ADS7138-Q1 Small, 8-Channel, 12-Bit ADC With I²C Interface, GPIOs, and CRC

1 Features

- AEC-Q100 qualified for automotive applications:
  - Temperature grade 1: –40°C to +125°C, T_A
- Small package size:
  - 3-mm × 3-mm WQFN
  - Wettable flanks for visual inspection of solder joints
- 8 channels configurable as any combination of:
  - Up to 8 analog inputs, digital inputs, or digital outputs
- GPIOs for I/O expansion:
  - Open-drain, push-pull digital outputs
- Wide operating ranges:
  - AVDD: 2.35 V to 5.5 V
  - DVDD: 1.65 V to 5.5 V
  - –40°C to +125°C temperature range
- CRC for read/write operations:
  - CRC on data read/write
  - CRC on power-up configuration
- I²C interface:
  - Up to 3.4 MHz (high-speed mode)
  - 8 configurable I²C addresses
- Programmable averaging filters:
  - Programmable sample size for averaging
  - Averaging with internal conversions
  - 16-bit resolution for average output

2 Applications

- Camera modules without processing
- Automotive center information displays
- Automotive cluster displays

3 Description

The ADS7138-Q1 is an easy-to-use, 8-channel, multiplexed, 12-bit, successive approximation register analog-to-digital converter (SAR ADC). The eight channels can be independently configured as either analog inputs, digital inputs, or digital outputs. The device has an internal oscillator for ADC conversion processes.

The ADS7138-Q1 communicates via an I²C-compatible interface and operates in either autonomous or single-shot conversion mode. The ADS7138-Q1 implements analog watchdog function by event-triggered interrupts per channel using a digital window comparator with programmable high and low thresholds, hysteresis, and an event counter. The ADS7138-Q1 has a built-in cyclic redundancy check (CRC) for data read/write operations and the power-up configuration.

Device Information(1)

PART NAME	PACKAGE	BODY SIZE (NOM)
ADS7138-Q1	WQFN (16)	3.00 mm × 3.00 mm

(1) For all available packages, see the orderable addendum at the end of the datasheet.

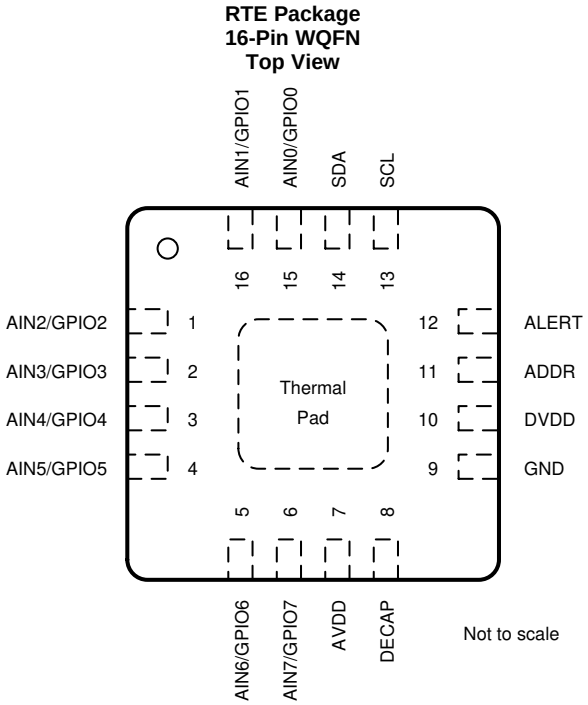
DATE	REVISION	NOTES
May 2020	*	Initial release.

5 Device Comparison Table

PART NUMBER	DESCRIPTION	CRC MODULE	ZERO-CROSSING-DETECT (ZCD) MODULE	ROOT-MEAN-SQUARE (RMS) MODULE
ADS7128	8-channel, 12-bit ADC with I^2C interface and GPIOs	Yes	Yes	Yes
ADS7138		Yes	No	No
ADS7138-Q1		Yes	No	No

6 Pin Configuration and Functions



Pin Functions

PIN		FUNCTION(1)	DESCRIPTION
NAME	NO.		
AIN0/GPIO0	15	AI, DI, DO	Channel 0; configurable as either an analog input (default) or a general-purpose input/output (GPIO)
AIN1/GPIO1	16	AI, DI, DO	Channel 1; configurable as either an analog input (default) or a GPIO
AIN2/GPIO2	1	AI, DI, DO	Channel 2; configurable as either an analog input (default) or a GPIO
AIN3/GPIO3	2	AI, DI, DO	Channel 3; configurable as either an analog input (default) or a GPIO
AIN4/GPIO4	3	AI, DI, DO	Channel 4; configurable as either an analog input (default) or a GPIO
AIN5/GPIO5	4	AI, DI, DO	Channel 5; configurable as either an analog input (default) or a GPIO
AIN6/GPIO6	5	AI, DI, DO	Channel 6; configurable as either an analog input (default) or a GPIO
AIN7/GPIO7	6	AI, DI, DO	Channel 7; configurable as either an analog input (default) or a GPIO
ADDR	11	AI	Input for selecting the device I^2C address. Connect a resistor to this pin from DECAP pin or GND to select one of the eight addresses.
ALERT	12	Digital output	Open-drain (default) or push-pull output for the digital comparator
AVDD	7	Supply	Analog supply input, also used as the reference voltage to the ADC; connect a 1-µF decoupling capacitor to GND
DECAP	8	Supply	Connect a1-µF decoupling capacitor between the DECAP and GND pins for the internal power supply
DVDD	10	Supply	Digital I/O supply voltage; connect a 1-µF decoupling capacitor to GND
GND	9	Supply	Ground for the power supply; all analog and digital signals are referred to this pin voltage
SDA	14	DI, DO	Serial data input or output for the I^2C interface
SCL	13	DI	Serial clock for the I^2C interface
Thermal pad	—	Supply	Exposed thermal pad; connect to GND.

(1) AI = analog input, DI = digital input, and DO = digital output.

ADVANCE INFORMATION

7 Specifications

7.1 Absolute Maximum Ratings

over operating ambient temperature range (unless otherwise noted)(1)

	MIN	MAX	UNIT
DVDD to GND	–0.3	5.5	V
AVDD to GND	–0.3	5.5	V
AINx/GPOx(2)	GND – 0.3	AVDD + 0.3	V
ADDR	GND – 0.3	2.1	V
Digital inputs	GND – 0.3	5.5	V
Current through any pin except supply pins(3)	–10	10	mA
Junction temperature, T_J	–40	125	°C
Storage temperature, T_{stg}	–60	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Rating* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Condition*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) AINx/GPIOx refers to pins 1, 2, 3, 4, 5, 6, 15, and 16.
(3) Pin current must be limited to 10mA or less.

7.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per AEC Q100-002(1)	±2000	V
		Charged-device model (CDM), per AEC Q100-011; corner pins (1, 4, 5, 8, 9, 12, 13, 16)	±750	
		Charged-device model (CDM), per AEC Q100-011; all other pins	±500	

(1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification

7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
POWER SUPPLY						
AVDD	Analog supply voltage		2.35	3.3	5.5	V
DVDD	Digital supply voltage		1.65	3.3	5.5	V
ANALOG INPUTS						
FSR	Full-scale input range	AIN_X(1) - GND	0		AVDD	V
V_{IN}	Absolute input voltage	AIN_X - GND	–0.1		AVDD + 0.1	V
TEMPERATURE RANGE						
T_A	Ambient temperature		–40	25	125	℃

(1) AINx refers to AIN0, AIN1, AIN2, AIN3, AIN4, AIN5, AIN6, and AIN7.

V_{OL}	Output low logic level	I_{SINK} = 2 mA	0		0.2 x AVDD	V
I_{OH}	Output high source current	V_{OH} > 0.7 x AVDD			5	mA
I_{OL}	Output low sink current	V_{OL} < 0.3 x AVDD			5	mA
DIGITAL OUTPUT (ALERT)						
V_{OH}	Output high logic level	GPO_DRIVE_CFG = push-pull, I_{SOURCE} = 2 mA	0.8 x DVDD		DVDD	V
V_{OL}	Output low logic level	I_{SINK} = 2 mA	0		0.2 x DVDD	V
I_{OH}	Output high sink current	V_{OH} > 0.7 x DVDD			5	mA
I_{OL}	Output low sink current	V_{OL} < 0.3 x DVDD			5	mA
POWER SUPPLY CURRENTS						
I_{AVDD}	Analog supply current	I^2C high-speed mode, AVDD = 5 V		150	210	µA
		I^2C fast mode plus, AVDD = 5 V		45	85	
		I^2C fast mode, AVDD = 5 V		28	46	
		I^2C standard mode, AVDD = 5 V		12	26	
		No conversion, AVDD = 5 V		7	20	

7.6 I^2C Timing Requirements

		MODE(1)				UNIT
		STANDARD, FAST, AND FAST MODE PLUS		HIGH-SPEED MODE		
		MIN	MAX	MIN	MAX	
f_{SCL}	SCL clock frequency(2)		1		3.4	MHz
t_{SUSTA}	START condition setup time for repeated start	260		160		ns
t_{HDSTA}	Start condition hold time	260		160		ns
t_{LOW}	Clock low period	500		160		ns
t_{HIGH}	Clock high period	260		60		ns
t_{SUDAT}	Data in setup time	50		10		ns
t_{HDDAT}	Data in hold time	0		0		ns
t_R	SCL rise time		120		80	ns
t_F	SCL fall time		120		80	ns
t_{SUSTO}	STOP condition hold time	260		60		ns
t_{BUF}	Bus free time before new transmission	500		300		ns

(1) The device supports standard, full-speed, and fast modes by default on power-up. For selecting high-speed mode refer to the section on *Configuring the Device for High-Speed I^2C Mode*.
(2) Bus load (C_B) consideration; C_B ≤ 400 pF for f_{SCL} ≤ 1 MHz; C_B < 100 pF for f_{SCL} = 3.4 MHz.

7.7 Timing Requirements

at AVDD = 2.35 V to 5 V, DVDD = 1.65 V to 5.5 V, and maximum throughput (unless otherwise noted); minimum and maximum values at T_A = –40°C to +125°C; typical values at T_A = 25°C.

		MIN	MAX	UNIT
t_{ACQ}	Acquisition time	300		ns

ADVANCE INFORMATION

7.8 I²C Switching Characteristics

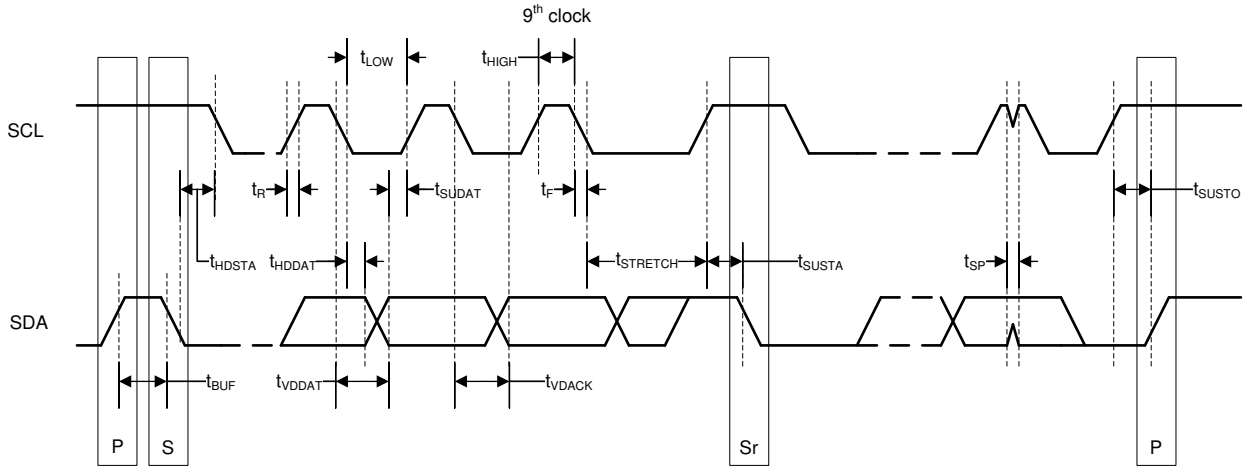
		MODE				UNIT
		STANDARD, FAST, AND FAST MODE PLUS		HIGH-SPEED MODE		
		MIN	MAX	MIN	MAX	
t_{VDDATA}	SCL low to SDA data out valid		450		200	ns
t_{VDACK}	SCL low to SDA acknowledge time		450		200	ns
$t_{STRETCH}$	Clock stretch time in one-shot conversion mode		1400		1000	ns
t_{SP}	Noise supression time constant on SDA and SCL		50		10	ns

7.9 Switching Characteristics

at AVDD = 2.35 V to 5 V, DVDD = 1.65 V to 5.5 V, and maximum throughput (unless otherwise noted); minimum and maximum values at T_A = –40°C to +125°C; typical values at T_A = 25°C.

PARAMETER		TEST CONDITIONS	MIN	MAX	UNIT
CONVERSION CYCLE					
t_{CONV}	ADC conversion time	Manual and auto sequence modes		$t_{STRETCH}$	ns
		Autonomous mode		600	ns
RESET AND ALERT					
t_{PU}	Power-up time for device	AVDD ≥ 2.35 V		5	ms
t_{RST}	Delay time; RST bit = 1b to device reset complete(1)			5	ms
t_{ALERT_HI}	ALERT high period	ALERT_LOGIC[1:0] = 1x	50	150	ns
t_{ALERT_LO}	ALERT low period	ALERT_LOGIC[1:0] = 1x	50	150	ns

(1) RST bit is automatically reset to 0b after t_{RST}.



NOTE: S = start, Sr = repeated start, and P = stop.

8 Detailed Description

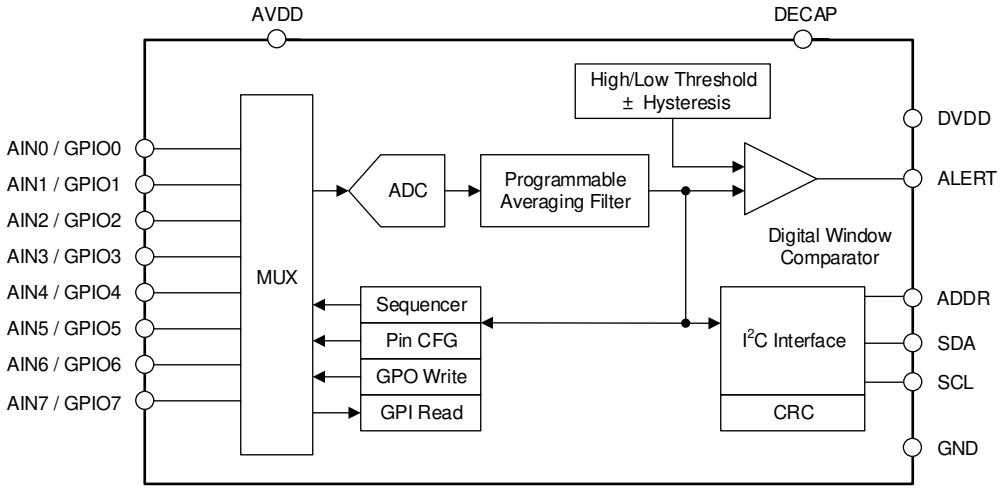
8.1 Overview

The ADS7138-Q1 is a small, eight-channel, multiplexed, 12-bit, analog-to-digital converter (ADC) with an I^2C-compatible serial interface. The eight channels of the ADS7138-Q1 can be individually configured as either analog inputs, digital inputs, or digital outputs. The device includes a digital comparator with a dedicated alert pin that can be used to interrupt the host when a programmed high or low threshold is crossed on any input channel. The device uses an internal oscillator for conversion. The ADC can be used in the manual mode for reading ADC data over the I^2C interface or in autonomous mode for monitoring the analog inputs without an active I^2C interface.

The device features a programmable averaging filter that outputs a 16-bit result for enhanced resolution.

The I^2C serial interface supports standard-mode, fast-mode, fast-mode plus, and high-speed mode. The device also features an 8-bit cyclic redundancy check (CRC) for the serial communication interface.

8.2 Functional Block Diagram



ADVANCE INFORMATION

8.3 Feature Description

8.3.1 Multiplexer and ADC

The eight channels of the multiplexer can be independently configured as ADC inputs or general-purpose inputs/outputs (GPIOs). Figure 21 shows that each input pin has electrostatic discharge (ESD) protection diodes to AVDD and GND. On power-up or after device reset, all eight multiplexer channels are configured as analog inputs.

Figure 21 shows an equivalent circuit for pins configured as analog inputs. The ADC sampling switch is represented by an ideal switch (SW) in series with the resistor, R_{SW} (typically 150 Ω), and the sampling capacitor, C_{SH} (typically 12 pF).

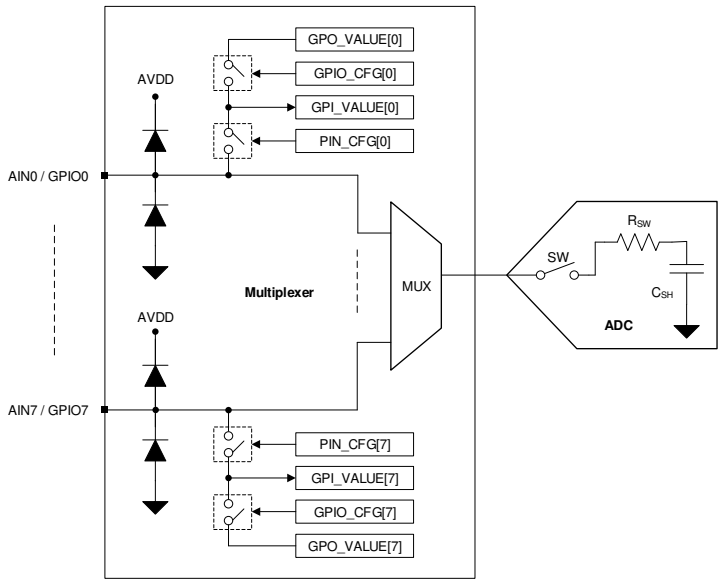


Figure 21. Analog Inputs, GPIOs, and ADC Connections

During acquisition, the SW switch is closed to allow the signal on the selected analog input channel to charge the internal sampling capacitor. During conversion, the SW switch is opened to disconnect the analog input channel from the sampling capacitor.

The multiplexer channels can be configured as GPIOs in the PIN_CFG register. The direction of a GPIO (either as an input or an output) can be set in the GPIO_CFG register. The logic level on the channels configured as digital I/O can be read from the GPI_VALUE register. The digital outputs can be accessed by writing to the GPO_VALUE register. The digital outputs can be configured as either open-drain or push-pull in the GPO_DRIVE_CFG register.

8.3.2 Reference

The device uses the analog supply voltage (AVDD) as a reference for the analog-to-digital conversion process. TI recommends connecting a 1-µF, low-equivalent series resistance (ESR) ceramic decoupling capacitor between the AVDD and GND pins.

8.3.3 ADC Transfer Function

The ADC output is in straight binary format. Equation 1 computes the ADC resolution:

$$1\ LSB = V_{REF} / 2^{N} \quad (1)$$

where:

- V_{REF} = AVDD
- N = 12

Figure 22 and Table 1 detail the transfer characteristics for the device.

ADVANCE INFORMATION

Feature Description (continued)

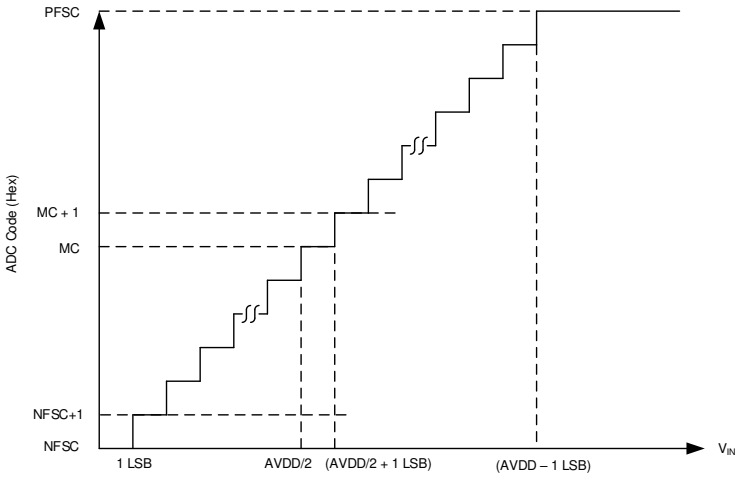

Figure 22. Ideal Transfer Characteristics

Table 1. Transfer Characteristics

INPUT VOLTAGE	CODE	DESCRIPTION	IDEAL OUTPUT CODE
≤1 LSB	NFSC	Negative full-scale code	000
1 LSB to 2 LSBs	NFSC + 1	—	001
(AVDD / 2) to (AVDD / 2) + 1 LSB	MC	Mid code	800
(AVDD / 2) + 1 LSB to (AVDD / 2) + 2 LSB	MC + 1	—	801
≥ AVDD – 1 LSB	PFSC	Positive full-scale code	FFF

8.3.4 ADC Offset Calibration

The variation in ADC offset error resulting from changes in temperature or AVDD can be calibrated by setting the CAL bit in the GENERAL_CFG register. The CAL bit is reset to 0 after calibration. The host can poll the CAL bit to check the ADC offset calibration completion status.

8.3.5 I^2C Address Selector

The I^2C address for the device is determined by connecting external resistors on the ADDR pin. The device address is determined at power-up based on the resistor values. The device retains this address until the next power-up event, until the next device reset, or until the device receives a command to program its own address. Figure 23 shows a connection diagram for the ADDR pin and Table 2 lists the resistor values for selecting different addresses of the device.

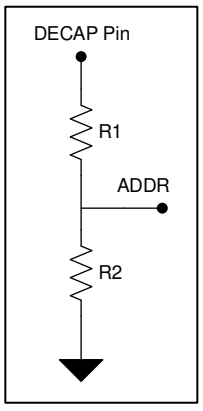

Figure 23. External Resistor Connection Diagram for the ADDR Pin

ADVANCE INFORMATION

Table 2. I²C Address Selection

RESISTORS		ADDRESS
R1 (1)	R2 (1)	
0 Ω	DNP (2)	001 0111b (17h)
11 kΩ	DNP (2)	001 0110b (16h)
33 kΩ	DNP (2)	001 0101b (15h)
100 kΩ	DNP (2)	001 0100b (14h)
DNP (2)	DNP (2)	001 0000b (10h)
DNP (2)	11 kΩ	001 0001b (11h)
DNP (2)	33 kΩ	001 0010b (12h)
DNP (2)	100 kΩ	001 0011b (13h)

(1) Tolerance for R1, R2 ≤ ±5%.
(2) DNP = Do not populate.

8.3.6 Programmable Averaging Filter

The ADS7138 features a built-in oversampling (OSR) function that can be used to average several samples. The averaging filter can be enabled by programming the OSR[2:0] bits in the OSR_CFG register. The averaging filter configuration is common to all analog input channels. Figure 24 shows that the averaging filter module output is 16 bits long. In the manual conversion mode and auto-sequence mode, only the first conversion for the selected analog input channel must be initiated by the host; see the *Manual Mode* and *Auto-Sequence Mode* sections. As shown in Figure 24, any remaining conversions for the selected averaging factor are generated internally. The time required to complete the averaging operation is determined by the sampling speed and number of samples to be averaged. As shown in Figure 24, the 16-bit result can be read out after the averaging operation completes.

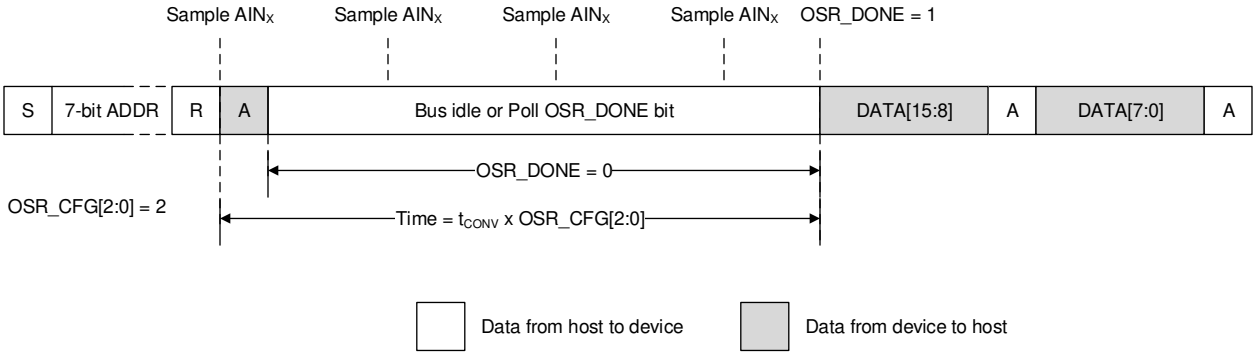

Figure 24. Averaging Example

In Figure 24, SCL is stretched by the device after the start of conversions until the averaging operation is complete.

If SCL stretching is not required during averaging, enable the statistics registers by setting STATS_EN to 1b and initiate conversions by writing 1b to the CNVST bit. The OSR_DONE bit in the SYSTEM_STATUS register can be polled to check the averaging completion status. When using the CNVST bit to initiate conversion, the result can be read in the RECENT_CHx_LSB and RECENT_CHx_MSB registers.

In the autonomous mode of operation, samples from the analog input channels that are enabled in the AUTO_SEQ_CH_SEL register are averaged sequentially; see the *Autonomous Mode* section. The digital window comparator compares the top 12 bits of the 16-bit average result with the thresholds.

Equation 2 provides the LSB value of the 16-bit average result.

$$1\ LSB = \frac{AVDD}{2^{16}} \quad (2)$$

8.3.7 CRC on Data Interface

The ADS7138-Q1 features a cyclic redundancy check (CRC) module for checking the integrity of the data bits exchanged over the I^2C interface. The CRC module is bidirectional and appends an 8-bit CRC to every byte read from the device while also evaluating the CRC of every incoming byte over the I^2C interface. The CRC module uses the CRC-8-CCITT polynomial ($x^8 + x^2 + x + 1$) for CRC computation.

To enable the CRC module, set the CRC_EN bit in the GENERAL_CFG register. Table 3 shows how a CRC error can be detected when configuring the ADS7138-Q1.

Table 3. Configuration Notifications When a CRC Error is Detected

CRC ERROR NOTIFICATION	CONFIGURATION	DESCRIPTION
ALERT pin	ALERT_CRCIN = 1b	ALERT pin is asserted if a CRC error is detected by the device.
Status flags	APPEND_STATUS = 10b	4-bit status flags are appended to the ADC data; see the *Output Data Format* section for details.
Register read	—	Read the CRC_ERR_IN bit to check if a CRC error is detected.

When the ADS7138-Q1 detects a CRC error, the erroneous data are ignored and the CRC_ERR_IN bit is set. Table 3 describes the additional notifications that can be enabled. Further register writes are disabled until the CRC_ERR_IN bit is cleared by writing 1b to it. When using autonomous mode, further conversions can be disabled on the CRC error by setting CONV_ON_ERR to 1b; see the *Autonomous Mode* section.

8.3.8 General-Purpose I/Os (GPIOs)

The eight channels of the ADS7138-Q1 can be independently configured as analog inputs, digital inputs, or digital outputs. Table 4 describes how the PIN_CFG and GPIO_CFG registers can be used to configure the channels.

Table 4. Configuring Channels as Analog Inputs or GPIOs

PIN_CFG[7:0]	GPIO_CFG[7:0]	GPO_DRIVE_CFG[7:0]	CHANNEL CONFIGURATION
0	x	x	Analog input (default)
1	0	x	Digital input
1	1	0	Digital output; open-drain driver
1	1	1	Digital output; push-pull driver

The digital outputs can be configured to logic 1 or 0 by writing to the GPO_VALUE register. Reading the GPI_VALUE register returns the logic level for all channels configured as digital inputs.

8.3.9 Oscillator and Timing Control

The device uses an internal oscillator for conversions. When using the averaging module, the host initiates the first conversion and all subsequent conversions are generated internally by the device. However, in the autonomous mode of operation, the start of the conversion signal is generated by the device. Table 5 shows that when the device generates the start of the conversion, the sampling rate is controlled by the OSC_SEL and CLK_DIV[3:0] register fields.

Table 5. Configuring Sampling Rate for Internal Conversion Start Control

CLK_DIV[3:0]	OSC_SEL = 0		OSC_SEL = 1	
	SAMPLING FREQUENCY, f_{CYCLE} (kSPS)	CYCLE TIME, t_{CYCLE} (µs)	SAMPLING FREQUENCY, f_{CYCLE} (kSPS)	CYCLE TIME, t_{CYCLE} (µs)
0000b	1000	1	31.25	32
0001b	666.7	1.5	20.83	48
0010b	500	2	15.63	64

1001b	41.7	24	1.3	768
1010b	31.3	32	0.98	1024
1011b	20.8	48	0.65	1536
1100b	15.6	64	0.49	2048
1101b	10.4	96	0.33	3072
1110b	7.8	128	0.24	4096
1111b	5.2	192	0.16	6144

The conversion time of the device (see t_{CONV} in the table) is independent of the OSC_SEL and CLK_DIV[3:0] configuration.

8.3.10 Output Data Format

Figure 25 illustrates various I^2C frames for reading data.

- Read the ADC conversion result: Two 8-bit I^2C packets are required (frame A).
- Read the averaged conversion result: Two 8-bit I^2C packets are required (frame B).
- Read data with the channel ID or status flags appended: The 4-bit channel ID or status flags can be appended to the 12-bit ADC result by configuring the APPEND_STATUS field in the GENERAL_CFG register. The status flags can be used to detect if a CRC error is detected and if an alert condition is detected by the digital window comparator. When the channel ID or status flags are appended to the 12-bit ADC data, two I^2C packets are required (frame C). If the channel ID or status flags are appended to the 16-bit average result, three I^2C frames are required (frame D).

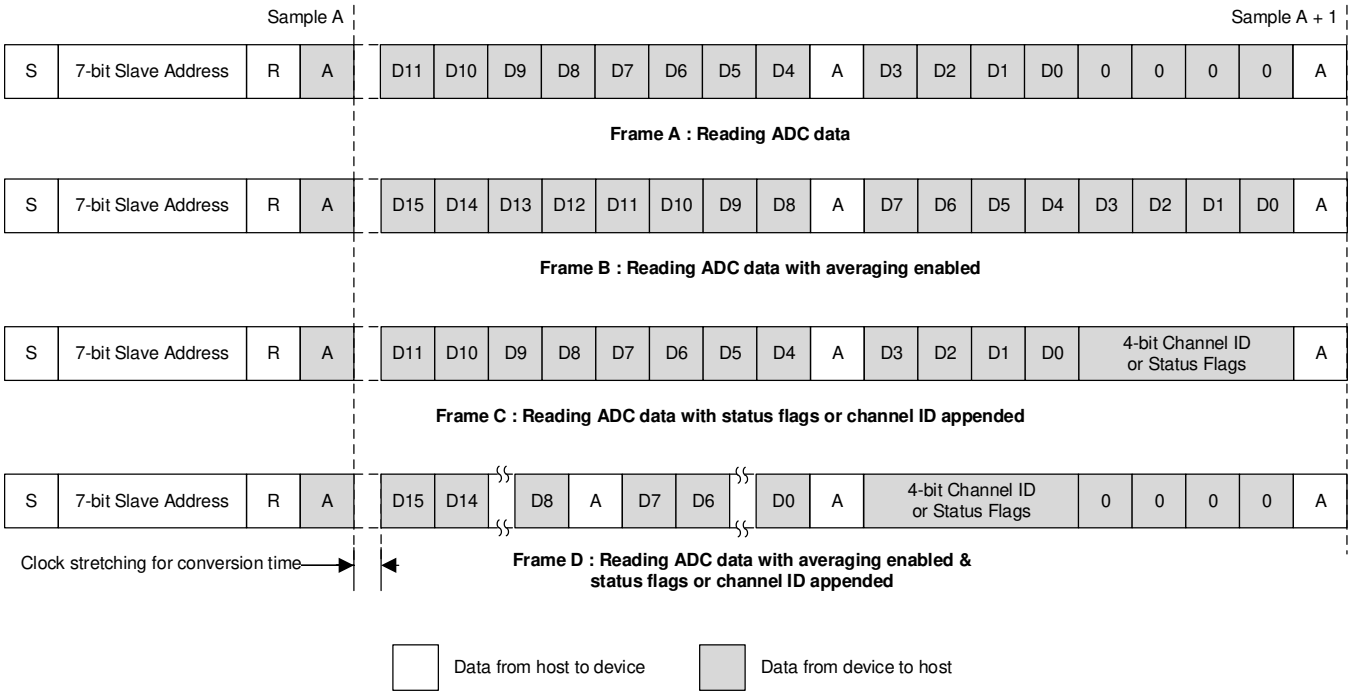

Figure 25. Data Frames for Reading Data

When status flags are enabled, APPEND_STATUS is set to 10b and four bits are appended to the ADC output. The device outputs status flags in this order: {1b, 0b, CRCERR_IN, ALERT}. The level transitions on the digital interface, resulting from the fixed 1b and 0b in the status flags, can be used to detect if the digital outputs are shorted to a fixed voltage in the system. The CRCERR_IN flag reflects the corresponding bit in the GENERAL_CFG register. The ALERT flag is the output of the logical OR of the bits in the EVENT_FLAG register.

8.3.11 Digital Window Comparator

The internal digital window comparator (DWC) is available in all functional modes of the device (see the *Device Functional Modes* section for details). The digital window comparator controls output of the ALERT pin buffer. The ALERT pin can be configured as open-drain (default) or push-pull output using the ALERT_DRIVE bit in the ALERT_PIN_CFG register. Figure 26 shows a block diagram for the digital window comparator.

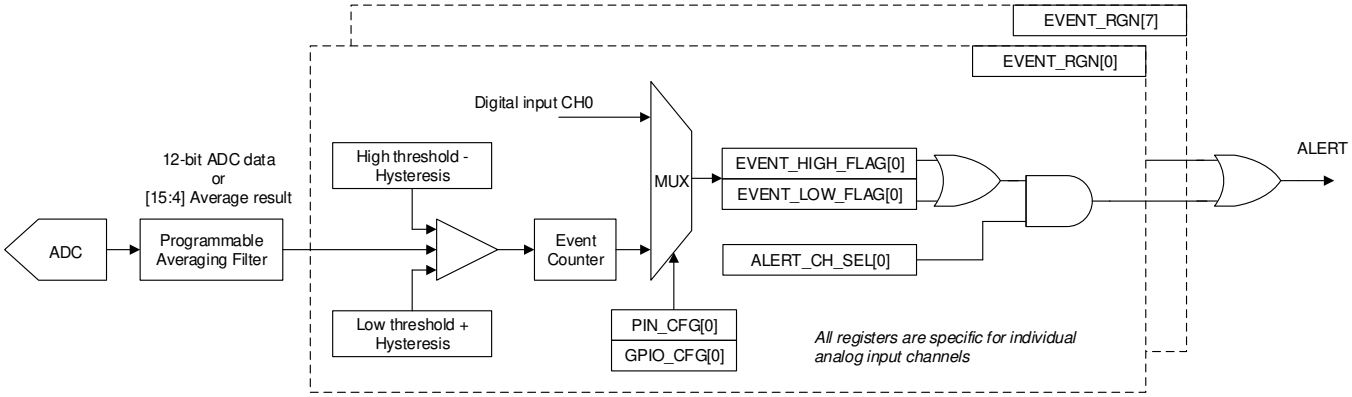

Figure 26. Digital Window Comparator Block Diagram

ADVANCE INFORMATION

The low-side threshold, high-side threshold, event counter, and hysteresis parameters are independently programmable for each input channel. Figure 27 shows the events that can be monitored for every analog input channel by the window comparator.

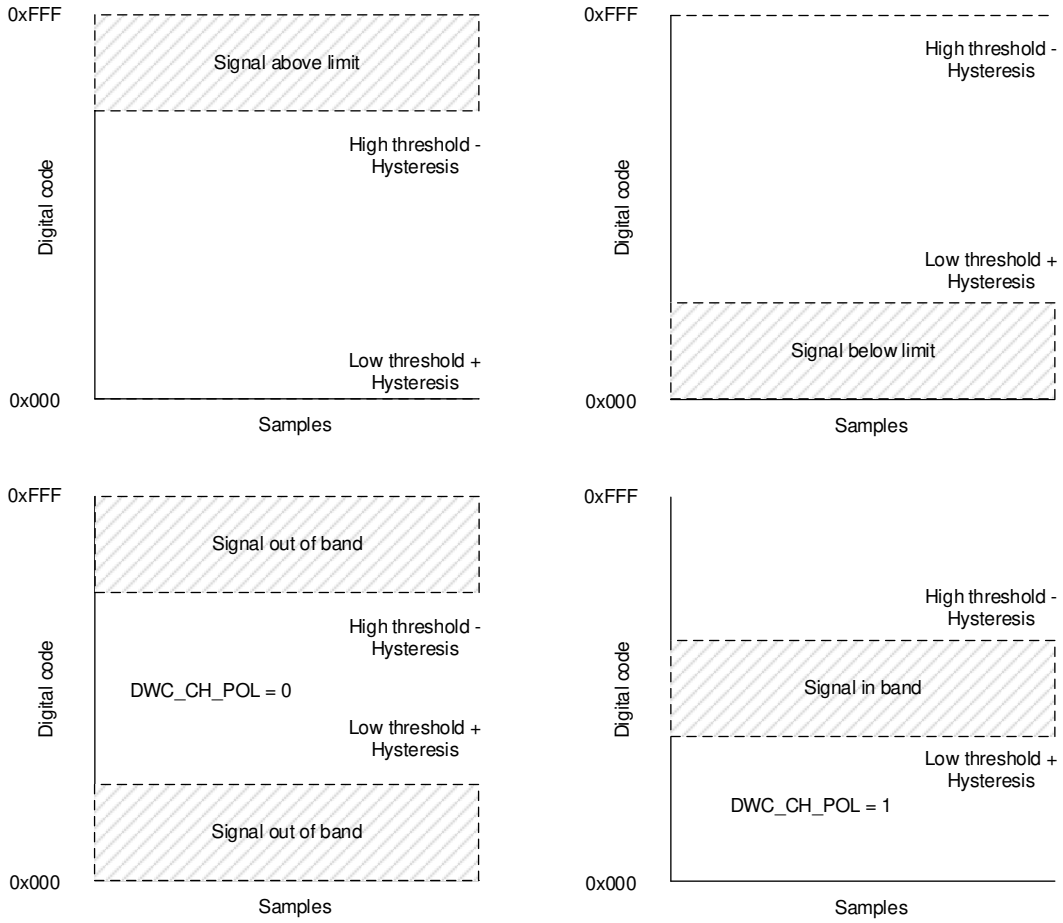

Figure 27. Event Monitoring With the Window Comparator

To enable the digital window comparator, set the DWC_EN bit in the GENERAL_CFG register. By default, hysteresis is 0, the high threshold is 0xFFF, and the low threshold is 0x000. A 12-bit straight binary code cannot be higher than 0xFFF or lower than 0x000, thus the thresholds have no effect unless set to different values. Figure 27 shows the various types of event that can be detected by adjusting the thresholds. For detecting when a signal is in-band, the EVENT_RGN register must be configured. In each of the cases shown in Figure 27, either or both EVENT_HIGH_FLAG and EVENT_LOW_FLAG can be set.

The programmable event counter counts consecutive thresholds violations before alert flags can be set. The event count can be set to a higher value to avoid transients in the input signal setting the alert flags.

In order to assert the ALERT pin when the alert flag is set for a particular analog input channel, set the corresponding bit in the ALERT_CH_SEL register. Alert flags are set regardless of the ALERT_CH_SEL configuration if DWC_EN is 1 and the high or low thresholds are exceeded.

ADVANCE INFORMATION

8.3.11.1 Interrupts From Digital Inputs

Logic 1 or logic 0 events can detected on channels configured as digital inputs, as shown in Table 6, by enabling the corresponding ALERT_CH_SEL bit.

Table 6. Configuring Interrupts From Digital Inputs

PIN_CFG[7:0]	GPIO_CFG[7:0]	ALERT_CH_SEL[7:0]	EVENT_RGN [7:0]	EVENT DESCRIPTION
1	0	1	0	EVENT_HIGH_FLAG is set when digital input channel is at logic 1.
1	0	1	1	EVENT_LOW_FLAG is set when digital input channel is at logic 0.

8.3.11.2 Changing Digital Outputs on Alert

Figure 28 shows how digital outputs can be updated in response to alerts from individual channels.

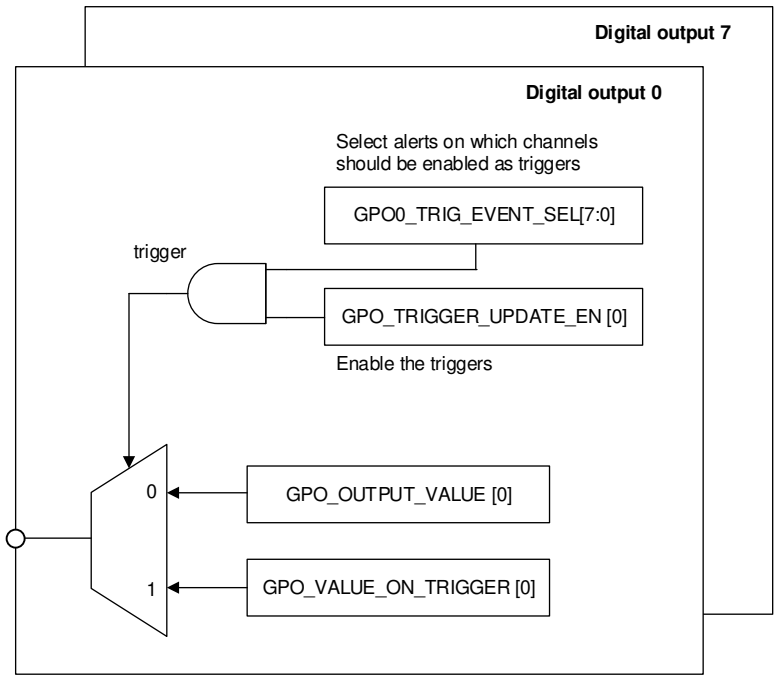

Figure 28. Block Diagram for the Digital Output Logic

8.3.11.2.1 Changing Digital Outputs on Alerts

Any given digital output can be updated in response to an alert condition on one or more analog inputs and digital inputs. To update the digital output in response to alert conditions, the trigger must be configured and the value must be launched on the trigger.

ADVANCE INFORMATION

8.3.11.2.1.1 Trigger

The following events can act as triggers for updating the value on the digital output:

- An alert occurs on one or more analog input channels. The digital window comparator must be enabled for these channels.
- An alert occurs on one or more digital input channels. The digital window comparator must be enabled for these channels.

Configure the GPOx_TRIG_EVENT_SEL register to select which channels, analog inputs, or digital inputs can trigger an update on the digital output pin. After configuring the triggers for updating a digital output, the logic can be enabled by configuring the corresponding bit in the GPO_TRIGGER_UPDATE_EN register.

8.3.11.2.1.2 Output Value

The digital outputs can be set to logic 1 or logic 0 in response to the triggers. The value to be updated on the digital output when a trigger event occurs can be configured in the GPO_VALUE_ON_TRIGGER register.

8.3.12 Minimum, Maximum, and Latest Data Registers

The ADS7138-Q1 can record the minimum, maximum, and latest code (statistics registers) for every analog input channel. To enable or re-enable recording statistics, set the STATS_EN bit in the GENERAL_CFG register. Writing 1 to the STATS_EN bit reinitializes the statistics module, after which results from new conversions are recorded in the statistics registers. Until a new conversion result is available, previous values can be read from the statistics registers. Before reading the statistics registers, set STATS_EN to 0 to prevent any updates to this register block.

8.3.13 I^2C Protocol Features

8.3.13.1 General Call

On receiving a general call (00h), the device provides an acknowledge (ACK).

8.3.13.2 General Call With Software Reset

On receiving a general call (00h) followed by a software reset (06h), the device resets itself.

8.3.13.3 General Call With a Software Write to the Programmable Part of the Slave Address

On receiving a general call (00h) followed by 04h, the device reevaluates its own I^2C address configured by the ADDR pin. During this operation, the device does not respond to other I^2C commands except the general-call command.

8.3.13.4 Configuring the Device for High-Speed I^2C Mode

The device can be configured in high-speed I^2C mode by providing an I^2C frame with one of these codes: 0x09, 0x0B, 0x0D, or 0x0F.

After receiving one of these codes, the device sets the I2C_HIGH_SPEED bit in the SYSTEM_STATUS register and remains in high-speed I^2C mode until a STOP condition is received in an I^2C frame.

8.4 Device Functional Modes

Table 7 lists the functional modes supported by the ADS7128-Q1.

Table 7. Functional Modes

FUNCTIONAL MODE	CONVERSION CONTROL	MUX CONTROL	CONV_MODE[1:0]	SEQ_MODE[1:0]
Manual	9th falling edge of SCL (ACK)	Register write to MANUAL_CHID	00b	00b
Auto-sequence	9th falling edge of SCL (ACK)	Channel sequencer	00b	01b
Autonomous	Internal to the device	Channel sequencer	01b	01b

The device powers up in manual mode (see the *Manual Mode* section) and can be configured into any mode listed in Table 7 by writing the configuration registers for the desired mode.

8.4.1 Device Power-Up and Reset

On power-up, the device calculates the address from the resistors connected on the ADDR pin and the BOR bit is set, thus indicating a power-cycle or reset event.

The device can be reset by an I^2C general call (00h) followed by a software reset (06h), by setting the RST bit, or by recycling the power on the AVDD pin.

8.4.2 Manual Mode

Manual mode allows the external host processor to directly select the analog input channel. Figure 29 lists the steps for operating the device in manual mode.

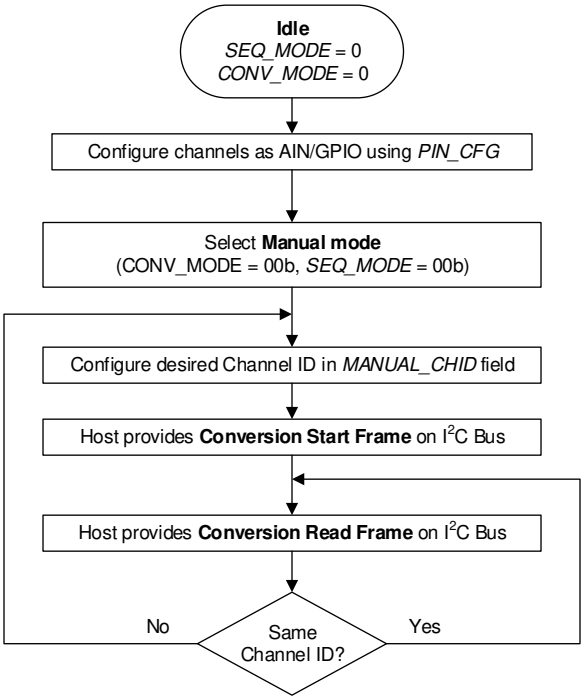

Figure 29. Device Operation in Manual Mode

Provide an I^2C start or restart frame to initiate a conversion, as shown in the conversion start frame of Figure 30, after configuring the device registers. ADC data can be read in subsequent I^2C frames. The number of I^2C frames required to read conversion data depends on the output data frame size; see the *Output Data Format* section for more details. A new conversion is initiated on the ninth falling edge of SCL (ACK bit) when the last byte of output data is read.

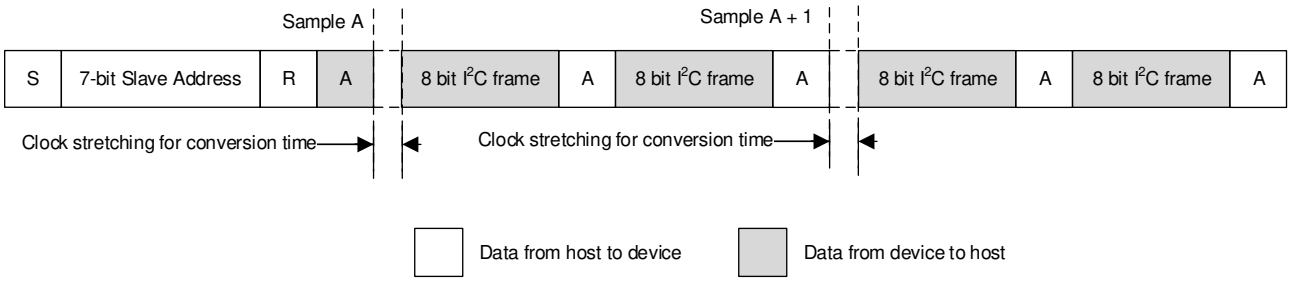

Figure 30. Starting a Conversion and Reading Data in Manual Mode

ADVANCE INFORMATION

8.4.3 Auto-Sequence Mode

In auto-sequence mode, the internal channel sequencer switches the multiplexer to the next analog input channel after every conversion. The desired analog input channels can be configured for sequencing in the AUTO_SEQ_CHSEL register. To enable the channel sequencer, set SEQ_START to 1b. After every conversion, the channel sequencer switches the multiplexer to the next analog input in ascending order. To stop the channel sequencer from selecting channels, set SEQ_START to 0b. Figure 31 lists the conversion start and read frames for auto-sequence mode.

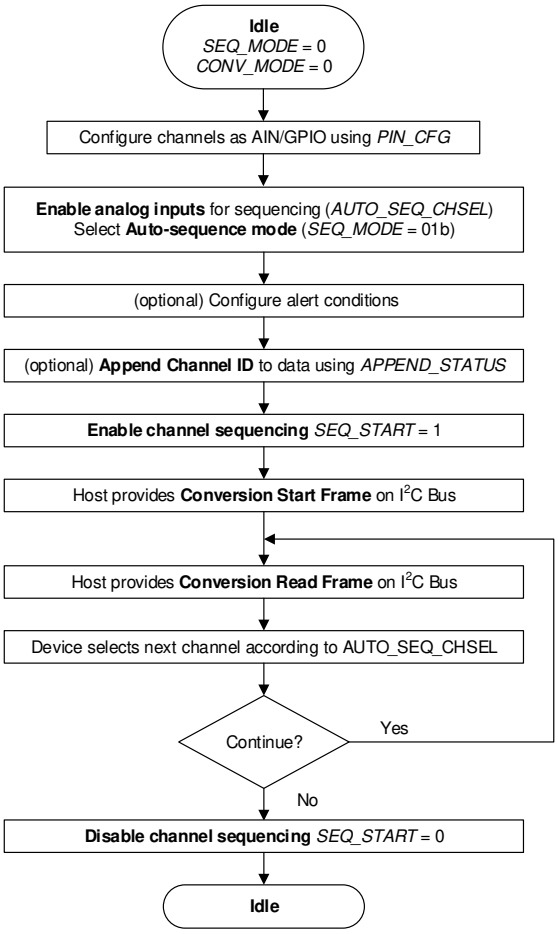

Figure 31. Device Operation in Auto-Sequence Mode

8.4.4 Autonomous Mode

In autonomous mode, the device can be programmed to monitor the voltage applied on the analog input pins of the device and generate a signal on the ALERT pin when the programmable high or low threshold values are crossed. In this mode, the device generates the start of conversion using the internal oscillator. The first start of conversion must be provided by the host and the device then generates the subsequent start of conversions.

Figure 32 shows the steps for configuring the operation mode to autonomous mode. Abort the ongoing sequence by setting SEQ_START to 0b before changing the functional mode or device configuration.

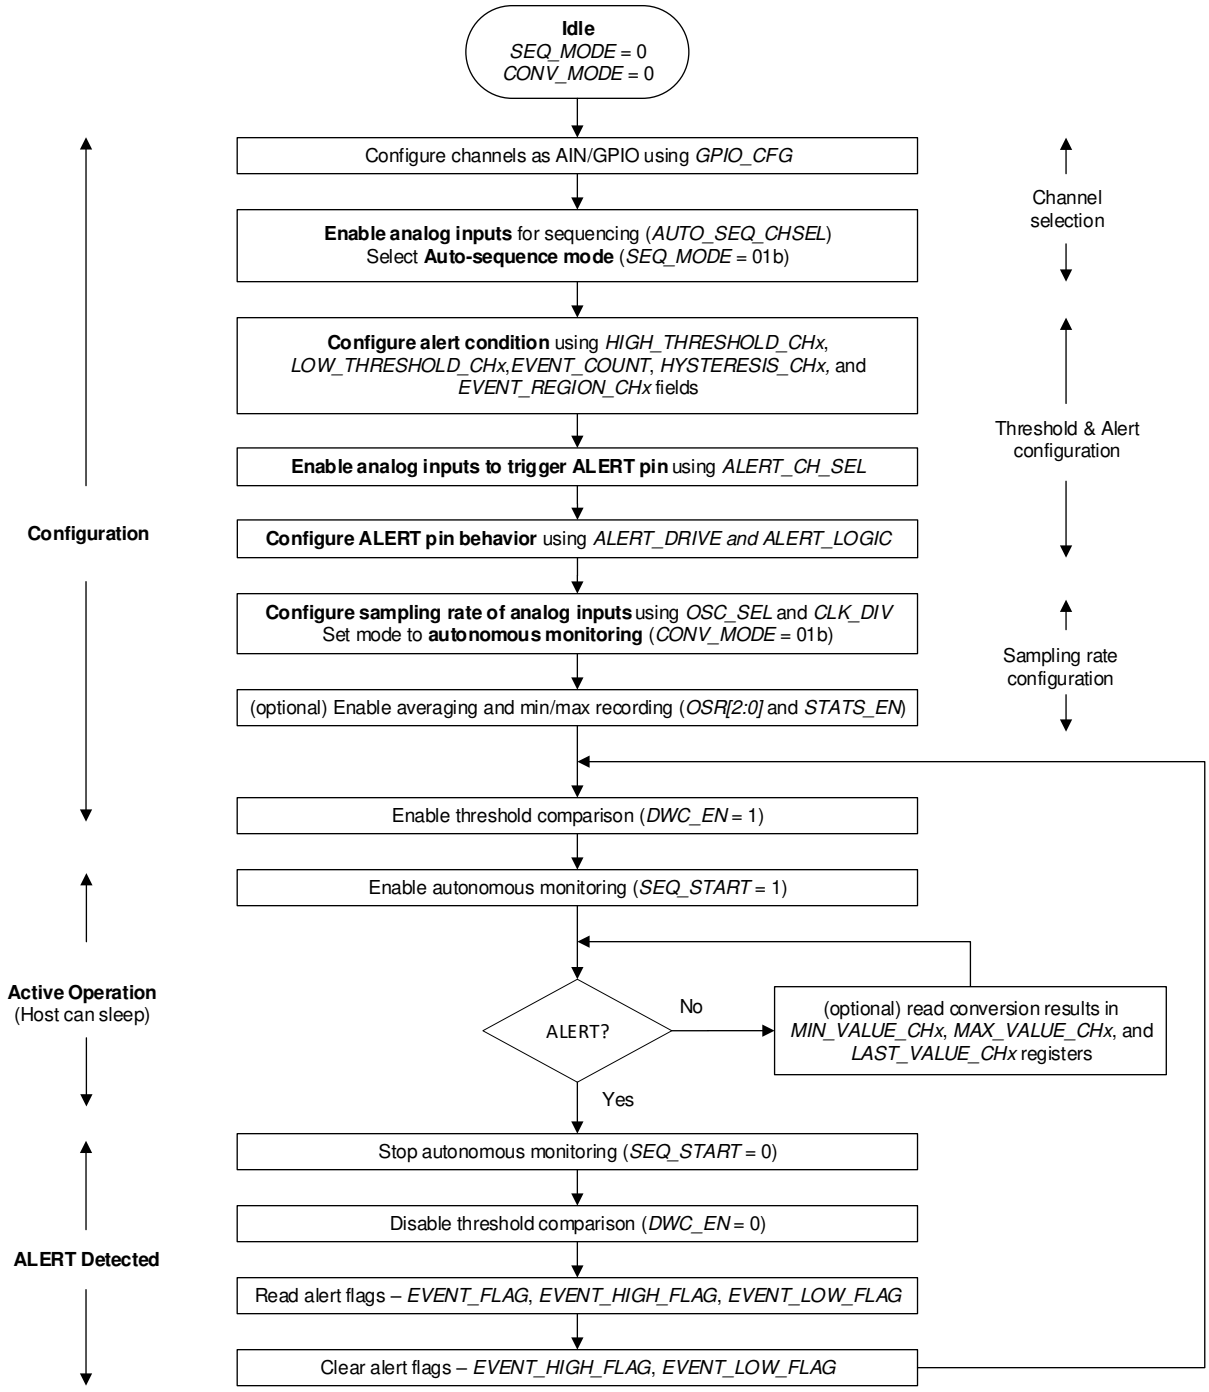

Figure 32. Configuring the Device in Autonomous Mode

ADVANCE INFORMATION

8.5 Programming

Table 8 provides the acronyms for different conditions in an I²C frame. Table 9 lists the various command opcodes.

Table 8. I²C Frame Acronyms

SYMBOL	DESCRIPTION
S	Start condition for the I²C frame
Sr	Restart condition for the I²C frame
P	Stop condition for the I²C frame
A	ACK (low)
N	NACK (high)
R	Read bit (high)
W	Write bit (low)

Table 9. Opcodes for Commands

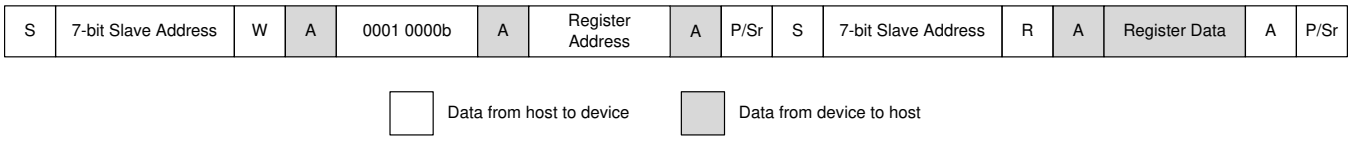
OPCODE	COMMAND DESCRIPTION
0001 0000b	Single register read
0000 1000b	Single register write
0001 1000b	Set bit
0010 0000b	Clear bit
0011 0000b	Reading a continuous block of registers
0010 1000b	Writing a continuous block of registers

8.5.1 Reading Registers

The I²C master can either read a single register or a continuous block registers from the device, as described in the *Single Register Read* and *Reading a Continuous Block of Registers* sections.

8.5.1.1 Single Register Read

To read a single register from the device, the I²C master must provide an I²C command with three frames to set the register address for reading data. Table 9 lists the opcodes for different commands. After this command is provided, the I²C master must provide another I²C frame (as shown in Figure 33) containing the device address and the read bit. After this frame, the device provides the register data. The device provides the same register data even if the host provides more clocks. To end the register read command, the master must provide a STOP or a RESTART condition in the I²C frame.



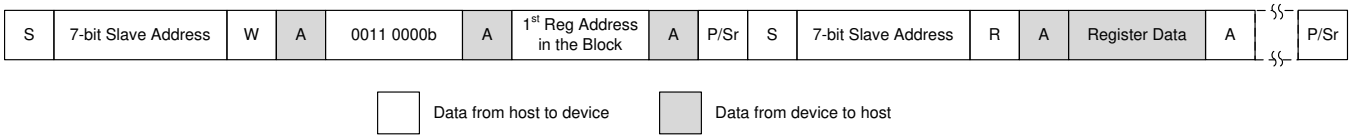
NOTE: S = start, Sr = repeated start, and P = stop.

Figure 33. Reading Register Data

ADVANCE INFORMATION

8.5.1.2 Reading a Continuous Block of Registers

To read a continuous block of registers, the I^{2}C master must provide an I^{2}C command to set the register address. The register address is the address of the first register in the block that must be read. After this command is provided, the I^{2}C master must provide another I^{2}C frame, as shown in Figure 34, containing the device address and the read bit. After this frame, the device provides the register data. The device provides data for the next register when more clocks are provided. When data are read from addresses that do not exist in the register map of the device, the device returns zeros. If the device does not have any further registers to provide data on, the device provide zeros. To end the register read command, the master must provide a STOP or a RESTART condition in the I^{2}C frame.



NOTE: S = start, Sr = repeated start, and P = stop.

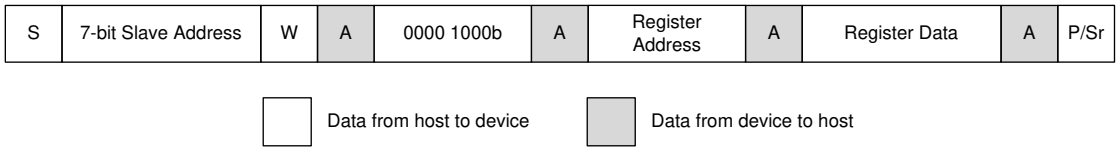
Figure 34. Reading a Continuous Block of Registers

8.5.2 Writing Registers

The I^{2}C master can either write a single register or a continuous block of registers to the device, set a few bits in a register, or clear a few bits in a register.

8.5.2.1 Single Register Write

To write a single register from the device, as shown in Figure 35, the I^{2}C master must provide an I^{2}C command with four frames. The register address is the address of the register that must be written and the register data is the value that must be written. Table 9 lists the opcodes for different commands. To end the register write command, the master must provide a STOP or a RESTART condition in the I^{2}C frame.



NOTE: S = start, Sr = repeated start, and P = stop.

Figure 35. Writing a Single Register

8.5.2.2 Set Bit

The I^{2}C master must provide an I^{2}C command with four frames, as shown in Figure 35, to set bits in a register without changing the other bits. The register address is the address of the register that the bits must set and the register data is the value representing the bits that must be set. Bits with a value of 1 in the register data are set and bits with a value of 0 in the register data are not changed. Table 9 lists the opcodes for different commands. To end this command, the master must provide a STOP or RESTART condition in the I^{2}C frame.

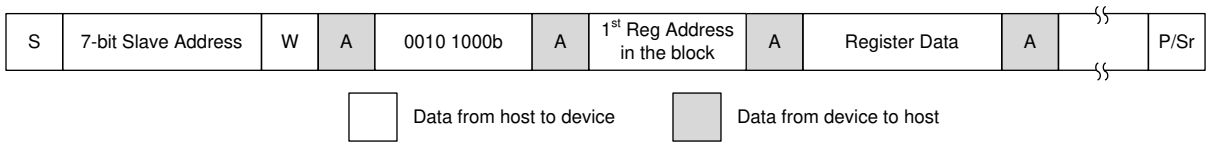
8.5.2.3 Clear Bit

The I^{2}C master must provide an I^{2}C command with four frames, as shown in Figure 35, to clear bits in a register without changing the other bits. The register address is the address of the register that the bits must clear and the register data is the value representing the bits that must be cleared. Bits with a value of 1 in the register data are cleared and bits with a value of 0 in the register data are not changed. Table 9 lists the opcodes for different commands. To end this command, the master must provide a STOP or a RESTART condition in the I^{2}C frame.

ADVANCE INFORMATION

8.5.2.4 Writing a Continuous Block of Registers

The I²C master must provide an I²C command, as shown in Figure 36, to write a continuous block of registers. The register address is the address of the first register in the block that must be written. The I²C master must provide data for registers in subsequent I²C frames in an ascending order of register addresses. Writing data to addresses that do not exist in the register map of the device have no effect. Table 9 lists the opcodes for different commands. If the data provided by the I²C master exceeds the address space of the device, the device ignores the data beyond the address space. To end the register write command, the master must provide a STOP or a RESTART condition in the I²C frame.



NOTE: S = start, Sr = repeated start, and P = stop.

Figure 36. Writing a Continuous Block of Registers

ADVANCE INFORMATION

8.6 ADS7138-Q1 Registers

Table 10 lists the ADS7138-Q1 registers. All register offset addresses not listed in Table 10 should be considered as reserved locations and the register contents should not be modified.

Table 10. ADS7138-Q1 Registers

Address	Acronym	Register Name	Section
0x0	SYSTEM_STATUS		SYSTEM_STATUS Register (Address = 0x0) [reset = 0x81]
0x1	GENERAL_CFG		GENERAL_CFG Register (Address = 0x1) [reset = 0x0]

0xAF	RECENT_CH7_MSB		RECENT_CH7_MSB Register (Address = 0xAF) [reset = 0x0]
0xC3	GPO0_TRIG_EVENT_SEL		GPO0_TRIG_EVENT_SEL Register (Address = 0xC3) [reset = 0x2]
0xC5	GPO1_TRIG_EVENT_SEL		GPO1_TRIG_EVENT_SEL Register (Address = 0xC5) [reset = 0x2]
0xC7	GPO2_TRIG_EVENT_SEL		GPO2_TRIG_EVENT_SEL Register (Address = 0xC7) [reset = 0x2]
0xC9	GPO3_TRIG_EVENT_SEL		GPO3_TRIG_EVENT_SEL Register (Address = 0xC9) [reset = 0x2]
0xCB	GPO4_TRIG_EVENT_SEL		GPO4_TRIG_EVENT_SEL Register (Address = 0xCB) [reset = 0x2]
0xCD	GPO5_TRIG_EVENT_SEL		GPO5_TRIG_EVENT_SEL Register (Address = 0xCD) [reset = 0x2]
0xCF	GPO6_TRIG_EVENT_SEL		GPO6_TRIG_EVENT_SEL Register (Address = 0xCF) [reset = 0x2]
0xD1	GPO7_TRIG_EVENT_SEL		GPO7_TRIG_EVENT_SEL Register (Address = 0xD1) [reset = 0x2]
0xE9	GPO_TRIGGER_CFG		GPO_TRIGGER_CFG Register (Address = 0xE9) [reset = 0x0]
0xEB	GPO_VALUE_TRIG		GPO_VALUE_TRIG Register (Address = 0xEB) [reset = 0x0]

Complex bit access types are encoded to fit into small table cells. Table 11 shows the codes that are used for access types in this section.

Table 11. ADS7138-Q1 Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
Write Type		
W	W	Write
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

8.6.1 SYSTEM_STATUS Register (Address = 0x0) [reset = 0x81]

SYSTEM_STATUS is shown in Figure 37 and described in Table 12.

Return to the Summary Table.

ADVANCE INFORMATION

Figure 37. SYSTEM_STATUS Register

7	6	5	4	3	2	1	0
RSVD	SEQ_STATUS	I²C_SPEED	RESERVED	OSR_DONE	CRC_ERR_FUSE	CRC_ERR_IN	BOR
R-1b	R-0b	R-0b	R-0b	R/W-0b	R-0b	R/W-0b	R/W-1b

Table 12. SYSTEM_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
7	RSVD	R	1b	Reads return 1b.
6	SEQ_STATUS	R	0b	Status of the channel sequencer. 0b = Sequence stopped 1b = Sequence in progress
5	I²C_SPEED	R	0b	I²C high-speed status. 0b = I²C bus is not in high-speed mode. 1b = I²C bus is in high-speed mode.
4	RESERVED	R	0b	Reserved. Reads return 0.
3	OSR_DONE	R/W	0b	Averaging status. Clear this bit by writing 1b to this bit. 0b = Averaging in progress or not started; average result is not ready. 1b = Averaging complete; average result is ready.
2	CRC_ERR_FUSE	R	0b	Device power-up configuration CRC check status. To re-evaluate this bit, software reset the device or power cycle AVDD. 0b = No problems detected in power-up configuration. 1b = Device configuration not loaded correctly.
1	CRC_ERR_IN	R/W	0b	Status of CRC check on incoming data. Write 1b to clear this error flag. 0b = No CRC error. 1b = CRC error detected. All register writes, except to addresses 0x00 and 0x01, are blocked.
0	BOR	R/W	1b	Brown out reset indicator. This bit is set if brown out condition occurs or device is power cycled. Write 1b to this bit to clear the flag. 0b = No brown out from last time this bit was cleared. 1b = Brown out condition detected or device power cycled.

8.6.2 GENERAL_CFG Register (Address = 0x1) [reset = 0x0]

GENERAL_CFG is shown in Figure 38 and described in Table 13.

Return to the Summary Table.

Figure 38. GENERAL_CFG Register

7	6	5	4	3	2	1	0
RESERVED	CRC_EN	STATS_EN	DWC_EN	CNVST	CH_RST	CAL	RST
R-0b	R/W-0b	R/W-0b	R/W-0b	W-0b	R/W-0b	R/W-0b	W-0b

Table 13. GENERAL_CFG Register Field Descriptions

Bit	Field	Type	Reset	Description
7	RESERVED	R	0b	Reserved. Reads return 0.
6	CRC_EN	R/W	0b	Enable or disable the CRC on device interface. 0b = CRC module disabled. 1b = CRC appended to data output. CRC check is enabled on incoming data.

Table 13. GENERAL_CFG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
5	STATS_EN	R/W	0b	Enable or disable the statistics module to update minimu, maximum, and latest output code registers. 0b = Statistics registers are not updated. 1b = Clear statistics registers and conitnue updating with new conversion results.
4	DWC_EN	R/W	0b	Enable or disable the digital window comparator. 0b = Reset or disable the digital window comparator. 1b = Enable the digital window comparator.
3	CNVST	W	0b	Control start conversion on selected analog input. Readback of this bit returns 0b. 0b = Normal operation; conversions starts on the 9th falling edge of I^{2}C frame. Device stretches SCL until end of conversion or completion of averaging. 1b = Initiate start of conversion. Device does not stretch SCL until end of conversion or completion of averaging.
2	CH_RST	R/W	0b	Force all channels to be analog inputs. 0b = Normal operation. 1b = All channels are configured as analog inputs irrespective of configuration in other registers.
1	CAL	R/W	0b	Calibrate ADC offset. 0b = Normal operation. 1b = ADC offset is calibrated. After calibration is complete, this bit is set to 0b.
0	RST	W	0b	Software reset all registers to default values. 0b = Normal operation. 1b = Device is reset. After reset is complete, this bit is set to 0b and BOR bit is set to 1b.

8.6.3 DATA_CFG Register (Address = 0x2) [reset = 0x0]

DATA_CFG is shown in Figure 39 and described in Table 14.

Return to the Summary Table.

Figure 39. DATA_CFG Register

7	6	5	4	3	2	1	0
FIX_PAT	RESERVED	APPEND_STATUS[1:0]		RESERVED			
R/W-0b	R-0b	R/W-0b		R-0b			

Table 14. DATA_CFG Register Field Descriptions

Bit	Field	Type	Reset	Description
7	FIX_PAT	R/W	0b	Device will output fixed data bits, which can be helpful for debugging communication with the device. 0b = Normal operation. 1b = Device outputs fixed code 0xA5A repeatitively when reading ADC data.
6	RESERVED	R	0b	Reserved. Reads return 0.
5-4	APPEND_STATUS[1:0]	R/W	0b	Append 4-bit channel ID or status flags to output data. 0b = Channel ID and status flags are not appended to ADC data. 1b = 4-bit channel ID is appended to ADC data. 10b = 4-bit status flags are appended to ADC data. 11b = Reserved.
3-0	RESERVED	R	0b	

ADVANCE INFORMATION

8.6.4 OSR_CFG Register (Address = 0x3) [reset = 0x0]

OSR_CFG is shown in Figure 40 and described in Table 15.

Return to the Summary Table.

Figure 40. OSR_CFG Register

7	6	5	4	3	2	1	0
RESERVED					OSR[2:0]		
R-0b					R/W-0b		

Table 15. OSR_CFG Register Field Descriptions

Bit	Field	Type	Reset	Description
7-3	RESERVED	R	0b	Reserved. Reads return 0.
2-0	OSR[2:0]	R/W	0b	Selects the oversampling ratio for ADC conversion result. 0b = No averaging 1b = 2 samples 10b = 4 samples 11b = 8 samples 100b = 16 samples 101b = 32 samples 110b = 64 samples 111b = 128 samples

8.6.5 OPMODE_CFG Register (Address = 0x4) [reset = 0x0]

OPMODE_CFG is shown in Figure 41 and described in Table 16.

Return to the Summary Table.

Figure 41. OPMODE_CFG Register

7	6	5	4	3	2	1	0
CONV_ON_ERR	CONV_MODE[1:0]		OSC_SEL	CLK_DIV[3:0]			
R/W-0b	R/W-0b		R/W-0b	R/W-0b			

Table 16. OPMODE_CFG Register Field Descriptions

Bit	Field	Type	Reset	Description
7	CONV_ON_ERR	R/W	0b	Control continuation of autonomous modes if CRC error is detected on communication interface. 0b = If CRC error is detected, device continues channel sequencing and pin configuration is retained. See the CRC_ERR_IN bit for more details. 1b = If CRC error is detected, device changes all channels to analog inputs and channel sequencing will be paused until CRC_ERR_IN = 1b. After clearing CRC_ERR_IN flag, device resumes channel sequencing and pin confguration is restored.
6-5	CONV_MODE[1:0]	R/W	0b	These bits set the mode of conversion of the ADC. 0b = Manual mode; conversions are initiated by host. 1b = Autonomous mode; conversions are initiated by internal state machine.
4	OSC_SEL	R/W	0b	Selects the oscillator for internal timing generation. 0b = High-speed oscillator. 1b = Low-power oscillator.
3-0	CLK_DIV[3:0]	R/W	0b	Sampling speed control in autonomous monitoring mode (CONV_MODE = 01b). See the section on oscillator and timing control for details.

8.6.6 PIN_CFG Register (Address = 0x5) [reset = 0x0]

PIN_CFG is shown in Figure 42 and described in Table 17.

Return to the Summary Table.

Figure 42. PIN_CFG Register

7-0	GPO_VALUE_ON_TRIGGER[7:0]	R/W	0b	Value to be set on digital outputs GPO[7:0] when corresponding trigger occurs. GPO update on alert flags must be enabled in corresponding bit in GPO_TRIGGER_CFG register. 0b = Digital output set to logic 0. 1b = Digital output set to logic 1.

9 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

The following sections give example circuits and suggestions for using the ADS7128-Q1 in various applications.

9.2 Typical Applications

9.2.1 Mixed-Channel Configuration

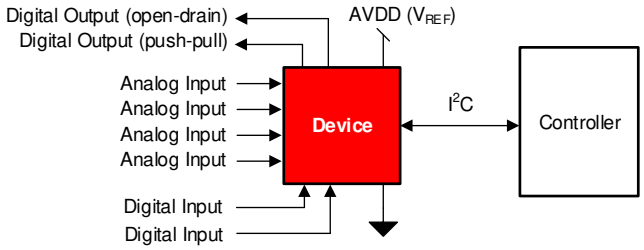

Figure 147. DAQ Circuit: Single-Supply DAQ

9.2.1.1 Design Requirements

The goal of this application is to configure some channels of the ADS7138-Q1 as digital inputs, open-drain digital outputs, and push-pull digital outputs.

9.2.1.2 Detailed Design Procedure

The ADS7138-Q1 can support GPIO functionality at each input pin. Any analog input pin can be independently configured as a digital input, a digital open-drain output, or a digital push-pull output though the PIN_CFG and GPIO_CFG registers; see Table 4.

9.2.1.2.1 Digital Input

The digital input functionality can be used to monitor a signal within the system. Figure 148 illustrates that the state of the digital input can be read from the GPI_VALUE register.

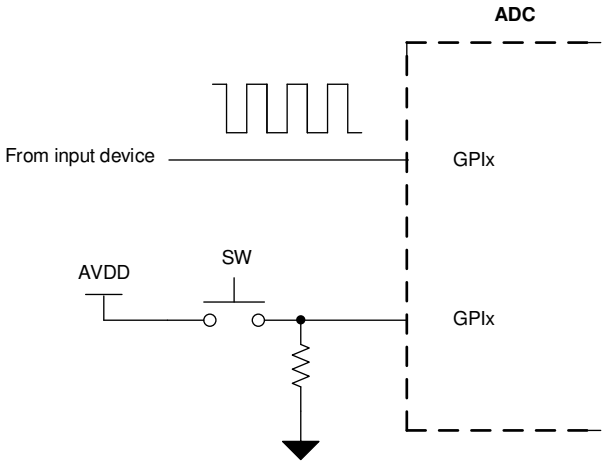

Figure 148. Digital Input

ADVANCE INFORMATION

Typical Applications (continued)

9.2.1.2.2 Digital Open-Drain Output

The channels of the ADS7138-Q1 can be configured as digital open-drain outputs supporting an output voltage up to 5.5 V. An open-drain output, as shown in Figure 149, consists of an internal FET (Q) connected to ground. The output is idle when not driven by the device, which means Q is off and the pull-up resistor, R_{PULL_UP}, connects the GPOx node to the desired output voltage. The output voltage can range anywhere up to 5.5 V, depending on the external voltage that the GPIOx is pulled up to. When the device is driving the output, Q turns on, thus connecting the pull-up resistor to ground and bringing the node voltage at GPOx low.

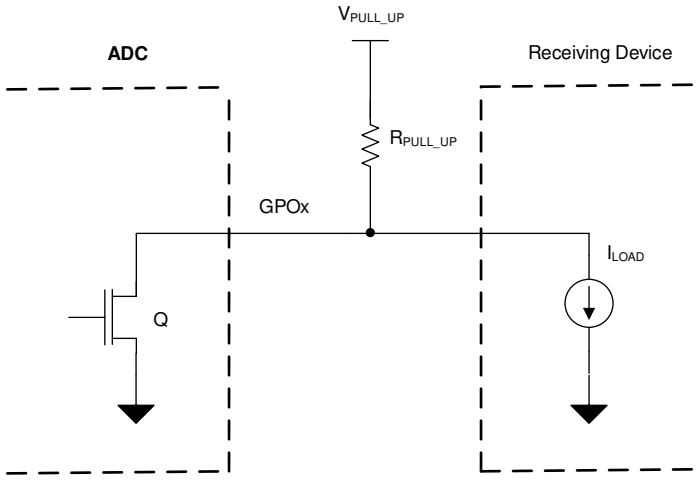

Figure 149. Digital Open-Drain Output

The minimum value of the pullup resistor, as calculated in Equation 3, is given by the ratio of V_{PULL_UP} and the maximum current supported by the device digital output (5 mA).

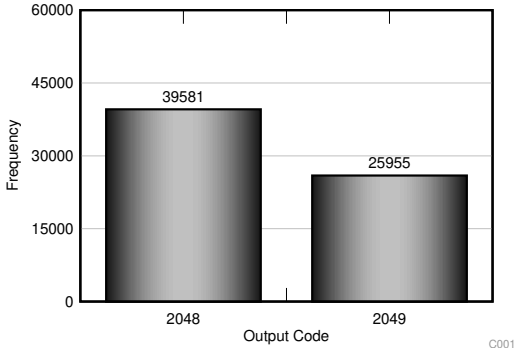
$$R_{MIN} = (V_{PULL\_UP} / 5\ mA) \quad (3)$$

The maximum value of the pullup resistor, as calculated in Equation 4, depends on the minimum input current requirement, I_{LOAD}, of the receiving device driven by this GPIO.

$$R_{MAX} = (V_{PULL\_UP} / I_{LOAD}) \quad (4)$$

Select R_{PULL_UP} such that $R_{MIN} < R_{PULL\_UP} < R_{MAX}$.

9.2.1.3 Application Curve



Standard deviation = 0.49 LSB

Figure 150. DC Input Histogram

Typical Applications (continued)

9.2.2 Digital Push-Pull Output

The channels of the ADS7138-Q1 can be configured as digital push-pull outputs supporting an output voltage up to AVDD. As shown in Figure 151, a push-pull output consists of two mirrored opposite bipolar transistors, Q1 and Q2. The device can both source and sink current because only one transistor is on at a time (either Q2 is on and pulls the output low, or Q1 is on and sets the output high). A push-pull configuration always drives the line opposed to an open-drain output where the line is left floating.

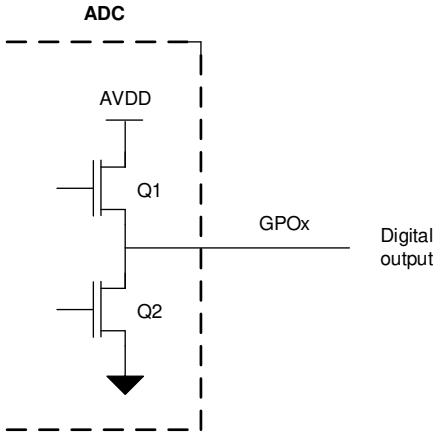


Figure 151. Digital Push-Pull Output

10 Power Supply Recommendations

10.1 AVDD and DVDD Supply Recommendations

The ADS7138-Q1 has two separate power supplies: AVDD and DVDD. The device operates on AVDD; DVDD is used for the interface circuits. For supplies greater than 2.35 V, AVDD and DVDD can be shorted externally if single-supply operation is desired. The AVDD supply also defines the full-scale input range of the device. Decouple the AVDD and DVDD pins individually, as shown in Figure 152, with 1-µF ceramic decoupling capacitors. The minimum capacitor value required for AVDD and DVDD is 200 nF and 20 nF, respectively. If both supplies are powered from the same source, a minimum capacitor value of 220 nF is required for decoupling.

Connect a 1-µF decoupling capacitor between the DECAP and GND pins for the internal power supply.

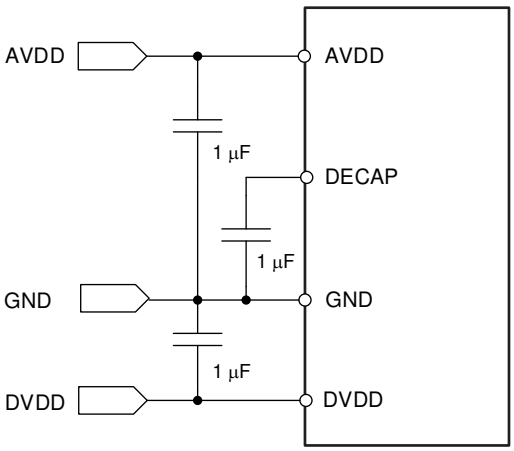

Figure 152. Power-Supply Decoupling

11 Layout

11.1 Layout Guidelines

Figure 153 shows a board layout example for the ADS7138-Q1. Avoid crossing digital lines with the analog signal path and keep the analog input signals and the AVDD supply away from noise sources.

Use 1-µF ceramic bypass capacitors in close proximity to the analog (AVDD) and digital (DVDD) power-supply pins. Avoid placing vias between the AVDD and DVDD pins and the bypass capacitors. Connect the GND pin to the ground plane using short, low-impedance paths. The AVDD supply voltage also functions as the reference voltage for the ADS7138-Q1. Place the decoupling capacitor for AVDD close to the device AVDD and GND pins and connect the decoupling capacitor to the device pins with thick copper tracks.

11.2 Layout Example

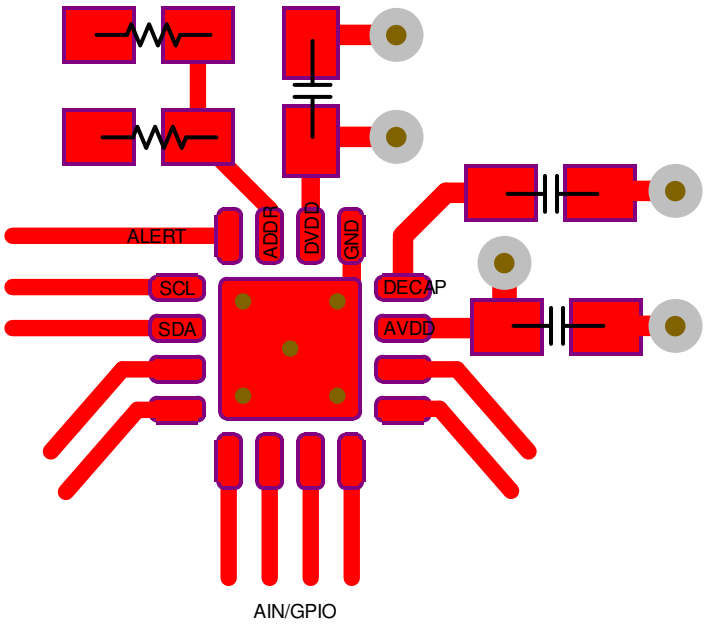

Figure 153. Example Layout

12 Device and Documentation Support

12.1 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. In the upper right corner, click on *Alert me* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

12.2 Support Resources

TI E2E™ support forums are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's Terms of Use.

12.3 Trademarks

E2E is a trademark of Texas Instruments.
All other trademarks are the property of their respective owners.

12.4 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

12.5 Glossary

SLYZ022 — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

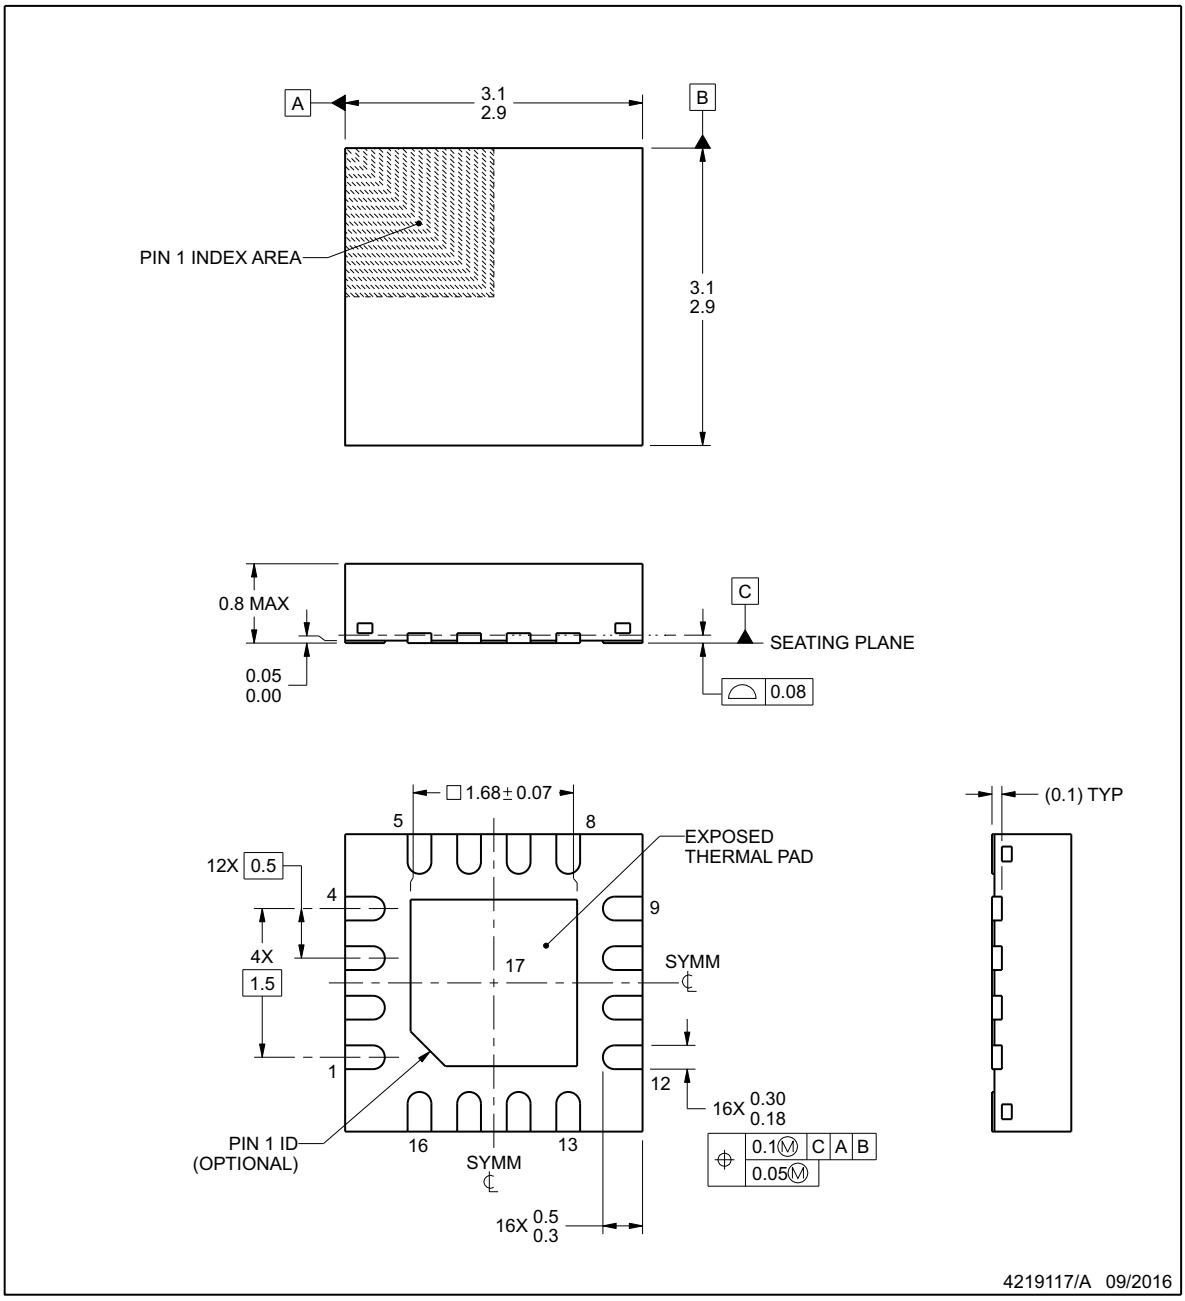
ADVANCE INFORMATION

PACKAGE OUTLINE

RTE0016C

WQFN - 0.8 mm max height

PLASTIC QUAD FLATPACK - NO LEAD



NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.

6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

ADVANCE INFORMATION

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
ADS7138QRTERQ1	PREVIEW	WQFN	RTE	16	3000	TBD	Call TI	Call TI	-40 to 125		
PADS7138QRTERQ1	ACTIVE	WQFN	RTE	16	3000	TBD	Call TI	Call TI	-40 to 125		Samples

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

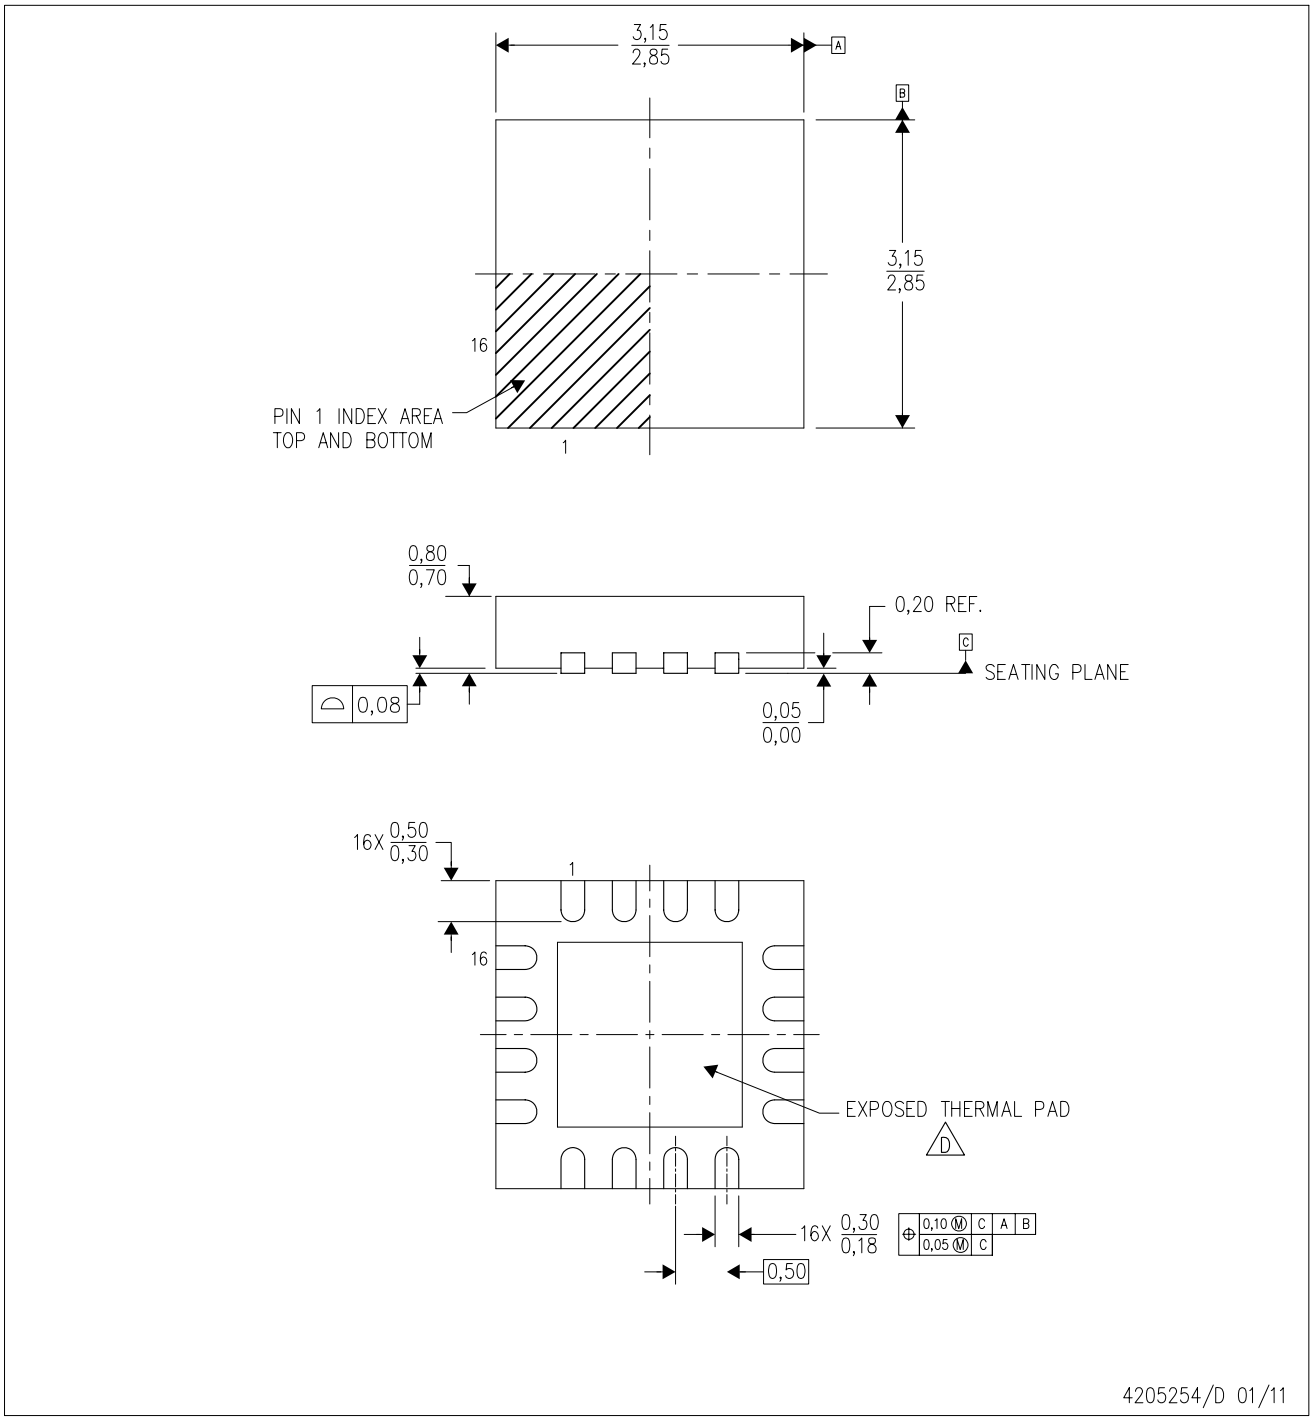
OTHER QUALIFIED VERSIONS OF ADS7138-Q1 :

- Catalog: ADS7138

NOTE: Qualified Version Definitions:

- Catalog - TI's standard catalog product

RTE (S–PWQFN–N16) PLASTIC QUAD FLATPACK NO–LEAD



NOTES:
A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M–1994.
B. This drawing is subject to change without notice.
C. Quad Flatpack, No–leads (QFN) package configuration.
D. The package thermal pad must be soldered to the board for thermal and mechanical performance. See the Product Data Sheet for details regarding the exposed thermal pad dimensions.
E. Falls within JEDEC MO–220.
