**20MHz, High Input Impedance,  
 High Slew Rate Operational Amplifier**

The HA-2529 is a monolithic operational amplifier which typifies excellence of design. With a design based on years of experience coupled with the reliable dielectric isolation process, this amplifier provides an outstanding combination of DC and AC parameters at closed loop gains greater than 3.

The HA-2529 offers 150V/μs slew rate and fast settling time (200ns), while consuming a mere 6mA of quiescent current, making this amplifier ideal for video circuitry and data acquisition designs. With 20MHz gain bandwidth combined with 7.5kV/V open loop gain, the HA-2529 is an ideal component for demanding signal conditioning designs. This device provides ±30mA output current drive with an output voltage swing of ±10V making it suited for pulse amplifier and RF amplifier components.

The HA-2529 will upgrade output current, slew rate, offset voltage drift and offset current drift in systems presently using the HA-2520/22/25 or EHA-2520/22/25.

**Pinout**

MIL-STD-883 product and data sheets are available upon request.

**Features**

- High Slew Rate . . . . . 150V/μs
- Fast Settling . . . . . 200ns
- Full Power Bandwidth . . . . . 2MHz
- Gain Bandwidth ( $A_V \geq 3$ ) . . . . . 20MHz
- High Input Impedance . . . . . 130MΩ
- Low Offset Current . . . . . 5nA
- High Output Current . . . . . ±30mA

**Applications**

- Data Acquisition Systems
- Signal Generators
- RF Amplifiers
- Pulse Amplification
- Video Amplifiers

NOTES:

- Refer to typical performance curve in data sheet.
- Parameter is guaranteed by design and characterization data.
- Settling Time is specified to 0.1% of final value for a 10V output step and  $A_V = -3$ . See Settling Time Test Circuit.
- Full Power Bandwidth is guaranteed by equation:  $FPBW = \frac{\text{Slew Rate}}{2\pi V_{PEAK}}$ ,  $V_{PEAK} = 10V$ .
- See Transient Response Test Circuit (Figure 3).

**Typical Application**

**Inverting Unity Gain Circuit**

Figure 6 shows a Compensation Circuit for an inverting unity gain amplifier. The circuit was tested for functionality with supply voltages from  $\pm 4V$  to  $\pm 15V$ , and the performance as tested was: Slew Rate  $\approx 120V/\mu s$ ; Bandwidth  $\approx 10MHz$ ; and Settling Time (0.1%)  $\approx 500ns$ . Figure 7 illustrates the amplifier's frequency response, and it is important to note that capacitance at pin 8 must be minimized for maximum bandwidth.
