Description

The B9948L is a low-voltage clock distribution buffer with the capability to select either a differential LVPECL or a LVCMOS/LVTTL compatible input clock. The two clock sources can be used to provide for a test clock as well as the primary system clock. All other control inputs are LVCMOS/LVTTL compatible. The twelve outputs are 2.5V or 3.3V LVCMOS or LVTTL compatible and can drive two series-terminated 50Ω transmission lines. With this capability the B9948L has an effective fanout of 1:24. The outputs can also be three-stated via the three-state input TS#. Low output-to-output skews make the B9948L an ideal clock distribution buffer for nested clock trees in the most demanding of synchronous systems.

The B9948L also provides a synchronous output enable input for enabling or disabling the output clocks. Since this input is internally synchronized to the input clock, potential output glitching or runt pulse generation is eliminated.

Note:

1. PD = Internal Pull-Down, PU = Internal Pull-Up.

Output Enable/Disable

The B9948L features a control input to enable or disable the outputs. This data is latched on the falling edge of the input clock. When SYNC_OE is asserted LOW, the outputs are disabled in a LOW state. When SYNC_OE is set HIGH, the outputs are enabled as shown in *Figure 1*.

Maximum Ratings^[2]

Maximum Input Voltage Relative to V_{SS} : $V_{SS} - 0.3V$
 Maximum Input Voltage Relative to V_{DD} : $V_{DD} + 0.3V$
 Storage Temperature: $-65^{\circ}C$ to $+150^{\circ}C$
 Operating Temperature: $-40^{\circ}C$ to $+85^{\circ}C$
 Maximum ESD protection 2 kV
 Maximum Power Supply: 5.5V
 Maximum Input Current: ± 20 mA

This device contains circuitry to protect the inputs against damage due to high static voltages or electric field; however, precautions should be taken to avoid application of any voltage higher than the maximum rated voltages to this circuit. For proper operation, V_{in} and V_{out} should be constrained to the range:

$$V_{SS} < (V_{in} \text{ or } V_{out}) < V_{DD}$$

Unused inputs must always be tied to an appropriate logic voltage level (either V_{SS} or V_{DD}).

DC Parameters: $V_{DDC} = 2.5V \pm 5\%$ or $3.3V \pm 5\%$, $V_{DD} = 3.3V \pm 5\%$, $T_A = -40^{\circ}C$ to $+85^{\circ}C$

Notes:

- The voltage on any input or I/O pin cannot exceed the power pin during power-up. Power supply sequencing is NOT required.
- Inputs have pull-up resistors that effect input current, PECL_CLK# has a pull-down resistor.
- The V_{CMR} is the difference from the most positive side of the differential input signal. Normal operation is obtained when the "High" input is within the V_{CMR} range and the input lies within the V_{PP} specification.
- Driving series or parallel terminated 50 Ω (or 50 Ω to $V_{DD}/2$) transmission lines.
