

ACE1117H

1A Bipolar Linear Regulator

Description

ACE1117H is a series of low dropout three-terminal regulators with a dropout of 1.3V at 1A load current. ACE1117H features a low standby current 2mA.

Other than a fixed version ($V_{out} = 1.2V, 1.8V, 2.5V, 3.3V, 5V, \text{ and } 12V$), ACE1117H has an adjustable version, which can provide an output voltage from 1.25 to 12V with only two external resistors.

ACE1117H offers thermal shut down and current limit functions, to assure stability of chip and power system. Trimming technique is used to guarantee output voltage accuracy within $\pm 2\%$. Other output voltage accuracy such as $\pm 1\%$ can be customized on demand.

Features

- Other than a fixed version and an adjustable version, output value can be customized on command.
- Maximum output current is 1A.
- Range of operation input voltage: Max 18V
- Standby current: 2mA (typ.)
- Line regulation: 0.1% (typ.)
- Load regulation: 10mV (typ.)
- Environment Temperature: $-20^{\circ}\text{C} \sim 85^{\circ}\text{C}$
- Compatible with tantalum capacitor, electrolytic capacitor and MLCC

Application

- Power Management for Computer Mother Board, Graphic Card
- LCD Monitor and LCD TV
- DVD Decode Board
- ADSL Modem
- Post Regulators for switching supplies

Absolute Maximum Ratings

Parameter		Symbol	Max	Unit
Input voltage		V_{IN}	18	V
Operating Junction Temperature		T_J	150	$^{\circ}\text{C}$
Ambient Temperature		T_A	-40~85	$^{\circ}\text{C}$
Package Thermal Resistance	SOT-223		20	$^{\circ}\text{C/W}$
	TO-252		12.5	
Storage temperature		T_S	- 40 to 150	$^{\circ}\text{C}$

Note: Exceed these limits to damage to the device. Exposure to absolute maximum rating conditions may affect device reliability.

Current Limit	I_{limit}	$V_{in}-V_{out}=2V, T_J=25^\circ C$	1			A
Minimum load Current	I_{min}	ACE1117H-ADJ		2	10	mA
Temperature coefficient	$\Delta V/\Delta T$			± 100		ppm
V_{drop}	Dropout voltage	$I_{out}=100mA$		1.23	1.3	V
		$I_{out}=1A$		1.3	1.5	V
Thermal Resistance	Θ_{JC}	SOT-223		20		$^\circ C/W$
		TO-252		10		

Note1: All test are conducted under ambient temperature $25^\circ C$ and within a short period of time 20ms

Note2: Load current smaller than minimum load current of ACE1117H-ADJ will lead to unstable or oscillation output.

Block Diagram

ACE1117H is a series of low dropout voltage, three terminal regulators. Its application circuit is very simple: the fixed version only needs two capacitors and the adjustable version only needs two resistors and two capacitors to work. It is composed of some modules including start-up circuit, bias circuit, bandgap, thermal shutdown, current limit, power transistors and its driver circuit and so on.

The bandgap module provides stable reference voltage, whose temperature coefficient is compensated by careful design considerations. The temperature coefficient is under 100ppm/°C. And the accuracy of output voltage is guaranteed by trimming technique.

ACE1117H

1A Bipolar Linear Regulator

Typical Application

ACE1117H has an adjustable version and six fixed versions (1.2V, 1.8V, 2.5V, 3.3V, 5.0V and 12V)

Fixed output voltage version

Application circuit of ACE1117H fixed version

1. Recommend using 10uF tan capacitor as bypass capacitor (C1) for all application circuit.
2. Recommend using 10uF tan capacitor to assure circuit stability.

Adjustable Output Voltage Version

ACE1117H provides a 1.25V reference voltage. Any output voltage between 1.25V~12V can be achievable by choosing two external resistors (schematic is shown below), R1 and R2

Application Circuit of ACE1117H –ADJ

The output voltage of adjustable version follows the equation: $V_{out} = 1.25 \cdot (1 + R2/R1) + I_{Adj} \cdot R2$. We can ignore I_{Adj} because I_{Adj} (about 50uA) is much less than the current of R1 (about 2~10mA).

1. To meet the minimum load current (>10mA) requirement, R1 is recommended to be 125Ω or lower. As ACE1117H-ADJ can keep itself stable at load current about 2mA, R1 is not allowed to be higher than 625Ω.
2. Using a bypass capacitor (C_{ADJ}) between the ADJ pin and ground can improve ripple rejection. This bypass capacitor prevents ripple from being amplified as the output voltage is increased. The impedance of C_{ADJ} should be less than R1 to prevent ripple from being amplified. As R1 is normally in the range of 100Ω~500Ω, the value of C_{ADJ} should satisfy this equation: $1/(2\pi \cdot f_{ripple} \cdot C_{ADJ}) < R1$.

ACE1117H

1A Bipolar Linear Regulator

Thermal Considerations

We have to take heat dissipation into great consideration when output current or differential voltage of input and output voltage is large. Because in such cases, the power dissipation consumed by ACE1117H is very large. ACE1117H series uses SOT-223 package type and its thermal resistance is about 20°C/W . And the copper area of application board can affect the total thermal resistance. If copper area is $5\text{cm} \times 5\text{cm}$ (two sides), the resistance is about 30°C/W . So the total thermal resistance is about $20^{\circ}\text{C/W} + 30^{\circ}\text{C/W}$. We can decrease total thermal resistance by increasing copper area in application board. When there is no good heat dissipation copper are in PCB, the total thermal resistance will be as high as 120°C/W , then the power dissipation of ACE1117H could allow on itself is less than 1W. And furthermore, ACE1117H will work at junction temperature higher than 125°C under such condition and no lifetime is guaranteed.
