

128K x 8 Static RAM

Features

- 4.5V – 5.5V operation
- CMOS for optimum speed/power
- Low active power (70 ns, LL version)
 - 330 mW (max.) (60 mA)
- Low standby power (70 ns, LL version)
 - 110 μ W (max.) (20 μ A)
- Automatic power-down when deselected
- TTL-compatible inputs and outputs
- Easy memory expansion with \overline{CE}_1 , CE_2 , and \overline{OE} options

Functional Description

The CY62128 is a high-performance CMOS static RAM organized as 131,072 words by 8 bits. Easy memory expansion is provided by an active LOW chip enable (\overline{CE}_1), an active HIGH chip enable (CE_2), an active LOW output enable (\overline{OE}), and three-state drivers. This device has an automatic power-down

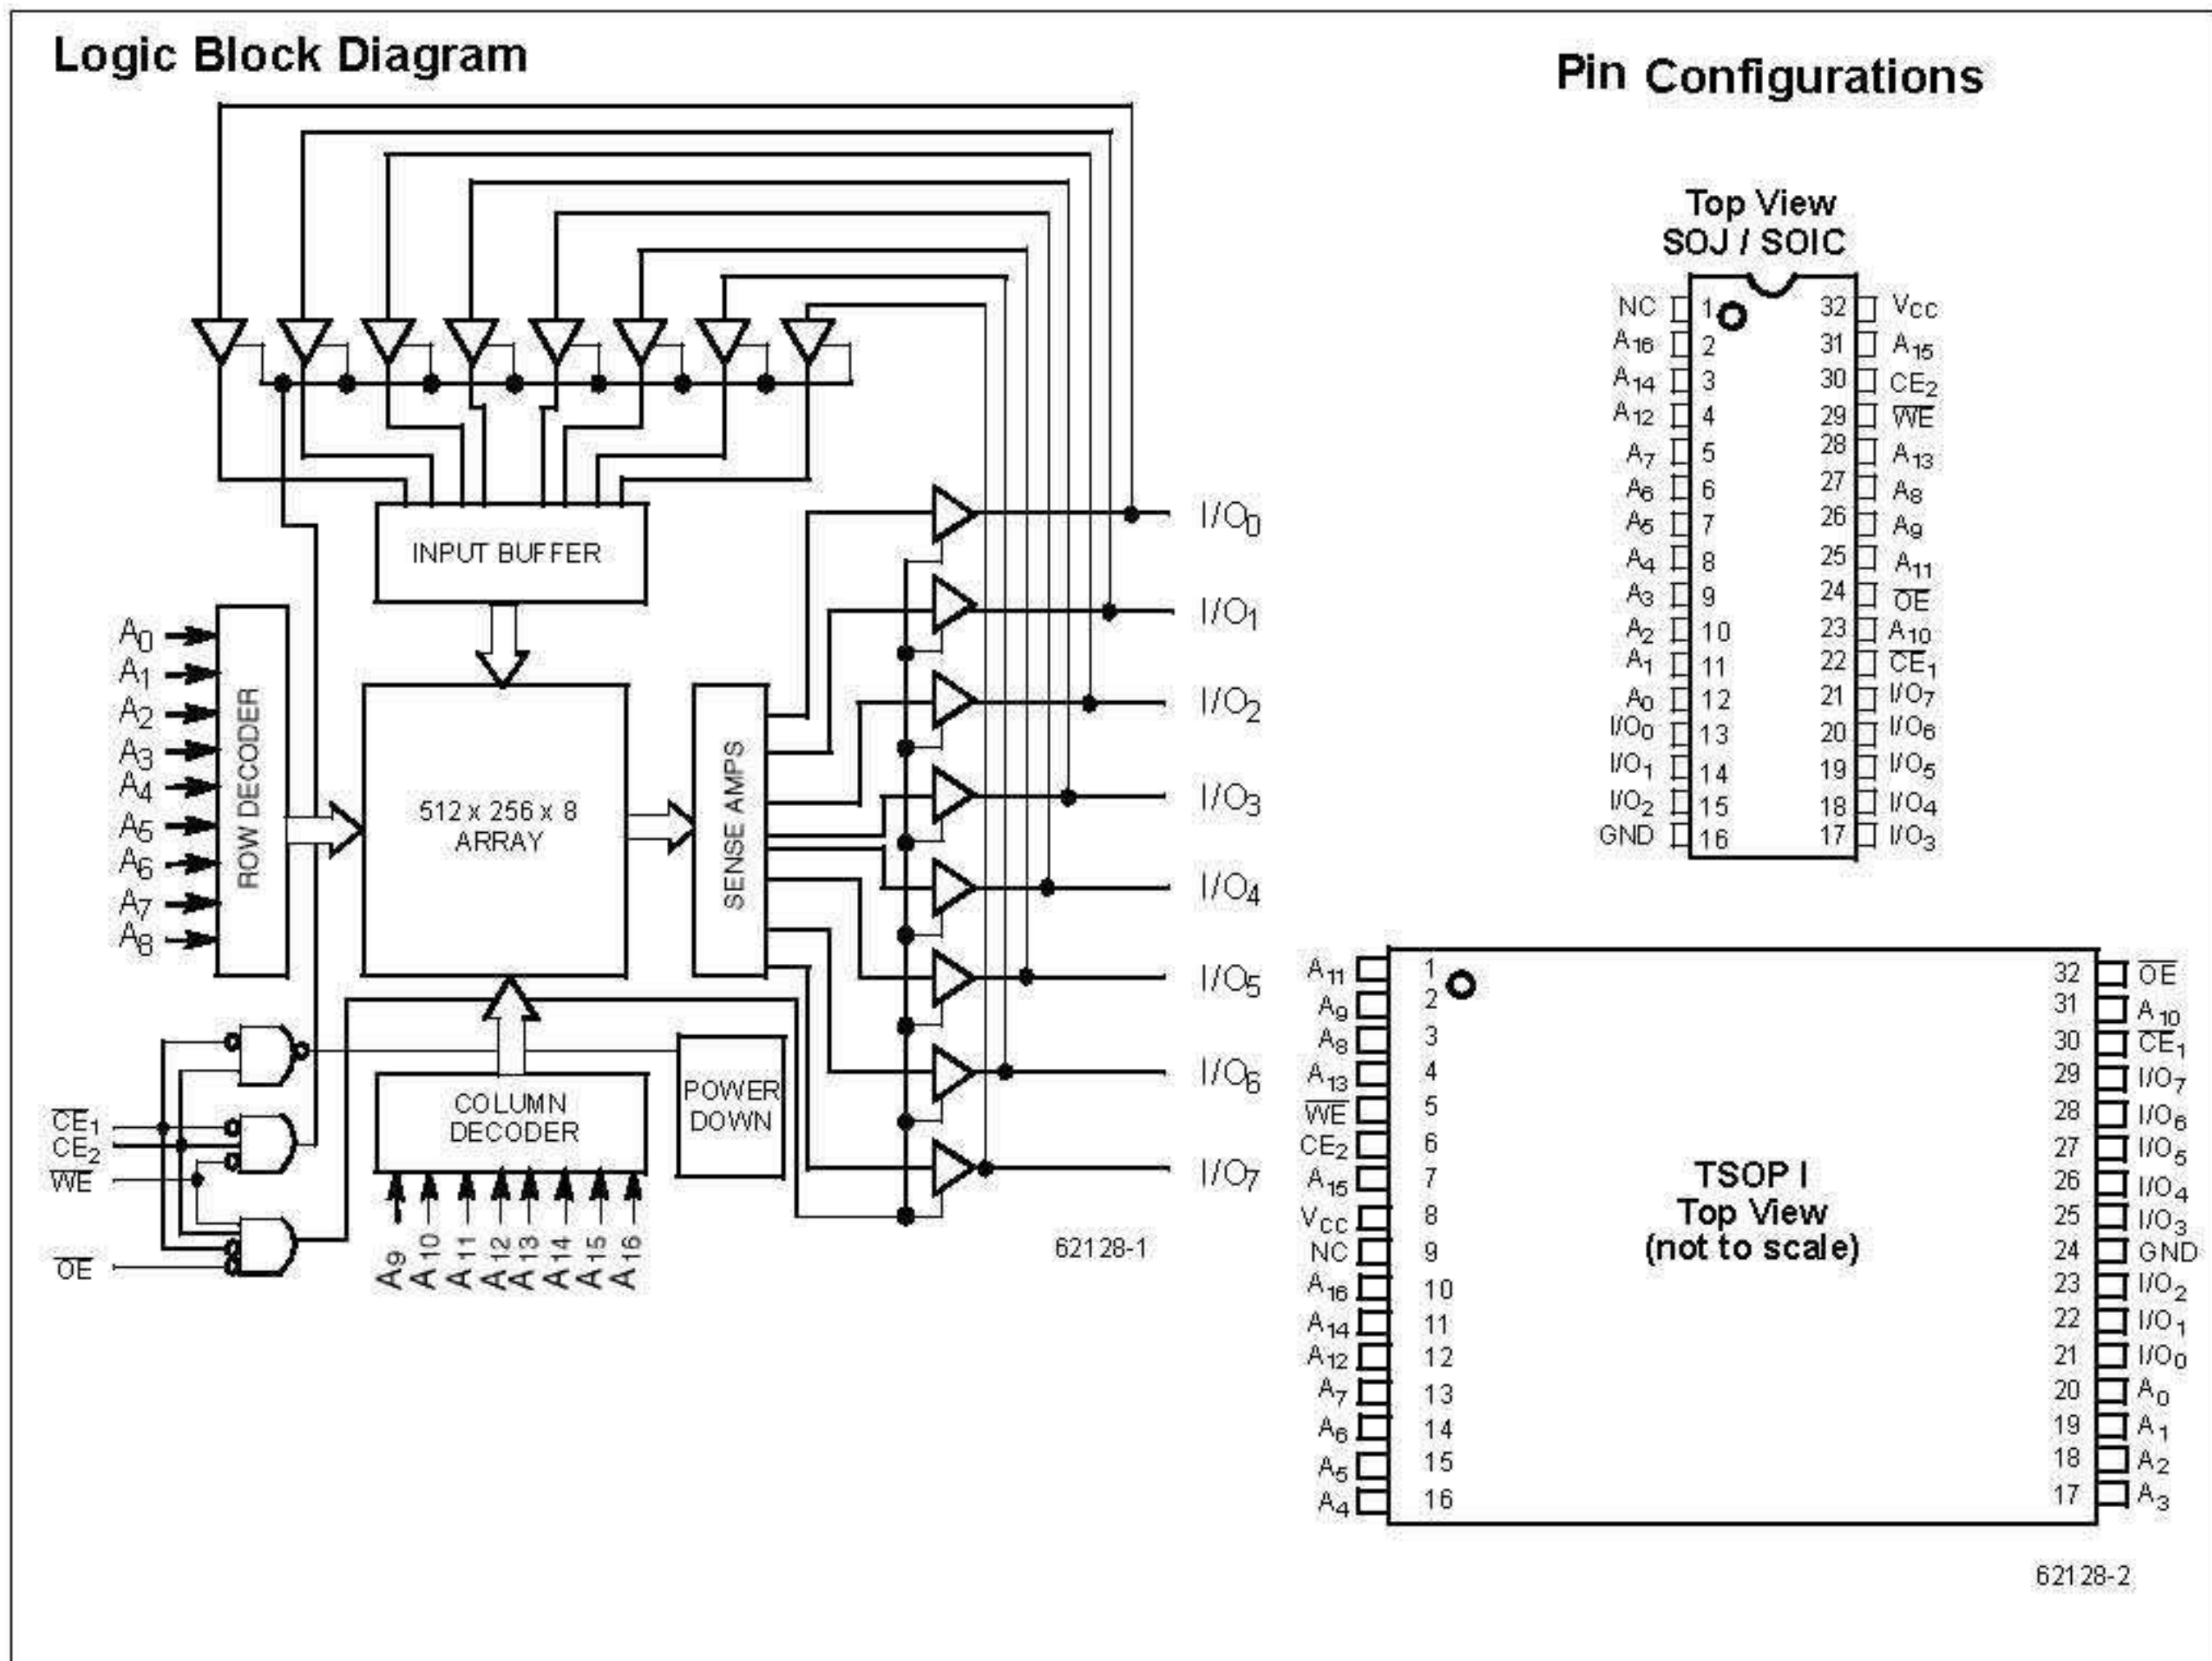

feature that reduces power consumption by more than 75% when deselected.

Writing to the device is accomplished by taking chip enable one (\overline{CE}_1) and write enable (\overline{WE}) inputs LOW and chip enable two (CE_2) input HIGH. Data on the eight I/O pins (I/O_0 through I/O_7) is then written into the location specified on the address pins (A_0 through A_{16}).

Reading from the device is accomplished by taking chip enable one (\overline{CE}_1) and output enable (\overline{OE}) LOW while forcing write enable (\overline{WE}) and chip enable two (CE_2) HIGH. Under these conditions, the contents of the memory location specified by the address pins will appear on the I/O pins.

The eight input/output pins (I/O_0 through I/O_7) are placed in a high-impedance state when the device is deselected (\overline{CE}_1 HIGH or CE_2 LOW), the outputs are disabled (\overline{OE} HIGH), or during a write operation (\overline{CE}_1 LOW, CE_2 HIGH, and \overline{WE} LOW).

The CY62128 is available in a standard 400-mil-wide SOJ, 525-mil wide (450-mil-wide body width) SOIC and 32-pin TSOP type I.

Notes:

- V_{IL} (min.) = -2.0V for pulse durations of less than 20 ns.
- T_A is the "instant on" case temperature.
- See the last page of this specification for Group A subgroup testing information.
- Not more than one output should be shorted at one time. Duration of the short circuit should not exceed 30 seconds.

Notes:

- Tested initially and after any design or process changes that may affect these parameters.
- Test conditions assume signal transition time of 5ns or less, timing reference levels of 1.5V, input pulse levels of 0 to 3.0V, and output loading of the specified I_{OL}/I_{OH} and 100pF load capacitance.
- t_{HZOE} , t_{HZCE} , and t_{HZWE} are specified with a load capacitance of 5 pF as in part (b) of AC Test Loads. Transition is measured ± 500 mV from steady-state voltage.
- At any given temperature and voltage condition, t_{HZCE} is less than t_{LZCE} ; t_{HZOE} is less than t_{LZOE} , and t_{HZWE} is less than t_{LZWE} for any given device.
- The internal write time of the memory is defined by the overlap of \overline{CE}_1 LOW, CE_2 HIGH, and \overline{WE} LOW. \overline{CE}_1 and \overline{WE} must be LOW and CE_2 HIGH to initiate a write, and the transition of any of these signals can terminate the write. The input data set-up and hold timing should be referenced to the leading edge of the signal that terminates the write.

Notes:

10. Device is continuously selected. $\overline{OE}, \overline{CE}_1 = V_{IL}, \overline{CE}_2 = V_{IH}$.
11. \overline{WE} is HIGH for read cycle.
12. Address valid prior to or coincident with \overline{CE}_1 transition LOW and \overline{CE}_2 transition HIGH.

Notes:

- 13. Data I/O is high impedance if $\overline{OE} = V_{IH}$.
- 14. If \overline{CE}_1 goes HIGH or CE_2 goes LOW simultaneously with \overline{WE} going HIGH, the output remains in a high-impedance state.
- 15. During this period the I/Os are in the output state and input signals should not be applied.
