

### Description

Electronic circuit breaker type ESS20-0.. is designed to ensure **selective** disconnection of individual loads in systems which are powered by a DC 24 V switch-mode power supply.

DC 24 V power supplies, which are widely used in industry today, will shut down the output in the event of an overload with the result that one faulty load in the system can lead to complete disconnection of all loads. As well as an unidentified failure this also means stoppage of the whole system.

Through **selective** disconnection the ESS20-0.. responds much faster to overload or short circuit conditions than the switch-mode power supply. This is achieved by a combination of active current limitation and well-proven circuit breaker technology including physical isolation. The ESS20-0.. limits the highest possible current to 1.8 or 1.5 times the selected rated current of the circuit breaker. Thus it is possible to switch on capacitive loads of up to 75,000 µF lamp loads, but they are disconnected only in the event of an overload or short circuit.

For optimal adjustment to the application conditions the current rating of the ESS20-0.. can be selected in fixed values from 0.5 A...10 A and in adjustable variants 1 A/2 A or 3 A/6 A. Failure and status indication are provided by a bicolour LED and an integral signal contact.

The ESS20-0.. features a width of only 12.5 mm and can be plugged into the E-T-A power distribution socket Module 17plus and SVSxx (for ESS20-003) ensuring ease of installation and saving space in control cabinets.

**US patent number:** US 6,490,141 B2

### Approvals

Authority	Norm	Voltage ratings	Current ratings
VDE	EN 60934	DC 32 V	0.5 A...10 A
UL	UL 1077	DC 28 V	0.5 A...10 A

### Notes

- The user should ensure that the cable cross sections of the relevant load circuit are suitable for the current rating of the ESS20 used.
- Automatic start-up of machinery after shut down must be prevented (Machinery Directive 98/37/EG and EN 60204-1). In the event of a short circuit or overload the load circuit will be disconnected electronically by the ESS20.

## Time/Current characteristic curve ( $T_A = 25\text{ °C}$ )

\*1) current limitation typically  $1.8 \times I_N$  times rated current at  $I_N = 0.5\text{ A} \dots 6\text{ A}$   
 current limitation typically  $1.5 \times I_N$  times rated current at  $I_N = 8\text{ A} \dots 10\text{ A}$

- The trip time is typically 5 s in the range between  $1.1$  and  $1.8 \times I_N^{*1}$ .
- Electronic current limitation starts at typically  $1.8 \times I_N^{*1}$  which means that under all overload conditions (independent of the power supply and the resistance of the load circuit) the max. overload until disconnection will not exceed  $1.8 \times I_N^{*1}$  times the current rating. Trip time is between 100 ms (short circuit current  $I_k$ ) and 5 sec (at overload with high line attenuation).
- Without the current limitation activated at typically  $1.8 \times I_N^{*1}$  a considerably higher overload current would flow in the event of an overload or short circuit.
- After detection of an overload or short circuit the LED changes colour from GREEN to ORANGE. The LED will no longer be lighted after the circuit breaker has tripped.
- Resetting the circuit breaker is not possible before the integral bimetal has cooled down (approx. 10 sec).
