

Typical Applications

- Dual-Band CDMA Base Stations
- TDMA/TDMA-EDGE Base Stations
- GSM-EDGE/EGSM Base Stations
- W-CDMA Base Stations
- WLAN and WLL Systems
- TETRA Systems

Product Description

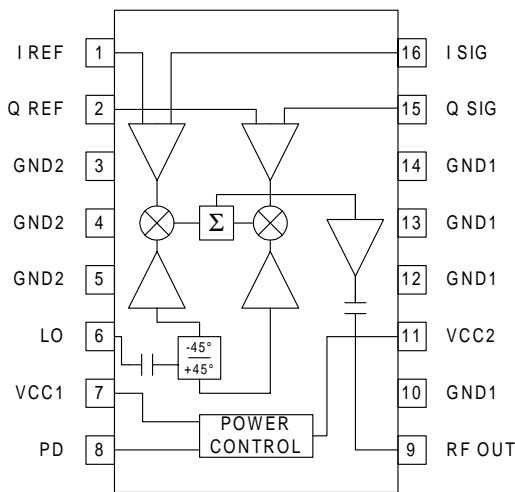

The RF2480 is a monolithic integrated quadrature modulator IC capable of universal direct modulation for high-frequency AM, PM, or compound carriers. This low-cost IC features excellent linearity, noise floor, and over-temperature carrier suppression performance. The device implements differential amplifiers for the modulation inputs, 90° carrier phase shift network, carrier limiting amplifiers, two matched double-balanced mixers, summing amplifier, and an output RF amplifier which will drive 50Ω from 800MHz to 2500MHz. Component matching is used to obtain excellent amplitude balance and phase accuracy.

Optimum Technology Matching® Applied

- Si BJT GaAs HBT GaAs MESFET
 Si Bi-CMOS SiGe HBT Si CMOS

Functional Block Diagram

Package Style: SOIC-16

Features

- Typical Carrier Suppression > 35dBc over temperature with highly linear operation
- Single 5V Power Supply
- Integrated RF quadrature network
- Digitally controlled Power Down mode
- 800MHz to 2500MHz operation

Ordering Information

- RF2480 Direct Quadrature Modulator
 RF2480 PCBA Fully Assembled Evaluation Board

RF2480

Pin	Function	Description	Interface Schematic
1	I REF	Reference voltage for the I mixer. This voltage should be the same as the DC voltage supplied to the I SIG pin. A voltage of 3.0V is recommended. The SIG and REF inputs are inputs of a differential amplifier. Therefore the REF and SIG inputs are interchangeable. If swapping the I SIG and I REF pins, the Q SIG and Q REF also need to be swapped to maintain the correct phase. It is also possible to drive the SIG and REF inputs in a balanced mode. This will increase the gain. For optimum carrier suppression, the DC voltages on I REF, Q REF, I SIG and Q SIG should be adjusted slightly to compensate for inherent undesired internal DC offsets; for optimum sideband suppression, phase and signal amplitude on IREF, Q REF, I SIG and Q SIG should be adjusted slightly to compensate for inherent undesired internal offsets. See RFMD AN0001 for more detail.	
2	Q REF	Reference voltage for the Q mixer. This voltage should be the same as the DC voltage supplied to the Q SIG pin. A voltage of 3.0V is recommended. See pin 1 for more details.	
3	GND2	Ground connection of the LO phase shift network. This pin should be connected directly to the ground plane.	
4	GND2	Same as pin 3.	
5	GND2	Same as pin 3.	
6	LO	The input of the phase shifting network. This pin has an internal DC blocking capacitor. This port is voltage driven so matching at different frequencies is not required.	
7	VCC1	Power supply for all circuits except the RF output stage. An external capacitor is needed if no other low frequency bypass capacitor is nearby.	
8	PD	Power Down control. When this pin is "low", all circuits are shut off. A "low" is typically 1.2V or less at room temperature. When this pin is "high" (V_{CC}), all circuits are operating normally. If PD is below V_{CC} , output power and performance will be degraded. Operating in this region is not recommended, although it might be useful in some applications where power control is required.	
9	RF OUT	RF Output. This pin has an internal DC blocking capacitor. At some frequencies, external matching may be needed to optimize output power.	
10	GND3	Ground connection for the RF output stage. This pin should be connected directly to the ground plane.	
11	VCC2	Power supply for the RF output amplifier. An external capacitor is needed if no other low frequency bypass capacitor is near by.	
12	GND1	Ground connection for the LO and baseband amplifiers, and for the mixers. This pin should be connected directly to the ground plane.	
13	GND1	Same as pin 12.	
14	GND1	Same as pin 12.	

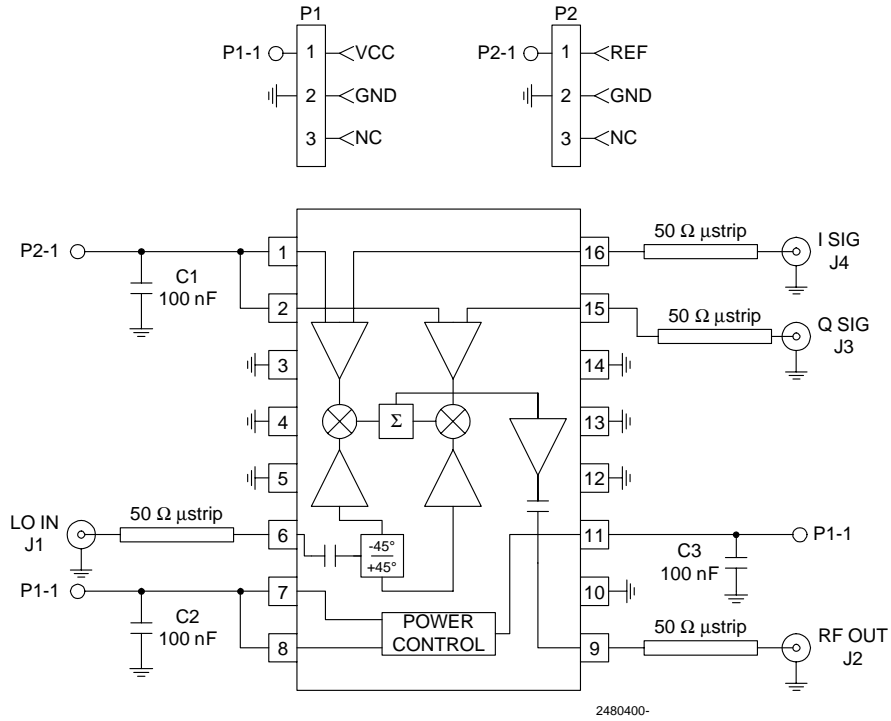

Pin	Function	Description	Interface Schematic
15	Q SIG	Baseband input to the Q mixer. This pin is DC-coupled. Maximum output power is obtained when the input signal has a peak to peak amplitude of 2V; for highly linear operation, the input signal (and output power) must be reduced appropriately. The recommended DC level for this pin is 3.0V. The peak minimum voltage on this pin ($V_{REF} - \text{peak modulation amplitude}$) should never drop below 2.0V. The peak maximum voltage on this pin ($V_{REF} + \text{peak modulation amplitude}$) should never exceed 4.0V. See pin 1 for more details.	
16	I SIG	Baseband input to the I mixer. This pin is DC-coupled. Maximum output power is obtained when the input signal has a peak to peak amplitude of 2V; for highly linear operation, the input signal (and output power) must be reduced appropriately. The recommended DC level for this pin is 3.0V. The peak minimum voltage on this pin ($V_{REF} - \text{peak modulation amplitude}$) should never drop below 2.0V. The peak maximum voltage on this pin ($V_{REF} + \text{peak modulation amplitude}$) should never exceed 4.0V. See pin 1 for more details.
