## 1.2 Description

The Qimonda HYS64D32301[G/H]U-5-B, HYS[64/72]D64xxx[G/H]U-[5/6]-B and HYS[64/72]D128xxx[G/H]U-[5/6]-B are industry standard 184-Pin Unbuffered Double-Data-Rate Memory Modules (UDIMM) organized as 32M × 64M (256 MB), 64M × 64 (512 MB), 128M × 64 (1 GB) for non-parity and 64M × 72 (512 MB), 128M × 72 (1 GB) for ECC main memory applications. The memory array is designed with 512Mbit Double Data Rate

Synchronous DRAMs. A variety of decoupling capacitors are mounted on the printed circuit board. The DIMMs feature serial presence detect (SPD) based on a serial E<sup>2</sup>PROM device using the 2-pin I<sup>2</sup>C protocol. The first 128 bytes are programmed with configuration data and the second 128 bytes are available to the customer.

*Note: All part numbers end with a place code designating the silicon-die revision. Reference information available on request. Example: HYS72D64300HU-6-B, indicating rev. B dies are used for SDRAM components. The Compliance Code is printed on the module labels describing the speed sort (for example "PC2700"), the latencies and SPD code definition (for example "20330" means CAS latency of 2.0 clocks, RCD (Row-Column-Delay) latency of 3 clocks, Row Precharge latency of 3 clocks, and JEDEC SPD code definition version 0), and the Raw Card used for this module.*

## 2 Pin Configuration

## 3 Electrical Characteristics

This chapter lists the electrical characteristics.

### 3.1 Operating Conditions

This chapter describes the operating conditions.

**TABLE 7**  
Absolute Maximum Ratings

Parameter	Symbol	Values			Unit	Note/ Test Condition
		min.	typ.	max.		
Voltage on I/O pins relative to $V_{SS}$	$V_{IN}, V_{OUT}$	-0.5	—	$V_{DDQ} + 0.5$	V	—
Voltage on inputs relative to $V_{SS}$	$V_{IN}$	-1	—	+3.6	V	—

**Attention:** Permanent damage to the device may occur if “Absolute Maximum Ratings” are exceeded. This is a stress rating only, and functional operation should be restricted to recommended operation conditions. Exposure to absolute maximum rating conditions for extended periods of time may affect device reliability and exceeding only one of the values may cause irreversible damage to the integrated circuit.

- 1)  $0\text{ }^\circ\text{C} \leq T_A \leq 70\text{ }^\circ\text{C}$
- 2) DDR400 conditions apply for all clock frequencies above 166 MHz
- 3) Under all conditions,  $V_{DDQ}$  must be less than or equal to  $V_{DD}$ .
- 4) Peak to peak AC noise on  $V_{REF}$  may not exceed  $\pm 2\%$  VREF (DC). VREF is also expected to track noise variations in  $V_{DDQ}$ .
- 5)  $V_{TT}$  is not applied directly to the device.  $V_{TT}$  is a system supply for signal termination resistors, is expected to be set equal to  $V_{REF}$ , and must track variations in the DC level of  $V_{REF}$ .
- 6)  $V_{ID}$  is the magnitude of the difference between the input level on CK and the input level on  $\overline{CK}$ .
- 7) The ration of the pull-up current to the pull-down current is specified for the same temperature and voltage, over the entire temperature and voltage range, for device drain to source voltage from 0.25 to 1.0 V. For a given output, it represents the maximum difference between pull-up and pull-down drivers due to process variation.
- 8) Inputs are not recognized as valid until  $V_{REF}$  stabilizes.
- 9) Values are shown per component

- 1)  $0\text{ }^{\circ}\text{C} \leq T_A \leq 70\text{ }^{\circ}\text{C}$ ;  $V_{DDQ} = 2.5\text{ V} \pm 0.2\text{ V}$ ,  $V_{DD} = +2.5\text{ V} \pm 0.2\text{ V}$  (DDR333);  $V_{DDQ} = 2.6\text{ V} \pm 0.1\text{ V}$ ,  $V_{DD} = +2.6\text{ V} \pm 0.1\text{ V}$  (DDR400)
- 2) Input slew rate  $\geq 1\text{ V/ns}$  for DDR400, DDR333
- 3) The  $\overline{CK}/\overline{CK}$  input reference level (for timing reference to  $\overline{CK}/\overline{CK}$ ) is the point at which  $\overline{CK}$  and  $\overline{CK}$  cross: the input reference level for signals other than  $\overline{CK}/\overline{CK}$ , is  $V_{REF}$ .  $\overline{CK}/\overline{CK}$  slew rate are  $\geq 1.0\text{ V/ns}$ .
- 4) Inputs are not recognized as valid until  $V_{REF}$  stabilizes.
- 5) The Output timing reference level, as measured at the timing reference point indicated in AC Characteristics (note 3) is  $V_{TT}$ .
- 6) These parameters guarantee device timing, but they are not necessarily tested on each device.
- 7)  $t_{HZ}$  and  $t_{LZ}$  transitions occur in the same access time windows as valid data transitions. These parameters are not referred to a specific voltage level, but specify when the device is no longer driving (HZ), or begins driving (LZ).
- 8) The specific requirement is that DQS be valid (HIGH, LOW, or some point on a valid transition) on or before this CK edge. A valid transition is defined as monotonic and meeting the input slew rate specifications of the device. When no writes were previously in progress on the bus, DQS will be transitioning from Hi-Z to logic LOW. If a previous write was in progress, DQS could be HIGH, LOW, or transitioning from HIGH to LOW at this time, depending on  $t_{DQSS}$ .
- 9) The maximum limit for this parameter is not a device limit. The device operates with a greater value for this parameter, but system performance (bus turnaround) degrades accordingly.
- 10) Fast slew rate  $\geq 1.0\text{ V/ns}$ , slow slew rate  $\geq 0.5\text{ V/ns}$  and  $< 1\text{ V/ns}$  for command/address and  $\overline{CK}$  &  $\overline{CK}$  slew rate  $> 1.0\text{ V/ns}$ , measured between  $V_{IH(ac)}$  and  $V_{IL(ac)}$ .
- 11) For each of the terms, if not already an integer, round to the next highest integer.  $t_{CK}$  is equal to the actual system clock cycle time.
- 12) A maximum of eight Autorefresh commands can be posted to any given DDR SDRAM device.
