

Digitally Controlled Potentiometer (XDCP™)

FEATURES

- Solid-state potentiometer
- 3-wire serial interface
- Terminal voltage, 0 to +15V
- 100 wiper tap points
 - Wiper position stored in nonvolatile memory and recalled on power-up
- 99 resistive elements
 - Temperature compensated
 - End to end resistance range $\pm 20\%$
- Low power CMOS
 - $V_{CC} = 5V$
 - Active current, 3mA max.
 - Standby current, 1mA max.
- High reliability
 - Endurance, 100,000 data changes per bit
 - Register data retention, 100 years
- R_{TOTAL} values = 10k Ω , 50k Ω , and 100k Ω
- Packages
 - 8-lead SOIC and DIP

DESCRIPTION

The Intersil X9312 is a digitally controlled potentiometer (XDCP). The device consists of a resistor array, wiper switches, a control section, and nonvolatile memory. The wiper position is controlled by a 3-wire interface.

The potentiometer is implemented by a resistor array composed of 99 resistive elements and a wiper switching network. Between each element and at either end are tap points accessible to the wiper terminal. The position of the wiper element is controlled by the $\overline{CS}$, $U/\overline{D}$, and $\overline{INC}$ inputs. The position of the wiper can be stored in nonvolatile memory and then be recalled upon a subsequent power-up operation.

The device can be used as a three-terminal potentiometer or as a two-terminal variable resistor in a wide variety of applications including:

- control
- parameter adjustments
- signal processing

BLOCK DIAGRAM

PIN DESCRIPTIONS

 R_H/V_H and R_L/V_L

The high (R_H/V_H) and low (R_L/V_L) terminals of the X9312 are equivalent to the fixed terminals of a mechanical potentiometer. The minimum voltage is 0V and the maximum is +15V. The terminology of R_L/V_L and R_H/V_H references the relative position of the terminal in relation to wiper movement direction selected by the $U/\overline{D}$ input and not the voltage potential on the terminal.

 R_W/V_W

R_W/V_W is the wiper terminal and is equivalent to the movable terminal of a mechanical potentiometer. The position of the wiper within the array is determined by the control inputs. The wiper terminal series resistance is typically 40 Ω .

Up/Down ($U/\overline{D}$)

The $U/\overline{D}$ input controls the direction of the wiper movement and whether the counter is incremented or decremented.

Increment ($\overline{INC}$)

The $\overline{INC}$ input is negative-edge triggered. Toggling $\overline{INC}$ will move the wiper and either increment or decrement the counter in the direction indicated by the logic level on the $U/\overline{D}$ input.

Chip Select ($\overline{CS}$)

The device is selected when the $\overline{CS}$ input is LOW. The current counter value is stored in nonvolatile memory when $\overline{CS}$ is returned HIGH while the $\overline{INC}$ input is also HIGH. After the store operation is complete the X9312 will be placed in the low power standby mode until the device is selected once again.

PIN CONFIGURATION

PIN NAMES

Symbol	Description
R_H/V_H	High terminal
R_W/V_W	Wiper terminal
R_L/V_L	Low terminal
V_{SS}	Ground
V_{CC}	Supply voltage
$U/\overline{D}$	Up/Down control input
$\overline{INC}$	Increment control input
$\overline{CS}$	Chip select control input

PRINCIPLES OF OPERATION

There are three sections of the X9312: the input control, counter and decode section; the nonvolatile memory; and the resistor array. The input control section operates just like an up/down counter. The output of this counter is decoded to turn on a single electronic switch connecting a point on the resistor array to the wiper output. Under the proper conditions the contents of the counter can be stored in nonvolatile memory and retained for future use. The resistor array is comprised of 99 individual resistors connected in series. At either end of the array and between each resistor is an electronic switch that transfers the potential at that point to the wiper.

The wiper, when at either fixed terminal, acts like its mechanical equivalent and does not move beyond the last position. That is, the counter does not wrap around when clocked to either extreme.

The electronic switches on the device operate in a "make before break" mode when the wiper changes tap positions. If the wiper is moved several positions, multiple taps are connected to the wiper for t_{WV} ($\overline{INC}$ to V_W change). The R_{TOTAL} value for the device can temporarily be reduced by a significant amount if the wiper is moved several positions.

When the device is powered-down, the last wiper position stored will be maintained in the nonvolatile memory. When power is restored, the contents of the memory are recalled and the wiper is set to the value last stored.

INSTRUCTIONS AND PROGRAMMING

The $\overline{\text{INC}}$, U/D and $\overline{\text{CS}}$ inputs control the movement of the wiper along the resistor array. With $\overline{\text{CS}}$ set LOW the device is selected and enabled to respond to the U/D and $\overline{\text{INC}}$ inputs. HIGH to LOW transitions on $\overline{\text{INC}}$ will increment or decrement (depending on the state of the U/D input) a seven bit counter. The output of this counter is decoded to select one of one hundred wiper positions along the resistive array.

The value of the counter is stored in nonvolatile memory whenever $\overline{\text{CS}}$ transitions HIGH while the $\overline{\text{INC}}$ input is also HIGH.

The system may select the X9312, move the wiper and deselect the device without having to store the latest wiper position in nonvolatile memory. After the wiper movement is performed as described above and once the new position is reached, the system must keep $\overline{\text{INC}}$ LOW while taking $\overline{\text{CS}}$ HIGH. The new wiper position will be maintained until changed by the system or until a powerup/down cycle recalled the previously stored data.

This procedure allows the system to always power-up to a preset value stored in nonvolatile memory; then during system operation minor adjustments could be made. The adjustments might be based on user preference, system parameter changes due to temperature drift, etc...

The state of U/D may be changed while $\overline{\text{CS}}$ remains LOW. This allows the host system to enable the device and then move the wiper up and down until the proper trim is attained.

MODE SELECTION

$\overline{\text{CS}}$	$\overline{\text{INC}}$	U/D	Mode
L		H	Wiper up
L		L	Wiper down
	H	X	Store wiper position
H	X	X	Standby current
	L	X	No store, return to standby

SYMBOL TABLE

WAVEFORM	INPUTS	OUTPUTS
	Must be steady	Will be steady
	May change from Low to High	Will change from Low to High
	May change from High to Low	Will change from High to Low
	Don't Care: Changes Allowed	Changing: State Not Known
	N/A	Center Line is High Impedance

ABSOLUTE MAXIMUM RATINGS

Temperature under bias -65°C to +135°C
 Storage temperature -65°C to +150°C
 Voltage on $\overline{CS}$, $\overline{INC}$, $U/\overline{D}$ and V_{CC}
 with respect to V_{SS} -1V to +7V
 $\Delta V = |V_H - V_L|$ 15V
 Lead temperature (soldering 10 seconds) 300°C
 I_W (10 seconds) ± 8.8 mA

COMMENT

Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only; functional operation of the device (at these or any other conditions above those listed in the operational sections of this specification) is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

RECOMMENDED OPERATING CONDITIONS

Temperature	Min.	Max.
Commercial	0°C	+70°C
Industrial	-40°C	+85°C

Supply Voltage (V_{CC})	Limits
X9312	5V $\pm 10\%$

POTENTIOMETER CHARACTERISTICS (Over recommended operating conditions unless otherwise stated.)

Symbol	Parameter	Limits				Test Conditions/Notes
		Min.	Typ.	Max.	Unit	
	End to end resistance tolerance			± 20	%	
V_{VH}	V_H terminal voltage	V_{SS}		15	V	$V_{SS} = 0V$
V_{VL}	V_L terminal voltage	V_{SS}		15	V	$V_{SS} = 0V$
	Power rating			25	mW	$R_{TOTAL} \geq 10k\Omega$
	Power rating			225	mW	$R_{TOTAL} = 1k\Omega$
R_W	Wiper resistance		40	100	Ω	$I_W = 1mA$, $V_{CC} = 5V$
I_W	Wiper current			± 4.4	mA	
	Noise		-120		dBV	Ref: 1kHz
	Resolution		1		%	
	Absolute linearity ⁽¹⁾			± 1	MI ⁽³⁾	$R_{W(n)(actual)} - R_{W(n)(expected)}$
	Relative linearity ⁽²⁾			± 0.2	MI ⁽³⁾	$R_{W(n+1)} - [R_{W(n)} + MI]$
	R_{TOTAL} temperature coefficient		± 300		ppm/°C	
	Ratiometric temperature coefficient			± 20	ppm/°C	
$C_H/C_L/C_W$	Potentiometer capacitances		10/10/25		pF	See circuit #3

- Notes: (1) Absolute linearity is utilized to determine actual wiper voltage versus expected voltage = ($V_{W(n)(actual)} - V_{W(n)(expected)}$) = ± 1 MI Maximum.
 (2) Relative linearity is a measure of the error in step size between taps = $R_{W(n+1)} - [R_{W(n)} + MI]$ = ± 0.2 MI.
 (3) 1 MI = Minimum Increment = $R_{TOT}/99$.

D.C. OPERATING CHARACTERISTICS (Over recommended operating conditions unless otherwise specified.)

Symbol	Parameter	Limits			Unit	Test Conditions
		Min.	Typ.(4)	Max.		
I_{CC}	V_{CC} active current (Increment)		1	3	mA	$\overline{CS} = V_{IL}$, $U/\overline{D} = V_{IL}$ or V_{IH} and $INC = 0.4V/2.4V$ @ max. t_{CYC}
I_{SB}	Standby supply current		500	1000	μA	$\overline{CS} = V_{CC} - 0.3V$, $U/\overline{D}$ and $INC = V_{SS}$ or $V_{CC} - 0.3V$
I_{LI}	$\overline{CS}$, INC , $U/\overline{D}$ input leakage current			± 10	μA	$V_{IN} = V_{SS}$ to V_{CC}
V_{IH}	$\overline{CS}$, INC , $U/\overline{D}$ input HIGH voltage	2		$V_{CC} + 1$	V	
V_{IL}	$\overline{CS}$, INC , $U/\overline{D}$ input LOW voltage	-1		0.8	V	
$C_{IN}^{(5)}$	$\overline{CS}$, INC , $U/\overline{D}$ input capacitance			10	pF	$V_{CC} = 5V$, $V_{IN} = V_{SS}$, $T_A = 25^\circ C$, $f = 1MHz$

ENDURANCE AND DATA RETENTION

Parameter	Min.	Unit
Minimum endurance	100,000	Data changes per bit
Data retention	100	Years

Notes: (4) Typical values are for $T_A = 25^\circ C$ and nominal supply voltage.

(5) This parameter is periodically sampled and not 100% tested.

Test Circuit #1**Test Circuit #2****Circuit #3 SPICE Macro Model****A.C. CONDITIONS OF TEST**

Input pulse levels	0V to 3V
Input rise and fall times	10ns
Input reference levels	1.5V

A.C. OPERATING CHARACTERISTICS (Over recommended operating conditions unless otherwise specified)

Symbol	Parameter	Limits			Unit
		Min.	Typ. ⁶	Max.	
t_{CI}	$\overline{CS}$ to $\overline{INC}$ setup	100			ns
t_{ID}	$\overline{INC}$ HIGH to $U/\overline{D}$ change	100			ns

t_{PU}^7	Power-up to wiper stable			500	μ s
$t_R V_{CC}^7$	V_{CC} power-up rate	0.2		50	V/ms

POWER-UP AND DOWN REQUIREMENTS

There are no restrictions on the sequencing of V_{CC} and the voltages applied to the potentiometer pins during power-up or power-down conditions. During power-up, the data sheet parameters for the DCP do not fully apply until 1 millisecond after V_{CC} reaches its final value. The V_{CC} ramp spec is always in effect.

A.C. TIMING

Notes: (6) Typical values are for $T_A = 25^\circ\text{C}$ and nominal supply voltage.

(7) This parameter is sample tested.

(8) MI in the A.C. timing diagram refers to the minimum incremental change in the V_W output due to a change in the wiper position.

APPLICATIONS INFORMATION

Electronic digitally controlled (XDCP) potentiometers provide three powerful application advantages; (1) the variability and reliability of a solid-state potentiometer, (2) the flexibility of computer-based digital controls, and (3) the retentivity of nonvolatile memory used for the storage of multiple potentiometer settings or data.

Basic Configurations of Electronic Potentiometers

Three terminal potentiometer;
variable voltage divider

Two terminal variable resistor;
variable current

Basic Circuits

Buffered Reference Voltage

$$V_{OUT} = V_W/R_W$$

Cascading Techniques

Noninverting Amplifier

$$V_O = (1 + R_2/R_1)V_S$$

Voltage Regulator

$$V_O (REG) = 1.25V (1 + R_2/R_1) + I_{adj} R_2$$

Offset Voltage Adjustment

Comparator with Hysteresis

$$V_{UL} = \{R_1/(R_1 + R_2)\} V_O(\max)$$

$$V_{LL} = \{R_1/(R_1 + R_2)\} V_O(\min)$$

(for additional circuits see AN115)
