MOUNTING INSTRUCTIONS – TBA641 B11 Power dissipation can be increased by means of an additional external heat sink fixed with two screws or by soldering the pins of the external bar to suitable copper areas on the PC board (TBA641 B11).

A. In the former case, the thermal resistance case-ambient of the added heat sink can be calculated as follows:

$$\theta_{C-A} = \frac{(T_{J(MAX)} - T_A) - (P_D) (\theta_{J-C})}{P_D}$$

where:

$T_{J(MAX)}$ = Max junction temperature

T_A = Ambient temperature

P_D = Power dissipation

θ_{J-C} = Thermal resistance junction to case

B. If copper areas on the PC board are used (TBA641 B11) the diagrams below give the maximum power dissipation as a function of copper area, with copper thickness 35μ and ambient temperature 55°C .
