## 8-Bit CMOS Microcontroller Family

**C511  
C511A  
C513  
C513A  
C513A-H**

### Preliminary

- Fully software compatible to standard 8051/8052 microcontrollers
- Up to 12 MHz operating frequency
- Up to 12 K×8 ROM / EEPROM
- Up to 256×8 RAM
- Up to 256 x 8 XRAM
- Four 8-bit ports
- Up to three 16-bit Timers / Counters (Timer 2 with Up/Down and 16-bit Autoreload Feature)
- Synchronous Serial Channel (SSC)
- Optional USART
- Up to seven interrupt sources, two priority levels
- Power Saving Modes
- P-LCC-44 package (C513A also in P-MQFP-44 package)
- Temperature Ranges : SAB-C511 / 511A / 513 / 513A / C513A-H  $T_A$  : 0 °C to 70 °C  
SAF-C513A  $T_A$  : -40 °C to 85 °C

The C511, C511A, C513, C513A, and C513A-H are members of a family of low cost micro-controllers, which are software compatible with the components of the SAB 8051, SAB 80C51 and C500 families.

The first four versions contains a non-volatile read-only (ROM) program memory. The C513A-H is a version with a 12 Kbyte EEPROM instead of ROM. This device can be used for prototype designs which have a demand for reprogrammable on-chip code memory.

The members of the microcontroller family differ in functionality according **table 1**. They offer different ROM sizes, different RAM/XRAM sizes and a different timer/USART configuration. Common to all devices is an advanced SSC serial port, a second synchronous serial interface, which is compatible to the SPI serial bus industry standard. The functionality of the C513A-H is a superset of all ROM versions of the C511/C513 family.

**Table 1**  
**Functionality of the C511/C513 MCUs**

Device	ROM Size	EEPROM Size	RAM Size	XRAM Size	Timers <sup>1)</sup>	USART	SSC
C511	2.5 KB	–	128 B	–	T0, T1	–	✓
C511A	4 KB	–	256 B	–	T0, T1	–	✓
C513	8 KB	–	256 B	–	T0, T1, T2	✓	✓
C513A	12, 16 KB	–	256 B	256 B	T0, T1, T2	✓	✓
C513A-H	–	12 KB	256 B	256 B	T0, T1, T2	✓	✓

1) T0/T1 refers to the standard 8051 timer 0/1 units, T2 refers to the 8052 timer 2 unit.

**Ordering Information**

Type	Ordering Code	Package	Description (8-Bit CMOS microcontroller)
C511-RN	Q67120-DXXXX	P-LCC-44	with mask-programmable ROM (2.5K), 12 MHz
C511A-RN	Q67120-DXXXX	P-LCC-44	with mask-programmable ROM (4K), 12 MHz
C513-1RN	Q67120-DXXXX	P-LCC-44	with mask-programmable ROM (8K), 12 MHz
C513A-RN	Q67120-DXXXX	P-LCC-44	with mask-programmable ROM (12K), 12 MHz
	Q67120-DXXXX	P-LCC-44	with mask-programmable ROM (12K), 12 MHz, ext. temp. – 40 °C to 85 °C
C513A-2RN	Q67120-DXXXX	P-LCC-44	with mask-programmable ROM (16K), 12 MHz
	Q67120-DXXXX	P-LCC-44	with mask-programmable ROM (16K), 12 MHz, ext. temp. – 40 °C to 85 °C
C513A-2RM	Q67120-DXXXX	P-MQFP-44	with mask-programmable ROM (16K), 12 MHz
	Q67120-DXXXX	P-MQFP-44	with mask-programmable ROM (16K), 12 MHz, ext. temp. – 40 °C to 85 °C
C513A-LN	Q67120-C1017	P-LCC-44	for external memory (12 MHz)
	Q67120-C1035	P-LCC-44	for external memory (12 MHz), ext. temp. – 40 °C to 85 °C
C513A-LM	Q67120-C1026	P-MQFP-44	for external memory (12 MHz)
	Q67120-C1036	P-MQFP-44	for external memory (12 MHz), ext. temp. – 40 °C to 85 °C
C513A-HN	Q67120-C0989	P-LCC-44	with reprogrammable EEPROM (12K), 12 MHz, ext. temp. – 40 °C to 85 °C

**Note :** The ordering number of the ROM types (DXXXX extension) is defined after program release (verification) of the customer.

**Figure 2**  
**P-LCC-44 Package Pin Configuration (Top View)**

If the C513A-H is used in programming mode, the pin configuration is different to **figure 2** and **3** (see **figure 5**).

**Pin Definitions and Functions** (cont'd)

Symbol	Pin Number		I/O*)	Function
	P-LCC-44	P-MQFP-44		
P3.0-P3.7	11, 13-19	5, 7-13	I/O	<p><b>Port 3</b> is a bidirectional I/O port with internal pull-up resistors. Port 3 pins that have 1s written to them are pulled high by the internal pullup resistors, and in that state can be used as inputs. As inputs, port 3 pins being externally pulled low will source current (<math>I_{IL}</math>, in the DC characteristics) because of the internal pullup resistors. Port 3 also contains the interrupt, timer, serial port and external memory strobe pins that are used by various options. The output latch corresponding to a secondary function must be programmed to a one (1) for that function to operate.</p> <p>The secondary functions are assigned to the pins of port 3 as follows:</p>
	11	5	P3.0	RXD Receiver data input (asynchronous) or data input/output (synchronous) of serial interface (USART) <sup>1)</sup>
	13	7	P3.1	TXD Transmitter data output (USART) <sup>1)</sup> (asynchronous) or clock output (synchronous) of serial interface
	14	8	P3.2	$\overline{\text{INT0}}$ Interrupt 0 input / timer 0 gate control
	15	9	P3.3	$\overline{\text{INT1}}$ Interrupt 1 input / timer 1 gate control
	16	10	P3.4	T0 Counter 0 input
	17	11	P3.5	T1 Counter 1 input
	18	12	P3.6	$\overline{\text{WR}}$ Write control signal : latches the data byte from port 0 into the external data memory
	19	13	P3.7	$\overline{\text{RD}}$ Read control signal : enables the external data memory to port 0
				<sup>1)</sup> not available in the C511/511A
XTAL2	20	14	–	<p><b>XTAL2</b> Output of the inverting oscillator amplifier.</p>

\*) I = Input  
O = Output

**Table 3**  
**Pin Definitions and Functions** (cont'd)

Symbol	Pin Number		I/O*)	Function
	P-LCC-44	P-MQFP-44		
XTAL1	21	15	–	<p><b>XTAL1</b>            Input to the inverting oscillator amplifier and input to the internal clock generator circuits.            To drive the device from an external clock source, XTAL1 should be driven, while XTAL2 is left unconnected. There are no requirements on the duty cycle of the external clock signal, since the input to the internal clocking circuitry is divided down by a divide-by-two flip-flop. Minimum and maximum high and low times as well as rise/fall times specified in the AC characteristics must be observed.</p>
P2.0-P2.7	24-31	18-25	I/O	<p><b>Port 2</b>            is a bidirectional I/O port with internal pullup resistors. Port 2 pins that have 1s written to them are pulled high by the internal pullup resistors, and in that state can be used as inputs. As inputs, port 2 pins being externally pulled low will source current (<math>I_{IL}</math>, in the DC characteristics) because of the internal pullup resistors. Port 2 emits the high-order address byte during fetches from external program memory and during accesses to external data memory that use 16-bit addresses (MOVX @DPTR). In this application it uses strong internal pullup resistors when issuing 1s. During accesses to external data memory that use 8-bit addresses (MOVX @Ri), port 2 issues the contents of the P2 special function register.</p>
PSEN	32	26	O	<p>The <b>Program Store Enable</b> output is a control signal that enables the external program memory to the bus during external fetch operations. It is activated every six oscillator periods except during external data memory accesses. Remains high during internal program execution.</p>
RESET	10	4	I	<p><b>RESET</b>            A high level on this pin for two machine cycles while the oscillator is running resets the device. An internal resistor to <math>V_{SS}</math> permits power-on reset using only an external capacitor to <math>V_{CC}</math>.</p>

**Functional Description**

The C511/C513 microcontrollers are fully compatible to the standard 8051/80C52 and C500 microcontroller family. While maintaining all architectural and operational characteristics of the 80C52/C500 the C511/C513 incorporates enhancements such as additional internal XRAM and a second (synchronous) serial interface unit.

**Figure 6** shows a block diagram of the C511/C513 microcontroller family.

**Figure 6**  
**Block Diagram of the C511/C513 Units**

## CPU

The C511/C513 are efficient both as a controller and as an arithmetic processor. It has extensive facilities for binary and BCD arithmetic and for bit-handling capabilities. Efficient use of program memory results from an instruction set consisting of 44 % one-byte, 41 % two-byte, and 15 % three-byte instructions. With a 12 MHz crystal, 58 % of the instructions execute in 1  $\mu$ s.

### Special Function Register PSW (Address D0<sub>H</sub>)

Reset Value : 00<sub>H</sub>

Bit No.	MSB				LSB				PSW
	7	6	5	4	3	2	1	0	
D0 <sub>H</sub>	CY	AC	F0	RS1	RS0	OV	F1	P	

Bit	Function
CY	Carry Flag
AC	Auxiliary Carry Flag (for BCD operations)
F0	General Purpose Flag
RS1 RS0	Register Bank select control bits
0 0	Bank 0 selected, data address 00 <sub>H</sub> -07 <sub>H</sub>
0 1	Bank 1 selected, data address 08 <sub>H</sub> -0F <sub>H</sub>
1 0	Bank 2 selected, data address 10 <sub>H</sub> -17 <sub>H</sub>
1 1	Bank 3 selected, data address 18 <sub>H</sub> -1F <sub>H</sub>
OV	Overflow Flag
F1	General Purpose Flag
P	Parity Flag Set/cleared by hardware each instruction cycle to indicate an odd/even number of "one" bits in the accumulator, i.e. even parity.

### Special Function Registers

All registers except the program counter and the four general purpose register banks reside in the special function register area.

The 34 special function registers (SFR) include pointers and registers that provide an interface between the CPU and the other on-chip peripherals. There are also 128 directly addressable bits within the SFR area.

All SFRs are listed in **table 5** and **table 6**. In **table 5** they are organized in groups which refer to the functional blocks of the C511/C513. **Table 6** illustrates the contents of the SFRs, e.g. the bits of the SFRs, in numeric order of their addresses.

**Table 5**  
**SFRs - Functional Blocks**

Block	Symbol	Name	Address	Contents after Reset

**Table 6**  
**Contents of the SFRs, SFRs in Numeric Order of their Addresses (cont'd)**

Addr	Register	Content after Reset <sup>1)</sup>	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
F8 <sub>H</sub>	SCF	XXXX- XX00 <sub>B</sub>	–	–	–	–	–	–	WCOL	TC
F9 <sub>H</sub>	SCIEN	XXXX- XX00 <sub>B</sub>	–	–	–	–	–	–	WCEN	TCEN

- <sup>1)</sup> X means that the value is indeterminate and the location is reserved.
- <sup>2)</sup> The availability of the XMAP bit and the reset value of SYSCON depends on the specific microcontroller :  
 C511/C511A/C513 : 101X0XXX<sub>B</sub> - bit XMAP is not available  
 C513A/C513A-H : 101X0XX0<sub>B</sub> - bit XMAP is available
- <sup>3)</sup> This register is only used for test purposes and must not be written. Otherwise unpredictable results may occur.  
 Shaded registers are bit-addressable special function registers.

**Timer/ Counter 0 and 1**

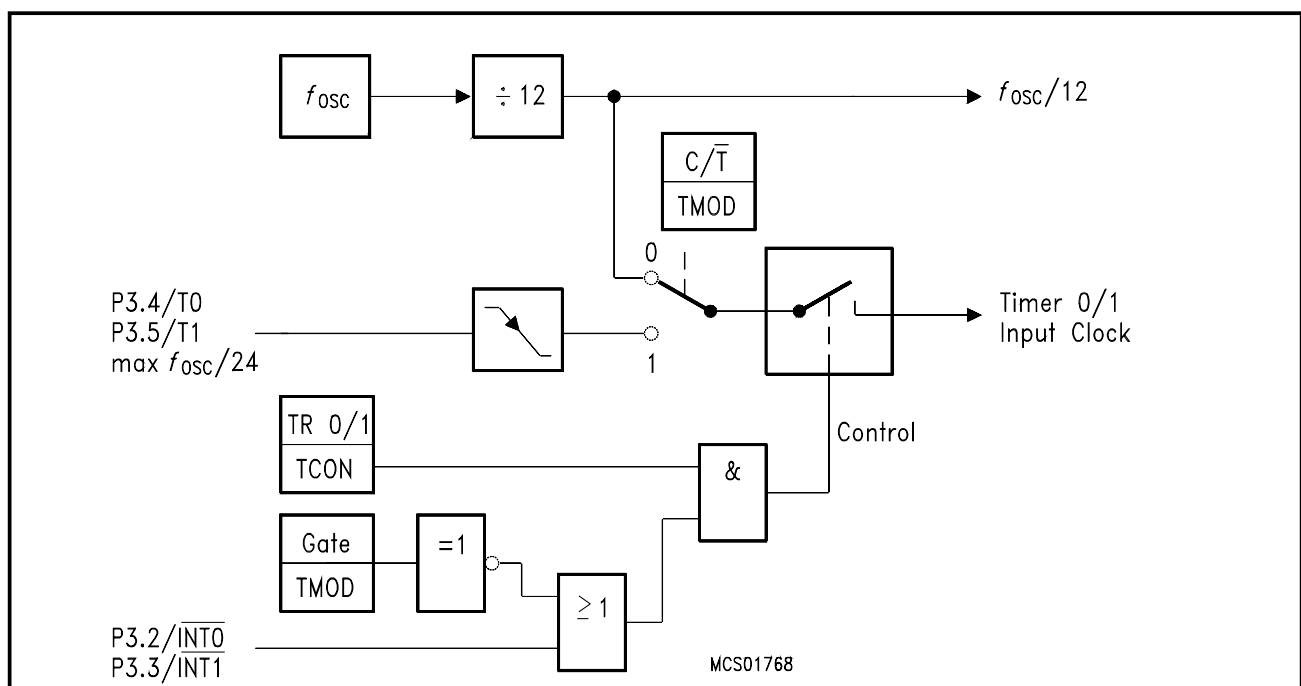

Timer/Counter 0 and 1 can be used in four operating modes as listed in **table 7**:

**Table 7**  
**Timer/Counter 0 and 1 operating modes**

Mode	Description	TMOD				Input Clock	
		Gate	C/T	M1	M0	internal	external (max)
0	8-bit timer/counter with a divide-by-32 prescaler	X	X	0	0	$f_{osc}/12 \times 32$	$f_{osc}/24 \times 32$
1	16-bit timer/counter	X	X	0	1	$f_{osc}/12$	$f_{osc}/24$
2	8-bit timer/counter with 8-bit auto-reload	X	X	1	0	$f_{osc}/12$	$f_{osc}/24$
3	Timer/counter 0 used as one 8-bit timer/counter and one 8-bit timer Timer 1 stops	X	X	1	1	$f_{osc}/12$	$f_{osc}/24$

In “timer” function (C/T = ‘0’) the register is incremented every machine cycle. Therefore the count rate is  $f_{osc}/12$ .

In “counter” function the register is incremented in response to a 1-to-0 transition at its corresponding external input pin (P3.4/T0, P3.5/T1). Since it takes two machine cycles to detect a falling edge the max. count rate is  $f_{osc}/24$ . External inputs INT0 and INT1 (P3.2, P3.3) can be programmed to function as a gate to facilitate pulse width measurements. **Figure 7** illustrates the input clock logic.

**Figure 7**  
**Timer/Counter 0 and 1 Input Clock Logic**

### Timer / Counter 2 (not available in the C511/C511A)

Timer 2 is a 16-bit Timer/Counter with up/down count feature. It can operate either as timer or as an event counter which is selected by bit  $C/\overline{T2}$  (T2CON.1). It has three operating modes as shown in table 8.

**Table 8**  
**Timer/Counter 2 Operating Modes**

Mode	T2CON			T2MOD	T2CON	P1.1/ T2EX	Remarks	Input Clock	
	R×CLK or T×CLK	CP/ RL2	TR2	DCEN	EXEN			internal	external (P1.0/T2)
16-bit Auto- reload	0	0	1	0	0	X	reload upon overflow	$f_{osc}/12$	max $f_{osc}/24$
	0	0	1	0	1	↓	reload trigger (falling edge)		
	0	0	1	1	X	0	Down counting		
	0	0	1	1	X	1	Up counting		
16-bit Cap- ture	0	1	1	X	0	X	16-bit Timer/Counter (only up-counting)	$f_{osc}/12$	max $f_{osc}/24$
	0	1	1	X	1	↓	capture TH2, TL2 → RC2H, RC2L		
Baud Rate Gene- rator	1	X	1	X	0	X	no overflow interrupt	$f_{osc}/2$	max $f_{osc}/24$
	1	X	1	X	1	↓	request (TF2) extra external interrupt ("Timer 2")		
off	X	X	0	X	X	X	Timer 2 stops	–	–

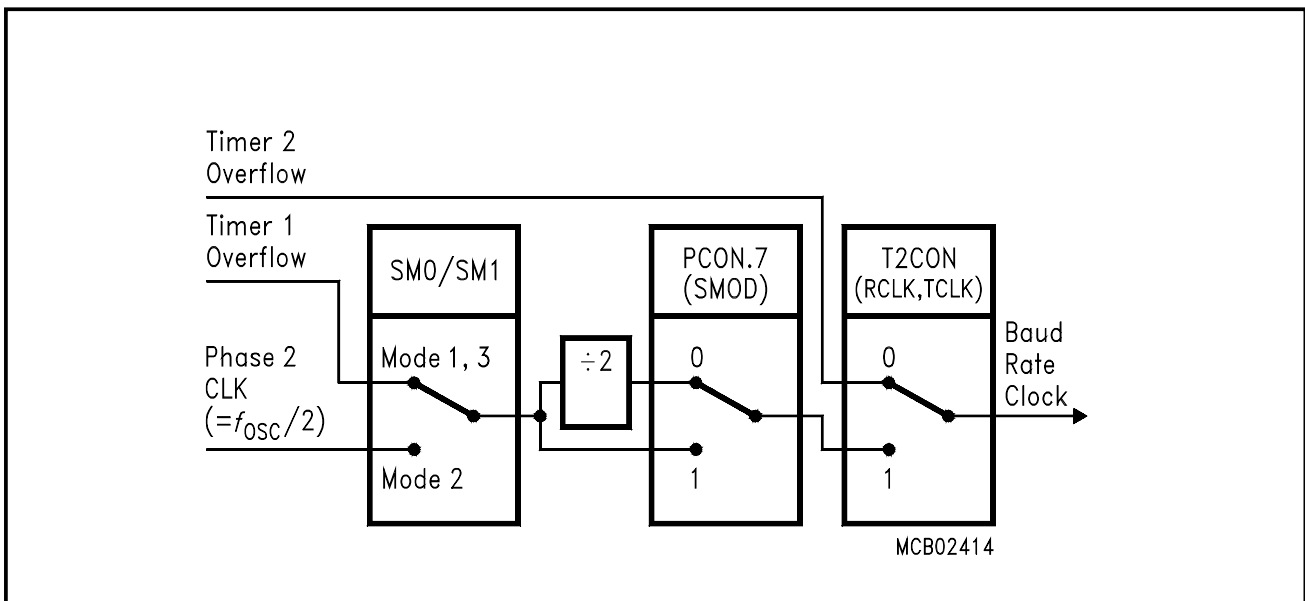

**Note:** ↓ =  falling edge

**Serial Interface (USART, not available in the C511/C511A)**

The serial port is full duplex and can operate in four modes (one synchronous mode, three asynchronous modes) as illustrated in **table 9**. **Figure 8** illustrates the block diagram of Baudrate generation for the serial interface.

**Table 9**  
**USART Operating Modes**

Mode	SCON		Baudrate	Description
	SM0	SM1		
0	0	0	$f_{osc}/12$	Serial data enters and exits through RxD. TxD outputs the shift clock. 8-bit are transmitted/received (LSB first)
1	0	1	Timer 1/2 overflow rate	8-bit UART 10 bits are transmitted (through TxD) or received (RxD)
2	1	0	$f_{osc}/32$ or $f_{osc}/64$	9-bit UART 11 bits are transmitted (TxD) or received (RxD)
3	1	1	Timer 1/2 overflow rate	9-bit UART Like mode 2 except the variable baud rate

**Figure 8**  
**Block Diagram of Baud Rate Generation for the Serial Interface**

The possible baudrates can be calculated using the formulas given in **table 10**.

**Table 10**  
**Baudrates Selection**

Baud rate derived from	Interface Mode	Baudrate
Oscillator	0	$f_{osc}/12$
	2	$(2^{SMOD} \times f_{osc})/64$
Timer 1 (16-bit timer) (8-bit timer with 8-bit autoreload)	1,3	$(2^{SMOD} \times \text{timer 1 overflow rate})/32$
	1,3	$(2^{SMOD} \times f_{osc})/(32 \times 12 \times (256-TH1))$
Timer 2	1,3	$f_{osc}/(32 \times (65536-(RC2H, RC2L)))$

**Synchronous Serial Channel (SSC)**

The C511/C513 microcontrollers provide a Synchronous Serial Channel unit, the SSC. This interface is compatible to the popular SPI serial bus interface. It can be used for simple I/O expansion via shift registers, for connection of a variety of peripheral components, such as A/D converters, EEPROMs etc., or for allowing several microcontrollers to be interconnected in a master/slave structure. It supports full-duplex or half-duplex operation and can run in a master or a slave mode. **Figure 9** shows the block diagram of the SSC.

**Figure 9**  
**SSC Blockdiagram**

**Additional On-Chip XRAM (not available in the C511/C511A/C513)**

The C513A/C513A-H contain another 256 byte of on-chip RAM additional to the 256 byte internal RAM. This RAM is called XRAM ('eXtended RAM').

The additional on-chip XRAM is logically located in the external data memory range from address FF00<sub>H</sub> to FFFF<sub>H</sub>. The contents of the XRAM are not affected by a reset. After power up the content is undefined, while it remains unchanged during and after reset as long as the power supply is not turned off. The XRAM is controlled by SFR SYSCON as shown in **table 11**.

**Table 11**  
**Control of the XRAM**

SFR SYSCON Bit XMAP	Description
0	Reset value. Access to XRAM is disabled.
1	XRAM enabled. The signals $\overline{RD}$ and $\overline{WR}$ are not activated during MOVX accesses in the XRAM address range.

The XRAM is accessed as external data memory. Therefore, MOVX instruction types must be used for accessing the XRAM. A general overview gives **table 12**.

**Table 12**  
**Accessing the XRAM**

Instruction using	Instruction	Remarks
DPTR (16-bit addr.)	MOVX A @DPTR MOVX @DPTR,A	Normally the use of these instructions would use a physically external memory. However, in the C513A/C513A-H the XRAM is accessed if it is enabled by bit XMAP and the 16-bit address (DPTR) is within the XRAM address range FF00 <sub>H</sub> - FFFF <sub>H</sub> .
R0/R1 (8-bit addr.)	MOVX A, @Ri MOVX @Ri,A	If XRAM is enabled in the C513A/C513A-H, MOVX instructions using Ri will always access the internal XRAM. External data memory cycles will not be generated in this case. If the XRAM is disabled, MOVX instructions using Ri will generate normal external data memory cycles.

**Interrupt System**

The C511/C513 provide 7 interrupt sources with two priority levels. **Figure 10** gives a general overview of the interrupt sources and illustrates the request and control flags.

**Figure 10**  
**Interrupt Request Sources**

**Table 13**  
**Interrupt Sources and their Corresponding Interrupt Vectors**

Source (Request Flags)	Vector	Vector Address
IE0	External interrupt 0	0003 <sub>H</sub>
TF0	Timer 0 interrupt	000B <sub>H</sub>
IE1	External interrupt 1	0013 <sub>H</sub>
TF1	Timer 1 interrupt	001B <sub>H</sub>
RI + TI	USART serial port interrupt, (C513/C513A/C513A-H only)	0023 <sub>H</sub>
TF2 + EXF2	Timer 2 interrupt	
SSCI	Synchronous serial channel interrupt (SSC)	002B <sub>H</sub> 0043 <sub>H</sub>

A low-priority interrupt can itself be interrupted by a high-priority interrupt, but not by another low-priority interrupt. A high-priority interrupt cannot be interrupted by any other interrupt source.

If two requests of different priority level are received simultaneously, the request of higher priority is serviced. If requests of the same priority are received simultaneously, an internal polling sequence determines which request is serviced. Thus within each priority level there is a second priority structure determined by the polling sequence as shown in **table 14**.

**Table 14**  
**Priority-within-Level Structure**

Interrupt Source	Priority
External Interrupt 0, IE0	High
Synchronous Serial Channel SSC	
Timer 0 Interrupt, TF0	↓
External Interrupt 1, IE1	
Timer 1 Interrupt, TF1	
Universal Serial Channel, RI or TI	
Timer 2 Interrupt, TF2 or EXF2	Low

### Power Saving Modes

Two power down modes are available, the idle mode and the power down mode. In the idle mode only the CPU will be deactivated while in the power down mode the on-chip oscillator is stopped.

The bits PDE and IDLE select the power down mode or the idle mode, respectively. If the power down mode and the idle mode are set at the same time, power down takes precedence. **Table 15** gives a general overview of the power saving modes.

**Table 15**  
**Entering and leaving the power saving modes**

Mode	Entering Example	Leaving by	Remarks
Idle mode	ORL PCON, #01H	– enabled interrupt – Hardware Reset	CPU is gated off CPU status registers maintain their data. Peripherals are active
Power Down Mode	ORL PCON, #02H	Hardware Reset	Oscillators are stopped. Contents of on-chip RAM and SFR's are maintained (leaving power down mode means redefinition of SFR's contents)

In the power down mode of operation,  $V_{CC}$  can be reduced to minimize power consumption. It must be ensured, however, that  $V_{CC}$  is not reduced before the power down mode is invoked, and that  $V_{CC}$  is restored to its normal operating level, before the power down mode is terminated. The reset signal that terminates the power down mode also restarts the oscillator. The reset should not be activated before  $V_{CC}$  is restored to its normal operating level and must be held active long enough to allow the oscillator to restart and stabilize (similar to power-on reset).

**Absolute Maximum Ratings**

Ambient temperature under bias ( $T_A$ ) .....	0 °C to + 70 °C
Storage temperature ( $T_{ST}$ ) .....	- 65 °C to + 150 °C
Voltage on $V_{CC}$ pins with respect to ground ( $V_{SS}$ ) .....	- 0.5 V to 6.5 V
Voltage on any pin with respect to ground ( $V_{SS}$ ) .....	- 0.5 V to $V_{CC} + 0.5$ V
Input current on any pin during overload condition .....	- 10 mA to + 10 mA
Absolute sum of all input currents during overload condition .....	100 mA
Power dissipation.....	TBD

**Note:**

*Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage of the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for longer periods may affect device reliability. During overload conditions ( $V_{IN} > V_{CC}$  or  $V_{IN} < V_{SS}$ ) the Voltage on  $V_{CC}$  pins with respect to ground ( $V_{SS}$ ) must not exceed the values defined by the absolute maximum ratings.*

## DC Characteristics

$V_{CC} = 5\text{ V} + 10\%, -15\%$ ;  $V_{SS} = 0\text{ V}$ ;  $T_A = 0\text{ to } +70\text{ }^\circ\text{C}$

Parameter	Symbol	Limit Values		Unit	Test Condition
		min.	max.		
Input low voltage (except $\overline{EA}$ , RESET)	$V_{IL}$	- 0.5	$0.2 V_{CC}$ - 0.1	V	-
Input low voltage ( $\overline{EA}$ )	$V_{IL1}$	- 0.5	$0.2 V_{CC}$ - 0.3	V	-

MCT00096

**Figure 11**  
Program Memory Read Cycle

MCT00097

**Figure 12**  
Data Memory Read Cycle

**Figure 13**  
Data Memory Write Cycle

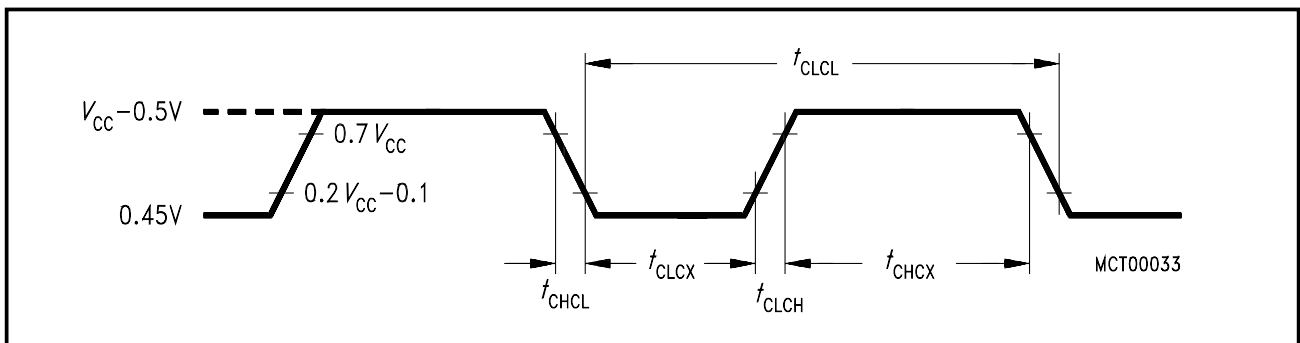

**Notes:** Shown is the data/clock relationship for CPOL = CPHA = 1. The timing diagram is valid for the other cases accordingly.

In the case of slave mode and CPHA = 0, the output delay for the MSB applies to the falling edge of  $\overline{SLS}$  (if transmitter is enabled).

In the case of master mode and CPHA = 0, the MSB becomes valid after the data has been written into the shift register, i.e. at least one half SCLK clock cycle before the first clock transition.

Chip select setup to ALE active	$t_{PCS}$	0	–	ns
Chip select hold after $\overline{\text{PRD}}/\overline{\text{PWR}}$ inactive	$t_{PCH}$	0	–	ns
ALE to $\overline{\text{PWR}}$ or $\overline{\text{PRD}}$	$t_{PLC}$	90	–	ns
$\overline{\text{PWR}}$ or $\overline{\text{PRD}}$ high to ALE high	$t_{PCL}$	20	–	ns
Data setup before $\overline{\text{PWR}}$ rising edge	$t_{PWDS}$	50	–	ns
Data hold after $\overline{\text{PWR}}$ rising edge	$t_{PWDH}$	0	–	ns
Data float after $\overline{\text{PCS}}$	$t_{PDF}$	–	40	ns

C513A-H Programming Interface Write Cycle

### Reset Characteristics (C513A-H only)

Parameter	Symbol	Limit Values				Unit
		12 MHz Clock		Variable Clock $1/t_{CLCL} = 3.5 \text{ MHz to } 12 \text{ MHz}$		
		min.	max.	min.	max.	
RESET pulse width	$t_{RLRH}$	10	–	10	–	ms
