

High-precision Low Voltage Detector

LR6301

LR6301 is a series of high precision voltage detector with ultra low current consumption (500nA typ. at V_{DD}=3.0V). It can work at very low voltage, which makes it perfect for system reset.

LR6301 is composed of high precision voltage reference, comparator, output driver and resistor array. Internally preset detect voltage has a low temperature drift and requires no external trimming.

Two type of output, CMOS and N-channel open-drain are available.

LR6301 is available in SOT-89-3, SOT-23-3 TO92, SOT23-5 packages which is Pb free.

Features:

- High-precision detection Voltage: $\pm 2\%$
- Detection Voltage: 0.9V~6.0V (in 0.1V steps)
- Precise hysteresis: 4% typ.
- Operating Voltage range: 0.7V~10V
- Ultra-low current consumption: 500nA typ. (at V_{DD}=3.0V)
- Two Output forms : CMOS and N-channel open-drain
- Externally Programmable Time Delay Generator
- We declare that the material of product compliance with RoHS requirements.

Selection Guide:

Application:

- Power monitor for portable equipment such as PDA, DSC, Mobile phone, Notebook, MP3
- CPU and Logic Circuit Reset
- Battery Checker
- Battery Back-up Circuit
- Power Failure Detector

Pin Assignment:

Pin Description:

PIN Number				PIN Name	Function
SOT-89-3	TO-92	SOT-23-3	SOT-23-5		
1	3	1	1	VOUT	Voltage detection output Pin
2	1	3	2	VDD	Voltage input Pin
3	2	2	3	VSS	GND Pin
—	—	—	4	NC	No connection
—	—	—	5	CD	Externally Programmable Time Delay

Product Classification:

Product Name	Detector Voltage	Output Type	Package
LR6301-XXNRM	XX V	Nch Open-Drain	SOT-23-3
LR6301-XXNRN	XX V	Nch Open-Drain	SOT-23-5

OPERATING DESCRIPTION FOR DELAY CD

The LR6301 with SOT23-5 series devices consist of precision voltage detector that drives a time delay generator. Figures 37 and 38 show a timing diagram and a typical application. Initially consider that input voltage V_{in} is at a nominal level and it is greater than the voltage detector upper threshold (V_{DET+}). The voltage at Pin 5 and capacitor C_D will be at the same level as V_{in} , and the reset output (Pin 1) will be in the high state for active low devices, or in the low state for active high devices. If there is a power interruption and V_{in} becomes significantly deficient, it will fall below the lower detector threshold (V_{DET-}) and the external time delay capacitor C_D will be immediately discharged by an internal N-Channel MOSFET that connects to Pin 5. This sequence of events causes the Reset output to be in the low state for active low devices, or in the high state for active high devices. After completion of the power interruption, V_{in} will again return to its nominal level and become greater than the V_{DET+} . The voltage detector will turn off the N-Channel MOSFET and allow pullup resistor R_D to charge external capacitor C_D , thus creating a programmable delay for releasing the reset signal. When the voltage at Pin 5 exceeds the inverter/buffer threshold, typically $0.675 V_{in}$, the reset output will revert back to its original state. The voltage detector and inverter/buffer have built-in hysteresis to prevent erratic reset operation.

Although these device series are specifically designed for use as reset controllers in portable microprocessor based systems, they offer a cost-effective solution in numerous applications where precise voltage monitoring and time delay are required.

Timing Waveforms

APPLICATION CIRCUIT INFORMATION

Microprocessor Reset Circuit

Battery Charge Indicator

Missing Pulse Detector or Frequency Detector

Microprocessor Reset Circuit with Additional Hysteresis

Comparator hysteresis can be increased with the addition of resistor R_H. The hysteresis equations have been simplified and do not account for the change of input current I_{in} as V_{in} crosses the comparator threshold. The internal resistance, R_{in} is simply calculated using I_{in} = 0.26 μA at 2.6 V.

V_{in} Decreasing:

$$V_{th} = \left(\frac{R_H}{R_{in}} + 1 \right) (V_{DET-})$$

V_{in} Increasing:

$$V_{th} = \left(\frac{R_H}{R_{in} \parallel R_L} + 1 \right) (V_{DET-} + V_{HYS})$$

$$V_{HYS} = V_{in} \text{ Increasing} - V_{in} \text{ Decreasing}$$

Test Data				
V _{th} Decreasing (V)	V _{th} Increasing (V)	V _{HYS} (V)	R _H (Ω)	R _L (kΩ)
2.70	2.84	0.135	0	–

0.1	490	21.97
1.0	52	22.07

Simple Clock Oscillator

This circuit monitors the current at the load. As current flows through the load, a voltage drop with respect to ground appears across R_{sense} where $V_{sense} = I_{load} * R_{sense}$. The following conditions apply:

If:	Then:
$I_{Load} < V_{DET-} / R_{sense}$	Reset Output = 0 V
$I_{Load} \geq (V_{DET-} + V_{HYS}) / R_{sense}$	Reset Output = V_{DD}

Microcontroller Systems Load Sensing

A simple voltage monitor can be constructed by connecting several voltage detectors as shown above. Each LED will sequentially turn on when the respective voltage detector threshold ($V_{DET-} + V_{HYS}$) is exceeded. Note that detector thresholds (V_{DET-}) that range from 0.9 V to 4.9 V in 100 mV steps can be manufactured.

LED Bar Graph Voltage Monitor

For monitoring power supplies with a time delay reset, only a single LR6301 with delay capacitor is required.

Multiple Power Supply Undervoltage Supervision with Time Delay Reset

No.	Operation status	Output status
I	$V_{DD} > -V_{DET}$	Output voltage is equal to the supply voltage
II	V_{DD} drops below $-V_{DET}$	Output voltage equals to GND level
III	V_{DD} drops further below V_{DDL}	Output voltage is undefined
IV	V_{DD} rises above V_{DDL}	Output voltage equals to GND level
V	V_{DD} rises above $+V_{DET}$	Output voltage equals to supply voltage, $V_{HYS} = (+V_{DET}) - (-V_{DET})$

Test circuits:

(1) Supply current test circuit

(2) Detector threshold test circuit

(3) NCH Drive Output Current Test Circuit

(4) PCH Drive Output Current Test Circuit

Typical Performance Characteristics:

1) Output voltage VS. Input voltage

Detector threshold=4.4V (-40°C)

Detector threshold=4.4V (25°C)

Detector threshold=4.4V (70°C)

2) Supply current VS. Input voltage

Detector threshold=0.9V

Detector threshold=2.7V

Detector threshold=3.0V

Detector threshold=4.4V

3) Detector Threshold Hysteresis VS. Temperature

Detector threshold= 0.9V

Detector threshold=2.7V

Detector threshold=3.0V

Detector threshold=4.4V

4) Nch Driver Output Current VS. V_{DS}

LR6301-09CXX

LR6301-27CXX

LR6301-30CXX

LR6301-44CXX

5) NCH Driver Output Current vs. Input Voltage

Detector threshold=2.7V

Detector threshold=3.0V

6) PCH Driver Output Current vs. Input Current

Detector threshold=0.9V

Detector threshold=2.7V

Detector threshold=4.4V
