) 的完整电池组监控和保护解决方案的一部分。bq769x0 在设计时充分考虑了低功耗要求, 不仅可通过使能/禁用集成电路 (IC) 中的子模块来控制整个芯片的电流消耗, 而且还可以利用 SHIP 模式将电池组轻松切换至超低功耗状态。

#### **器件信息<sup>(1)</sup>**

| 器件型号    | 封装                     | 封装尺寸 (标称值)       |
|---------|------------------------|------------------|
| bq76920 | 薄型小外形尺寸封装 (TSSOP) (20) | 6.50mm x 4.40mm  |
| bq76930 | TSSOP (30)             | 7.80mm x 4.40mm  |
| bq76940 | TSSOP (44)             | 11.00mm x 4.40mm |

(1) 要了解所有可用封装, 请见数据表末尾的可订购产品附录。

## 2 修订历史记录

注：之前版本的页码可能与当前版本有所不同。

| Changes from Revision E (November 2014) to Revision F                                         | Page |
|-----------------------------------------------------------------------------------------------|------|
| • Changed bq7693002 From: Product Preview To Production in the <i>Device Comparison Table</i> | 4    |
| • Added bq7693007 device to the <i>Device Comparison Table</i>                                | 4    |
| • Changed table note to group ground reference in <i>bq76930 Pin Functions</i>                | 7    |
| • Changed table note to group ground reference in <i>bq76940 Pin Functions</i>                | 9    |
| • Changed 10th cell to 11th cell in the Description of pin 29                                 | 10   |
| • Changed table formats for online data sheet                                                 | 11   |
| • Changed <i>Handling Ratings</i> table to <i>ESD Ratings</i>                                 | 11   |
| • 已更改 note for R1 on 图 7-3                                                                    | 26   |
| • 已添加 more description to the <i>Communications Subsystem</i> section                         | 29   |
| • 已更改 "SHUTA" to "SHUT_A" and "SHUTB" to "SHUT_B" in the <i>SHIP Mode</i> section             | 30   |
| • 已更改 CAUTION verbiage (editorial)                                                            | 31   |
| • 已更改 the SHUT_A, SHUT_B bit descriptions in the <i>SYS_CTRL1 (0x04)</i> table                | 35   |

| Changes from Revision D (July 2014) to Revision E                                                     | Page |
|-------------------------------------------------------------------------------------------------------|------|
| • Added a note to the <i>Absolute Maximum Ratings</i> table                                           | 11   |
| • Changed the <i>Handling Ratings</i>                                                                 | 11   |
| • 已添加 the cross-reference to a new table note at $V_{ALERT\_IH}$ in <i>Electrical Characteristics</i> | 16   |
| • 已添加 a new table note                                                                                | 16   |
| • 已添加 the <i>Typical Characteristics</i> section                                                      | 18   |
| • 已更改 the <i>Alert</i> section                                                                        | 28   |
| • 已更改 verbiage in <i>Communications Subsystem</i>                                                     | 29   |
| • 已删除 the READ/WRITE RSVD register in the <i>Register Map</i>                                         | 32   |
| • 已删除 the READ ONLY register information in the <i>Register Map</i>                                   | 32   |
| • 已更改 the reset for Bit 3 in the PROTECT3 register                                                    | 37   |
| • 已更改 wording in the ADCGAIN bit descriptions                                                         | 40   |
| • 已添加 <i>Application and Implementation</i> note                                                      | 42   |

|                                                  |                    |
|--------------------------------------------------|--------------------|
| • 已添加 <i>Design Requirements</i> .....           | <a href="#">45</a> |
| • 已添加 the <i>Detailed Design Procedure</i> ..... | <a href="#">46</a> |
| • 已更改 the <i>Layout Guidelines</i> .....         | <a href="#">50</a> |
| • 已更改 the <i>Layout Example</i> .....            | <a href="#">50</a> |
| • 已添加 a <i>Caution</i> .....                     | <a href="#">50</a> |
| • 已更改 the Good Layout figure .....               | <a href="#">51</a> |
| • 已更改 the Weak Layout figure .....               | <a href="#">52</a> |

---

| • 已删除 duplicate CELLBAL3 table .....                                              | <a href="#">34</a> |
| • 已更改 bq76940 with bq783xx Companion Controller IC Schematic .....                | <a href="#">45</a> |

### 3 说明（继续）

bq76920 器件支持多达 5 节串联电池或者典型值为 18V 的电池组；bq76930 可处理多达 10 节串联电池或者典型值为 36V 的电池组；而 bq76940 支持多达 15 节串联电池或者典型值为 48V 的电池组。这些 AFE 可用于管理各种电池化学成分，例如锂离子、磷酸铁锂，等等。

通过 I<sup>2</sup>C，主机控制器可以使用 bq769x0 来执行很多电池组管理功能，诸如监视（电池电压、电池组电流、电池组温度），保护（控制充电/放电 FET），以及均衡功能。集成模数 (A/D) 转换器可实现对关键系统参数的纯数字读取，这些参数的校准在 TI 制造过程中处理。

(1) Product Preview only

Texas Instruments pre-configures the bq769x0 devices for a specific I<sup>2</sup>C address, LDO voltage, and more. These settings are permanently stored in EEPROM and cannot be further modified.

Contact Texas Instruments for other options not listed above, as well as any options noted as “Product Preview only.”

## 5 Pin Configuration and Functions

### 5.1 Versions

**Figure 5-1. Pin Versions**

bq76920: 3–5 Series Cells (20-TSSOP)

- 6.5 mm x 4.4 mm x 1.2 mm

bq76930: 6–10 Series Cells (30-TSSOP)

- 7.8 mm x 4.4 mm x 1.2 mm

bq76940: 9–15 Series Cells (44-TSSOP)

- 11.3 mm x 4.4 mm x 1.2 mm

(1) The Absolute Maximum Ratings for (TS1–VSS) apply after the device completes POR and should be observed after  $t_{BOOTREADY}$  (10 ms), following the application of the boot signal on TS1. Prior to completion of POR, TS1 should not exceed 5 V.

### 6.2 ESD Ratings

|             |                         |                                                              | VALUE | UNIT |
|-------------|-------------------------|--------------------------------------------------------------|-------|------|
| $V_{(ESD)}$ | Electrostatic discharge | Human body model (HBM) ESD stress voltage <sup>(1)</sup>     | ±2    | kV   |
|             |                         | Charged device model (CDM) ESD stress voltage <sup>(2)</sup> | ±500  | V    |

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 6.3 Recommended Operating Conditions

Over-operating free-air temperature range (unless otherwise noted). See [§ 8.1.1](#) for more information on cell configurations. All voltages are relative to VSS, except "Cell input differential."

- (1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report (SPRA953).
- (2) The junction-to-ambient thermal resistance under natural convection is obtained in a simulation on a JEDEC-standard, high-K board, as specified in JESD51-7, in an environment described in JESD51-2a.
- (3) The junction-to-case (top) thermal resistance is obtained by simulating a cold plate test on the package top. No specific JEDEC-standard test exists, but a close description can be found in the ANSI SEMI standard G30-88.
- (4) The junction-to-board thermal resistance is obtained by simulating in an environment with a ring cold plate fixture to control the PCB temperature, as described in JESD51-8.
- (5) The junction-to-top characterization parameter,  $\Psi_{JT}$ , estimates the junction temperature of a device in a real system and is extracted from the simulation data for obtaining  $R_{\theta JA}$ , using a procedure described in JESD51-2a (sections 6 and 7).
- (6) The junction-to-board characterization parameter,  $\Psi_{JB}$ , estimates the junction temperature of a device in a real system and is extracted from the simulation data for obtaining  $R_{\theta JA}$ , using a procedure described in JESD51-2a (sections 6 and 7).
- (7) The junction-to-case (bottom) thermal resistance is obtained by simulating a cold plate test on the exposed (power) pad. No specific JEDEC standard test exists, but a close description can be found in the ANSI SEMI standard G30-88.

## 6.5 Electrical Characteristics

Typical conditions are measured at 25°C with nominal BAT voltages of 18 V (bq76920), 36 V (bq76930), or 48 V (bq76940) with  $V_{CELL} = 4$  V. Min and max values include full recommended operating condition temperature range from –40°C to +85°C. Certain characteristics may be shown at different voltage or temperature ranges, as clarified in the Test Condition sections.

(1) Measured at BAT pin, rising.

## Electrical Characteristics (continued)

Typical conditions are measured at 25°C with nominal BAT voltages of 18 V (bq76920), 36 V (bq76930), or 48 V (bq76940) with  $V_{CELL} = 4$  V. Min and max values include full recommended operating condition temperature range from –40°C to +85°C. Certain characteristics may be shown at different voltage or temperature ranges, as clarified in the Test Condition sections.

(2) Values indicate nominal thresholds only. For Min and Max variation, apply OC<sub>OFFSET</sub> and OC<sub>SCALERR</sub>.

(3) Values indicate nominal thresholds only. For Min and Max variation, apply t<sub>PROTACC</sub>.

## Electrical Characteristics (continued)

Typical conditions are measured at 25°C with nominal BAT voltages of 18 V (bq76920), 36 V (bq76930), or 48 V (bq76940) with  $V_{CELL} = 4$  V. Min and max values include full recommended operating condition temperature range from –40°C to +85°C. Certain characteristics may be shown at different voltage or temperature ranges, as clarified in the Test Condition sections.

(4) MIN specifies the threshold below which the device will never register that an external alert has occurred. MAX specifies the minimum threshold above which the device will always register that an external alert has occurred.

## Electrical Characteristics (continued)

Typical conditions are measured at 25°C with nominal BAT voltages of 18 V (bq76920), 36 V (bq76930), or 48 V (bq76940) with  $V_{CELL} = 4$  V. Min and max values include full recommended operating condition temperature range from –40°C to +85°C. Certain characteristics may be shown at different voltage or temperature ranges, as clarified in the Test Condition sections.

## 7 Detailed Description

### 7.1 Overview

In the bq769x0 family of analog front-end (AFE) devices, the bq76920 device supports up to 5-series cells, the bq76930 device supports up to 10-series cells, and the bq76940 device supports up to 15-series cells. Via I<sup>2</sup>C, a host controller can use the bq769x0 to implement battery pack management functions, such as monitoring (cell voltages, pack current, pack temperatures), protection (controlling charge/discharge FETs), and balancing. Integrated A/D converters enable a purely digital readout of critical system parameters including cell voltages and internal or external temperature, with calibration handled in TI's manufacturing process. For an additional degree of pack reliability, the bq769x0 includes hardware protections for voltage (OV, UV) and current (OCD, SCD).

The bq769x0 provides two low-side FET drivers, charge (CHG) and discharge (DSG), which may be used to directly manipulate low-side power NCH FETs, or as signals that control an external circuit that enables high-side PCH or NCH FETs. A dedicated ALERT input/output pin serves as an interrupt signal to the host microcontroller, quickly informing the microcontroller of an updated status in the AFE. This may include a fault event or that a coulomb counter sample is available for reading. An available ALERT pin may also be driven externally by a secondary protector to provide a redundant means of disabling the CHG and DSG signals and higher system visibility.

### 7.2 Functional Block Diagram

图 7-1. Functional Block Diagram

## 7.3 Feature Description

### 7.3.1 Subsystems

bq769x0 consists of three major subsystems: Measurement, Protection, and Control. These work together to ensure that the fundamental battery pack parameters—voltage, current and temperature—are accurately captured and easily available to a host controller, while ensuring a baseline or secondary level of hardware protection in the event that a host controller is unable or unavailable to manage certain fault conditions.

#### 注

The bq769x0 is intended to serve as an analog front-end (AFE) as part of a chipset system solution: A companion microcontroller is required to oversee and control this AFE.

- The Measurement subsystem's core responsibility is to digitize the cell voltages, pack current (integrated into a passed charge calculation), external thermistor temperature, and internal die temperature. It also performs an automatic calculation of the total battery stack voltage, by simply adding up all measured cell voltages.
- The Protection subsystem provides a baseline or secondary level of hardware protections to better support a battery pack's FMEA requirements in the event of a loss of host control or simply if a host is unable to respond to a certain fault event in time. Integrated protections include pack-level faults such as OV, UV, OCD, SCD, detection of an external secondary protector fault, and internal logic "watchdog"-style device fault (XREADY). Protection events will trigger toggling of the ALERT pin, as well as automatic disabling of the DSG and/or CHG FET driver (depending on the fault). Recovery from a fault event must be handled by the host microcontroller.
- The Control subsystem implements a suite of useful pack features, including direct low-side NCH FET drivers, cell balancing drivers, the ALERT digital output, an external LDO and more.

The following sections describe each subsystem in greater detail, as well as explaining the various power states that are available.

#### 7.3.1.1 Measurement Subsystem Overview

The monitoring subsystem ensures that all cell voltages, temperatures, and pack current may be easily measured by the host. All ADCs are trimmed by TI.

ADC and CC data are always returned as atomic values if both high and low registers are read in the same transaction (using address auto-increment).

##### 7.3.1.1.1 Data Transfer to the Host Controller

The bq769x0 has a fully digital interface: All information is transferred through I<sup>2</sup>C, simply by reading and/or writing to the appropriate register(s) storing the relevant data. Block reads and writes, buffered by an 8-bit CRC code per byte, ensure a fast and robust transmission of data.

##### 7.3.1.1.2 14-Bit ADC

Each bq769x0 device measures cell voltages and temperatures using a 14-bit ADC. This ADC measures all differential cell voltages, thermistors and/or die temperature with a nominal full-scale unsigned range of 0–6.275 V and LSB of 382  $\mu$ V.

To enable the ADC, the [ADC\_EN] bit in the SYS\_CTRL1 register must be set. This bit is set automatically whenever the device enters NORMAL mode. When enabled, the ADC ensures that the integrated OV and UV protections are functional.

For each contiguous set of five cells (VC1 to VC5, VC6 to VC10), when no cells in that particular set are being balanced, each cell is measured over a 50-ms decimation window and a complete update is available every 250 ms. In the bq76930 and bq76940, every set of five cells above the primary five cells is measured in parallel. The 50-ms decimation greatly assists with removing the aliasing effects present in a noisy motor environment.

When any cells in a contiguous set of 5 cells are being balanced, those affected cells are measured in a reduced 12.5-ms decimation period, to allow the cell balancing to function properly without affecting the integrated OV and UV protections. Since cell balancing is typically only performed during pack charge or idle periods, the shortened decimation periods should not impact accuracy as the system noise during these times is greatly reduced. This reduced decimation period is only applied to sets where one of the cells is being balanced. The following summarizes this for the bq76920–bq76940 devices:

- VC1 to VC5 measurements are each taken in a 50-ms decimation period when all bits in CELLBAL1 register are 0, and a 12.5-ms decimation period when any bits in CELLBAL1 register are 1.
- VC6 to VC10 measurements are each taken in a 50-ms decimation period when all bits in CELLBAL2 register are 0, and a 12.5-ms decimation period when any bits in CELLBAL2 register are 1.
- VC11 to VC15 measurements are each taken in a 50-ms decimation period when all bits in CELLBAL3 register are 0, and a 12.5-ms decimation period when any bits in CELLBAL3 register are 1.
- Total update interval is 250 ms.

Each differential cell input is factory-trimmed for gain and/or offset, such that the resulting reading via I<sup>2</sup>C is always consistent from part-to-part and requires no additional calibration or correction factor application.

The ADC is required to be enabled in order for the integrated OV and UV protections to be operating.

The following shows how to convert the 14-bit ADC reading into an analog voltage. Each device is factory calibrated, with a GAIN and OFFSET stored into EEPROM.

The ADC transfer function is a linear equation defined as follows:

$$V(\text{cell}) = \text{GAIN} \times \text{ADC}(\text{cell}) + \text{OFFSET} \quad (1)$$

GAIN is stored in units of  $\mu\text{V}/\text{LSB}$ , while OFFSET is stored in mV units.

Some example cell voltage calculations are provided in the table below. For illustration purposes, the example uses a hypothetical GAIN of 380  $\mu\text{V}/\text{LSB}$  (ADCGAIN<4:0> = 0x0F) and OFFSET of 30 mV (ADCOFFSET<7:0> = 0x1E).

| 14-Bit ADC Result | ADC Result in Decimal | GAIN ( $\mu\text{V}/\text{LSB}$ ) | OFFSET (mV) | Cell Voltage (mV) |
|-------------------|-----------------------|-----------------------------------|-------------|-------------------|
| 0x1800            | 6144                  | 380                               | 30          | 2365              |
| 0x1F10            | 7952                  | 380                               | 30          | 3052              |

### 注

When entering NORMAL mode from SHIP mode, please allow for the following times before reading out initial cell voltage data:

bq76920: 250 ms

bq76930: 400 ms

bq76940: 800 ms

### 7.3.1.1.2.1 Optional Real-time Calibration Using the Host Microcontroller

The performance of the cell voltage values measured by the 14-bit ADC has a factory-calibrated accuracy, as follows:

- $\pm 10$  mV TYP,  $\pm 40$  mV MIN and MAX from 3.6 to 4.3 V,
- $\pm 15$  mV TYP,  $\pm 40$  mV MIN and MAX from 3.2 to 4.6 V, and
- $\pm 50$  mV MIN and MAX from 2.0 to 5.0 V

While this is suitable for the majority of pack protection and basic monitoring applications the bq769x0 AFE family is intended to support, certain systems may require a higher accuracy performance.

To achieve this, use an available ADC channel and general purpose output terminal on the host microcontroller paired with the bq769x0. A simple external circuit consisting of two precision resistors and a small-signal FET is activated by the host microcontroller to determine the total stack voltage,  $V_{STACK}$ . This is then compared against the sum of the individual cell voltages as measured by the internal ADC of the bq769x0. The resulting transfer function coefficient,  $GAIN_2$ , is simply applied to each cell voltage ADC value for improved accuracy.

图 7-2. External Real-Time Calibration Circuit to Host Microcontroller

The process is as follows:

- Periodically measure  $V_{STACK}$ .
  - $V_{STACK} = V_{AD} \times (R1 + R2) / R1$
- Read out all  $V_{CELL}$  ADC readings from the bq769x0 and apply the standard GAIN and OFFSET values stored in the bq769x0.
  - $V(1) = GAIN \times ADC_1 + OFFSET$ ,  $V(2) = GAIN \times ADC_2 + OFFSET$ , and so on
- Sum up all  $V_{CELL}$  values,  $V_{SUM}$ .
  - $V_{SUM} = V(1) + V(2) + V(3) \dots$
- Calculate  $GAIN_2$ .
  - $GAIN_2 = V_{STACK} / V_{SUM}$

As a general recommendation, a new  $GAIN_2$  function should be generated when the cell voltages increase or decrease by more than 100 mV. With  $GAIN_2$ , each cell voltage calculation becomes:

$$V(\text{cell}) = GAIN_2 \times (GAIN \times ADC(\text{cell}) + OFFSET) \quad (2)$$

For systems that do not require this additional in-use calibration function,  $GAIN_2$  is simply "1".

### 7.3.1.1.3 16-Bit CC

A 16-bit integrating ADC, commonly referred to as the coulomb counter (CC), provides measurements of accumulated charge across the current sense resistor. The integration period for this reading is 250 ms.

The CC may be operated in one of two modes: ALWAYS ON and 1-SHOT.

- In ALWAYS ON mode, the CC runs at 100%, gathering a fresh reading every 250 ms. The conclusion of each reading sets the CC\_READY bit, which toggles the ALERT pin high to inform the microcontroller that a new reading is available. To enable Always On mode, set  $[CC\_EN] = 1$ .
- In 1-SHOT mode, the CC performs a single 250-ms reading, and similarly sets the CC\_READY bit when completed. This mode is intended for non-gauging usages, where the host simply desires to check the pack current.

To enable a 1-SHOT reading, ensure  $[CC\_EN] = 0$  and set  $[CC\_ONESHOT] = 1$ .

The full scale range of the CC is  $\pm 270$  mV, with a max recommended input range of  $\pm 200$  mV, thus yielding an LSB of approximately 8.44  $\mu$ V.

The following equation shows how to convert the 16-bit CC reading into an analog voltage if no board-level calibration is performed:

$$\text{CC Reading (in } \mu\text{V)} = [\text{16-bit 2's Complement Value}] \times (8.44 \mu\text{V/LSB}) \quad (3)$$

| 16-Bit CC Result | ADC Result in Decimal | CC Reading (in $\mu$ V) |
|------------------|-----------------------|-------------------------|
| 0x0001           | 1                     | 8.44                    |
| 0x2710           | 10000                 | 84,400                  |
| 0x7D00           | 32000                 | 270,080                 |
| 0x8300           | –32000                | –270,080                |
| 0xC350           | –15536                | –131,123.84             |
| 0xFFFF           | –1                    | –8.44                   |

### 7.3.1.1.4 External Thermistor

One (bq76920), two (bq76930), or three (bq76940) 10 k $\Omega$  NTC 103AT thermistors may be measured by the device. These are measured by applying a factory-trimmed internal 10k pull-up resistance to an internal regulator value of nominally 3.3 V, the result of which can be read out from the TSx (TS1, TS2, TS3) registers.

To select thermistor measurement mode, set  $[TEMP\_SEL] = 1$ .

Thermistor TS1 is connected between TS1 and VSS; TS2 is connected between TS2 and VC5x (bq76930 and bq76940 only); and TS3 is connected between TS3 and VC10x (bq76940 only). These thermistors may be placed in various areas in the battery pack to measure such things as localized cell temperature, FET heating, etc.

The thermistor impedance may be calculated using the 14-bit ADC reading in the TS1/TS2/TS3 registers and 10k internal pull-up resistance as follows:

The following equations show how to use the 14-bit ADC readings in TS1, TS2, and TS3 to determine the resistance of the external 103AT thermistor:

$$V_{TSX} = (\text{ADC in Decimal}) \times 382 \mu\text{V/LSB} \quad (4)$$

$$R_{TS} = (10,000 \times V_{TSX}) \div (3.3 - V_{TSX}) \quad (5)$$

To convert the thermistor resistance into temperature, please refer to the thermistor component manufacturer's datasheet.

### 7.3.1.1.5 Die Temperature Monitor

#### 注

When switching between external and internal temperature monitoring, a 2-s latency may be incurred due to the natural scheduler update interval.

A die temperature block generates a voltage that is proportional to the die temperature, and provides a way of reducing component count if pack thermistors are not used or ensuring that the die power dissipation requirements are observed. The die is measured using the same on-board 14-bit ADC as the cell voltages.

To select internal die temperature measurement mode, set  $[TEMP\_SEL] = 0$ .

For bq76930 and bq76940, multiple die temperature measurements are available. These are stored in TS2 and TS3.

To convert a DIETEMP reading into temperature, refer to the following equation box. If more accurate temperature readings are needed from DIETEMP, the DIETEMP at room temperature value should be stored during production calibration.

The following equation shows how to use the 14-bit ADC readings in TS1, TS2, and TS3 when  $[TEMPSEL] = 0$  to determine the internal die temperature:

$$V_{25} = 1.200 \text{ V (nominal)} \quad (6)$$

$$V_{TSX} = (\text{ADC in Decimal}) \times 382 \mu\text{V/LSB} \quad (7)$$

$$TEMP_{DIE} = 25^\circ - ((V_{TSX} - V_{25}) \div 0.0042) \quad (8)$$

### 7.3.1.1.6 16-Bit Pack Voltage

Once converted to digital form, each cell voltage is added up and the summation result stored in the BAT registers. This 16-bit value has a nominal LSB of 1.532 mV.

The following shows how to convert the 16-bit pack voltage ADC reading into an analog voltage. This value also uses the GAIN and OFFSET stored into EEPROM.

The ADC transfer function is a linear equation defined as follows:

$$V_{(BAT)} = 4 \times \text{GAIN} \times \text{ADC}(\text{cell}) + (\# \text{Cells} \times \text{OFFSET}) \quad (9)$$

GAIN is stored in units of  $\mu\text{V/LSB}$ , while OFFSET is stored in mV units.

### 7.3.1.1.7 System Scheduler

A master scheduler oversees the monitoring intervals, creating a full update every 250 ms. Temperature measurements are taken every 2 seconds. Pack voltage is calculated every 250 ms.

## 7.3.1.2 Protection Subsystem

### 7.3.1.2.1 Integrated Hardware Protections

Integrated hardware protections are provided as an extra degree of safety and are meant to supplement the standard protection feature set that would be incorporated into the host controller firmware. They should not be used as the sole means of protecting a battery pack, but are useful for FMEA purposes; for example, in the event that a host microcontroller is unable to react to any of the below protection situations. All hardware protection thresholds and delays should be loaded into the AFE by the host microcontroller during system startup. The AFE will also default to pre-defined threshold and delay settings, in case the host microcontroller is unable to or does not wish to program the protection settings.

Overcurrent in Discharge (OCD) and Short Circuit in Discharge (SCD) are implemented using sampled analog comparators that run at 32 kHz, and that continuously monitor the voltage across (SRP–SRN) while the device is in NORMAL mode. Upon detection of a voltage that exceeds the programmed OCD or SCD threshold, a counter begins to count up to a programmed delay setting. If the counter reaches its target value, the SYS\_STAT register is updated to indicate the fault condition, the FET state(s) are updated as shown in

表 7-1, and the ALERT pin is driven high to interrupt the host.

The protection fault threshold and delay settings for OCD and SCD protections are configured via the PROTECT1 and PROTECT2 registers. See 节 7.5 for details about supported values.

Overvoltage (OV) and Undervoltage (UV) protections are handled digitally, by comparing the cell voltage readings against the 8-bit programmed thresholds in the OV and UV registers.

The OV threshold is stored in the OV\_TRIP register and is a direct mapping of 8 bits of the 14-bit ADC reading, with the upper 2 MSB preset to “10” and lower 4 LSB preset to “1000”. In other words, the corresponding OV trip level is mapped to “10-XXXX-XXXX-1000”. The programmable range of OV thresholds is approximately 3.15 to 4.7 V, but this is subject to variation due to the (GAIN, OFFSET) linear equation used to map the ADC values.

The UV threshold is stored in the UV\_TRIP register and is a direct mapping of 8 bits of the 14-bit ADC reading, with the upper 2 MSB preset to “01” and lower 4 LSB preset to “0000”. In other words, the corresponding UV trip level is mapped to “01-XXXX-XXXX-0000”. The programmable range of UV thresholds is approximately 1.58 to 3.1 V, but this is subject to variation due to the (GAIN, OFFSET) linear equation used to map the ADC values.

| Protection | Upper 2 MSB | Middle 8 Bits           | Lower 4 LSB |
|------------|-------------|-------------------------|-------------|
| OV         | 10          | Set in OV_TRIP Register | 1000        |
| UV         | 01          | Set in UV_TRIP Register | 0000        |

#### 注

To support flexible cell configurations within bq76920, bq76930, and bq76940, UV is ignored on any cells that have a reading under  $UV_{MINQUAL}$ . This allows cell pins to be shorted in implementations where not all cells are needed (for example, 6-series cells using the bq76930).

Default protection thresholds and delays are shown in the register description at the end of this datasheet. These are loaded into the digital register (RAM) of the device when the device enters NORMAL mode. These RAM values may then be overwritten by the host controller to any other values, which they will retain until a POR event. It is recommended that the host controller reload these values during its standard power-up and/or re-initialization sequence.

To calculate the correct OV\_TRIP and UV\_TRIP register values for a device, use the following procedure:

- Determine desired OV.
- Read out  $[ADCGAIN]$  and  $[ADCOFFSET]$  from their corresponding registers. Note that ADCGAIN is stored in units of  $\mu V/LSB$ , while ADCOFFSET is stored in mV.
- Calculate the full 14-bit ADC value needed to meet the desired OV and UV trip thresholds as follows:
  - $OV\_TRIP\_FULL = (OV - ADCOFFSET) \div ADCGAIN$
  - $UV\_TRIP\_FULL = (UV - ADCOFFSET) \div ADCGAIN$
- Remove the upper 2 MSB and lower 4 LSB from the full 14-bit value, retaining only the remaining middle 8 bits. This can be done by shifting the OV\_TRIP\_FULL and UV\_TRIP\_FULL binary values 4 bits to the right and removing the upper 2 MSB.
- Write OV\_TRIP and UV\_TRIP to their corresponding registers.

**表 7-1. CHG, DSG Response Under Various System Events (continued)**

| EVENT                       | [CHG_ON] | [DSG_ON] |
|-----------------------------|----------|----------|
| ALERT Override              | Set to 0 | Set to 0 |
| DEVICE_XREADY is set        | Set to 0 | Set to 0 |
| Enter SHIP mode from NORMAL | Set to 0 | Set to 0 |

### 注

All protection recovery must be initiated by the host microcontroller. In order to resume FET operation after a fault condition has occurred, the host microcontroller must first clear the corresponding status bit in the SYS\_STAT register, which will clear the ALERT pin, and then manually re-enable the CHG and/or DSG bit. Certain faults, such as OV or UV, may immediately re-toggle if such a condition still persists. Refer to 表 7-3 for details on clearing status bits.

There are no conditions under which the bq769x0 automatically sets either [CHG\_ON] or [DSG\_ON] to 1.

#### 7.3.1.3.2 Load Detection

A load detection circuit is present on the CHG pin and activated whenever the CHG FET is disabled ([CHG\_ON] = 0). This circuit detects if the CHG pin is externally pulled high when the high impedance (approximately 1 MΩ) pull-down path should actually be holding the CHG pin to VSS, and is useful for determining if the PACK– pin (outside of the AFE) is being held at a high voltage—for example, if the load is present while the power FETs are off. The state of the load detection circuit is read from the [LOAD\_PRESENT] bit of the SYS\_CTRL1 register.

After an OCD or SCD fault has occurred, the DSG FET will be disabled ([DSG\_ON] cleared), and the CHG FET must similarly be explicitly disabled to activate the load detection circuit. The host microcontroller may periodically poll the [LOAD\_PRESENT] bit to determine the state of the PACK– pin and determine when the load is removed ([LOAD\_PRESENT] = 0).

#### 7.3.1.3.3 Cell Balancing

Both internal and external passive cell balancing options are fully supported by the bq76920, while external cell balancing is recommended for bq76930 and bq76940. It is left to the host controller to determine the exact balancing algorithm to be used in any given system. Each bq769x0 device provides the cell voltages and balancing drivers to enable this. If using the internal cell balance drivers, up to 50 mA may be balanced per cell. If using external cell balancing, much higher balancing currents may be employed.

To activate a particular cell balancing channel, simply set the corresponding bit for that cell in the CELLBAL1, CELLBAL2, or CELLBAL3 register. For example, VC1–VC0 is enabled by setting [CB1], while VC12–VC11 is set via [CB12].

Multiple cells may be simultaneously balanced. It is left to the user's discretion to determine the ideal number of cells to concurrently balance. Adjacent cells should not be balanced simultaneously. This may cause cell pins to exceed their absolute maximum conditions and is also not recommended for external balancing implementations. Additionally, if internal balancing is used, care should be taken to avoid exceeding package power dissipation ratings.

### 注

The host controller must ensure that no two adjacent cells are balanced simultaneously within each set of the following:

- VC1–VC5
- VC6–VC10
- VC11–VC15

The total duty cycle devoted to balancing is approximately 70% per 250 ms. This is because a portion of the 250 ms is allotted for normal cell voltage measurements via the ADC.

If  $[ADC\_EN] = 1$ , OV and UV protections are not affected by cell balancing, since the cell balancing is temporarily suspended for a small slice of time every 250 ms during which the cell voltage readings are taken. This ensures that the OV and UV protections do not accidentally trigger, or miss an actual OV/UV condition on the cells while balancing is enabled.

#### 注

All cell balancing control bits in CELLBAL1, CELLBAL2, and CELLBAL3 are automatically cleared under the following events, and must be explicitly re-written by the host microcontroller following clearing of the event:

- DEVICE\_XREADY is set
- Enters NORMAL mode from SHIP mode

#### 7.3.1.3.4 Alert

The ALERT pin serves as an active high digital interrupt signal that can be connected to a GPIO port of the host microcontroller. This signal is an OR of all bits in the SYS\_STAT register.

In order to clear the ALERT signal, the source bit in the SYS\_STAT register must first be cleared by writing a “1” to that bit. This will cause an automatic clear of the ALERT pin once all bits are cleared.

The ALERT pin may also be driven by an external source; for example, the pack may include a secondary overvoltage protector IC. When the ALERT pin is forced high externally while low, the device will recognize this as an OVRD\_ALERT fault and set the  $[OVRD\_ALERT]$  bit. This triggers automatic disabling of both CHG and DSG FET drivers. The device cannot recognize the ALERT signal input high when it is already forcing the ALERT signal high from another condition.

The ALERT pin has no internal debounce support so care should be taken to protect the pin from noise or other parasitic transients.

#### 注

It is highly recommended to place an external 500 k $\Omega$ –1 M $\Omega$  pull-down resistor from ALERT to VSS as close to the IC as possible. Additional recommendations are:

- a) To keep all traces between the IC and components connected to the ALERT pin very short.
- b) To include a guard ring around the components connected to the ALERT pin and the pin itself.

#### 7.3.1.3.5 Output LDO

An adjustable output voltage regulator LDO is provided as a simple way to provide power to additional components in the battery pack, such as the host microcontroller or LEDs. The LDO is configured in EEPROM by TI during the production test process, and can support 2.5-V or 3.3-V options.

A cascode small-signal FET must be added in the external path between BAT and REGSRC with the bq76930 and bq76940. This helps drop most of the power dissipation outside of the package and cuts down on package power dissipation.

#### 7.3.1.4 Communications Subsystem

The AFE implements a standard 100-kHz I<sup>2</sup>C interface and acts as a slave device. The I<sup>2</sup>C device address is 7-bits and is factory programmed. Consult the Device Comparison Table ([Section 4](#)) of this datasheet for more information.

A write transaction is shown in 图 7-4. Block writes are allowed by sending additional data bytes before the Stop. The I<sup>2</sup>C block will auto-increment the register address after each data byte.

When enabled, the CRC is calculated as follows:

- In a single-byte write transaction, the CRC is calculated over the slave address, register address, and data.
- In a block write transaction, the CRC for the first data byte is calculated over the slave address, register address, and data. The CRC for subsequent data bytes is calculated over the data byte only.

The CRC polynomial is  $x^8 + x^2 + x + 1$ , and the initial value is 0.

When the slave detects a bad CRC, the I<sup>2</sup>C slave will NACK the CRC, which causes the I<sup>2</sup>C slave to go to an idle state.

图 7-4. I<sup>2</sup>C Write

图 7-5 shows a read transaction using a Repeated Start.

图 7-5. I<sup>2</sup>C Read with Repeated Start

图 7-6 shows a read transaction where a Repeated Start is not used, for example if not available in hardware. For a block read, the master ACK's each data byte except the last and continues to clock the interface. The I<sup>2</sup>C block will auto-increment the register address after each data byte.

When enabled, the CRC for a read transaction is calculated as follows:

- In a single-byte read transaction, the CRC is calculated after the second start and uses the slave address and data byte.
- In a block read transaction, the CRC for the first data byte is calculated after the second start and uses the slave address and data byte. The CRC for subsequent data bytes is calculated over the data byte only.

The CRC polynomial is  $x^8 + x^2 + x + 1$ , and the initial value is 0.

When the master detects a bad CRC, the I<sup>2</sup>C master will NACK the CRC, which causes the I<sup>2</sup>C slave to go to an idle state.

图 7-6. I²C Read Without Repeated Start

## 7.4 Device Functional Modes

Each bq769x0 device supports the following modes of operation.

表 7-2. Supported Power Modes

| Mode   | Description                                                                                                                                                                                                                                                                            |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NORMAL | Fully operational state. Both ADC and CC may be on, or disabled by host microcontroller. OV and UV protection enabled if ADC is on. OCD and SCD enabled. ADC and CC may be disabled to reduce power consumption, and CC may be operated in a “1-SHOT” mode for flexible power savings. |
| SHIP   | Lowest possible power state, intended for pack assembly and/or long term pack storage. Must see a BOOT signal (> 1 VBOOT) on TS1 pin to boot from SHIP → NORMAL. Note that the device always enters SHIP mode upon POR.                                                                |

### 7.4.1 NORMAL Mode

NORMAL mode represents the fully operational mode where all blocks are enabled and the device sees its highest current consumption. In this mode, certain blocks/functions may be disabled to save power—these include the ADC and CC. OV and UV are running continuously as long as the ADC is enabled. The OCD and SCD comparators may not be disabled in this mode.

Transitioning from NORMAL to SHIP mode is also initiated by the host, and requires consecutive writes to two bits in the SYS\_CTRL1 register.

### 7.4.2 SHIP Mode

SHIP mode is the basic and lowest power mode that bq769x0 supports. SHIP mode is automatically entered during initial pack assembly and after every POR event. When the device is in NORMAL mode, it may enter SHIP by the host controller via a specific sequence of I²C commands.

In SHIP mode, only a minimum of blocks are turned on, including the VSTUP power supply and primal boot detector. Waking from SHIP mode to NORMAL mode requires pulling the TS1 pin greater than VBOOT, which triggers the device boot-up sequence.

To enter SHIP mode from NORMAL mode, the *[SHUT\_A]* and *[SHUT\_B]* bits in the SYS\_CTRL1 register must be written with specific patterns across two consecutive writes:

- Write #1: *[SHUT\_A]* = 0, *[SHUT\_B]* = 1
- Write #2: *[SHUT\_A]* = 1, *[SHUT\_B]* = 0

Note that *[SHUT\_A]* and *[SHUT\_B]* should each be in a 0 state prior to executing the shutdown command above. If this specific sequence is entered into the device, the device transitions into SHIP mode. If any other sequence is written to the *[SHUT\_A]* and *[SHUT\_B]* bits or if either of the two patterns is not correctly entered, the device will not enter SHIP mode.

**CAUTION**

DO NOT OPERATE THE DEVICE BELOW POR. When designing with the bq76940, the intermediate voltages (BAT–VC10x), (VC10x–VC5x), and (VC5x–VSS) must each never fall below  $V_{SHUT}$ . When this occurs, a full device reset must be initiated by powering down all three intermediate voltages (BAT–VC10x), (VC10x–VC5x), and (VC5x–VSS) below  $V_{SHUT}$  and rebooting by applying the appropriate VBOOT signal to the TS1 pin. When designing with the bq76930, the intermediate voltages (BAT–VC5x) and (VC5x–VSS) must each never fall below  $V_{SHUT}$ . If this occurs, a full device reset must be initiated by powering down both intermediate voltages (BAT–VC5x) and (VC5x–VSS) below  $V_{SHUT}$  and rebooting by applying the appropriate VBOOT signal to the TS1 pin.

The device will also enter SHIP mode during a POR event; however, this is not a recommended method of SHIP mode entry. If any of the supply-side voltages below fall below  $V_{SHUT}$  and then back up above VPORA, the device defaults into the SHIP mode state. This is similar to an initial pack assembly condition. In order to exit SHIP mode into NORMAL mode, the device must follow the standard boot sequence by applying a voltage greater than the VBOOT threshold on the TS1 pin.

## 7.5 Register Maps

| Name                    | Addr | D7           | D6        | D5                         | D4         | D3         | D2         | D1     | D0     |
|-------------------------|------|--------------|-----------|----------------------------|------------|------------|------------|--------|--------|
| SYS_STAT                | 0x00 | CC_READY     | RSVD      | DEVICE_XREADY              | OVRD_ALERT | UV         | OV         | SCD    | OCD    |
| CELLBAL1                | 0x01 | RSVD         | RSVD      | RSVD                       | CB<5:1>    |            |            |        |        |
| CELLBAL2 <sup>(1)</sup> | 0x02 | RSVD         | RSVD      | RSVD                       | CB<10:6>   |            |            |        |        |
| CELLBAL3 <sup>(2)</sup> | 0x03 | RSVD         | RSVD      | RSVD                       | CB<15:11>  |            |            |        |        |
| SYS_CTRL1               | 0x04 | LOAD_PRESENT | RSVD      | RSVD                       | ADC_EN     | TEMP_SEL   | RSVD       | SHUT_A | SHUT_B |
| SYS_CTRL2               | 0x05 | DELAY_DIS    | CC_EN     | CC_ONESHOT                 | RSVD       |            |            | DSG_ON | CHG_ON |
| PROTECT1                | 0x06 | RSNS         | RSVD      | RSVD                       | SCD_DELAY  |            | SCD_THRESH |        |        |
| PROTECT2                | 0x07 | RSVD         | OCD_DELAY |                            |            | OCD_THRESH |            |        |        |
| PROTECT3                | 0x08 | UV_DELAY     |           | OV_DELAY                   |            | RSVD       |            |        |        |
| OV_TRIP                 | 0x09 | OV_THRESH    |           |                            |            |            |            |        |        |
| UV_TRIP                 | 0x0A | UV_THRESH    |           |                            |            |            |            |        |        |
| CC_CFG                  | 0x0B | RSVD         | RSVD      | Must be programmed to 0x19 |            |            |            |        |        |

### 7.5.1 Register Details

**表 7-3. SYS\_STAT (0x00)**

| BIT    | 7        | 6    | 5             | 4          | 3  | 2  | 1   | 0   |
|--------|----------|------|---------------|------------|----|----|-----|-----|
| NAME   | CC_READY | RSVD | DEVICE_XREADY | OVRD_ALERT | UV | OV | SCD | OCD |
| RESET  | 0        | 0    | 0             | 0          | 0  | 0  | 0   | 0   |
| ACCESS | RW       | RW   | RW            | RW         | RW | RW | RW  | RW  |

#### 注

Bits in SYS\_STAT may be cleared by writing a "1" to the corresponding bit.

Writing a "0" does not change the state of the corresponding bit.

**CC\_READY (Bit 7):** Indicates that a fresh coulomb counter reading is available. Note that if this bit is not cleared between two adjacent CC readings becoming available, the bit remains latched to 1. This bit may only be cleared (and not set) by the host.

0 = Fresh CC reading not yet available or bit is cleared by host microcontroller.

1 = Fresh CC reading is available. Remains latched high until cleared by host.

**RSVD (Bit 6):** Reserved. Do not use.

**DEVICE\_XREADY (Bit 5):** Internal chip fault indicator. When this bit is set to 1, it should be cleared by the host. May be set due to excessive system transients. This bit may only be cleared (and not set) by the host.

0 = Device is OK.

1 = Internal chip fault detected, recommend that host microcontroller clear this bit after waiting a few seconds. Remains latched high until cleared by the host.

**OVRD\_ALERT (Bit 4):** External pull-up on the ALERT pin indicator. Only active when ALERT pin is not already being driven high by the AFE itself.

0 = No external override detected

1 = External override detected. Remains latched high until cleared by the host.

**UV (Bit 3):** Undervoltage fault event indicator.

0 = No UV fault is detected.

1 = UV fault is detected. Remains latched high until cleared by the host.

**OV (Bit 2):** Overvoltage fault event indicator.

0 = No OV fault is detected.

1 = OV fault is detected. Remains latched high until cleared by the host.

**SCD (Bit 1):** Short circuit in discharge fault event indicator.

0 = No SCD fault is detected.

1 = SCD fault is detected. Remains latched high until cleared by the host.

**OCD (Bit 0):** Over current in discharge fault event indicator.

0 = No OCD fault is detected.

1 = OCD fault is detected. Remains latched high until cleared by the host.

**表 7-4. CELLBAL1 (0x01) for bq76920, bq76930, and bq76940**

| BIT    | 7 | 6 | 5 | 4   | 3   | 2   | 1   | 0   |
|--------|---|---|---|-----|-----|-----|-----|-----|
| NAME   | — | — | — | CB5 | CB4 | CB3 | CB2 | CB1 |
| RESET  | 0 | 0 | 0 | 0   | 0   | 0   | 0   | 0   |
| ACCESS | R | R | R | RW  | RW  | RW  | RW  | RW  |

**CBx (Bits 4–0):**

0 = Cell balancing on Cell “x” is disabled.

1 = Cell balancing on Cell “x” is enabled.

**表 7-5. CELLBAL2 (0x02) for bq76930 and bq76940**

| BIT    | 7 | 6 | 5 | 4    | 3   | 2   | 1   | 0   |
|--------|---|---|---|------|-----|-----|-----|-----|
| NAME   | — | — | — | CB10 | CB9 | CB8 | CB7 | CB6 |
| RESET  | 0 | 0 | 0 | 0    | 0   | 0   | 0   | 0   |
| ACCESS | R | R | R | RW   | RW  | RW  | RW  | RW  |

**CBx (Bits 4–0):**

0 = Cell balancing on Cell “x” is disabled.

1 = Cell balancing on Cell “x” is enabled.

**表 7-6. CELLBAL3 (0x03) for bq76940**

| BIT    | 7 | 6 | 5 | 4    | 3    | 2    | 1    | 0    |
|--------|---|---|---|------|------|------|------|------|
| NAME   | — | — | — | CB15 | CB14 | CB13 | CB12 | CB11 |
| RESET  | 0 | 0 | 0 | 0    | 0    | 0    | 0    | 0    |
| ACCESS | R | R | R | RW   | RW   | RW   | RW   | RW   |

**CBx (Bits 4–0):**

0 = Cell balancing on Cell “x” is disabled.

1 = Cell balancing on Cell “x” is enabled.

**表 7-7. SYS\_CTRL1 (0x04)**

| BIT    | 7            | 6 | 5 | 4      | 3        | 2    | 1      | 0      |
|--------|--------------|---|---|--------|----------|------|--------|--------|
| NAME   | LOAD_PRESENT | — | — | ADC_EN | TEMP_SEL | RSVD | SHUT_A | SHUT_B |
| RESET  | 0            | 0 | 0 | 0      | 0        | 0    | 0      | 0      |
| ACCESS | R            | R | R | RW     | RW       | RW   | RW     | RW     |

**LOAD\_PRESENT (Bit 7):** Valid only when [CHG\_ON] = 0. Is high if CHG pin is detected to exceed VLOAD\_DETECT while CHG\_ON = 0, which suggests that external load is present. Note this bit is read-only and automatically clears when load is removed.

0 = CHG pin < VLOAD\_DETECT or [CHG\_ON] = 1.

1 = CHG pin > VLOAD\_DETECT, while [CHG\_ON] = 0.

**ADC\_EN (Bit 4):** ADC enable command

0 = Disable voltage and temperature ADC readings (also disables OV protection)

1 = Enable voltage and temperature ADC readings (also enables OV protection)

**TEMP\_SEL (Bit 3):** TSx\_HI and TSx\_LO temperature source

0 = Store internal die temperature voltage reading in TSx\_HI and TSx\_LO

1 = Store thermistor reading in TSx\_HI and TSx\_LO (all thermistor ports)

**RSVD (Bit 2):** Reserved, do not set to 1.

**SHUT\_A, SHUT\_B (Bits 1–0):** Shutdown command from host microcontroller. Must be written in a specific sequence, shown below:

Starting from: [SHUT\_A] = 0, [SHUT\_B] = 0

Write #1: [SHUT\_A] = 0, [SHUT\_B] = 1

Write #2: [SHUT\_A] = 1, [SHUT\_B] = 0

Other writes cause the command to be ignored.

**表 7-8. SYS\_CTRL2 (0x05)**

| BIT    | 7         | 6     | 5          | 4    | 3    | 2    | 1      | 0      |
|--------|-----------|-------|------------|------|------|------|--------|--------|
| NAME   | DELAY_DIS | CC_EN | CC_ONESHOT | RSVD | RSVD | RSVD | DSG_ON | CHG_ON |
| RESET  | 0         | 0     | 0          | 0    | 0    | 0    | 0      | 0      |
| ACCESS | RW        | RW    | RW         | RW   | RW   | RW   | RW     | RW     |

**DELAY\_DIS (Bit 7):** Disable OV, UV, OCD, and SCD delays for faster customer production testing.

0 = Normal delay settings

1 = OV, UV, OCD, and SCD delay circuit is bypassed, creating zero delay (approximately 250 ms).

**CC\_EN (Bit 6):** Coulomb counter continuous operation enable command. If set high, [CC\_ONESHOT] bit is ignored.

0 = Disable CC continuous readings

1 = Enable CC continuous readings and ignore [CC\_ONESHOT] state

**CC\_ONESHOT (Bit 5):** Coulomb counter single 250-ms reading trigger command. If set to 1, the coulomb counter will be activated for a single 250-ms reading, and then turned back off.

[CC\_ONESHOT] will also be cleared at the conclusion of this reading, while [CC\_READY] bit will be set to 1.

0 = No action

1 = Enable single CC reading (only valid if [CC\_EN] = 0), and [CC\_READY] = 0)

**RSVD (Bit 4–2):** Reserved. Do not use.

**DSG\_ON (Bit 1):** Discharge FET driver (low side NCH) or discharge signal control

0 = DSG is off.

1 = DSG is on.

**CHG\_ON (Bit 0):** Discharge FET driver (low side NCH) or discharge signal control

0 = CHG is off.

1 = CHG is on.

**表 7-9. PROTECT1 (0x06)**

| Code | (in s) |
|------|--------|
| 0x0  | 1      |
| 0x1  | 4      |
| 0x2  | 8      |
| 0x3  | 16     |

**OV\_D1:0 (Bits 5–4):** Overvoltage delay setting

| Code | (in s) |
|------|--------|
| 0x0  | 1      |
| 0x1  | 2      |
| 0x2  | 4      |
| 0x3  | 8      |

**RSVD (Bits 3–0):** These bits are for TI internal debug use only and must be configured to the default settings indicated.

**表 7-12. OV\_TRIP (0x09)**

| BIT    | 7     | 6     | 5     | 4     | 3     | 2     | 1     | 0     |
|--------|-------|-------|-------|-------|-------|-------|-------|-------|
| NAME   | OV_T7 | OV_T6 | OV_T5 | OV_T4 | OV_T3 | OV_T2 | OV_T1 | OV_T0 |
| RESET  | 1     | 0     | 1     | 0     | 1     | 1     | 0     | 0     |
| ACCESS | RW    | RW    | RW    | RW    | RW    | RW    | RW    | RW    |

**OV\_T7:0 (Bits 7–0):** Middle 8 bits of the direct ADC mapping of the desired OV protection threshold, with upper 2 MSB set to 10 and lower 2 LSB set to 1000. The equivalent OV threshold is mapped to:  $10\text{-OV\_T}<7:0>1000$ .

By default, OV\_TRIP is configured to a 0xAC setting.

Note that OV\_TRIP is based on the ADC voltage, which requires back-calculation using the GAIN and OFFSET values stored in ADCGAIN<4:0> and ADCOFFSET<7:0>.

**表 7-13. UV\_TRIP (0x0A)**

| BIT    | 7     | 6     | 5     | 4     | 3     | 2     | 1     | 0     |
|--------|-------|-------|-------|-------|-------|-------|-------|-------|

| RESET  | 1     | 0     | 0     | 1     | 0     | 1     | 1     | 1     |
| ACCESS | RW    | RW    | RW    | RW    | RW    | RW    | RW    | RW    |

**UV\_T7:0 (Bits 7–0):** Middle 8 bits of the direct ADC mapping of the desired UV protection threshold, with upper 2 MSB set to 01 and lower 4 LSB set to 0000. In other words, the equivalent OV threshold is mapped to:  $01\text{-UV\_T}<7:0>0000$ .

By default, UV\_TRIP is configured to a 0x97 setting. .

Note that UV\_TRIP is based on the ADC voltage, which requires back-calculation using the GAIN and OFFSET values stored in ADCGAIN<4:0> and ADCOFFSET<7:0>.

**表 7-14. CC\_CFG REGISTER (0x0B)**

| BIT    | 7 | 6 | 5       | 4       | 3       | 2       | 1       | 0       |
|--------|---|---|---------|---------|---------|---------|---------|---------|
| NAME   | — | — | CC_CFG5 | CC_CFG4 | CC_CFG3 | CC_CFG2 | CC_CFG1 | CC_CFG0 |
| RESET  | 0 | 0 | 0       | 0       | 0       | 0       | 0       | 0       |
| ACCESS | R | R | RW      | RW      | RW      | RW      | RW      | RW      |

**CC\_CFG5:0 (Bits 5–0):** For optimal performance, these bits should be programmed to 0x19 upon device startup.

| NAME                                                                                                                                                                                                                                                                                                                                                                                                                     | D7 | D6 | D5  | D4  | D3  | D2  | D1 | D0 |
| RESET                                                                                                                                                                                                                                                                                                                                                                                                                    | 0  | 0  | 0   | 0   | 0   | 0   | 0  | 0  |

**D11:8 (Bits 3–0):** Cell “x” ADC reading, upper 6 MSB. Always returned as an atomic value if both high and low registers are read in the same transaction (using address auto-increment).

**D7:0 (Bits 7–0):** Cell “x” ADC reading, lower 8 LSB.

表 7-16. BAT\_HI (0x2A) and BAT\_LO (0x2B)

| BIT   | 7   | 6   | 5   | 4   | 3   | 2   | 1  | 0  |
|-------|-----|-----|-----|-----|-----|-----|----|----|
| NAME  | D15 | D14 | D13 | D12 | D11 | D10 | D9 | D8 |
| RESET | 0   | 0   | 0   | 0   | 0   | 0   | 0  | 0  |
| NAME  | D7  | D6  | D5  | D4  | D3  | D2  | D1 | D0 |
| RESET | 0   | 0   | 0   | 0   | 0   | 0   | 0  | 0  |

**D15:8 (Bits 7–0):** BAT calculation based on adding up Cells 1–15, upper 8 MSB. Always returned as an atomic value if both high and low registers are read in the same transaction (using address auto-increment).

**D7:0 (Bits 7–0):** BAT calculation based on adding up Cells 1–15, lower 8 LSB

表 7-17. TS1\_HI (0x2C) and TS1\_LO (0x2D)

| BIT   | 7  | 6  | 5   | 4   | 3   | 2   | 1  | 0  |
|-------|----|----|-----|-----|-----|-----|----|----|
| NAME  | —  | —  | D13 | D12 | D11 | D10 | D9 | D8 |
| RESET | 0  | 0  | 0   | 0   | 0   | 0   | 0  | 0  |
| NAME  | D7 | D6 | D5  | D4  | D3  | D2  | D1 | D0 |
| RESET | 0  | 0  | 0   | 0   | 0   | 0   | 0  | 0  |

**D11:8 (Bits 3–0):** TS1 or DIETEMP ADC reading, upper 6 MSB. Always returned as an atomic value if both high and low registers are read in the same transaction (using address auto-increment).

**D7:0 (Bits 7–0):** TS1 or DIETEMP ADC reading, lower 8 LSB

表 7-18. TS2\_HI (0x2E) and TS2\_LO (0x2F)

| BIT   | 7  | 6  | 5   | 4   | 3   | 2   | 1  | 0  |
|-------|----|----|-----|-----|-----|-----|----|----|
| NAME  | —  | —  | D13 | D12 | D11 | D10 | D9 | D8 |
| RESET | 0  | 0  | 0   | 0   | 0   | 0   | 0  | 0  |
| NAME  | D7 | D6 | D5  | D4  | D3  | D2  | D1 | D0 |
| RESET | 0  | 0  | 0   | 0   | 0   | 0   | 0  | 0  |

**D11:8 (Bits 3–0):** TS2 ADC reading, upper 6 MSB. Always returned as an atomic value if both high and low registers are read in the same transaction (using address auto-increment).

**D7:0 (Bits 7–0):** TS2 ADC reading, lower 8 LSB

表 7-19. TS3\_HI (0x30) and TS3\_LO (0x31)

| BIT   | 7  | 6  | 5   | 4   | 3   | 2   | 1  | 0  |
|-------|----|----|-----|-----|-----|-----|----|----|
| NAME  | —  | —  | D13 | D12 | D11 | D10 | D9 | D8 |

**ADCGAIN4:3 (Bits 3–2, address 0x50):**

ADC GAIN  
offset upper 2 MSB

**ADCGAIN2:0 (Bits 7–5, address 0x59):**

ADC GAIN offset lower 3 LSB

ADCGAIN<4:0> is a production-trimmed value for the ADC transfer function, in units of  $\mu\text{V}/\text{LSB}$ . The range is 365  $\mu\text{V}/\text{LSB}$  to 396  $\mu\text{V}/\text{LSB}$ , in steps of 1  $\mu\text{V}/\text{LSB}$ , and may be calculated as follows:

$$\text{GAIN} = 365 \mu\text{V}/\text{LSB} + (\text{ADCGAIN}<4:0>\text{in decimal}) \times (1 \mu\text{V}/\text{LSB})$$

Alternately, a conversion table is provided below:

| ADC GAIN | Gain ( $\mu\text{V}/\text{LSB}$ ) | ADC GAIN | Gain ( $\mu\text{V}/\text{LSB}$ ) |
|----------|-----------------------------------|----------|-----------------------------------|
| 0x00     | 365                               | 0x10     | 381                               |
| 0x01     | 366                               | 0x11     | 382                               |
| 0x02     | 367                               | 0x12     | 383                               |
| 0x03     | 368                               | 0x13     | 384                               |
| 0x04     | 369                               | 0x14     | 385                               |
| 0x05     | 370                               | 0x15     | 386                               |
| 0x06     | 371                               | 0x16     | 387                               |
| 0x07     | 372                               | 0x17     | 388                               |

**ADCOFFSET7:0 (Bits 7–0):**

ADC offset, stored in 2's complement format in mV units. Positive full-scale range corresponds to 0x7F and negative full-scale corresponds to 0x80. The full-scale input range is –128 mV to 127 mV, with an LSB of 1 mV.

The table below shows example offsets.

| ADCOFFSET | Offset (mV) |
|-----------|-------------|
| 0x00      | 0           |
| 0x01      | 1           |
| 0x7F      | 127         |
| 0x80      | –128        |
| 0x81      | –127        |
| 0xFF      | –1          |

## 8 Application and Implementation

### 注

Information in the following application section is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 8.1 Application Information

The bq769x0 family of battery monitoring AFEs enabling cell parametric measurement and protection is a variety of 3-series to 15-series Li-Ion/Li Polymer battery packs.

To evaluate the performance and configurations of the device users need the bq76940/bq76930/bq76920 Evaluation Software, ([SLUCC539](#)) tool to configure the internal registers for a specific battery pack and application. The Evaluation Software tool is a graphical user-interface tool installed on a PC during development. This can be used in conjunction with the bq76920EVM, bq76930EVM or bq76940EVM.

The bq769x0 devices are expected to be implemented in a system with a microcontroller that can perform additional functions based on the data made collected. The bq78350 is one example of a companion to the bq769x0 family.

#### 8.1.1 Configuring Alternative Cell Counts

Each bq769x0 family of IC's support a variety of cell counts. The following tables provide guidance on which device and which input pins to use, depending on the number of cells in the pack.

**表 8-1. Cell Connections for bq76920**

| Cell Input | 3 Cells | 4 Cells | 5 Cells |
|------------|---------|---------|---------|
| VC5–VC4    | CELL 3  | CELL 4  | CELL 5  |
| VC4–VC3    | short   | short   | CELL 4  |
| VC3–VC2    | short   | CELL 3  | CELL 3  |
| VC2–VC1    | CELL 2  | CELL 2  | CELL 2  |
| VC1–VC0    | CELL 1  | CELL 1  | CELL 1  |

**表 8-2. Cell Connections for bq76930**

| Cell Input | 6 Cells | 7 Cells | 8 Cells | 9 Cells | 10 Cells |
|------------|---------|---------|---------|---------|----------|

## 8.2 Typical Applications

## CAUTION

The external circuitries in the following schematics show minimum requirements to ensure device robustness during cell connection to the PCB and normal operation.

**图 8-1. bq76920 with bq78350 Companion Controller IC**

图 8-2. bq76930 with bq78350 Companion Controller IC

### 图 8-3. bq76940 与 bq78350 伴生控制器 IC

### 8.2.1 Design Requirements

### 表 8-4. bq769x0 Design Requirements

| DESIGN PARAMETER                 | EXAMPLE VALUE at TA = 25°C |
|----------------------------------|----------------------------|
| Minimum system operating voltage | 24 V                       |
| Cell minimum operating voltage   | 3.0 V                      |
| Series Cell Count                | 8                          |
| Charge Voltage                   | 33.6 V                     |
| Maximum Charge Current           | 3.0 A                      |
| Peak Discharge Current           | 10.0 A                     |
| OV Protection Threshold          | 4.30 V                     |
| OV Protection Delay              | 2s                         |
| UV Protection Threshold          | 2.5 V                      |

表 8-4. bq769x0 Design Requirements (continued)

| DESIGN PARAMETER             | EXAMPLE VALUE at TA = 25°C |
|------------------------------|----------------------------|
| UV Protection Delay          | 4s                         |
| OCD Protection Threshold Max | 15 A                       |
| OCD Protection Delay Time    | 320 ms                     |
| SCD Protection Threshold Max | 25 A                       |
| SCD Protection Delay Time    | 100 $\mu$ s                |

## 8.2.2 Detailed Design Procedure

To begin the design process, there are some key steps required for component selection and protection configuration.

### 8.2.2.1 Step-by-Step Design Procedure

- Determine the number of series cells.
  - This value depends on the cell chemistry and the load requirements of the system. For example, to support a minimum battery voltage of 24 V using Li-CO<sub>2</sub> type cells with a cell minimum voltage of 3.0 V, there needs to be at least 8-series cells.
- Select the correct bq769x0 device.
  - For 8-series cells, the bq76930 is needed.
  - For the correct cell connections, see 表 8-2.
- Select the correct protection FETs.
  - The bq76930 uses a low-side drive suitable for N-CH FETs.
  - These FETs should be rated for the maximum:
    - Voltage, which should be approximately 5 V (DC) 10 V (peak) per series cell: for example, 40 V.
    - Current, which should be calculated based on both the maximum DC current and the maximum transient current with some margin: for example, 30 A.
    - Power Dissipation, which can be a factor of the RDS(ON) rating of the FET, the FET package, and the PCB design: for example, 5 W, assuming 5 m $\Omega$  RDS(ON).
- Select the correct sense resistor.
  - The resistance value should be selected to maximize the input bandwidth use of the coulomb counter range, CC<sub>RANGE</sub>, but not exceed the absolute maximum ratings.
    - Using the normal max discharge current, RSNS = 200 mV / 10.0 A = 20 m $\Omega$ .
    - However, considering I<sub>SCD</sub> of 25 A and Abs Max SRP–SRN input of –300 mV, RSNS = 300 mV / 25 A = 7.5 m $\Omega$
    - The maximum operating current of the system should also be considered as this should be below the maximum OCD Threshold, which with a RSNS of 7.5 m $\Omega$  gives a max OCD current setting of 13.3 A.
  - Further tolerance analysis (value tolerance, temperature variation, and so on) and PCB design margin should also be considered, so RSNS of 5 m $\Omega$  would be suitable with a 75-ppm temperature coefficient and power rating of 5 W.
- The bq76930 is chosen, and so the REGSRC pin needs to be powered through a source follower circuit where the FET is used to provide current for REGSRC from the battery positive terminal while reducing the voltage to a suitable value for the IC.
  - The FET also dissipates the power resulting from the load current and dropped voltage external to the IC and care should be taken to ensure the correct dissipation ratings are specified by the chosen FET.

- Configure the Current-based protection settings through PROTECT1 and PROTECT2:
  - Ideal SCD Threshold =  $25\text{ A} \times 5\text{ m}\Omega = 125\text{ mV}$ .
    - However, the closest options are 111 mV (0x03) and 133 mV (0x04) providing 22.2 A and 26.6 A, respectively. Both options have the RSNS bit = 1.
    - 0x03 (22.2 A) will be used in this example.
  - The SCD delay threshold setting for a 100  $\mu\text{s}$  delay is 0x01.
  - Therefore, PROTECT1 should be programmed with 0x8C.
  - Ideal OCD Threshold =  $15\text{ A} \times 5\text{ m}\Omega = 75\text{ mV}$ .
    - However, the closest options are 72 mV (0x0A) and 78 mV (0x0B), providing 14.4 A and 15.6 A, respectively. Both options have the RSNS bit = 1.
    - 0x0A (14.4A) will be used in this example.
  - The OCD delay threshold setting for a 320-ms delay is 0x05.
  - Therefore, PROTECT2 should be programmed with 0x5B.

#### 注

Care should be taken when determining the setting of OV\_TRIP and UV\_TRIP as these are ADC value outputs and correlation to cell voltage also requires consideration of the ADC GAIN and ADC OFFSET registers. More specific details can be found in [节 7.3.1.2](#).

- Configure the Voltage-based protection settings through OV\_TRIP, UV\_TRIP and PROTECT3:
  - The selected OV Threshold is 4.30 V.
    - Therefore, OV\_TRIP should be programmed with 0xC9.
  - The selected UV Threshold is 2.5 V.
    - Therefore, UV\_TRIP should be programmed with 0x1A.
  - The selected OV Delay is 2 s and the selected UV Delay is 4 s.
    - Therefore, PROTECT3 should be programmed with 0x50.

### 8.2.3 Application Curves

图 8-4. bq76930 VCx Error Across Input Range @ 25°C

图 8-5. Coulomb Counter Offset

## 9 Power Supply Recommendations

The bq769x0 devices are powered through the BAT and REGSRC pins but the bq76930 and bq76940 have additional 'Power' pins to provide the power to the entire device in the higher cell configurations.

The use of Rf and Cf connected to the BAT pin, noted in the typical application diagrams, are required to filter system transients from disturbing the device power supply. These components should be placed as close as to the IC as possible.

Additionally, for the bq76930 and bq76940 there are additional requirements to ensure a stable power supply to the device. The REGSRC pin is powered through a source follower circuit where the FET is used to provide current for REGSRC from the battery positive terminal while reducing the voltage to a suitable value for the IC. The FET also dissipates the power resulting from the load current and dropped voltage external to the IC and care should be taken to ensure the correct dissipation ratings are specified by the chosen FET.

The bq76920 does not use a FET because the battery voltage is within the REGSRC range.

## 10 Layout

### 10.1 Layout Guidelines

It is strongly recommended for best measurement performance to keep high current signals from interfering with the measurement system inputs and ground.

A second key recommendation is to ensure that the bq769x0 input filtering capacitors and power capacitors are connected to a common ground with as little parasitic resistance between the connections as possible.

### 10.2 Layout Example

图 10-1 shows a guideline of how to place key components compared to respective ground zones, based on the bq76920/30/40 EVMs.

图 10-1. System Component Placement Layout vs. Ground Zone Guide

#### CAUTION

Care should be taken when placing key power pin capacitors to minimize PCB trace impedances. These impedances could result in device resets or other unexpected operations when the device is at peak power consumption.

Although not shown in the diagrams, this caution also applies to the resistor and capacitor network surrounding the current sense resistor.

### 11.4 静电放电警告

ESD 可能会损坏该集成电路。德州仪器 (TI) 建议通过适当的预防措施处理所有集成电路。如果不遵守正确的处理措施和安装程序，可能会损坏集成电路。

ESD 的损坏小至导致微小的性能降级，大至整个器件故障。精密的集成电路可能更容易受到损坏，这是因为非常细微的参数更改都可能会导致器件与其发布的规格不相符。

### 11.5 Glossary

**TI Glossary** This glossary lists and explains terms, acronyms, and definitions.

## 12 机械、封装和可订购信息

以下页中包括机械、封装和可订购信息。这些信息是针对指定器件可提供的最新数据。这些数据会在无通知且不对本文档进行修订的情况下发生改变。欲获得该数据表的浏览器版本，请查阅左侧的导航栏。

## 重要声明

德州仪器(TI) 及其下属子公司有权根据 JESD46 最新标准, 对所提供的产品和服务进行更正、修改、增强、改进或其它更改, 并有权根据 JESD48 最新标准中止提供任何产品和服务。客户在下订单前应获取最新的相关信息, 并验证这些信息是否完整且是最新的。所有产品的销售都遵循在订单确认时所提供的TI 销售条款与条件。

TI 保证其所销售的组件的性能符合产品销售时 TI 半导体产品销售条件与条款的适用规范。仅在 TI 保证的范围内, 且 TI 认为 有必要时才会使用测试或其它质量控制技术。除非适用法律做出了硬性规定, 否则没有必要对每种组件的所有参数进行测试。

TI 对应用帮助或客户产品设计不承担任何义务。客户应对其使用 TI 组件的产品和应用自行负责。为尽量减小与客户产品和应用相关的风险, 客户应提供充分的设计与操作安全措施。

TI 不对任何 TI 专利权、版权、屏蔽作品权或其它与使用了 TI 组件或服务的组合设备、机器或流程相关的 TI 知识产权中授予 的直接或隐含权限作出任何保证或解释。TI 所发布的与第三方产品或服务有关的信息, 不能构成从 TI 获得使用这些产品或服务 的许可、授权、或认可。使用此类信息可能需要获得第三方的专利权或其它知识产权方面的许可, 或是 TI 的专利权或其它 知识产权方面的许可。

对于 TI 的产品手册或数据表中 TI 信息的重要部分, 仅在没有对内容进行任何篡改且带有相关授权、条件、限制和声明的情况 下才允许进行复制。TI 对此类篡改过的文件不承担任何责任或义务。复制第三方的信息可能需要服从额外的限制条件。

在转售 TI 组件或服务时, 如果对该组件或服务参数的陈述与 TI 标明的参数相比存在差异或虚假成分, 则会失去相关 TI 组件 或服务的所有明示或暗示授权, 且这是不正当的、欺诈性商业行为。TI 对任何此类虚假陈述均不承担任何责任或义务。

客户认可并同意, 尽管任何应用相关信息或支持仍可能由 TI 提供, 但他们将独力负责满足与其产品及其应用中使用的 TI 产品 相关的所有法律、法规和安全相关要求。客户声明并同意, 他们具备制定与实施安全措施所需的全部专业技术和知识, 可预见 故障的危险后果、监测故障及其后果、降低有可能造成人身伤害的故障的发生机率并采取适当的补救措施。客户将全额赔偿因 在此类安全关键应用中使用任何 TI 组件而对 TI 及其代理造成的任何损失。

在某些场合中, 为了推进安全相关应用有可能对 TI 组件进行特别的促销。TI 的目标是利用此类组件帮助客户设计和创立其特 有的可满足适用的功能安全性标准 and 要求的终端产品解决方案。尽管如此, 此类组件仍然服从这些条款。

TI 组件未获得用于 FDA Class III (或类似的生命攸关医疗设备) 的授权许可, 除非各方授权官员已经达成了专门管控此类使 用的特别协议。

只有那些 TI 特别注明属于军用等级或“增强型塑料”的 TI 组件才是设计或专门用于军事/航空应用或环境的。购买者认可并同 意, 对并非指定面向军事或航空航天用途的 TI 组件进行军事或航空航天方面的应用, 其风险由客户单独承担, 并且由客户独 力负责满足与此类使用相关的所有法律和法规要求。

TI 已明确指定符合 ISO/TS16949 要求的产品, 这些产品主要用于汽车。在任何情况下, 因使用非指定产品而无法达到 ISO/TS16949 要 求, TI 不承担任何责任。

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSELETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

<sup>(4)</sup> There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

<sup>(5)</sup> Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

<sup>(6)</sup> Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

PW (R-PDSO-G20)

PLASTIC SMALL OUTLINE

- NOTES:
- A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
  - B. This drawing is subject to change without notice.
  - C. Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0,15 each side.
  - D. Body width does not include interlead flash. Interlead flash shall not exceed 0,25 each side.
  - E. Falls within JEDEC MO-153

PW (R-PDSO-G20)

PLASTIC SMALL OUTLINE

- NOTES:
- A. All linear dimensions are in millimeters.
  - B. This drawing is subject to change without notice.
  - C. Publication IPC-7351 is recommended for alternate design.
  - D. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525 for other stencil recommendations.
  - E. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

DBT (R-PDSO-G30)

PLASTIC SMALL OUTLINE

- NOTES:
- A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
  - B. This drawing is subject to change without notice.
  - C. Body dimensions do not include mold flash or protrusion.
  - D. Falls within JEDEC MO-153.

4220223/A 02/2017

## NOTES:

- All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
- This drawing is subject to change without notice.
- This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm per side.
- This dimension does not include interlead flash. Interlead flash shall not exceed 0.25 mm per side.
