HIGH PERFORMANCE ANALOG INTEGRATED CIRCUITS

EL4332C

Triple 2:1 300 MHz Mux-Amp AV =2

Features

- 3 ns A-B switching
- 300 MHz bandwidth
- Fixed gain of 2, for cable driving
- > 650V/µs slew rate
- TTL/CMOS compatible switch

Applications

- RGB multiplexing
- Picture-in-picture
- Cable driving
- HDTV processing
- Switched gain amplifiers
- ADC input multiplexer

Ordering Information

Part No.	Temp. Range	Package	Outline #
EL4332CS	-40°C to 85°C	SO16	MDP0027

Demo Board

A demo PCB is available for this product. Request “EL4332/1 Demo Board.”

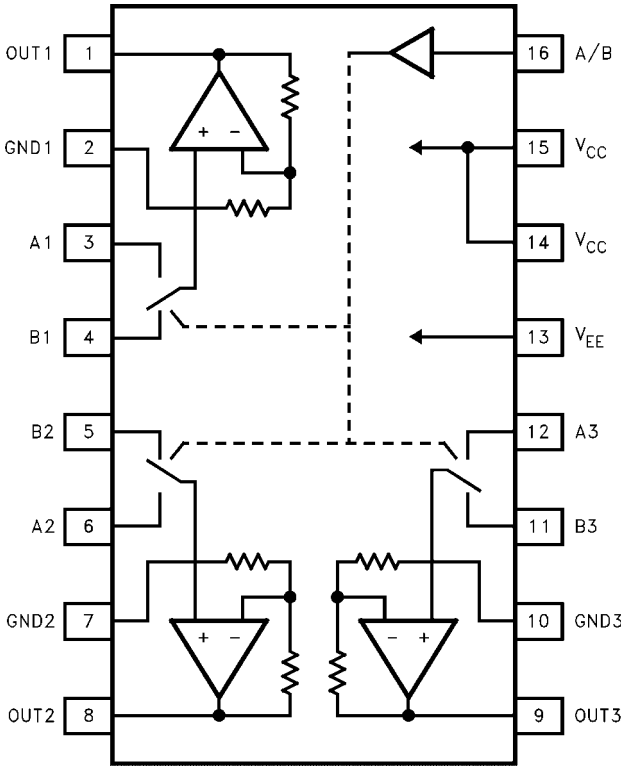
General Description

The EL4332C is a triple very high speed 2:1 Multiplexer-Amplifier. It is intended primarily for component video multiplexing and is especially suited for pixel switching. The amplifiers have their gain set to 2 internally, which reduces the need for many external components. The gain-of-2 facilitates driving back terminated cables. All three amplifiers are switched simultaneously from their A to B inputs by the TTL/CMOS compatible, common A/B control pin.

A -3 dB bandwidth of 300 MHz together with 3 ns multiplexing time enable the full performance of the fastest component video systems to be realized.

The EL4332C runs from standard ±5V supplies, and is available in the narrow 16-pin small outline package.

Connection Diagrams



EL4332C

Triple 2:1 300 MHz Mux-Amp AV =2

Absolute Maximum Ratings (T_A = 25 °C)

V_{CC} to V_{EE}	14V	Input Current, Any Input	5 mA
V_{CC} to any GND	12V	Power Dissipation	See Curves
V_{EE} to any GND	12V	Operating Temperature	-40°C to 85°C
Continuous Output Current	45 mA	Junction Temperature	170°C
Any Input	V_{EE} - 0.3V to V_{CC} + 0.3V	Storage Temperature	-60°C to +150°C

Important Note:

All parameters having Min/Max specifications are guaranteed. The Test Level column indicates the specific device testing actually performed during production and Quality inspection. Elantec performs most electrical tests using modern high-speed automatic test equipment, specifically the LTX77 Series system. Unless otherwise noted, all tests are pulsed tests, therefor $T_J = T_C = T_A$.

Test Level	Test Procedure
I	100% production tested and QA sample tested per QA test plan QCX0002.
II	100% production tested at T_A = 25°C and QA sample tested at T_A = 25°C, T_{MAX} and T_{MIN} per QA test plan QCX0002.
III	QA sample tested per QA test plan QCX0002.
IV	Parameter is guaranteed (but not tested) by Design and Characterization Data.
V	Parameter is typical value at T_A = 25°C for information purposes only.

DC Electrical Characteristics

V_{CC} = +5V, V_{EE} = -5V, Temperature = 25°C, R_L = ×

Parameter	Description	Min	Typ	Max	Test Level	Units
V_{OS}	Input Referred Offset Voltage		8	20	II	mV
dV_{OS}	Input Referred Offset Voltage Delta [1]		2	8	II	mV
R_{IN}	Input Resistance		30		V	kΩ
I_B	Input Bias Current		-7	-30	II	µA
dI_B	Input Bias Current Delta [1]		0.5	4.0	II	µA
A_V	Gain	1.94	2.00	2.06	II	V/V
dA_V	Gain Delta [1]		0.5	2.5	II	%
C_{IN}	Input Capacitance		3.3		V	pF
PSRR	Power Supply Rejection Ratio	50	70		II	dB
V_O	Output Voltage Swing into 500Ω load	±2.7	±3.6		II	V
	Output Voltage Swing into 150Ω load		+3/-2.7		V	V
I_{OUT}	Current Output, Measured with 75W Load [2]	30	40		II	mA
$Xtalk_{AB}$	Crosstalk from Non-selected Input (at DC)	-70	-100		III	dB
$Xtalk_{CH-CH}$	Crosstalk from one Amplifier to another Amplifier	-70	-100		V	dB
V_{IH}	Input Logic High Level	2.0			II	V
V_{IL}	Input Logic Low Level			0.8	II	V
I_{IL}	Logic Low Input Current (V_{IN} = 0V)	-0.3	-40	-80	II	µA
I_{IH}	Logic High Input Current (V_{IN} = 0V)	-3	0	3	II	µA
I_S	Total Supply Current	38	48	60	II	mA

1. Each channel's A-input to its B-input.
2. There is no short circuit protection on any output.

AC Electrical Characteristics

V_{CC} = +5V, V_{EE} = -5V, Temperature = 25°C, R_L = 150Ω, C_L = 3 pF.

Parameter		Description	Min	Typ	Max	Test Level	Units
BW		-3 dB Bandwidth		300		V	MHz
BW 0.1dB		±0.1 dB Bandwidth		105		V	MHz
DG		Differential Gain at 3.58 MHz		0.04		V	%
DP		Differential Phase at 3.58 MHz		0.08		V	°
Pkg		Peaking with Nominal Load		0.2		V	dB
SR		Slew Rate (4V Square Wave, Measured 25%–75%)		650		V	V/µs
t_s		Settling Time to 0.1% of Final Value		13		V	ns
T_{SW}		Time to Switch Inputs		3		V	ns
OS		Overshoot, V_{OUT} = 4 V_{P-P}		8		V	%
I_{SO}ab	10M	Input to Input Isolation at 10 MHz		60		V	dB
	100M	Input to Input Isolation at 100 MHz		40		V	dB
I_{SO}ch-ch	10M	Channel to Channel Isolation at 10 MHz		61		V	dB
	100M	Channel to Channel Isolation at 100 MHz		50		V	dB

Pin Descriptions

Pin Name	Function
A1, A2, A3	“A” inputs to amplifiers 1, 2 and 3 respectively
B1, B2, B3	“B” inputs to amplifiers 1, 2 and 3 respectively
GND1, GND2, GND3	These are the individual ground pins for each channel.
Out1, Out2, Out3	Amplifier outputs. Note: there is no short circuit protection on any output.
V_{CC}	Positive power supply. Typically +5V.
V_{EE}	Negative power supply. Typically -5V.
A/B	Common input select pin, a logic high selects the “A” inputs, logic low selects the “B” inputs. CMOS/TTL compatible.

Applications

Figure 1 shows a typical use for the EL4332C. The circuit is a component video (R,G,B or Y,U,V) multiplexer. Since the gain of the internal amplifiers has been set to 2, the only extra components needed are the supply decoupling capacitors and the back terminating resistors, if transmission lines are to be driven. The EL4332 can drive backmatched 50Ω or 75Ω loads.

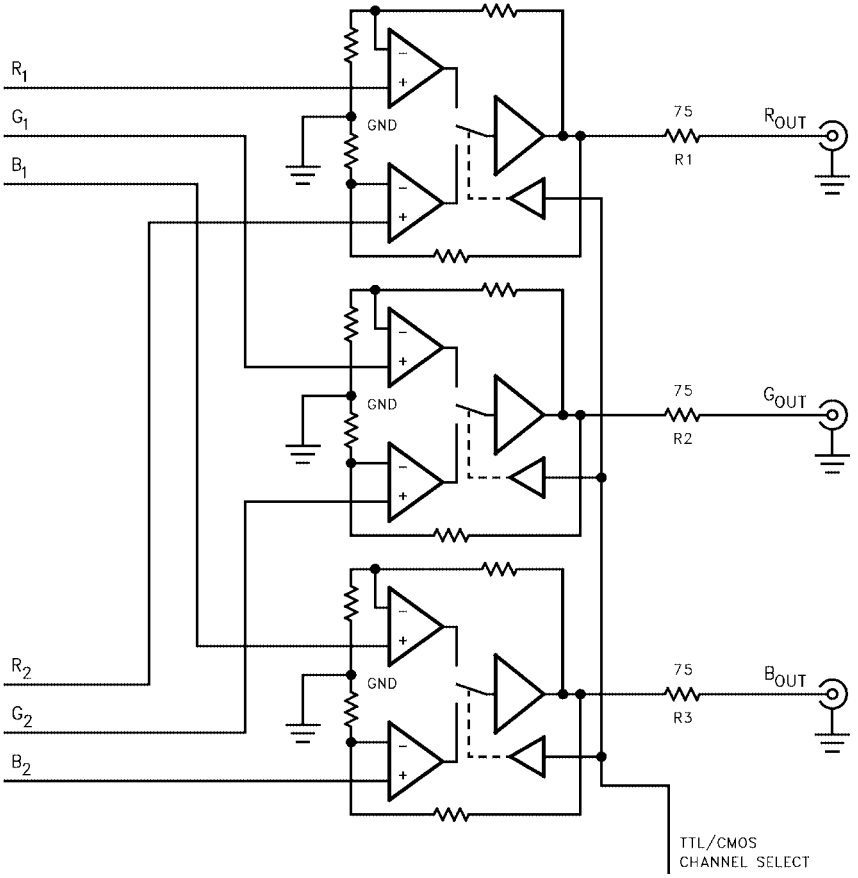

Figure 1. Typical Connection for a 2:1 Component Video Multiplexer

Grounds

It will be noticed that each mux-amp channel has its own separate ground pin. These ground pins have been kept separate to keep the channel separation inside the chip as large as possible. The feedback resistors use these ground pins as their reference. The resistors total 400Ω, so there is a significant signal current flowing from these pins to ground.

The ground pins should all be connected together, to a ground plane underneath the chip. 1 oz. copper for the ground plane is highly recommended.

Further notes and recommended practices for high speed printed circuit board layout can be found in the tutorials in the Elantec databooks.

Supplies

Supply bypassing should be as physically near the power pins as possible. Chip capacitors should be used to minimize lead inductance. Note that larger values of capacitor tend to have larger internal inductances. So when designing for 3 transmission lines or similar moderate loads, a 0.1 µF ceramic capacitor right next to the power pin in parallel with a 22 µF tantalum capacitor placed as close to the 0.1 µF is recommended. For lighter loadings, or if not all the channels are being used, a single 4.7 µF capacitor has been found quite adequate.

Note that component video signals do tend to have a high level of signal correlation. This is especially true if the video signal has been derived from 3 synchronously clocked DACs. This corresponds to all three channels drawing large slew currents simultaneously from the supplies. Thus, proper bypassing is critical.

Logic Inputs

The A/B select, logic input, is internally referenced to ground. It is set at 2 diode drops above ground, to give a threshold of about 1.4V (see Figure 2). The PNP input transistor requires that the driving gate be able to sink current, typically < 30 µA, for a logic “low”. If left to float, it will be a logic “high”.

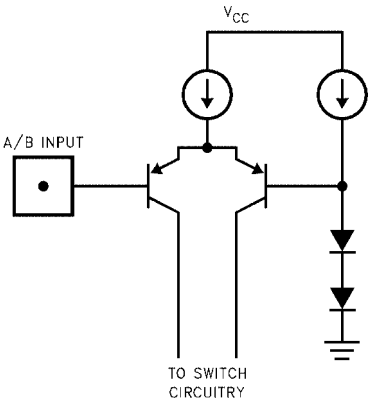

Figure 2. Simplified Logic Input Stage

The input PNP transistors have sufficient gain that a simple level shift circuit (see Figure 3) can be used to provide a simple interface with Emitter Coupled Logic. Typically, 200 mV is enough to switch from a solid logic “low” to a “high.”

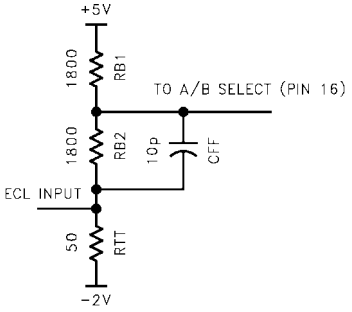

Figure 3. Adapting the Select Pin for ECL Logic Levels

The capacitor Cff is only in the network to prevent the A/B pin’s capacitance from slowing the control signal. The network shown level shifts the ECL levels, -0.7V to -1.5V to +1.6V and +1.1V respectively. The terminating resistor, Rtt, is required since the open emitter of the ECL gate can not sink current. If a -2V rail is not being

used, a 220Ω to 330Ω resistor to the -5.2V rail would have the same effect.

Expanding the Multiplexer

In Figure 4, a 3:1 multiplexer circuit is shown. The expansion to more inputs is very straight forward. Since the EL4332C has a fixed gain of 2, interstage attenuators may be required as shown in Figure 3. The truth table for the 3:1 multiplexer select lines is:

X	Y	Mux Output
0	0	R3, G3, B3
0	1	R2, G2, B2
1	X	R1, G1, B1

When interstage attenuators are used, the values should be kept down in the region of 50Ω–300Ω. This is to prevent a combination of circuit board stray capacitance and the EL4332C's input capacitance forming a significant pole. For example, if instead of 100Ω as shown, resistors of 1 kΩ had been used, and assuming 3 pF of stray and 3 pF of input capacitance, a pole would be formed at about 53 MHz.

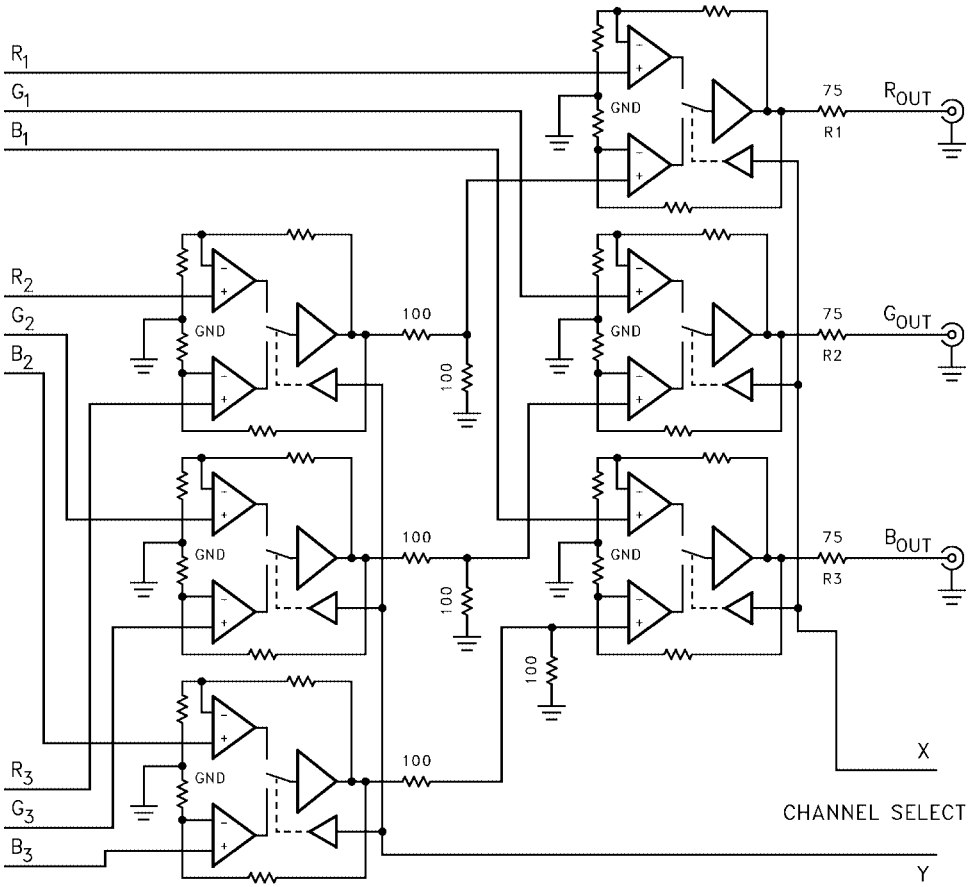

Figure 4. Typical Connection for a 3:1 Component Video Multiplexer

A Bandwidth Selectable Circuit

In *Figure 5*, a circuit is shown that allows three signals to be either low pass filtered or full bandwidth.

This could be useful where an input signal is frequently noisy. The component values shown give a Butterworth LPF response, with a -3 dB frequency of 50 MHz. Note again, the resistor values are low, so that stray capacitance does not affect the desired cut-off frequency.

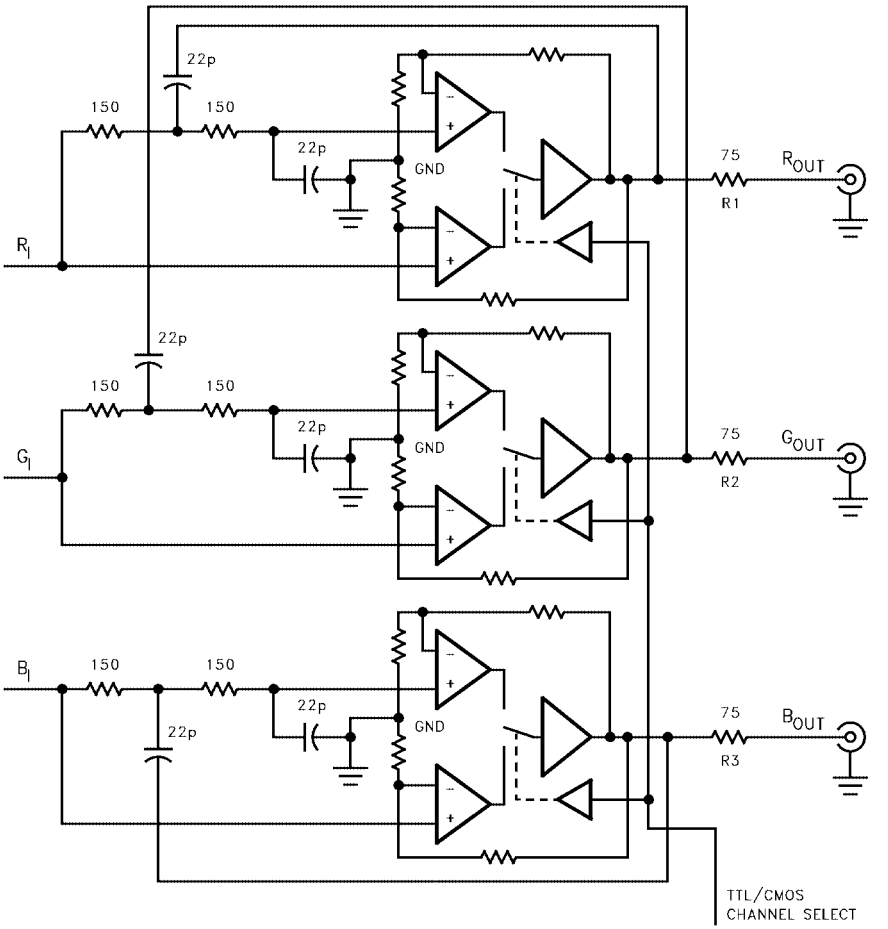

Figure 5. Switched 50 MHz Low Pass Filter for High/Low Resolution Monitors
