INTRODUCTION

The S6B0728 is a driver and controller LSI for graphic dot-matrix liquid crystal display systems. It contains 128 common and 132 segment driver circuits. It is connected directly to a microprocessor, accepts serial or 8-bit parallel display data and stores in an on-chip display data RAM of 128 x 132 bits. It provides a highly flexible display section due to 1-to-1 correspondence between on-chip display data RAM bits and LCD panel pixels. And it performs display data RAM read/write operation with no external-operating clock to minimize power consumption. In addition, because it contains power supply circuits necessary to drive liquid crystal, it is possible to make a display system with the fewest components.

FEATURES

Driver Output Circuits

- 128 common outputs / 132 segment outputs

Applicable Duty-ratios

Programmable duty ratio	Applicable LCD bias	Maximum display area
1/16 to 1/128	1/5 to 1/12	128 × 132

- Various partial display
- Partial window moving & data scrolling

On-chip Display Data RAM

- Capacity: 128 x 132 = 16,896 bits
- Bit data "1": a dot of display is illuminated
- Bit data "0": a dot of display is not illuminated

Microprocessor Interface

- 8-bit parallel bi-directional interface with 6800-series or 8080-series
- Serial interface(only write operation) with 4-pin or 3-pin SPI(Serial Peripheral Interface)

On-chip Low Power Analog Circuit

- On-chip oscillator circuit
- Voltage converter (x3, x4, x5, x6 or x7)
- Voltage regulator (temperature coefficient: -0.05%/°C or external input)
- On-chip electronic contrast control function (64 steps)
- Voltage follower (LCD bias: 1/5 to 1/12)

Operating Voltage Range

- Supply voltage (V_{DD}): 2.4 to 3.6 [V]
- LCD driving voltage (V_{LCD} = V_O - V_{SS}): 4.0 to 17.0 [V]

Low Power Consumption

- TBD mA Typ. (V_{DD} = 3V, x6 boosting, V_O = 15V, Internal power supply ON and display OFF)
- TBD mA Max. (during power save [standby] mode)

Package Type

- Gold bumped chip or TCP

PIN DESCRIPTION

Table 3. Power Supply Pins

Name	I/O	Description				
VDD	Supply	Power supply				
Vss	Supply	Ground				
V0 V1 V2 V3 V4	I/O	LCD drivers supply voltages The voltage determined by LCD pixel is impedance-converted by an operational amplifier for application. Voltages should have the following relationship: $V0 \geq V1 \geq V2 \geq V3 \geq V4 \geq Vss$ When the internal power circuit is active, these voltages are generated as following table according to the state of LCD bias.				
		LCD bias	V1	V2	V3	V4
		1/N bias	(N-1)/N x V0	(N-2)/N x V0	2/N x V0	1/N x V0
		NOTE : *N = 5 to 12				

Table 4. LCD Driver Supply Pins

Name	I/O	Description
C1-, C2-	I/O	Capacitor negative connection pins used for voltage converter
C1+, C2+ C3+, C4+ C5+, C6+	I/O	Capacitor positive connection pins used for voltage converter
VOUT	I/O	Voltage converter input/output pin. $VOUT = \text{Boost level} \times VCI$, for internal booster
VCI	I	Voltage converter input voltage pin for internal booster.
VR	I	V0 voltage adjustment pin used to adjust V0 by means of external resistors(INTRS = "L")
REF	I	Selects the external VREF voltage via VEXT pin – REF = "L": using the external VREF – REF = "H": using the internal VREF
VEXT	I	Externally-input reference voltage(VREF) for the internal voltage regulator. It is valid only when REF is "L".
INTRS	I	Internal resistors select pin used to select resistors for adjusting V0 voltage level. – INTRS = "H": use the internal resistors. – INTRS = "L": use the external resistors. VR pin and external resistive divider control V0 voltage.

Table 5. Microprocessor Interface Pins

Name	I/O	Description					
RESETB	I	Reset input pin. When RESETB is “L”, initialization is executed.					
PS	I	Parallel / Serial data input select input					
		PS	Interface mode	Data / instruction	Data	Read / Write	Serial clock
		H	Parallel	RS	DB0 to DB7	E_RD RW_WR	-
		L	Serial	RS	SID (DB7)	Write only	SCLK (DB6)
		*NOTE: When PS is “L”, DB0 to DB5 are high impedance and E_RD and RW_WR must be fixed to either “H” or “L”.					
C68	I	Microprocessor interface(PS = “H”) / Register Select(PS = “L”)input pin					
		PS		C68	Interface mode		
		H	H	6800-series MPU mode			
			L	8080-series MPU mode			
		L	H	4-Pin SPI MPU mode			
			L	3-Pin SPI MPU mode			
CS1B CS2	I	Chip select input pins Data / instruction I/O is enabled only when CS1B is “L” and CS2 is “H”. When chip select is non-active, DB0 to DB7 may be high impedance.					
RS	I	Register select input pin – RS = “H”: DB0 to DB7 are display data – RS = “L”: DB0 to DB7 are control data					
RW_WR	I	Read / Write execution control pin					
		C68	MPU Type	RW_WR	Description		
		H	6800-series	RW	Read/Write control input pin – RW = “H”: read – RW = “L”: write		
		L	8080-series	/WR	Write enable clock input pin The data on DB0 to DB7 are latched at the rising edge of the /WR signal.		

Table 5. Microprocessor Interface Pins (Continued)

Name	I/O	Description			
E_RD	I	Read / Write execution control pin			
		C68	MPU type	E_RD	Description
		H	6800-series	E	Read / Write control input pin – RW = "H": When E is "H", DB0 to DB7 are in an output status. – RW = "L": The data on DB0 to DB7 are latched at the falling edge of the E signal.
		L	8080-series	/RD	Read enable clock input pin When /RD is "L", DB0 to DB7 are in an output status.
DB0 to DB7	I/O	8-bit bi-directional data bus that is connected to the standard 8-bit microprocessor data bus. When the serial interface selected (PS = "L"); – DB0 to DB5: high impedance – DB6: serial input clock (SCLK) – DB7: serial input data (SID). When chip select is not active, DB0 to DB7 may be high impedance.			

Table 6. Test Pins

Name	I/O	Description
TEST1 to TEST3	I	Test pins Don't use these pins.

Table 7. LCD driver output pins

Name	I/O	Description			
SEG0 to SEG131	O	LCD segment driver outputs The display data and the M signal control the output voltage of segment driver.			
		Display data	M	Segment driver output voltage	
				Normal display	Reverse display
		H	H	V0	V2
		H	L	Vss	V3
		L	H	V2	V0
		L	L	V3	Vss
		Power save mode		Vss	Vss
COM0 to COM127	O	LCD common driver outputs The internal scanning data and M signal control the output voltage of common driver.			
		Scan data	M	Common driver output voltage	
		H	H	Vss	
		H	L	V0	
		L	H	V1	
		L	L	V4	
		Power save mode		Vss	

FUNCTIONAL DESCRIPTION

MICROPROCESSOR INTERFACE

Chip Select Input

There are CS1B and CS2 pins for chip selection. The S6B0728 can interface with an MPU only when CS1B is "L" and CS2 is "H". When these pins are set to any other combination, RS, E_RD, and RW_WR inputs are disabled and DB0 to DB7 are to be high impedance. And, in case of serial interface, the internal shift register and the counter are reset.

Parallel / Serial Interface

The S6B0728 has four types of interface with an MPU, which are two serial and two parallel interfaces. This parallel or serial interface is determined by PS pin as shown in **Table 8**.

Table 8. Parallel / Serial Interface Mode.

PS	Type	CS1B	CS2	C68	Interface mode
H	Parallel	CS1B	CS2	H	6800-series MPU mode
				L	8080-series MPU mode
L	Serial	CS1B	CS2	H	4-Pin SPI MPU mode
				L	3-Pin SPI MPU mode

Parallel Interface (PS = "H")

The 8-bit bi-directional data bus is used in parallel interface and the type of MPU is selected by C68 as shown in **Table 9**. The type of data transfer is determined by signals at RS, E_RD and RW_WR as shown in **Table 10**.

Table 9. Microprocessor Selection for Parallel Interface

C68	CS1B	CS2	RS	E_RD	RW_WR	DB0 to DB7	MPU bus
H	CS1B	CS2	RS	E	RW	DB0 to DB7	6800-series
L	CS1B	CS2	RS	/RD	/WR	DB0 to DB7	8080-series

Table 10. Parallel Data Transfer

Common	6800-series		8080-series		Description
RS	E_RD (E)	RW_WR (RW)	E_RD (/RD)	RW_WR (/WR)	
H	H	H	L	H	Read display data
H	H	L	H	L	Write display data
L	H	H	L	H	Read out internal status register
L	H	L	H	L	Write instruction data

Serial Interface (PS = "L")

Communication with the microprocessor occurs via a clock-synchronized serial peripheral interface when PS is low. When using the serial interface, read operations are not allowed. . When the chip select inputs are valid (CS1B = "L" & CS2 = "H"), the serial data is sent most significant bit first on the rising edge of a serial clock going into DB6 and processed as 8-bit parallel data on the eighth clock. Since the clock signal is easy to be affected by the external noise caused by the line length, the operation check on the actual machine is recommended. And not valid, the internal 8-bit shift register and the 3-bit counter are reset.

The serial interface type is selected by setting C68 as shown in **Table 11**.

Table 11. Microprocessor Selection for Serial Interface

C68	Serial interface mode	Chip Select	Register Select	Serial Data / Clock input
H	4-Pin SPI	CS1B, CS2	by RS pin	DB7 / DB6
L	3-Pin SPI	CS1B, CS2	by software	DB7 / DB6

4-Pin SPI Interface (PS = "L", C68 = "H")

In 4-pin SPI interface mode, RS pin is used for indicating whether serial data input is display or instruction data. Data is display data when RS is high and instruction data when RS is low.

Figure 3. 4-Pin SPI Timing (RS is used)

3-Pin SPI Interface (PS = "L" , C68 = "L")

In 3-Pin SPI Interface mode, the pre-defined instruction called Display Data Length, is used to indicate whether serial data input is display or instruction data instead of RS pin. The data is handled as instruction data until the Display Data Length instruction is issued. This Display Data Length instruction consists two bytes instruction. The first byte instruction enables the next instruction to be valid, and the data of the second byte indicates that a specified number of display data bytes(1 to 256) are to be transmitted. The next byte after the display data string is handled as instruction data. For details, refers the Figure 4.

Figure 4. 3 Pin SPI Timing (RS is not used)

*NOTES:

- In spite of transmission of data, if CS1B will be disable, state terminates abnormally. Next state is initialized.
- The number of writing display data = DDL register value + 1

Busy Flag

The Busy Flag indicates whether the S6B0728 is operating or not. When DB7 is "H" in read status operation, this device is in busy status and will accept only read status instruction. If the cycle time is correct, the microprocessor needs not to check this flag before each instruction, which improves the MPU performance.

Data Transfer

The S6B0728 uses bus holder and internal data bus for data transfer with the MPU. When writing data from the MPU to on-chip RAM, data is automatically transferred from the bus holder to the RAM as shown in figure 4. And when reading data from on-chip RAM to the MPU, the data for the initial read cycle is stored in the bus holder (dummy read) and the MPU reads this stored data from bus holder for the next data read cycle as shown in figure 5. This means that a dummy read cycle must be inserted between each pair of address sets when a sequence of address sets is executed. Therefore, the data of the specified address cannot be output with the read display data instruction right after the address sets, but can be output at the second read of data.

Figure 5. Write Timing

Figure 6. Read Timing

DISPLAY DATA RAM (DDRAM)

The Display Data RAM stores pixel data for the LCD. It is 128-row by 132-column addressable array. Each pixel can be selected when the page and column addresses are specified. The 128 rows are divided into 16 pages of 8 lines. Data is read from or written to the 8 lines of each page directly through DB0 to DB7. The display data of DB0 to DB7 from the microprocessor correspond to the LCD common lines as shown in figure 6. The microprocessor can read from and write to RAM through the I/O buffer. Since the LCD controller operates independently, data can be written into RAM at the same time as data is being displayed without causing the LCD flicker.

Figure 7. RAM-to-LCD Data Transfer

Page Address Circuit

This circuit is for providing a page address to Display Data RAM shown in figure 8. It incorporates 4-bit page address register changed by only the "Set Page" instruction.

Line Address Circuit

This circuit assigns DDRAM a line address corresponding to the first line (COM0) of the display. Therefore, by setting line address repeatedly, it is possible to realize the screen scrolling and page switching without changing the contents of on-chip RAM as shown in figure 7. It incorporates 7-bit line address register changed by only the initial display line instruction and 7-bit counter circuit. At the beginning of each LCD frame, the contents of register are copied to the line counter which is increased by internal latch signal and generates the Line Address for transferring the 132-bit RAM data to the display data latch circuit. However, display data of icons are not scrolled because the MPU can not access Line Address of icons.

Column Address Circuit

Column Address circuit has an 8-bit preset counter that provides Column Address to the Display Data RAM as shown in figure 8. When set Column Address MSB / LSB instruction is issued, 8-bit [Y7:Y0] is updated. And, since this address is increased by 1 each a read or write data instruction, microprocessor can access the display data continuously. However, the counter is not incremented and locked if a non-existing address above 83H. It is unlocked if a column address is set again by set Column Address MSB / LSB instruction. And the Column Address counter is independent of page address register.

ADC select instruction makes it possible to invert the relationship between the Column Address and the segment outputs. It is necessary to rewrite the display data on built-in RAM after issuing ADC select instruction. Refer to the following figure 7.

SEG Output	SEG 0	SEG 1	SEG 2	SEG 3		SEG 128	SEG 129	SEG 130	SEG 131
Column address [Y7:Y0]	00H	01H	02H	03H		80H	81H	82H	83H
Display data	1	0	1	0		1	1	0	0
LCD panel display (ADC = 0)									
									
LCD panel display (ADC = 1)									

Figure 8. The Relationship between the Column Address and The Segment Outputs

Segment Control Circuit

This circuit controls the display data by the display ON / OFF, reverse display ON / OFF and entire display ON / OFF instructions without changing the data in the display data RAM.

Figure 9. Display Data RAM Map

LCD DISPLAY CIRCUITS

Oscillator

This is completely on-chip Oscillator and its frequency is nearly independent of V_{DD} . This oscillator signal is used in the voltage converter and display timing generation circuit.

Display Timing Generator Circuit

This circuit generates some signals to be used for displaying LCD. The internal display clock, CL, generated by oscillation clock, generates the clock for the line counter and the signal for the display data latch. The line address of on-chip RAM is generated in synchronization with the display clock (CL) and the display data latch circuit in synchronization latches the 132-bit display data with the display clock. The display data, which is read to the LCD driver, is completely independent of the access to the display data RAM from the microprocessor. The display clock generates an LCD AC signal (M) which enables the LCD driver to make a AC drive waveform, and also generates an internal common timing signal and start signal to the common driver. The frame or the line changes the phase of M by setting internal instruction. Driving waveform and internal timing signal are shown in figure 10.

Figure 10. 2-frame AC Driving Waveform (Duty Ratio = 1/85)

Figure 11. N-line Inversion Driving Waveform (N = 5, Duty Ratio = 1/85)

LCD DRIVER CIRCUIT

128-channel common driver and 132-channel segment driver configure this driver circuit. This LCD panel driver voltage depends on the combination of display data and M signal.

Figure 12. Segment and Common Timing

Partial Display on LCD

The S6B0728 realizes the partial display function on LCD with low-duty driving for saving power consumption and showing the various display duties. To show the various display duties on LCD, LCD driving duty and bias are programmable via the instruction. And, built-in power supply circuits are controlled by the instruction for adjusting the LCD driving voltages

Figure 13. Reference Example for Partial Display

POWER SUPPLY CIRCUITS

The Power Supply circuits generate the voltage levels necessary to drive liquid crystal driver circuits with low-power consumption and the fewest components. There are voltage converter circuits, voltage regulator circuits, and voltage follower circuits. They are valid only in master operation and controlled by power control instruction. For details, refers to "Instruction Description". Table 12 shows the referenced combinations in using Power Supply circuits.

Table 12. Recommended Power Supply Combinations

User setup	Power control (VC VR VF)	V/C circuits	V/R circuits	V/F circuits	VOUT	V0	V1 to V4
Only the internal power supply circuits are used	1 1 1	ON	ON	ON	Open	Open	Open
Only the voltage regulator circuits and voltage follower circuits are used	0 1 1	OFF	ON	ON	External input	Open	Open
Only the voltage follower circuits are used	0 0 1	OFF	OFF	ON	External input	Open	Open
Only the external power supply circuits are used	0 0 0	OFF	OFF	OFF	Open	External input	External input

Voltage Converter Circuits

These circuits boost up the electric potential between VCI and VSS to 3, 4, 5, 6 or 7 times toward positive side and boosted voltage is outputted from VOUT pin. It is possible to select the lower boosting level in any boosting circuit by "Set DC-DC Step-up" instruction. When the higher level is selected by instruction, VOUT voltage is not valid.

[C1 = 1.0 to 4.7 mF]

Figure 14. Boosting Circuits

Voltage Regulator Circuits

The function of the internal voltage regulator circuits is to determine liquid crystal operating voltage, V_0 , by adjusting resistors, R_a and R_b , within the range of $|V_0| < |V_{OUT}|$. Because V_{OUT} is the operating voltage of operational-amplifier circuits shown in figure 19, it is necessary to be applied internally or externally.

For the Eq. 6-1, we determine V_0 by R_a , R_b and V_{EV} . The R_a and R_b are connected internally or externally by INTRS pin. And V_{EV} called the voltage of electronic volume is determined by Eq. 6-2, where the parameter α is the value selected by instruction, "Set Reference Voltage Register", within the range 0 to 63. V_{REF} voltage at $T_a = 25^\circ\text{C}$ is shown in Table 13.

$$V_0 = (1 + (R_b / R_a)) \times V_{EV} \quad [\text{V}] \text{ ----- (Eq. 6-1)}$$

$$V_{EV} = (1 - ((63 - \alpha) / 200)) \times V_{REF} \quad [\text{V}] \text{ ----- (Eq. 6-2)}$$

Table 13. V_{REF} Voltage at $T_a = 25^\circ\text{C}$

REF	Temp. coefficient	V_{REF} [V]
1	-0.05% / $^\circ\text{C}$	2.0
0	External input	V_{EXT}

Figure 15. Internal Voltage Regulator Circuit

In Case of Using Internal Resistors, Ra and Rb (INTRS = "H")

When INTRS pin is "H", resistor Ra is connected internally between VR pin and Vss, and Rb is connected between V0 and VR. We determine V0 by two instructions, "Regulator Resistor Select" and "Set Reference Voltage".

	3-bit data settings (R2 R1 R0)							
	0 0 0	0 0 1	0 1 0	0 1 1	1 0 0	1 0 1	1 1 0	1 1 1
$1 + (R_b / R_a)$	2.6	3.4	4.2	5.0	5.8	6.6	7.4	8.3

Table 14. Internal Rb / Ra ratio Depending on 3-bit Data (R2 R1 R0)

Figure 16 shows V0 voltage measured by adjusting internal regulator register ratio (Rb / Ra) and 6-bit electronic volume registers for each temperature coefficient at Ta = 25 °C.

Figure 16. V0 Voltage by $1 + (R_b / R_a)$ and Electronic Volume Levels

In Case of Using External Resistors, Ra and Rb (INTRS = "L")

When INTRS pin is "L", it is necessary to connect external regulator resistor Ra between VR and VSS, and Rb between V0 and VR.

Example: For the following requirements

1. LCD driver voltage, $V_0 = 10V$
2. 6-bit reference voltage register = (1, 0, 0, 0, 0, 0)
3. Maximum current flowing Ra, Rb = $1 \mu A$

From Eq. 6.1

$$10 = (1 + (R_b / R_a)) \times V_{EV} \quad [V] \text{ ----- (Eq. 6.3)}$$

From Eq. 6.2

$$V_{EV} = (1 - ((63 - 32) / 200)) \times 2.0 = 1.69 \quad [V] \text{ ----- (Eq. 6.4)}$$

From requirement 3.

$$10 / (R_a + R_b) = 1 [\mu A] \text{ ----- (Eq. 6.5)}$$

From equations Eq. 6.3, 6.4 and 6.5

$$R_a = 1.69 \quad [M\Omega], \quad R_b = 8.31 \quad [M\Omega]$$

Table 15 shows the range of V0 depending on the above requirements.

Table 15. The Range of V0

	Electronic volume level				
	0		32		63
V0	8.10		10.00		11.83

Voltage Follower Circuits

VLCD voltage (V0) is resistively divided into four voltage levels (V1, V2, V3 and V4), and these output impedance are converted by the Voltage Follower for increasing drive capability. Table 16 shows the relationship between V1 to V4 level and each duty ratio.

Table 16. V1 to V4 Level

LCD bias	V1	V2	V3	V4	Remarks
1/N	$(N-1)/N \times V_0$	$(N-1)/N \times V_0$	$2/N \times V_0$	$1/N \times V_0$	N = 5 to 12

REFERENCE CIRCUIT EXAMPLES

[C1 = 1.0 to 4.7 [mF], C2 = 0.1 to 0.47 [mF]]

Figure 17. When Using all LCD Power Circuits (7-times V/C: ON, V/R: ON, V/F: ON)

Figure 18. When Using some LCD Power Circuits (V/C: OFF, V/R: ON, V/F: ON)

Figure 20. When Not Using all LCD Power Circuits (V/C: OFF, V/R: OFF, V/F: OFF)

RESET CIRCUIT

Setting RESETB to "L" or Reset instruction can initialize internal function.
When RESETB becomes "L", following procedure is occurred.

Page address: 0
Column address: 0
Modify-read: Off
Display On / Off: Off
Initial display line: 0 (first)
Initial COM0 register: 0 (COM0)
Partial display duty ratio: 1/128
Reverse display On / Off: Off (normal)
n-line inversion register: 0 (disable)
Entire display On / Off: Off (normal)
Power control register (VC, VR, VF) = (0, 0, 0)
DC-DC step up: 3 times converter circuit = (0, 0, 0)
Regulator resistor select register: (R2, R1, R0) = (0, 0, 0)
Reference voltage control register: (EV5, EV4, EV3, EV2, EV1, EV0) = (1, 0, 0, 0, 0, 0)
LCD bias ratio: 1/12
SHL select: Off (normal)
ADC select: Off (normal)
Oscillator status: Off
Power save mode: release

When RESET instruction is issued, following procedure is occurred.

Page address: 0
Column address: 0
Modify-read: Off
Initial display line: 0 (first)
Regulator resistor select register: (R2, R1, R0) = (0, 0, 0)
Reference voltage control register (EV5, EV4, EV3, EV2, EV1, EV0) = (1, 0, 0, 0, 0, 0)

While RESETB is "L" or reset instruction is executed, no instruction except read status could be accepted. Reset status appears at DB4. After DB4 becomes "L", any instruction can be accepted. RESETB must be connected to the reset pin of the MPU, and initialize the MPU and this LSI at the same time. The initialization by RESETB is essential before used.

INSTRUCTION DESCRIPTION

Table 17. Instruction Table

× : Don't care

Instruction	RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0	Description
Read display data	1	1	Read data								Read data from DDRAM
Write display data	1	0	Write data								Write data into DDRAM
Read status	0	1	BUSY	ADC	ON	RES	0	0	0	0	Read the internal status
Set page address	0	0	1	0	1	1	P3	P2	P1	P0	Set page address

Oscillator ON start	0	0	1	0	1	0	1	0	1	1	Start the built-in oscillator
Set power save mode	0	0	1	0	1	0	1	0	0	1	Power save mode
Release power save mode	0	0	1	1	1	0	0	0	0	1	Release power save mode
Set DDL register	0	0	0	1	1	1	0	0	0	0	Set DDL register in 3-pin serial mode
Reset	0	0	1	1	1	0	0	0	1	0	Initialize the internal functions
NOP	0	0	1	1	1	0	0	0	1	1	No operation
Test instruction	0	0	1	1	1	1	×	×	×	×	Don't use this instruction.

Read Display Data

8-bit data from Display Data RAM specified by the column address and page address can be read by this instruction. As the column address is incremented by 1 automatically after each this instruction, the microprocessor can continuously read data from the addressed page. A dummy read is required after loading an address into the column address register. Display data cannot be read through the serial interface.

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
1	1	Read data							

Write Display Data

8-bit data of display data from the microprocessor can be written to the RAM location specified by the column address and page address. The column address is incremented by 1 automatically so that the microprocessor can continuously write data to the addressed page.

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
1	0	Write data							

Figure 21. Sequence for Writing Display Data

Figure 22. Sequence for Reading Display Data

Read Status

Indicates the internal status of the S6B0728

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	1	BUSY	ADC	ON	RES	0	0	0	0

Flag	Description
BUSY	The device is busy when internal operation or reset Any instruction is rejected until BUSY goes Low. 0: chip is active, 1: chip is being busy.
ADC	Indicates the relationship between RAM column address and segment driver. 0: reverse direction (SEG131 → SEG0), 1: normal direction (SEG0 → SEG131)
ON	Indicates display ON / OFF status 0: display ON, 1: display OFF
RES	Indicates the initialization is in progress by RESETB signal 0: chip is active, 1: chip is being reset.

Set Page Address

Sets the Page Address of display data RAM from the microprocessor into the Page Address register. Any RAM data bit can be accessed when its Page Address and column address are specified. Along with the column address, the Page Address defines the address of the display RAM to write or read display data. Changing the Page Address doesn't effect to the display status.

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	0	1	1	P3	P2	P1	P0

P3	P2	P1	P0	Specified page address
0	0	0	0	0
0	0	0	1	1
0	0	1	0	2
⋮	⋮	⋮	⋮	⋮
1	1	0	1	13
1	1	1	0	14
1	1	1	1	15

Set Column Address

Sets the Column Address of display RAM from the microprocessor into the Column Address register. Along with the Column Address, the Column Address defines the address of the display RAM to write or read display data. When the microprocessor reads or writes display data to or from display RAM, Column Addresses are automatically incremented.

Set Column Address MSB

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	1	Y7	Y6	Y5	Y4

Set Column Address LSB

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	0	Y3	Y2	Y1	Y0

Y7	Y6	Y5	Y4	Y3	Y2	Y1	Y0	Selected column address
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	1	1
0	0	0	0	0	0	1	0	2
⋮	⋮	⋮	⋮	⋮	⋮	⋮	⋮	⋮
1	0	0	0	0	0	0	1	129
1	0	0	0	0	0	1	0	130
1	0	0	0	0	0	1	1	131
1	0	0	0	0	1	0	0	Not accessible column
1	0	0	0	0	1	0	1	
⋮	⋮	⋮	⋮	⋮	⋮	⋮	⋮	
1	1	1	1	1	1	1	0	
1	1	1	1	1	1	1	1	

Set Modify-Read

This instruction stops the automatic increment of the column address by the read display data instruction, but the column address is still increased by the write display data instruction. And it reduces the load of microprocessor when the data of a specific area is repeatedly changed during cursor blinking or others. This mode is canceled by the reset Modify-read instruction.

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	1	1	0	0	0	0	0

Reset Modify-Read

This instruction cancels the Modify-read mode, and makes the column address return to its initial value just before the set Modify-read instruction is started.

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	1	1	0	1	1	1	0

Figure 23. Sequence for Cursor Display

Display ON / OFF

Turns the Display ON or OFF

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	0	1	0	1	1	1	D

D = 1: display ON

D = 0: display OFF

Set Initial Display Line Register

Sets the line address of display RAM to determine the initial display line using 2-byte instruction. The RAM display data is displayed at the top row (COM0) of LCD panel.

The 1st Instruction

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	1	0	0	0	0	×	×

The 2nd Instruction

1	1	1	1	1	1	0	COM126
1	1	1	1	1	1	1	COM127

Figure 25. Sequence for Setting the Initial COM0

Set Partial Display Duty Ratio

Sets the duty ratio within range of 16 to 128 to realize Partial Display by using the 2-byte instruction.

The 1st Instruction

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	1	0	0	1	0	×	×

The 2nd Instruction

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	D7	D6	D5	D4	D3	D2	D1	D0

D7	D6	D5	D4	D3	D2	D1	D0	partial duty ratio
0	0	0	1	0	0	0	0	1/16
0	0	0	1	0	0	0	1	1/17
⋮	⋮	⋮	⋮	⋮	⋮	⋮	⋮	⋮
0	1	1	1	1	1	1	1	1/127
1	0	0	0	0	0	0	0	1/128
Other combinations								No operation

Figure 26. Sequence for Setting Partial Display

Set N-line Inversion Register

Sets the inverted line number within range of 2 to 32 to improve the display quality by controlling the phase of the internal LCD AC signal (M) by using the 2-byte instruction.

The 1st Instruction

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	1	0	0	1	1	×	×

The 2nd Instruction

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	'	'	'	N4	N3	N2	N1	N0

N4	N3	N2	N1	N0	Selected n-line inversion
0	0	0	0	0	0-line inversion (frame inversion)
0	0	0	0	1	2-line inversion
0	0	0	1	0	3-line inversion
0	0	0	1	1	4-line inversion
:	:	:	:	:	:
1	1	1	0	1	30-line inversion
1	1	1	1	0	31-line inversion
1	1	1	1	1	32-line inversion

Figure 27. Sequence for Setting Partial Display

Release N-line Inversion

Returns to the frame inversion condition from the n-line inversion condition.

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	1	1	0	0	1	0	0

Reverse Display ON / OFF

Reverses the display status on LCD panel without rewriting the contents of the display data RAM.

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	0	1	0	0	1	1	REV

REV	RAM bit data = "1"	RAM bit data = "0"
0 (normal)	LCD pixel is illuminated	LCD pixel is not illuminated
1 (reverse)	LCD pixel is not illuminated	LCD pixel is illuminated

Entire Display ON / OFF

Forces the whole LCD points to be turned on regardless of the contents of the display data RAM. At this time, the contents of the display data RAM are held. This instruction has priority over the reverse Display ON / OFF instruction.

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	0	1	0	0	1	0	EON

EON	RAM bit data = "1"	RAM bit data = "0"
0 (Normal)	LCD pixel is illuminated	LCD pixel is not illuminated
1 (Entire)	LCD pixel is illuminated	LCD pixel is illuminated

Power Control

Selects one of eight power circuit functions by using 3-bit register. An external power supply and part of internal power supply functions can be used simultaneously.

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	1	0	1	VC	VR	VF

VC	VR	VF	Status of internal power supply circuits
0			Internal voltage converter circuit is OFF
1			Internal voltage converter circuit is ON
	0		Internal voltage regulator circuit is OFF
	1		Internal voltage regulator circuit is ON
		0	Internal voltage follower circuit is OFF
		1	Internal voltage follower circuit is ON

Select DC/DC Step-up

Selects one of 5 DC/DC step-up to reduce the power consumption by this instruction. It is very useful to realize the partial display function.

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	1	1	0	0	DC2	DC1	DC0

DC1	DC0	DC0	Selected DC-DC converter circuit
0	0	0	3 times boosting circuit
0	0	1	4 times boosting circuit
0	1	0	5 times boosting circuit
0	1	1	6 times boosting circuit
1	0	0	7 times boosting circuit

Regulator Resistor Select

Selects resistance ratio of the internal resistor used in the internal voltage regulator. See voltage regulator section in power supply circuit. Refer to the table 15.

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	1	0	0	R2	R1	R0

R2	R1	R0	[Rb / Ra] ratio
0	0	0	Small
0	0	1	:
:	:	:	:
1	1	0	:
1	1	1	Large

Set Electronic Volume Register

Consists of 2-byte instruction. The 1st instruction sets Electronic Volume mode, the 2nd one updates the contents of Electronic Volume register. After second instruction, Electronic Volume mode is released.

The 1st Instruction

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	0	0	0	0	0	0	1

The 2nd Instruction

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	×	×	EV5	EV4	EV3	EV2	EV1	EV0

EV5	EV4	EV3	EV2	EV1	EV0	Reference voltage (a)
0	0	0	0	0	0	0
0	0	0	0	0	1	1
⋮	⋮	⋮	⋮	⋮	⋮	⋮
1	1	1	1	1	0	62
1	1	1	1	1	1	63

Figure 28. Sequence for Setting the Electronic Volume

Select LCD Bias

Selects LCD Bias ratio of the voltage required for driving the LCD.

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	1	0	1	0	B2	B1	B0

B2	B1	B0	Selected LCD bias
0	0	0	1/5
0	0	1	1/6
0	1	0	1/7
0	1	1	1/8
1	0	0	1/9
1	0	1	1/10
1	1	0	1/11
1	1	1	1/12

SHL Select

COM output scanning direction is selected by this instruction which determines the LCD driver output status.

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	1	0	0	SHL	×	×	×

SHL = 0: normal direction (COM0 → COM127)

SHL = 1: reverse direction (COM127 → COM0)

ADC Select

Changes the relationship between RAM column address and segment driver. The direction of segment driver output pins can be reversed by software. This makes IC layout flexible in LCD module assembly.

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	0	1	0	0	0	0	ADC

ADC = 0: normal direction (SEG0 → SEG131)

ADC = 1: reverse direction (SEG131 → SEG0)

Oscillator ON Start

This instruction enables the built-in oscillator circuit.

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	0	1	0	1	0	1	1

Reset

This instruction resets initial display line, column address, page address, and common output status select to their initial status, but does not affect the contents of display data RAM. This instruction cannot initialize the LCD power supply that is initialized by the RESETB pin.

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	1	1	0	0	0	1	0

Power Save

The S6B0728 enters the Power Save status to reduce the power consumption to the static power consumption value and returns to the normal operation status by the following instructions.

Set Power Save Mode

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	0	1	0	1	0	0	1

Release Power Save Mode

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	1	1	0	0	0	0	1

The internal status during power save mode are as follows :

- Oscillator circuit : off
- LCD power supply circuit : off
- All COM / SEG output level : VSS
- Consumption Current < 2 μ A

NOP

Non-operation

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	1	1	0	0	0	1	1

Test Instruction

This instruction is for testing IC. Please do not use it.

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	1	1	1	×	×	×	×

SPECIFICATIONS

ABSOLUTE MAXIMUM RATINGS

Table 18. Absolute Maximum Ratings

(V_{SS} = 0V)

Parameter	Symbol	Rating	Unit
Supply voltage range	V _{DD}	- 0.3 ~ + 7.0	V
	V ₀ , V _{OUT}	+ 0.3 ~ + 20.0	V
	V ₁ , V ₂ , V ₃ , V ₄	+ 0.3 ~ V ₀	V
External reference voltage	V _{EXT}	+0.3 ~ V _{DD}	
Input voltage range	V _{IN}	- 0.3 ~ V _{DD} + 0.3	V
Operating temperature range	T _{OPR}	- 40 ~ + 85	°C
Storage temperature range	T _{STR}	- 55 ~ + 125	°C

NOTES :

1. V_{DD}, V₀, V_{OUT}, V₁ to V₄, V_{EXT} and V_{CI} are based on V_{SS} = 0V.
2. Voltage V_{OUT} ≥ V₀ ≥ V₁ ≥ V₂ ≥ V₃ ≥ V₄ ≥ V_{SS} must always be satisfied.
3. If supply voltage exceeds its absolute maximum range, this LSI may be damaged permanently.
It is desirable to use this LSI under electrical characteristic conditions during general operation.
Otherwise, this LSI may malfunction or reduced LSI reliability may result.

DC CHARACTERISTICS

Table 19. DC Characteristics

(V_{SS} = 0V, V_{DD} = 2.4 to 3.6V, Ta = -40~85°C)

Item	Symbol	Condition	Min.	Typ.	Max.	Unit	Pin used
Operating voltage (1)	V _{DD}		2.4	-	3.6	V	V _{DD} *1

Item	Symbol	Condition	Min.	Typ.	Max.	Unit	Pin used
Power save mode current	IDDS	During power save	-	-	2	μA	

Table 26. The Relationship between Oscillation Frequency and Frame Frequency

Duty ratio	Item	f _{CL}	f _{osc}
1/N	On-chip oscillator circuit is used	$f_{FR} \times N$	$f_{FR} \times 2 \times N$

(f_{osc}: oscillation frequency, f_{CL}: display clock frequency, f_{FR}: frame frequency, N = 16 to 128)

[* Remark Solves]

- *1. Though the wide range of operating voltages is guaranteed, a spike voltage change may affect the voltage assurance during access from the MPU.
- *2. In case of external power supply is applied.
- *3. CS1B, CS2, RS, DB0 to DB7, E_RD, RW_WR, RESETB, C68, PS, INTR, REF, CL, M
- *4. DB0 to DB7, CL, M
- *5. Applies when the DB0 to DB7 pins are in high impedance.
- *6. Resistance value when -0.1[mA] is applied during the On status of the output pin SEGn or COMn.
 $R_{ON} [k\Omega] = \Delta V [V] / 0.1 [mA]$ (ΔV : voltage change when -0.1[mA] is applied in the ON status.)
- *7. See Table 26 for the relationship between oscillation frequency and frame frequency.
- *8. The voltage regulator circuit adjusts V0 within the voltage follower operating voltage range.
- *9. On-chip reference voltage source of the voltage regulator circuit to adjust V0.
- *10. Applies to the case where the on-chip oscillation circuit is used and no access is made from the MPU.
 The current consumption, when the built-in power supply circuit is on or OFF.
 The current flowing through voltage regulation resistors (Rb and Ra) is not included.
 It does not include the current of the LCD panel capacity, wiring capacity, etc.

AC CHARACTERISTICS
