

# RZ/G Series

User's Manual: Hardware

for Rich Graphics Applications

Specifications Common to RZ/G Series Products

RZ/G1H

RZ/G1M

RZ/G1N

RZ/G1E

All information contained in these materials, including products and product specifications, represents information on the product at the time of publication and is subject to change by Renesas Electronics Corp. without notice. Please review the latest information published by Renesas Electronics Corp.

## Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation of these circuits, software, and information in the design of your equipment. Renesas Electronics assumes no responsibility for any losses incurred by you or third parties arising from the use of these circuits, software, or information.
2. Renesas Electronics has used reasonable care in preparing the information included in this document, but Renesas Electronics does not warrant that such information is error free. Renesas Electronics assumes no liability whatsoever for any damages incurred by you resulting from errors in or omissions from the information included herein.
3. Renesas Electronics does not assume any liability for infringement of patents, copyrights, or other intellectual property rights of third parties by or arising from the use of Renesas Electronics products or technical information described in this document. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
4. You should not alter, modify, copy, or otherwise misappropriate any Renesas Electronics product, whether in whole or in part. Renesas Electronics assumes no responsibility for any losses incurred by you or third parties arising from such alteration, modification, copy or otherwise misappropriation of Renesas Electronics product.
5. Renesas Electronics products are classified according to the following two quality grades: "Standard" and "High Quality". The recommended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below.  
"Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; and industrial robots etc.  
"High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control systems; anti-disaster systems; anti-crime systems; and safety equipment etc.  

Renesas Electronics products are neither intended nor authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems, surgical implantations etc.), or may cause serious property damages (nuclear reactor control systems, military equipment etc.). You must check the quality grade of each Renesas Electronics product before using it in a particular application. You may not use any Renesas Electronics product for any application for which it is not intended. Renesas Electronics shall not be in any way liable for any damages or losses incurred by you or third parties arising from the use of any Renesas Electronics product for which the product is not intended by Renesas Electronics.
6. You should use the Renesas Electronics products described in this document within the range specified by Renesas Electronics, especially with respect to the maximum rating, operating supply voltage range, movement power voltage range, heat radiation characteristics, installation and other product characteristics. Renesas Electronics shall have no liability for malfunctions or damages arising out of the use of Renesas Electronics products beyond such specified ranges.
7. Although Renesas Electronics endeavors to improve the quality and reliability of its products, semiconductor products have specific characteristics such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Further, Renesas Electronics products are not subject to radiation resistance design. Please be sure to implement safety measures to guard them against the possibility of physical injury, and injury or damage caused by fire in the event of the failure of a Renesas Electronics product, such as safety design for hardware and software including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult, please evaluate the safety of the final products or systems manufactured by you.
8. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. Please use Renesas Electronics products in compliance with all applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive. Renesas Electronics assumes no liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
9. Renesas Electronics products and technology may not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You should not use Renesas Electronics products or technology described in this document for any purpose relating to military applications or use by the military, including but not limited to the development of weapons of mass destruction. When exporting the Renesas Electronics products or technology described in this document, you should comply with the applicable export control laws and regulations and follow the procedures required by such laws and regulations.
10. It is the responsibility of the buyer or distributor of Renesas Electronics products, who distributes, disposes of, or otherwise places the product with a third party, to notify such third party in advance of the contents and conditions set forth in this document, Renesas Electronics assumes no responsibility for any losses incurred by you or third parties as a result of unauthorized use of Renesas Electronics products.
11. This document may not be reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products, or if you have any other inquiries.

(Note 1) "Renesas Electronics" as used in this document means Renesas Electronics Corporation and also includes its majority-owned subsidiaries.

(Note 2) "Renesas Electronics product(s)" means any product developed or manufactured by or for Renesas Electronics.

## General Precautions in the Handling of MPU/MCU Products

The following usage notes are applicable to all MPU/MCU products from Renesas. For detailed usage notes on the products covered by this manual, refer to the relevant sections of the manual. If the descriptions under General Precautions in the Handling of MPU/MCU Products and in the body of the manual differ from each other, the description in the body of the manual takes precedence.

### 1. Handling of Unused Pins

Handle unused pins in accord with the directions given under Handling of Unused Pins in the manual.

- The input pins of CMOS products are generally in the high-impedance state. In operation with unused pin in the open-circuit state, extra electromagnetic noise is induced in the vicinity of LSI, an associated shoot-through current flows internally, and malfunctions occur due to the false recognition of the pin state as an input signal become possible. Unused pins should be handled as described under Handling of Unused Pins in the manual.

### 2. Processing at Power-on

The state of the product is undefined at the moment when power is supplied.

- The states of internal circuits in the LSI are indeterminate and the states of register settings and pins are undefined at the moment when power is supplied.  
In a finished product where the reset signal is applied to the external reset pin, the states of pins are not guaranteed from the moment when power is supplied until the reset process is completed. In a similar way, the states of pins in a product that is reset by an on-chip power-on reset function are not guaranteed from the moment when power is supplied until the power reaches the level at which resetting has been specified.

### 3. Prohibition of Access to Reserved Addresses

Access to reserved addresses is prohibited.

- The reserved addresses are provided for the possible future expansion of functions. Do not access these addresses; the correct operation of LSI is not guaranteed if they are accessed.

### 4. Clock Signals

After applying a reset, only release the reset line after the operating clock signal has become stable.

When switching the clock signal during program execution, wait until the target clock signal has stabilized.

- When the clock signal is generated with an external resonator (or from an external oscillator) during a reset, ensure that the reset line is only released after full stabilization of the clock signal. Moreover, when switching to a clock signal produced with an external resonator (or by an external oscillator) while program execution is in progress, wait until the target clock signal is stable.

### 5. Differences between Products

Before changing from one product to another, i.e. to one with a different part number, confirm that the change will not lead to problems.

- The characteristics of MPU/MCU in the same group but having different part numbers may differ because of the differences in internal memory capacity and layout pattern. When changing to products of different part numbers, implement a system-evaluation test for each of the products.

# How to Use This Manual

## 1. Purpose and Target Readers

This manual is designed to provide the user with an understanding of the hardware functions of the MCU. It is intended for users designing application systems incorporating the MCU. A basic knowledge of electric circuits, logical circuits, and MCUs is necessary in order to use this manual.

The manual comprises the following contents; an address map, general-purpose I/O port pins, clock, reset, core functions, graphics, video processing, sound processing, and network modules, serial interfaces, storage, timers, other on-chip peripheral functions, testing, debugging, and usage notes.

For the sections on an overview of hardware, pin assignments, pin multiplexing, and pin function controller, see the user's manual for specifications of individual RZ/G series product.

Particular attention should be paid to the precautionary notes when using the manual. These notes occur within the body of the text, at the end of each section, and in the Usage Notes section.

The revision history summarizes the locations of revisions and additions. It does not list all revisions. Refer to the text of the manual for details.

We provide the following three types of user's manual for RZ/G series products.

Make sure to refer to the latest versions of these documents.

Document Type	Description	Document Title	Document No.
User's manual for specifications of individual RZ/G series product	Overview of hardware, pin assignments, pin multiplexing, and pin function controller	RZ/G1M User's Manual: Hardware	—*
		RZ/G1N User's Manual: Hardware	
		RZ/G1H User's Manual: Hardware	
		RZ/G1E User's Manual: Hardware	
User's manual for specifications common to RZ/G series products	Hardware specifications (address map, general-purpose I/O port pins, clock, reset, core functions, graphics, video processing, sound processing, and network modules, serial interfaces, storage, timers, other on-chip peripheral functions, testing, and debugging) and descriptions of operation	RZ/G Series User's Manual: Hardware	R01UH0543EJ 0100 Rev.1.00 (This user's manual)
User's manual for electrical characteristics	Electrical characteristics of the RZ/G series products	Provided as separate technical information.	

Note: \* For the document number of each product, contact your local Renesas sales representative.

## 2. Notation for the Individual Specifications by Product

### (1) Notation for Presence or Absence of On-Chip Modules by Product

The presence or absence of on-chip modules by product is shown in the upper right hand corner of the first pages of each section.

Example:

## 50. Serial-ATA Interface

RZ/G1H	RZ/G1N
RZ/G1M	RZ/G1E

### 50.1 Overview

The serial-ATA interface provides a serial ATA physical interface which complies with the serial-ATA standard.

The example above indicates that the SATA is present in the RZ/G1H, RZ/G1M, and RZ/G1N but not in the RZ/G1E.

### (2) Notation for Presence or Absence of Pins by Product

The presence or absence of pins by product is shown in the pin configuration table in each section and section 4, Pin Multiplexing.

Example:

### 50.1.3 Input/Output Pins

Table 50.1 shows the external pins of the SATA interface.

**Table 50.1 External Pins**

Name	Pin Name	SATA Symbol	I/O	Description	RZ/G Series Products			
					RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
Reference clock	CICREFP0_SATA	—	Input	Reference clock input to the PLL circuit in the Serial-ATA module (differential input). Apply a 100-MHz clock.	√	√	√	—
	CICREFN0_SATA							
	CICREFP1_SATA							
	CICREFN1_SATA							
Transmit data	TODP0_SATA	TX+	Output	Pins for data transmission pins. A 3.0-GHz (second generation) signal or 1.5-GHz (first generation) signal is transmitted through these pins.  The pins with names ending in P and N are combined to provide a differential signal.	√	√	√	—
	TODN0_SATA							
	TODP1_SATA							
	TODN1_SATA							

The example above indicates that the CICREFP0\_SATA pin is present in the RZ/G1H, RZ/G1M, and RZ/G1N but not in the RZ/G1E.

### (3) Notation for Presence or Absence of Registers by Product

The presence or absence of registers by product is shown in the list of registers and the descriptions of registers in each section.

Example:

50.2.2 ATAPI Control Register (ATAPI_CONTROL1)			
RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	—

The example above indicates that the ATAPI\_CONTROL1 register is present in the RZ/G1H, RZ/G1M, and RZ/G1N but not in the RZ/G1E.

### 3. Notation of Numbers and Symbols

Bit notation : Bits are shown in high-to-low order from left to right.

Number notation: Binary numbers are given as B'XXXX, hexadecimal numbers are given as H'XXXX, and decimal numbers are given as XXXX.

Signal notation: A number sign (#) after the name indicates that a signal or pin is active-low, unless otherwise specified.

Example: PRESET#

## 4. Register Notation

Each register description includes a bit chart, illustrating the arrangement of bits, and a table of bits, describing the meanings of the bit settings.

**[Bit Chart]**

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	ASID2	ASID1	ASID0	—	—	—	—	—	Q	ACMP2	ACMP1	ACMP0	IFE	
Initial value:	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

(1) (2) (3) (4) (5)

**[Table of Bits]**

Bit	Bit Name	Initial Value	R/W	Description
15	—	0	R	Reserved
14	—	0	R	These bits are always read as 0.
13 to 11	ASID2 to ASID0	All 0	R/W	Address Identifier These bits enable or disable the pin function.
10	—	0	R	Reserved This bit is always read as 0.
9	—	1	R	Reserved This bit is always read as 1.
8 to 0	—	0	—	—

Note: The bit names and sentences in the above figure are examples, and have nothing to do with the contents of this manual.

- (1) Bit  
Indicates the bit number or numbers.  
In the case of a 32-bit register, the bits are arranged in order from 31 to 0. In the case of a 16-bit register, the bits are arranged in order from 15 to 0.
- (2) Bit name  
Indicates the name of the bit or bit field.  
When the number of bits has to be clearly indicated in the field, appropriate notation is included (e.g., ASID[3:0]).  
A reserved bit is indicated by "—".  
Certain kinds of bits, such as those of timer counters, are not assigned bit names. In such cases, the entry under Bit Name is blank.
- (3) Initial value  
Indicates the value of each bit immediately after a power-on reset, i.e., the initial value.  
0: The initial value is 0.  
1: The initial value is 1.  
—: The initial value is undefined
- (4) R/W  
For each bit and bit field, this entry indicates whether the bit or field is readable or writable, or both writing to and reading from the bit or field are impossible.  
The notation is as follows:  
R/W: The bit or field is readable and writable.  
R/(W): The bit or field is readable and writable.  
However, writing is only performed to flag clearing.  
R/WC0: The bit or field is readable and writable. Writing 0 to the bit initializes the bit.  
Writing 1 to the bit is ignored.  
R/WC1: The bit or field is readable and writable. Writing 1 to the bit initializes the bit.  
Writing 0 to the bit is ignored.  
R: The bit or field is readable.  
"R" is indicated for all reserved bits. When writing to the register, write the value under Initial Value in the bit chart to reserved bits or fields.  
W: The bit or field is writable.  
Note that values read from write-only bits are not guaranteed, unless they are specified in the chart of bits.
- (5) Description  
Describes the function of the bit or field and specifies the values for writing.

7A.3.1.9	Module Stop Status Register 9 (MSTPSR9) .....	7A-21
7A.3.1.10	Module Stop Status Register 10 (MSTPSR10) .....	7A-23
7A.3.1.11	Module Stop Status Register 11 (MSTPSR11) .....	7A-25
7A.3.2	Module Stop Control Register (SMSTPCRn (n = 0 to 5, 7 to 11)) .....	7A-27
7A.3.2.1	System Module Stop Control Register 0 (SMSTPCR0) .....	7A-28
7A.3.2.2	System Module Stop Control Register 1 (SMSTPCR1) .....	7A-30
7A.3.2.3	System Module Stop Control Register 2 (SMSTPCR2) .....	7A-32
7A.3.2.4	System Module Stop Control Register 3 (SMSTPCR3) .....	7A-34
7A.3.2.5	System Module Stop Control Register 4 (SMSTPCR4) .....	7A-36
7A.3.2.6	System Module Stop Control Register 5 (SMSTPCR5) .....	7A-38
7A.3.2.7	System Module Stop Control Register 7 (SMSTPCR7) .....	7A-40
7A.3.2.8	System Module Stop Control Register 8 (SMSTPCR8) .....	7A-42
7A.3.2.9	System Module Stop Control Register 9 (SMSTPCR9) .....	7A-44
7A.3.2.10	System Module Stop Control Register 10 (SMSTPCR10) .....	7A-46
7A.3.2.11	System Module Stop Control Register 11 (SMSTPCR11) .....	7A-48

7A.3.3	Software Reset Register (SRCRn (n = 0 to 5, 7 to 11)).....	7A-50
7A.3.3.1	Software Reset Register 0 (SRCR0) .....	7A-51
7A.3.3.2	Software Reset Register 1 (SRCR1) .....	7A-53
7A.3.3.3	Software Reset Register 2 (SRCR2) .....	7A-55
7A.3.3.4	Software Reset Register 3 (SRCR3) .....	7A-57
7A.3.3.5	Software Reset Register 4 (SRCR4) .....	7A-59
7A.3.3.6	Software Reset Register 5 (SRCR5) .....	7A-61
7A.3.3.7	Software Reset Register 7 (SRCR7) .....	7A-63
7A.3.3.8	Software Reset Register 8 (SRCR8) .....	7A-65
7A.3.3.9	Software Reset Register 9 (SRCR9) .....	7A-67
7A.3.3.10	Software Reset Register 10 (SRCR10) .....	7A-69
7A.3.3.11	Software Reset Register 11 (SRCR11) .....	7A-71
7A.3.4	Software Reset Clearing Register n (SRSTCLRn (n = 0 to 5, 7 to 11)).....	7A-73
7B.	Advanced Power Management Unit for AP-System Core (APMU).....	7B-1
7B.1	Overview.....	7B-1
7B.2	Input/Output Pins .....	7B-1
7B.3	Register Descriptions .....	7B-2
7B.3.1	Cortex-A7/Cortex-A15 CPU <sub>n</sub> Power Status Control Register (CA7CPU <sub>n</sub> CR, CA15CPU <sub>n</sub> CR (n = 0 to 3)) .....	7B-3
7B.3.2	Cortex-A7/Cortex-A15 Common Power Control Register (CA7CPUCMCR, CA15CPUCMCR) .....	7B-4
7B.3.3	Cortex-A7/Cortex-A15 CPU Wake Up Control Register (CA7WUPCR, CA15WUPCR).....	7B-5
7B.3.4	Cortex-A7/Cortex-A15 Power Status Register (CA7PSTR, CA15PSTR) .....	7B-7
7B.3.5	Cortex-A7/Cortex-A15 Debug Resource Reset Control Register (CA7DBGRCR, CA15DBGRCR).....	7B-9
7B.4	PCCU Function.....	7B-12
7B.4.1	Power Control .....	7B-12
8.	Reset (RST).....	8-1
8.1	Features .....	8-1
8.2	WDT reset.....	8-1
8.3	LSI Pins Connected to RST .....	8-2
8.4	Register Descriptions .....	8-3
8.4.1	Mode Monitoring Register (MODEMR).....	8-5
8.4.2	Cortex-A15 Reset Control Register (CA15RESCNT) .....	8-7
8.4.3	Cortex-A7 Reset Control Register (CA7RESCNT) .....	8-9
8.4.4	Watchdog Timer Reset Control Register (WDTRSTCR) .....	8-11
8.4.5	PRESETOUT Control Register (RSTOUTCR) .....	8-12
8.4.6	SYS Boot Address Register (SBAR) .....	8-13
8.4.7	SYS Boot Address Register2 (SBAR2) .....	8-13
8.4.8	Cortex-A7 Boot Address Register (CA7BAR) .....	8-14
8.4.9	Cortex-A7 Boot Address Register2 (CA7BAR2) .....	8-15
8.4.10	Cortex-A15 Boot Address Register (CA15BAR) .....	8-16
8.4.11	Cortex-A15 Boot Address Register2 (CA15BAR2).....	8-17
8.5	Reset Timing .....	8-18
8.5.1	Power-On Reset by PRESET# Pin .....	8-18
8.6	Usage Notes .....	8-20
8.6.1	Usage of SYS Boot Address Register (SBAR) and SYS Boot Address Register 2 (SBAR2) .....	8-20
8.6.2	Usage of Boot Address Register and Boot Address Register 2 (SBAR, SBAR2, CA15BAR, CA15BAR2, CA7BAR, and CA7BAR2).....	8-20
9.	AP-System Core.....	9-1
9.1	Overview.....	9-1
9.2	Generic Counter .....	9-3
9.2.1	Frequency for Counting Up.....	9-3

9.2.2	Counter Module Control and Status Registers .....	9-3
9.2.3	How to Start a Generic Counter .....	9-3
9.2.4	Relation with a CoreSight Timestamp .....	9-3
9.3	Power-Down Mechanism.....	9-4
9.3.1	Overview .....	9-4
9.4	Cache Coherent Interconnect (CCI-400).....	9-5
9.4.1	Functional Registers of CCI-400.....	9-5
9.4.2	Maximum Outstanding Setting .....	9-5
9.4.3	System Address Map.....	9-6
9.5	Notes.....	9-7
9.5.1	L2 Cache Setting for Cortex-A15.....	9-7
10.	Inter Connect RAM.....	10-1
10.1	Overview.....	10-1
10.2	Features.....	10-1
11.	Interrupt Controller for AP-System Core (INTC-SYS).....	11-1
11.1	Features.....	11-1
11.2	Interrupt Requests to AP-SYSTEM core .....	11-2
11.2.1	Interrupts Mapping.....	11-2
11.3	Register Descriptions.....	11-12
11.3.1	INTC-SYS Register Configuration and Function Description.....	11-12
11.4	External Interrupt Controller (IRQC).....	11-13
11.4.1	Input/Output Pins .....	11-13
11.4.2	Clocking and Pulse Width.....	11-13
11.4.3	Block Diagram .....	11-14
11.4.4	Register Descriptions .....	11-15
11.4.4.1	Interrupt Request Status Register (INTREQ_STSx [x = 0]).....	11-17
11.4.4.2	Interrupt Enable Status register (INTEN_STSx [x = 0]).....	11-18
11.4.4.3	Interrupt Enable Set register (INTEN_SETx [x = 0]) .....	11-19
11.4.4.4	IRQn Chattering Reduction Status Register (CHTEN_STS).....	11-20
11.4.4.5	IRQn Detect Status Register (DETECT_STATUS).....	11-21
11.4.4.6	IRQn Signal Level Monitor Register (MONITOR) .....	11-22
11.4.4.7	IRQn High Level Detect Status Register (HLVL_STS) .....	11-23
11.4.4.8	IRQn Low Level Detect Status Register (LLVL_STS).....	11-24
11.4.4.9	IRQn Sync Rising Edge Detect Status Register (S_R_EDGE_STS).....	11-25
11.4.4.10	IRQn Sync Falling Edge Detect Status Register (S_F_EDGE_STS).....	11-26
11.4.4.11	IRQn Async Rising Edge Detect Status Register (A_R_EDGE_STS).....	11-27
11.4.4.12	IRQn Async Falling Edge Detect Status Register (A_F_EDGE_STS).....	11-28
11.4.4.13	IRQn Configuration Register (CONFIG_n).....	11-29
11.4.4.14	NMI Request Status Register (NMIREQ_STSx [x = 0]) .....	11-31
11.4.4.15	NMI Enable Status Register n (NMIEN_STSx [x = 0]).....	11-32
11.4.4.16	NMI Enable Set Register n (NMIEN_SETx [x = 0]).....	11-33
11.4.4.17	NMI Chattering Reduction Status Register (CHTEN_STS_NMI) .....	11-34
11.4.4.18	NMI Detect Status Register (DETECT_STATUS_NMI) .....	11-35
11.4.4.19	NMI Signal Level Monitor Register (MONITOR_NMI).....	11-36
11.4.4.20	NMI Debounce Setting Register (DEB_SET_NMI).....	11-37
11.4.4.21	NMI High Level Detect Status Register (HLVL_STS_NMI).....	11-38
11.4.4.22	NMI Low Level Detect Status Register (LLVL_STS_NMI).....	11-39
11.4.4.23	NMI Sync Rising Edge Detect Status Register (S_R_EDGE_STS_NMI).....	11-40
11.4.4.24	NMI Sync Falling Edge Detect Status Register (S_F_EDGE_STS_NMI).....	11-41
11.4.4.25	NMI Async Rising Edge Detect Status Register (A_R_EDGE_STS_NMI).....	11-42
11.4.4.26	NMI Async Falling Edge Detect Status Register (A_F_EDGE_STS_NMI) .....	11-43
11.4.4.27	NMI Configuration n Register (CONFIGn_NMI) .....	11-44

11.4.4.28	NMI Mask Lock Set Register (NMI_LCK) .....	11-45
11.4.4.29	NMI Lock Code Register (NMI_LCKCODE) .....	11-45
11.4.4.30	NMI Debug Control Enable Register (NMI_DBG) .....	11-46
11.4.4.31	NMI Debug Code Register (NMI_DBGCODE) .....	11-46
11.4.5	NMI Mask Lock Feature .....	11-47
11.4.6	Procedure of NMI Mask Lock .....	11-47
11.5	Usage Note .....	11-48
11.5.1	Under the particular condition, there is a possibility to be delayed to enter into the interrupt handler for AP-System Core. ....	11-48
12.	AXI-bus .....	12-1
12.1	Overview .....	12-1
12.1.1	Features .....	12-1
12.1.2	Block Diagram .....	12-2
12.1.3	Input/Output Pins .....	12-2
12.1.4	Register Base Address of AXI-bus .....	12-3
12.1.5	Register Configuration .....	12-4
12.2	Register Description .....	12-5
12.2.1	MXI SDRAM Address Allocation Register 0 (MXSAAR0) .....	12-6
12.2.2	MXI SDRAM Address Allocation Register 1 (MXSAAR1) .....	12-7
12.2.3	MXI Read Transaction Control Register (MXRTCR) .....	12-8
12.2.4	MXI Write Transaction Control Register (MXWTCR) .....	12-9
12.3	Operation .....	12-10
12.3.1	Media Domain AXI Access Control .....	12-10
13.	IPMMU .....	13-1
13.1	Overview .....	13-1
13.1.1	Features .....	13-1
13.2	IPMMU System Integration .....	13-2
13.3	Register Description .....	13-3
13.3.1	MMU Control Register N (IMCTRn) .....	13-7
13.3.2	MMU CCI Address Allocation Register N (IMCAARn) .....	13-8
13.3.3	MMU Bus Control Register N (IMBUSCRn) .....	13-9
13.3.4	MMU Translation Table Base Control Register N (IMTTBCRn) .....	13-10
13.3.5	MMU Translation Table Upper Base Register 0/1N (IMTTUBR0/1n) .....	13-12
13.3.6	MMU Translation Table Lower Base Register 0/1N (IMTTLBR0/1n) .....	13-12
13.3.7	MMU Memory Attribute Indirection Register 0N (IMMAIR0n) .....	13-13
13.3.8	MMU Memory Attribute Indirection Register 1N (IMMAIR1n) .....	13-15
13.3.9	MMU Error Status Register N (IMSTRn) .....	13-17
13.3.10	MMU Error Address Register N (IMEARn) .....	13-18
13.3.11	PMB Control Register (IMPCTR) .....	13-19
13.3.12	PMB Address Array N (IMPMBAn) .....	13-20
13.3.13	PMB Data Array N (IMPMBDn) .....	13-21
13.3.14	PMB Status Register (IMPSTR) .....	13-22
13.3.15	PMB Error Address Register (IMPEAR) .....	13-23
13.3.16	uTLB Control Register N (IMUCTRn) .....	13-24
13.3.17	uTLB ASID Register N (IMUASIDn) .....	13-25
13.3.18	MMU Performance Monitor Control Register (IMPFMMCTR) .....	13-26
13.3.19	DVM Performance Monitor Control Register (IMPFMDCTR) .....	13-27
13.3.20	MMU Performance Monitor Total Translation Counter (IMPFMMTOTAL) .....	13-28
13.3.21	MMU Performance Monitor Hit Counter (IMPFMHIT) .....	13-28
13.3.22	MMU Performance Monitor L3 Miss Counter (IMPFML3MISS) .....	13-29
13.3.23	MMU Performance Monitor L2 Miss Counter (IMPFML2MISS) .....	13-29
13.3.24	DVM Monitor Total Transaction Counter (IMPFMDTOTAL) .....	13-30

13.3.25	DVM Monitor User Counter (IMPFMDUSER).....	13-30
13.3.26	DVM Monitor Last TLB Invalidate 0 (IMPFMDLINV0).....	13-31
13.3.27	DVM Monitor Last TLB Invalidate 1 (IMPFMDLINV1).....	13-31
13.4	Operation .....	13-32
13.4.1	Address Translation Sequence in micro-TLBs.....	13-32
13.4.2	Address Translation Sequence in the IPMMU .....	13-33
13.4.3	Address Space .....	13-35
13.4.4	Initialization Sequence .....	13-39
13.4.5	TLB Maintenance.....	13-39
13.4.6	Security Extensions.....	13-40
13.4.7	Coherency Support.....	13-41
13.4.8	Error Handling .....	13-41
13.5	micro-TLB Assignment .....	13-43
13.5.1	micro-TLB Assignment.....	13-43
14.	LBSC within Bus Bridge .....	14-1
14.1	Overview.....	14-1
14.2	Features.....	14-1
14.3	Block Diagram.....	14-3
14.4	LBSC Areas .....	14-4
14.4.1	LBSC Support Areas.....	14-4
14.4.2	Functionality Supported in Each Area .....	14-5
14.5	Register Descriptions .....	14-6
14.5.1	Area 0 Control Register (CS0CTRL).....	14-9
14.5.2	Area 1 Control Register (CS1CTRL).....	14-11
14.5.3	Expansion Area x Control Register (ECSxCTRL (x = 0 to 5)).....	14-12
14.5.4	Area 0 RD/WE Pulse Control Register (CSWCR0).....	14-14
14.5.5	Area 1 RD/WE Pulse Control Register (CSWCR1).....	14-18
14.5.6	Expansion Area x RD/WE Pulse Control Register (ECSWCRx (x = 0 to 5)).....	14-21
14.5.7	LBSC-DMAC Channel y RD/WE Pulse Control Register (EXDMAWCRy (y = 0 to 2)) .....	14-24
14.5.8	Area 0 External Wait Control Register (CSPWCR0).....	14-27
14.5.9	Area 1 External Wait Control Register (CSPWCR1).....	14-29
14.5.10	Expansion Area x External Wait Control Register (ECSPWCRx (x = 0 to 5)).....	14-31
14.5.11	External Wait Input Control Register (EXWTSYNC) .....	14-33
14.5.12	Area 0 Burst Control Register (CS0BSTCTL).....	14-34
14.5.13	Area 0 Burst Pitch Set Register (CS0BTPH) .....	14-35
14.5.14	Area 1 Guard Setting Register (CS1GDST).....	14-36
14.5.15	Expansion Area x Guard Setting Register (ECSxGDST (x = 0 to 5)).....	14-37
14.5.16	LBSC-DMAC Channel y Area Assignment Register (EXDMASETy (y = 0 to 2)) .....	14-38
14.5.17	LBSC-DMAC Channel y Control Register (EXDMCRy (y = 0 to 2)) .....	14-39
14.5.18	BSC Interrupt Source Status Register (BCINTSR).....	14-41
14.5.19	BSC Interrupt Source Clear Register (BCINTCR).....	14-42
14.5.20	BSC Interrupt Enable Register (BCINTMR) .....	14-43
14.5.21	EX-BUS Priority Level Set Register (EXBATLV).....	14-44
14.5.22	External Wait Status Register (EXWTSTS).....	14-45
14.5.23	ATACS Control Register (ATACSCTRL).....	14-46
14.5.24	EX-BUS Wait Timeout Detection Base Counter Register (EXBCT) .....	14-48
14.5.25	EX-BUS Wait Timeout Detection Counter Register (EXTCT) .....	14-49
14.5.26	EX-BUS Wait Timeout Detection Access Source Indication Register (EXTSR).....	14-50
14.5.27	EX-BUS Wait Timeout Detection Address Indication Register (EXTADR).....	14-51
14.6	Operation .....	14-52
14.6.1	SRAM Interface (Basic Functionality).....	14-52
14.6.2	CPU (AXI Bus) Burst ROM Interface .....	14-61
14.6.3	LBSC-DMAC DMA Interface .....	14-62

14.6.4	CPU (AXI Bus) Byte-Control SRAM Interface.....	14-68
14.6.5	CPU (AXI Bus) ATA Device Interface.....	14-69
14.6.6	Wait Timeout .....	14-76
14.6.7	EX-BUS Arbitration.....	14-76
14.7	Usage Notes .....	14-78
14.7.1	Pin Multiplexing.....	14-78
14.7.2	Operations for Read Access by Ultra DMA.....	14-78
14.7.3	Short period low driving at the end of SRAM write access .....	14-79
14.7.4	Usage Note.....	14-79
15.	External Bus Controller for DDR3-SDRAM (DBSC3).....	15-1
15.1	Overview.....	15-1
15.1.1	Features .....	15-1
15.1.2	Definition of Terms and Symbols .....	15-3
15.1.3	Block Diagram .....	15-4
15.1.4	Input/Output Pins .....	15-8
15.2	Register Configuration.....	15-10
15.3	Register Descriptions .....	15-12
15.3.1	DBSC3 Status Register 1 (DBSTATE1).....	15-13
15.3.2	SDRAM Access Enable Register (DBACEN).....	15-14
15.3.3	Auto-Refresh Enable Register (DBRFEN).....	15-15
15.3.4	Manual Command-Issuing Register (DBCMD).....	15-16
15.3.5	Operation Completion Waiting Register (DBWAIT).....	15-18
15.3.6	SDRAM Type Setting Register (DBKIND).....	15-19
15.3.7	SDRAM Configuration Setting Register 0 (DBCONF0).....	15-20
15.3.8	PHY Type Setting Register (DBPHYTYPE).....	15-22
15.3.9	SDRAM Timing Register 0 (DBTR0) .....	15-23
15.3.10	SDRAM Timing Register 1 (DBTR1) .....	15-24
15.3.11	SDRAM Timing Register 2 (DBTR2) .....	15-25
15.3.12	SDRAM Timing Register 3 (DBTR3) .....	15-26
15.3.13	SDRAM Timing Register 4 (DBTR4) .....	15-27
15.3.14	SDRAM Timing Register 5 (DBTR5) .....	15-28
15.3.15	SDRAM Timing Register 6 (DBTR6) .....	15-29
15.3.16	SDRAM Timing Register 7 (DBTR7) .....	15-30
15.3.17	SDRAM Timing Register 8 (DBTR8) .....	15-31
15.3.18	SDRAM Timing Register 9 (DBTR9) .....	15-32
15.3.19	SDRAM Timing Register 10 (DBTR10) .....	15-33
15.3.20	SDRAM Timing Register 11 (DBTR11) .....	15-34
15.3.21	SDRAM Timing Register 12 (DBTR12) .....	15-35
15.3.22	SDRAM Timing Register 13 (DBTR13) .....	15-36
15.3.23	SDRAM Timing Register 14 (DBTR14) .....	15-37
15.3.24	SDRAM Timing Register 15 (DBTR15) .....	15-39
15.3.25	SDRAM Timing Register 16 (DBTR16) .....	15-40
15.3.26	SDRAM Timing Register 17 (DBTR17) .....	15-42
15.3.27	SDRAM Timing Register 18 (DBTR18) .....	15-43
15.3.28	SDRAM Timing Register 19 (DBTR19) .....	15-45
15.3.29	SDRAM Operation Setting Register (DBBL).....	15-46
15.3.30	DBSC3 Operation Adjustment Register 0 (DBADJ0).....	15-47
15.3.31	DBSC3 Operation Adjustment Register 2 (DBADJ2).....	15-48
15.3.32	Refresh Configuration Register 0 (DBRFCNF0).....	15-50
15.3.33	Refresh Configuration Register 1 (DBRFCNF1).....	15-51
15.3.34	Refresh Configuration Register 2 (DBRFCNF2).....	15-53
15.3.35	DDR3-SDRAM Calibration Configuration Register (DBCALCNF).....	15-54
15.3.36	DDR3-SDRAM Calibration Timing Register (DBCALTR).....	15-56

15.3.37	ODT Operation Setting Register (DBRNK0).....	15-58
15.3.38	Power-Down Configuration Register (DBPDNCNF).....	15-59
15.3.39	DFI Status IF Input Register (DBDFISTAT).....	15-61
15.3.40	DFI Status IF Output Register (DBDFICNT).....	15-62
15.3.41	PHY Unit Lock Register (DBPDLCK).....	15-63
15.3.42	PHY Unit Address Register (DBPDRGA).....	15-64
15.3.43	PHY Unit Access Register (DBPDRGD).....	15-65
15.3.44	Bus Control Unit 0 Control Register 1 (DBBS0CNT1).....	15-66
15.3.45	AXI Port Setting Register 0 (DBWT0CNF0).....	15-67
15.3.46	AXI Port Setting Register 4 (DBWT0CNF4).....	15-68
15.3.47	Scheduler Setting Register 0 (DBSCHECNT0).....	15-69
15.4	Operation.....	15-70
15.4.1	Supported SDRAM Commands.....	15-70
15.4.2	SDRAM Command Issue.....	15-71
15.4.3	Initialization Sequence.....	15-73
15.4.3.1	Starting the System.....	15-73
15.4.4	Self-Refresh Operation.....	15-77
15.4.5	Power-Down Operation.....	15-78
15.4.6	Modifying Refresh Settings during Operation.....	15-78
15.4.7	Restrictions on AXI Bus Interface.....	15-78
15.4.8	Switching PHY Channel Count (between 32-bit SDRAM and 64-bit SDRAM) [RZ/G1H/M].....	15-79
15.4.9	PHY 2-Channel Mode (Two 32-Bit SDRAMs) [RZ/G1H/M].....	15-79
15.4.10	PHY 1-Channel Mode (One 64-Bit SDRAM) [RZ/G1H/M].....	15-79
15.4.11	Setting the SDRAM Configuration Setting Register.....	15-80
15.4.12	Address Multiplexing.....	15-83
15.4.13	SDRAM Access and Timing Constraints.....	15-90
15.4.14	SDRAM Power-Supply Backup Function.....	15-101
15.4.15	Method for Securing Time Required for Initialization, Self-Refresh Release, etc.....	15-105
15.5	Notes on Board Design.....	15-106
15.5.1	Connection of M0ZQ or M1ZQ Pin.....	15-106
15.5.2	Connection of PLL Power Supply and GND Pins.....	15-106
15.6	Notes on 16 bit Mode Usage for Initial Settings.....	15-107
15.7	Notes on Address MAP.....	15-108
15.7.1	Address Map (Over view).....	15-108
15.7.2	RZ/G1H/M Address Map.....	15-108
15.7.3	RZ/G1N/E Address Map.....	15-112
15A.	S3 Cache Controller (S3CTRL).....	15A-1
15A.1	Overview.....	15A-1
15A.1.1	Features.....	15A-1
15A.1.2	Block Diagram.....	15A-2
15A.1.3	Input/Output Pins.....	15A-4
15A.1.4	Register Configuration.....	15A-5
15A.2	Register Description.....	15A-7
15A.2.1	Exclusive Address Mask Register (S3CEXCLADDMASK).....	15A-8
15A.2.2	Exclusive ID Mask Register (S3CEXCLIDMSK).....	15A-9
15A.2.3	S3C Address Split Control Register (S3CADSPLCR).....	15A-10
15A.2.4	Reserved Register (S3CMAAR).....	15A-11
15A.2.5	S3C Read Outstanding Regulation Register (S3CRORR).....	15A-12
15A.2.6	S3C Write Outstanding Regulation Register (S3CWORR).....	15A-13
15A.2.7	S3C Cache Master Control Register (S3CMCTR).....	15A-14
15A.2.8	Cache Configuration Register n (CCONFn).....	15A-15
15A.2.9	Interrupt Control Register (INTCR0).....	15A-17
15A.2.10	Interrupt Clear Register (INTCLR0).....	15A-18

15A.2.11	XY TL Area Control Register A0 to A7 (XYTLAREAAn, (n = 0 to 7)).....	15A-19
15A.2.12	XY TL Area Control Register B0 to B7 (XYTLAREAABn, (n = 0 to 7)).....	15A-20
15A.2.13	XY Mode Configuration Register (XYMODECONF).....	15A-21
15A.3	Operation.....	15A-22
15A.3.1	SDRAM Address Space.....	15A-22
15A.3.2	SDRAM Split/Linear Address Mapping for RZ/G1H and RZ/G1M.....	15A-24
15A.3.3	On-Chip RAM Address Space for RZ/G1H.....	15A-26
15A.3.4	XY Command Address Area.....	15A-27
15A.3.5	Cache Operation for RZ/G1H.....	15A-27
15A.3.6	QoS Arbitration.....	15A-27
15A.3.7	About Exclusive Instruction Monitor.....	15A-27
16.	Direct Memory Access Controller for System (SYS-DMAC).....	16-1
16.1	Features.....	16-1
16.2	Input/Output Pins.....	16-2
16.3	Register Descriptions.....	16-3
16.3.1	DMA Interrupt Status Register for Lower-Numbered Channels (DMAISTA_L).....	16-19
16.3.2	DMA Interrupt Status Register for Higher-Numbered Channels (DMAISTA_U).....	16-21
16.3.3	DMA Secure Control Register for Lower-Numbered Channels (DMASEC_L).....	16-23
16.3.4	DMA Secure Control Register Higher-Numbered Channels (DMASEC_U).....	16-25
16.3.5	DMA Operation Register for Lower-Numbered Channels (DMAOR_L).....	16-27
16.3.6	DMA Operation Register for Higher-Numbered Channels (DMAOR_U).....	16-29
16.3.7	DMA Channel Clear Register for Lower-Numbered Channels (DMACHCLR_L).....	16-31
16.3.8	DMA Channel Clear Register for Higher-Numbered Channels (DMACHCLR_U).....	16-32
16.3.9	DPRAM Secure Control Register for Lower-Numbered Channels (DMADPSEC_L).....	16-33
16.3.10	DPRAM Secure Control Register for Higher-Numbered Channels (DMADPSEC_U).....	16-34
16.3.11	DMA Source Address Registers 0 to 29 (DMASAR_0 to DMASAR_29).....	16-35
16.3.12	DMA Destination Address Registers 0 to 29 (DMADAR_0 to DMADAR_29).....	16-35
16.3.13	DMA Transfer Count Registers 0 to 29 (DMATCR_0 to DMATCR_29).....	16-36
16.3.14	DMA Transfer Count Registers B_0 to 29 (DMATCRB_0 to DMATCRB_29).....	16-37
16.3.15	DMA Transfer Size Registers 0 to 29 (DMATSR_0 to DMATSR_29).....	16-37
16.3.16	DMA Transfer Size Registers B_0 to 29 (DMATSRB_0 to DMATSRB_29).....	16-38
16.3.17	DMA Channel Control Registers 0 to 29 (DMACHCR_0 to DMACHCR_29).....	16-39
16.3.18	DMA Channel Control Register B_0 to 29 (DMACHCRB_0 to DMACHCRB_29).....	16-44
16.3.19	DMA Buffer Control Registers 0 to 29 (DMABUFCR_0 to DMABUFCR_29).....	16-46
16.3.20	DMA Extended Resource Selectors 0 to 29 (DMARS_0 to DMARS_29).....	16-47
16.3.21	DMA Descriptor Base Address Registers 0 to 29 (DMADPBASE_0 to DMADPBASE_29).....	16-48
16.3.22	DMA Descriptor Control Registers 0 to 29 (DMADPCR_0 to DMADPCR_29).....	16-49
16.3.23	DMA Fixed Source Address Registers 0 to 29 (DMAFIXSAR_0 to DMAFIXSAR_29).....	16-50
16.3.24	DMA Fixed Destination Address Registers 0 to 29 (DMAFIXDAR_0 to DMAFIXDAR_29).....	16-50
16.3.25	DMA Fixed Descriptor Base Address Registers 0 to 29 (DMAFIXDPBASE_0 to DMAFIXDPBASE_29).....	16-51
16.3.26	Descriptor Memory (DescriptorMEM).....	16-51
16.4	Operation.....	16-52

21.	Display Unit (DU) .....	21-1
21.1	Overview .....	21-1
21.1.1	Features .....	21-1
21.1.2	Block Diagram .....	21-4
21.1.3	Input/Output Pins .....	21-7
21.2	Register Configuration .....	21-19
21.3	Register Description .....	21-66
21.3.1	Display Unit System Control Registers .....	21-67

21.3.1.1	Display Unit System Control Register m (DSYSRm, m = 0 and 2 / m = 0)	21-67
21.3.1.2	Display Unit System Control Register 1 (DSYSR1)	21-70
21.3.1.3	Display Unit Mode Register n (DSMRn)	21-72
21.3.1.4	Display Unit Status Register 0 (DSSR0)	21-75
21.3.1.5	Display Unit Status Register 1 (DSSR1)	21-80
21.3.1.6	Display Unit Status Register 2 (DSSR2)	21-82
21.3.1.7	Display Unit Status Register Clear Register 0 (DSRCR0)	21-86
21.3.1.8	Display Unit Status Register Clear Register 1 (DSRCR1)	21-88
21.3.1.9	Display Unit Status Register Clear Register 2 (DSRCR2)	21-90
21.3.1.10	Display Unit Interrupt Enable Register 0 (DIER0)	21-92
21.3.1.11	Display Unit Interrupt Enable Register 1 (DIER1)	21-95
21.3.1.12	Display Unit Interrupt Enable Register 2 (DIER2)	21-97
21.3.1.13	Display Unit Domain 1 Status Register 0 (DD1SSR0)	21-99
21.3.1.14	Display Unit Domain 1 Status Register 1 (DD1SSR1)	21-102
21.3.1.15	Display Unit Domain 1 Status Register 2 (DD1SSR2)	21-104
21.3.1.16	Display Unit Domain 1 Status Register Clear Register 0 (DD1SRCR0)	21-105
21.3.1.17	Display Unit Domain 1 Status Register Clear Register 1 (DD1SRCR1)	21-106
21.3.1.18	Display Unit Domain 1 Status Register Clear Register 2 (DD1SRCR2)	21-106
21.3.1.19	Display Unit Domain 1 Interrupt Enable Register 0 (DD1IER0)	21-106
21.3.1.20	Display Unit Domain 1 Interrupt Enable Register 1 (DD1IER1)	21-106
21.3.1.21	Display Unit Domain 1 Interrupt Enable Register 2 (DD1IER2)	21-106
21.3.1.22	Color Palette Control Register m (CPCRm, m = 0 and 2)	21-107
21.3.1.23	Display Plane Priority Register m (DPPRm, m = 0 and 2)	21-109
21.3.1.24	Display Unit Extensional Function Control Register m (DEFRm/n, m/n = 0 and 2 or m/n = 0)	21-112
21.3.1.25	Display Unit Extensional Function Control Register 1 (DEFR1)	21-114
21.3.1.26	Display Alpha Ratio Plane Control Register m (DAPCRm, m = 0 and 2)	21-116
21.3.1.27	Display Capture Control Register m (DCPCRm, m = 0 and 2)	21-117
21.3.1.28	Display Unit Extensional Function Control 2 Register m (DEF2Rm, m = 0 and 2)	21-119
21.3.1.29	Display Unit Extensional Function Control 3 Register m (DEF3Rm, m = 0 and 2)	21-120
21.3.1.30	Display Unit Extensional Function Control 4 Register m (DEF4Rm, m = 0 and 2)	21-121
21.3.1.31	Display Unit Video Capture Status Register m (DVCSRm, m = 0 and 2)	21-122
21.3.1.32	Display Unit Extensional Function Control 5 Register m (DEF5Rm, m = 0 and 2)	21-125
21.3.1.33	Display Unit Data Latency Adjustment Register (DDLTR)	21-129
21.3.1.34	Display Unit Extensional Function Control 6 Register m (DEF6Rm, m = 0 and 2)	21-131
21.3.1.35	Display Unit Extensional Function Control 7 Register (DEF7R)	21-134
21.3.1.36	Display Unit Extensional Function Control 8 Register m (DEF8Rm, m = 0 and 2)	21-135
21.3.1.37	Display Unit Output Signal Fixed Level Register m (DOFLRm, m = 0 and 2)	21-137
21.3.1.38	Display Unit Input Dot Clock Select Register (DIDSR)	21-139
21.3.2	Display Timing Generation Registers	21-141
21.3.2.1	Horizontal Display Start Register n (HDSRn)	21-141
21.3.2.2	Horizontal Display End Register n (HDERN)	21-142
21.3.2.3	Vertical Display Start Register n (VDSRn)	21-142
21.3.2.4	Vertical Display End Register n (VDERN)	21-143
21.3.2.5	Horizontal Cycle Register n (HCRn)	21-144
21.3.2.6	Horizontal Sync Width Register n (HSWRn)	21-144
21.3.2.7	Vertical Cycle Register n (VCRn)	21-145
21.3.2.8	Vertical Sync Point Register n (VSPRn)	21-146
21.3.2.9	Equal Pulse Width Register n (EQWRn)	21-147
21.3.2.10	Serration Width Register n (SPWRn)	21-147
21.3.2.11	CLAMP Signal Start Register n (CLAMPSRn)	21-148
21.3.2.12	CLAMP Signal Width Register n (CLAMPWRn)	21-149
21.3.2.13	DE Signal Start Register n (DESRn)	21-150
21.3.2.14	DE Signal Width Register n (DEWRn)	21-151

21.3.3	Display Attribute Registers .....	21-152
21.3.3.1	Color Palette 1 Transparent Color Register m (CP1TRm, m = 0 and 2).....	21-152
21.3.3.2	Color Palette 2 Transparent Color Register m (CP2TRm, m = 0 and 2).....	21-155
21.3.3.3	Color Palette 3 Transparent Color Register m (CP3TRm, m = 0 and 2).....	21-158
21.3.3.4	Color Palette 4 Transparent Color Register m (CP4TRm, m = 0 and 2).....	21-161
21.3.3.5	Display Off Mode Output Register n (DOORn) .....	21-164
21.3.3.6	Color Detection Register n (CDERn).....	21-165
21.3.3.7	Background Plane Output Register n (BPORn) .....	21-166
21.3.3.8	Raster Interrupt Offset Register n (RINTOFSRn).....	21-167
21.3.4	Display Plane Registers (Alpha Plane Registers).....	21-168
21.3.4.1	Plane n Mode Register m (PnMRm, m = 0 and 2) .....	21-169
21.3.4.2	Plane n Memory Width Register m (PnMWRm, m = 0 and 2).....	21-172
21.3.4.3	Plane n Blending Ratio Register m (PnALPHARm, m = 0 and 2) .....	21-173
21.3.4.4	Plane n Display Size X Register m (PnDSXRm, m = 0 and 2).....	21-176
21.3.4.5	Plane n Display Size Y Register m (PnDSYRm, m = 0 and 2).....	21-177
21.3.4.6	Plane n Display Position X Register m (PnDPXRm, m = 0 and 2).....	21-178
21.3.4.7	Plane n Display Position Y Register m (PnDPYRm, m = 0 and 2).....	21-179
21.3.4.8	Plane n Display Area Start Address 0 Register m (PnDSA0Rm, m = 0 and 2) .....	21-181
21.3.4.9	Plane n Display Area Start Address 1 Register m (PnDSA1Rm, m = 0 and 2) .....	21-182
21.3.4.10	Plane n Display Area Start Address 2 Register m (PnDSA2Rm, m = 0 and 2) .....	21-183
21.3.4.11	Plane n Start Position X Register m (PnSPXRm, m = 0 and 2) .....	21-184
21.3.4.12	Plane n Start Position Y Register m (PnSPYRm, m = 0 and 2) .....	21-185
21.3.4.13	Plane n Wrap-Around Start Position Register m (PnWASPRm, m = 0 and 2) .....	21-186
21.3.4.14	Plane n Wrap-Around Memory Width Register m (PnWAMWRm, m = 0 and 2) .....	21-187
21.3.4.15	Plane n Blinking Time Register m (PnBTRm, m = 0 and 2).....	21-188
21.3.4.16	Plane n Transparent Color 1 Register m (PnTC1Rm, m = 0 and 2).....	21-189
21.3.4.17	Plane n Transparent Color 2 Register m (PnTC2Rm, m = 0 and 2).....	21-190
21.3.4.18	Plane n Transparent Color 3 Register m (PnTC3Rm, m = 0 and 2).....	21-191
21.3.4.19	Plane n Memory Length Register m (PnMLRm, m = 0 and 2).....	21-192
21.3.4.20	Plane n SWAP Control Register m (PnSWAPRm, m = 0 and 2).....	21-193
21.3.4.21	Plane n Display Data Control Register m (PnDDCRm, m = 0 and 2).....	21-195
21.3.4.22	Plane n Display Data Control 2 Register m (PnDDC2Rm, m = 0 and 2).....	21-197
21.3.4.23	Plane n Display Data Control 4 Register m (PnDDC4Rm, m = 0 and 2).....	21-199
21.3.4.24	Alpha-ratio Plane n Mode Register m (APnMRm, m = 0 and 2).....	21-201
21.3.5	Display Capture Registers .....	21-203
21.3.5.1	Display Capture n Mode Register m (DCnMRm, m = 0 and 2).....	21-203
21.3.5.2	Display Capture n Memory Width Register m (DCnMWRm, m = 0 and 2).....	21-204
21.3.5.3	Display Capture n Area Start Address Register m (DCnSARm, m = 0 and 2) .....	21-204
21.3.5.4	Display Capture n Memory Length Register m (DCnMLRm, m = 0 and 2).....	21-205
21.3.6	Color Palette Registers .....	21-206
21.3.6.1	Color Palette 1 (000 to 255) Register m (CP1_000Rm to CP1_255Rm, m = 0 and 2) .....	21-206
21.3.6.2	Color Palette 2 (000 to 255) Register m (CP2_000Rm to CP2_255Rm, m = 0 and 2) .....	21-208
21.3.6.3	Color Palette 3 (000 to 255) Register m (CP3_000Rm to CP3_255Rm, m = 0 and 2) .....	21-209
21.3.6.4	Color Palette 4 (000 to 255) Register m (CP4_000Rm to CP4_255Rm, m = 0 and 2) .....	21-210
21.3.7	External Synchronization Control Registers .....	21-211
21.3.7.1	External Synchronization Control Register n (ESCRn) .....	21-211
21.3.7.2	Output Signal Timing Adjustment Register n (OTARn).....	21-215
21.3.8	Dual Display Output Control Registers.....	21-219
21.3.8.1	Display Unit Output Route Control Register m (DORCRm, m = 0) .....	21-219
21.3.8.2	Display Unit Output Route Control Register 2 (DORCR2).....	21-222
21.3.8.3	Display Unit Plane Timing Select Register (DPTSR).....	21-223
21.3.8.4	Display Unit Alpha Plane Timing Select Register (DAPTSR) .....	21-225
21.3.8.5	Display Superimpose 0 Priority Register m (DS0PRm, m = 0 and 2) .....	21-226
21.3.8.6	Display Superimpose 1 Priority Register (DS1PR).....	21-231

21.3.9	YC-RGB Conversion Coefficient Registers.....	21-236
21.3.9.1	Y Normalization Coefficient Register m (YNCRm, m = 0 and 2).....	21-236
21.3.9.2	Y Normalization Offset Register m (YNORM, m = 0 and 2).....	21-237
21.3.9.3	Cr Normalization Offset Register m (CRNORM, m = 0 and 2).....	21-238
21.3.9.4	Cb Normalization Offset Register m (CBNORM, m = 0 and 2).....	21-239
21.3.9.5	Red Cr Coefficient Register m (RCRCRm, m = 0 and 2).....	21-240

41.3.11	FIFO Data Count Register An (SCAFDRn)	41-23
41.3.12	Transmit Data Stop Register An (SCATDSRn)	41-23
41.3.13	Serial Port Control Register An (SCAPCRn)	41-24
41.3.14	Serial Port Data Register An (SCAPDRn)	41-26
41.4	Operation	41-28
41.4.1	Overview	41-28
41.4.2	Asynchronous Mode	41-28
41.4.3	Serial Operation in Asynchronous Mode	41-29
41.4.4	Operation in Clocked Synchronous Mode	41-39
41.5	SCIFA Interrupt Sources and DMAC	41-46
41.6	Usage Notes	41-47
42.	Serial Communications Interface with FIFO B (SCIFB)	42-1
42.1	Features	42-1
42.2	Input/Output Pins	42-3
42.3	Register Descriptions	42-4
42.3.1	Receive Shift Register Bn (SCBRSRn)	42-6
42.3.2	Transmit Shift Register Bn (SCBTSRn)	42-6
42.3.3	Serial Mode Register Bn (SCBSMRn)	42-7
42.3.4	Bit Rate Register Bn (SCBBRRn)	42-10
42.3.5	Serial Control Register Bn (SCBSCRn)	42-12
42.3.6	Transmit Data Stop Register Bn (SCBTDSRn)	42-14
42.3.7	FIFO Error Count Register Bn (SCBFERN)	42-15
42.3.8	Serial Status Register Bn (SCBSSRn)	42-16
42.3.9	FIFO Control Register Bn (SCBFCRn)	42-22
42.3.10	Receive Data Count Compare Register Bn (SCBR CERn)	42-24
42.3.11	Multibyte Set Register Bn (SCBMBRn)	42-25
42.3.12	Serial Port Control Register Bn (SCBPCRn)	42-26
42.3.13	Serial Port Data Register Bn (SCBPDRn)	42-27
42.3.14	Transmit FIFO Data Count Register Bn (SCBTFDRn)	42-28
42.3.15	Receive FIFO Data Count Register Bn (SCBRFDRn)	42-28
42.3.16	Transmit FIFO Data Register Bn (SCBFTDRn)	42-29
42.3.17	Receive FIFO Data Register Bn (SCBFRDRn)	42-29
42.3.18	Serial Control Register 2 Bn (SCBSC2Rn)	42-30
42.3.19	Serial Status Register 2 Bn (SCBSS2Rn)	42-31
42.3.20	Receive Reading Count H Register Bn (SCBRRCHRn)	42-31
42.3.21	Receive Reading Count L Register Bn (SCBRRCLRn)	42-32
42.3.22	Receive Reading Count Compare H register Bn (SCBRRCCHRn)	42-32
42.3.23	Receive Reading Count Compare L Register Bn (SCBRRCCLRn)	42-33
42.3.24	Receive FIFO1 Register Bn (SCBFIFO1n)	42-33
42.3.25	Receive FIFO0 Register Bn (SCBFIFO0n)	42-34
42.4	Operation	42-35
42.4.1	Overview	42-35
42.4.2	Asynchronous Mode	42-35
42.4.3	Serial Operation in Asynchronous Mode	42-36
42.4.4	Operation in Clocked Synchronous Mode	42-44
42.5	SCIFB Interrupt Sources and DMAC	42-52
42.6	Receive-Reading-Count-Compare Interrupt	42-53
42.7	Multibyte Transfer	42-54
42.7.1	Basic Multibyte Settings	42-54
42.7.2	Specifying Transfer Count	42-54
42.8	Usage Notes	42-55

43.	High Speed Serial Communication Interface with FIFO (HSCIF)	43-1
43.1	Overview	43-1
43.1.1	Features	43-1
43.1.2	Block Diagram	43-2
43.1.3	Pin Configuration	43-3
43.1.4	Register Configuration	43-4
43.2	Register Descriptions	43-6
43.2.1	Receive Shift Register (HSRSR)	43-6
43.2.2	Receive FIFO Data Register (HSFRDR)	43-6
43.2.3	Transmit Shift Register (HSTSR)	43-7
43.2.4	Transmit FIFO Data Register (HSFTDR)	43-7
43.2.5	Serial Mode Register (HSSMR)	43-8
43.2.6	Serial Control Register (HSSCR)	43-10
43.2.7	Serial Status Register (HSFSR)	43-13
43.2.8	Bit Rate Register (HSBRR)	43-18
43.2.9	FIFO Control Register (HSFCR)	43-19
43.2.10	FIFO Data Count Register (HSFDR)	43-20
43.2.11	Serial Port Register (HSSPTR)	43-21
43.2.12	Line Status Register (HLSLR)	43-23
43.2.13	Sampling Rate Register (HSSRR)	43-25
43.2.14	Serial Error Register (HSRER)	43-26
43.2.15	RTS Output Active Trigger Register (HSRTGR)	43-27
43.2.16	Receive FIFO Data Count Trigger Register (HSRTRGR)	43-27
43.2.17	Transmit FIFO Data Count Trigger Register (HSTTRGR)	43-28
43.3	Operation	43-29

51.10	Power Management .....	51-115
51.10.1	Power-Off Sequence .....	51-115
51.10.1.1	OHCI Mode.....	51-115
51.10.1.2	EHCI Mode.....	51-116
51.10.2	Power On Sequence .....	51-117
51.10.2.1	OHCI Mode.....	51-117
51.10.2.2	EHCI Mode.....	51-117
51.10.3	Direct Power-Down Feature.....	51-118
51.10.3.1	Direct Power-Down Setting .....	51-118
51.11	Operating Procedures.....	51-119
51.11.1	Reset Sequence.....	51-119
51.11.2	Initial Setup Sequence .....	51-120
51.11.3	Transfer Overview.....	51-122
51.11.3.1	DMA Transfer Stop.....	51-122
51.12	Over Current and Vbus Control.....	51-123
51.12.1	Over Current Control .....	51-123
51.12.1.1	Description of OCI/PPON.....	51-123
51.12.1.2	Condition of PPON Assertion .....	51-123
51.12.2	VBUS Control.....	51-124
51.12.3	Over current detection flow.....	51-125
51.12.4	PPON setting flow.....	51-126
51.13	Usage Note.....	51-127
51.13.1	EXT1 register bit 12 (current: reserved bit) should be specified as 0 (default: 1) under some conditions.....	51-127
52.	USB High-Speed Module (HS-USB) .....	52-1
52.1	Features.....	52-1
52.1.1	Input/Output Pins .....	52-2
52.2	Register Descriptions.....	52-3
52.2.1	System Configuration Control Register (SYSCFG).....	52-8
52.2.2	CPU Bus Wait Register (BUSWAIT).....	52-10
52.2.3	System Configuration Status Register (SYSSTS).....	52-11
52.2.4	Device State Control Register (DVSTCTR) .....	52-12
52.2.5	Test Mode Register (TESTMODE).....	52-13
52.2.6	CFIFO Port Register.....	52-14
52.2.7	FIFO Port Select Registers (CFIFOSEL, D0FIFOSEL, D1FIFOSEL, D2FIFOSEL, D3FIFOSEL).....	52-16
52.2.8	FIFO Port Control Registers (CFIFOCTR, D0FIFOCTR, D1FIFOCTR, D2FIFOCTR, D3FIFOCTR) .....	52-22
52.2.9	Interrupt Enable Register 0 (INTENB0) .....	52-25
52.2.10	BRDY Interrupt Enable Register (BRDYENB).....	52-27
52.2.11	NRDY Interrupt Enable Register (NRDYENB) .....	52-29
52.2.12	BEMP Interrupt Enable Register (BEMPENB) .....	52-31
52.2.13	SOF Output Configuration Register (SOFCFG) .....	52-33

52.2.14	Interrupt Status Register 0 (INTSTS0).....	52-34
52.2.15	BRDY Interrupt Status Register (BRDYSTS) .....	52-37
52.2.16	NRDY Interrupt Status Register (NRDYSTS).....	52-39
52.2.17	BEMP Interrupt Status Register (BEMPSTS).....	52-41
52.2.18	Frame Number Register (FRMNUM).....	52-43
52.2.19	μ Frame Number Register (UFRMNUM).....	52-44
52.2.20	USB Address Register (USBADDR).....	52-45
52.2.21	USB Request Type Register (USBREQ).....	52-46
52.2.22	USB Request Value Register (USBVAL).....	52-46
52.2.23	USB Request Index Register (USBINDX).....	52-47
52.2.24	USB Request Length Register (USBLENG).....	52-47
52.2.25	DCP Maximum Packet Size Register (DCPMAXP).....	52-48
52.2.26	DCP Control Register (DCPCTR) .....	52-49
52.2.27	Pipe Window Select Register (PIPESEL) .....	52-52
52.2.28	Pipe Configuration Register (PIPECFG).....	52-53
52.2.29	Pipe Buffer Register (PIPEBUF).....	52-58
52.2.30	Pipe Maximum Packet Size Register (PIPEMAXP) .....	52-60
52.2.31	Pipe Cycle Control Register (PIPEPERI).....	52-61
52.2.32	Pipe n Control Register (PIPEnCTR) (n = 1 to F).....	52-62
52.2.33	Pipe n Transaction Counter Enable Register (PIPnTRE) (n = 1 to 5, 9 to F).....	52-70
52.2.34	Pipe n Transaction Counter Register (PIPnTRN) (n = 1 to 5, 9 to F).....	52-71
52.2.35	Low Power Status register (LPSTS).....	52-72
52.2.36	USB General Control Register (UGCTRL).....	52-73
52.2.37	USB General Control Register 2 (UGCTRL2).....	52-74
52.2.38	USB General Status Register (UGSTS) .....	52-75
52.3	Operation .....	52-76
52.3.1	System Control and Oscillation Control.....	52-76
52.3.2	Interrupt Function.....	52-78
52.3.3	Pipe Control .....	52-88
52.3.4	FIFO Buffer Memory .....	52-93
52.3.5	Control Transfer (DCP).....	52-99
52.3.6	Bulk Transfer (Pipes 1 to 5, 9 to F).....	52-100
52.3.7	Interrupt Transfer (Pipes 6 to A) .....	52-101
52.3.8	Isochronous Transfer (Pipes 1, 2).....	52-101
52.3.9	SOF Interpolation Function.....	52-108
52.4	Guidelines for Designing USB2.0 Hi-Speed Boards .....	52-109
52.4.1	USB Transmission Line .....	52-109
52.4.2	Power Supply and Ground Pattern .....	52-109
52.4.3	Oscillation .....	52-110
52.4.4	VBUS .....	52-110
52.4.5	RREF Pin .....	52-110
53.	USB High-Speed DMAC (USB-DMAC).....	53-1
53.1	Features.....	53-1
53.2	Register Descriptions.....	53-4
53.2.1	DMA0/1 VCR Register (USBDMA0_VCR/USBDMA1_VCR).....	53-7
53.2.2	DMA0/1 Software Reset Register (USBDMA0_SWR/USBDMA1_SWR).....	53-8
53.2.3	DMA0/1 Interrupt Source Register (USBDMA0_DMICR/USBDMA1_DMICR).....	53-9
53.2.4	DMA0/1 Source Address Registers 0 and 1 (USBDMA0_SAR_0/USBDMA1_SAR_1).....	53-11
53.2.5	DMA0/1 Destination Address Registers 0 and 1 (USBDMA0_DAR_0/USBDMA1_DAR_1) .....	53-11
53.2.6	DMA0/1 Transfer Count Registers 0 and 1 (USBDMA0_TCR_0/USBDMA1_TCR_1).....	53-12
53.2.7	DMA0/1 Timeout Count Registers 0 and 1 (USBDMA0_TOCNTR_0/USBDMA1_TOCNTR_1) .....	53-13
53.2.8	DMA0/1 Timeout Constant Registers 0 and 1 (USBDMA0_TOCSTR_0/USBDMA1_TOCSTR_1) ...	53-14
53.2.9	DMA0/1 Channel Control Registers 0 and 1 (USBDMA0_CHCR_0/USBDMA1_CHCR_1) .....	53-15

53.2.10	DMA0/1 Final Transaction Valid Data Transfer Enable Registers 0 and 1 (USBDMA0_TEND_0/USBDMA1_TEND_1).....	53-19
53.2.11	DMA0/1 Operation Register (USBDMA0_DMAOR/USBDMA1_DMAOR).....	53-20

56.1.1	Block Diagram.....	56-3
56.1.2	Input/Output Pins.....	56-4
56.2	Register Descriptions.....	56-5
56.2.1	Timer Control Register (TPU0_TCR).....	56-8

56.2.2	Timer Mode Register (TPU0_TMDR).....	56-10
56.2.3	Timer I/O Control Register (TPU0_TIOR).....	56-11
56.2.4	Timer Interrupt Enable Register (TPU0_TIER).....	56-12
56.2.5	Timer Status Registers (TPU0_TSR).....	56-14
56.2.6	Timer Counter (TPU0_TCNT).....	56-16
56.2.7	Timer General Register A to D (TPU0_TGRA/TPU0_TGRB/TPU0_TGRC/TPU0_TGRD).....	56-17
56.2.8	Timer Start Register (TPU0_TSTR).....	56-18
56.2.9	Motor Control Setting Register (TPU0_TMIR).....	56-19
56.2.10	Motor Deceleration (Stop) Transition Register (TPU0_TMRR).....	56-20
56.2.11	Motor Control Status Register (TPU0_TMSR).....	56-21
56.2.12	Motor Operation Pattern Storing Register 0 (TPU0_TMMPR0).....	56-22
56.2.13	Motor Operation Pattern Storing Register 1 (TPU0_TMMPR1).....	56-23
56.2.14	Motor Stop Pattern Storing Register 0 (TPU0_TMSPR0).....	56-24
56.2.15	Motor Stop Pattern Storing Register 1 (TPU0_TMSPR1).....	56-25
56.2.16	Motor Output Pattern Storing Register (TPU0_TMOPR).....	56-26
56.2.17	Motor Acceleration Step Count Register (TPU0_TMASR).....	56-26
56.2.18	Motor Normal the Number of Steps Register (TPU0_TMTSR).....	56-27
56.2.19	Motor Deceleration the Number of Steps Register (TPU0_TMRSR).....	56-27
56.2.20	Motor Control Sequence Counter Register (TPU0_TMSCR).....	56-28
56.2.21	Motor Control Normal Counter Register (TPU0_TMTCR).....	56-28
56.3	Operation.....	56-29
56.3.1	Overview.....	56-29
56.3.2	Basic Functions.....	56-30
56.3.3	Buffered Operation.....	56-33
56.3.4	PWM Mode.....	56-35
56.3.5	Stepping-Motor Control Mode.....	56-37
57A.	Compare Match Timer 0 (CMT0).....	57A-1
57A.1	Features.....	57A-1
57A.2	Register Descriptions.....	57A-2
57A.2.1	CLK Enable Register (CMCLKE).....	57A-3
57A.2.2	Compare Match Timer Start Registers 0 and 1 (CMSTR0, CMSTR1).....	57A-4
57A.2.3	Compare Match Timer Control/Status Registers 0 and 1 (CMCSR0, CMCSR1).....	57A-5
57A.2.4	Compare Match Timer Counters 0 and 1 (CMCNT0, CMCNT1).....	57A-7
57A.2.5	Compare Match Timer Constant Registers 0 and 1 (CMCOR0, CMCOR1).....	57A-8
57A.3	Operation.....	57A-9
57A.3.1	Counter Operation.....	57A-9
57A.3.2	Counter Size.....	57A-11
57A.3.3	Timing for Counting by CMCNTn.....	57A-11
57A.3.4	Internal Interrupt Request to CPU.....	57A-11
57A.3.5	CMT0 Register Access.....	57A-11
57A.3.6	Compare Match Flag Set/Clear Timing.....	57A-12
57A.3.7	CMT0 Usage.....	57A-12
57A.3.8	Module Stop/ CMCLKE Setting.....	57A-12
57B.	Compare Match Timer 1 (CMT1).....	57B-1
57B.1	Features.....	57B-1
57B.2	Register Descriptions.....	57B-3
57B.2.1	CLK Enable Register (CMCLKE).....	57B-7
57B.2.2	Compare Match Timer Start Registers 0 to 7 (CMSTRn).....	57B-8
57B.2.3	Compare Match Timer Control/Status Registers 0 to 7 (CMCSRn).....	57B-11
57B.2.4	Compare Match Timer Control/Status Registers H0 to 4 (CMCSRHn).....	57B-18
57B.2.5	Compare Match Timer Counters 0 to 7 (CMCNTn).....	57B-20
57B.2.6	Compare Match Timer Counters H 0 to 4 (CMCNTHn).....	57B-21

57B.2.7	Compare Match Timer Constant Registers 0 to 7 (CMCORn)	57B-22
57B.2.8	Compare Match Timer Constant Registers H0 to 4 (CMCORHn)	57B-23
57B.2.9	Compare Match Timer Counter 3 Backup 0 (CMCNT3BK0)	57B-24
57B.2.10	Compare Match Timer Counter 3 Backup 1 (CMCNT3BK1)	57B-24
57B.2.11	Compare Match Timer Match Control/Status Registers 0 and 3 (CMCSRm)	57B-25
57B.2.12	Compare Match Timer Match Counters 0 and 3 (CMCNTMn)	57B-26
57B.3	Operation	57B-27
57B.3.1	Counter Operation	57B-27
57B.3.2	Counter Size	57B-29
57B.3.3	Timing for Counting by CMCNTn	57B-29
57B.3.4	Internal Interrupt Request to CPU	57B-29
57B.3.5	Register Access	57B-29
57B.3.6	Compare Match Flag Set/Clear Timing	57B-30
57B.3.7	RCLK-Synchronous Counter Start/Stop Mode in Channel 0	57B-30
57B.3.8	Pseudo 32-kHz Counter	57B-34
57B.3.9	CMT1 Usage	57B-34
57B.3.10	Module Stop/ CMCLKE Setting	57B-34
58.	Timer Unit (TMU)	58-1
58.1	Features	58-1
58.2	Input/Output Pins	58-3
58.3	Register Descriptions	58-4
58.3.1	Timer Start Registers (TSTRn) (n = 0 to 3)	58-8
58.3.2	Timer Constant Registers (TCORn) (n = 0 to 11)	58-10
58.3.3	Timer Counters (TCNTn) (n = 0 to 11)	58-10
58.3.4	Timer Control Registers (TCRn) (n = 0 to 11)	58-11
58.3.5	Input Capture Registers n (TCPRn)	58-13
58.4	Operation	58-14
58.4.1	Counter Operation	58-14
58.4.2	Input Capture Function	58-16
58.5	Interrupt	58-17
58.6	Usage Notes	58-18
58.6.1	Writing to Registers	58-18
58.6.2	Reading TCNT Register	58-18
58.6.3	External Clock Frequency	58-18
59.	PWM Timer	59-1
59.1	Overview	59-1
59.1.1	Features	59-1
59.1.2	Block Diagram	59-1
59.1.3	Input/Output pins	59-2
59.1.4	Register Descriptions	59-2
59.2	Register Description	59-3
59.2.1	PWM Control Register (PWMCR)	59-4
59.2.2	PWM Count Register (PWMCNT)	59-6
59.3	Description of Operation	59-7
59.4	Usage Note	59-9
60.	Thermal Sensor (THS/TSC)	60-1
60.1	Overview	60-1
60.1.1	Features	60-1
60.1.2	Block Diagram	60-1
60.1.3	External Pins	60-2
60.1.4	Register Configuration	60-2

60.2	Register Description.....	60-3
60.2.1	Interrupt Status Register (STR).....	60-4
60.2.2	Interrupt Enable Register (ENR).....	60-5
60.2.3	Interrupt Mask Register (INT_MASK).....	60-6
60.2.4	Positive/Negative Logic Select Register (POSNEG).....	60-7
60.2.5	Edge/Level Sensing Select Register (EDGLEVEL).....	60-8
60.2.6	Chattering Prevention ON/OFF Setting Register (FILONOFF).....	60-9
60.2.7	THS Control Register (THSCR).....	60-11
60.2.8	THS Status Register (THSSR).....	60-12
60.2.9	Interrupt Control Register (INTCTLR).....	60-13
60.3	Operation.....	60-15
60.3.1	Flow of Register Initialization.....	60-15
60.3.2	Temperature Measurement Using Register (When CPCTL = 0).....	60-16
60.3.3	Temperature Measurement Using Register (When CPCTL = 1).....	60-16
60.3.4	Temperature Measurement Using External Pins.....	60-17
60.4	Usage Notes.....	60-19
61.	System Controller (SYSC).....	61-1
61.1	Overview.....	61-1
61.1.1	Features.....	61-1
61.1.2	Block Diagram.....	61-3
61.1.3	Input/Output Pins.....	61-5
61.2	Register Configuration.....	61-6
61.2.1	Common Registers.....	61-9
61.2.1.1	SYSC Status Register (SYSCSR).....	61-9
61.2.1.2	Interrupt Status Register (SYSCISR).....	61-10
61.2.1.3	Interrupt Status Clear Register (SYSCISCR).....	61-13
61.2.1.4	Interrupt Enable Register (SYSCIER).....	61-15
61.2.1.5	Interrupt Mask Register (SYSCIMR).....	61-18
61.2.1.6	Cortex-A15 Wake Up Mask Register (WUPMSKCA15).....	61-21
61.2.1.7	Cortex-A7 Wake Up Mask Register (WUPMSKCA7).....	61-23
61.2.1.8	External Event Request Status Register (SYSCEERSR).....	61-25
61.2.1.9	External Event Request Status Clear Register (SYSCEERSCR).....	61-27
61.2.1.10	External Event Request Status Enable Register (SYSCEERSER).....	61-29
61.2.1.11	External Event Request Status Register2 (SYSCEERSR2).....	61-31
61.2.1.12	External Event Request Status Clear Register2 (SYSCEERSCR2).....	61-33
61.2.1.13	External Event Request Status Enable Register2 (SYSCEERSER2).....	61-35
61.2.2	Power Control Registers for ARM CPUs.....	61-37
61.2.2.1	Power Status Register n (PWRSRn).....	61-37
61.2.2.2	Power Shutoff Status Register n (PWROFFSRn).....	61-39
61.2.2.3	Power Resume Status Register n (PWRONSRn).....	61-40
61.2.2.4	Power Shutoff/Resume Error Register n (PWRERn).....	61-41
61.2.3	Power Control Registers for RGX, and SCU of Cortex-A15.....	61-42
61.2.3.1	Power Status Register n (PWRSRn) (n = 2/3/5).....	61-42
61.2.3.2	Power Shutoff Control Register n (PWROFFCRn) (n = 2/3/5).....	61-43
61.2.3.3	Power Shutoff Status Register n (PWROFFSRn) (n = 2/3/5).....	61-44
61.2.3.4	Power Resume Control Register n (PWRONCRn) (n = 2/3/5).....	61-45
61.2.3.5	Power Resume Status Register n (PWRONSRn) (n = 2/3/5).....	61-46
61.2.3.6	Power Shutoff/Resume Error Register n (PWRERn) (n = 2/3/5).....	61-47
61.3	Operations.....	61-48
61.3.1	Power Control of ARM CPUs.....	61-48
61.3.2	Power Control of non-ARM-CPU modules.....	61-49
61.4	Usage Notes.....	61-52

62.	CoreSight .....	62-1
62.1	Features .....	62-1
62.2	Block Diagram .....	62-1
62.3	Input/Output Pins .....	62-2
62.3.1	JTAG Pins .....	62-2
62.3.2	Trace Pins .....	62-2
62.4	Address Map .....	62-6
62.5	Cross Trigger Connection .....	62-8
62.6	SYS-CTI0 Trigger Connection .....	62-9
62.7	SYS-CTI1 Trigger Connection .....	62-10
62.8	SYS-CTI2 Trigger Connection .....	62-11
62.9	CA15-CTI[0-3] Trigger Connection .....	62-12
62.10	CA15-CTICS Trigger Connection .....	62-13
62.11	CA7-CTI[0-3] Trigger Connection .....	62-14
62.12	CA7-CTICS Trigger Connection .....	62-15
62.13	CSReg .....	62-16
62.13.1	ATCLKCR_CA15 Register .....	62-16
62.13.2	LOCKACCESS Register .....	62-16
62.13.3	LOCKSTATUS Register .....	62-17
62.13.4	Peripheral ID4 Register .....	62-17
62.13.5	Peripheral ID0 Register .....	62-18
62.13.6	Peripheral ID1 Register .....	62-19
62.13.7	Peripheral ID2 Register .....	62-19
62.13.8	Peripheral ID3 Register .....	62-20
62.13.9	Component ID0 Register .....	62-20
62.13.10	Component ID1 Register .....	62-21
62.13.11	Component ID2 Register .....	62-21
62.13.12	Component ID3 Register .....	62-22
63.	Electrical Characteristics .....	63-1
63.1	Absolute Maximum Ratings .....	63-1
63.2	Power Supply .....	63-3
63.3	Sequence of Turning On/Off Power Supplies .....	63-5
63.3.1	Wave form definition for power sequence .....	63-7
63.3.2	Power On and Power Off Wave Form .....	63-8
63.4	DC Characteristics .....	63-9
63.5	Clock and Reset Timings .....	63-24
63.6	LBSC .....	63-25
63.6.1	Normal Read/Write, Burst ROM Read and DMA Access .....	63-25
63.6.2	Ultra ATA Transfer for ATA Interface .....	63-29
63.7	DBSC3 Access Timing .....	63-35
63.8	Display Unit (DU) .....	63-40
63.9	LVDS .....	63-44
63.10	Video Input Module (VIN) .....	63-45
63.11	SSI Interface .....	63-48
63.12	Ethernet MAC Controller Signal Timing .....	63-51
63.13	Ethernet AVB Module Signal Timing .....	63-53
63.14	PCI Express Interface (Gen2) .....	63-56
63.15	SCIF .....	63-57
63.16	SCIFA/B .....	63-58
63.17	HSCIF .....	63-60
63.18	I2C .....	63-61
63.19	IIC Bus Interface .....	63-62
63.20	MSIOF .....	63-64

63.21	QSPI.....	63-68
63.22	MMC Signal Timing.....	63-70
63.23	Serial ATA (Gen2).....	63-72
63.24	USB Signal Timing.....	63-73
63.25	USB 3.0 (Super-Speed).....	63-74
63.26	TMU.....	63-75
63.27	CoreSight.....	63-76
63.28	TS Interface (TSIF).....	63-77
63.29	CAN.....	63-78
63.30	AC Characteristics Test Circuit.....	63-79
63.30.1	Single-Ended Push-Pull Output.....	63-79
63.30.2	Single-Ended I2C/IIC LVTTTL and Open-Drain Output.....	63-79
63.30.3	Differential Output (LVDS).....	63-80
63.30.4	Differential Output (SATA, PCI Express, USB 3.0).....	63-80
63.30.5	Differential Output USB 2.0 Low-Speed and Full-Speed.....	63-81
63.30.6	Differential Output USB 2.0 High-Speed.....	63-81
63.30.7	SSTL Single-Ended Output (DDR3 Interface).....	63-82
63.30.8	AC Test Input Signal Wave Form.....	63-82
Appendix A. Product Register (PRR).....		A-1
A.1	Overview.....	A-1
A.2	Register Descriptions.....	A-1
Appendix B. Sequence of Activation for RZ/G Series Products.....		B-1
Main Revisions and Additions in this Edition.....		C-1

## 1. Overview

See section 1, Overview in the user's manual for specifications of individual RZ/G series product.

## 2. Area Map

<b>RZ/G1H</b>	<b>RZ/G1N</b>
<b>RZ/G1M</b>	<b>RZ/G1E</b>

**Table 2.1 Address Space (Over 4-Gbyte Space)**

Address	Space	Description	RZ/G Series Products			
			RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
H'00_00000000 to H'00_FFFFFFFF	Legacy 4-Gbyte space	LBSC, DBSC3, etc.	√	√	√	√
H'01_00000000 to H'01_FFFFFFFF	DDR0/DBSC3 (DDR0)	DBSC3	√	√	√	√
H'02_00000000 to H'02_FFFFFFFF	DDR1*	DBSC3 [H, M]	√	√	—	—
	Reserved	—	—	—	√	√
H'03_00000000 to H'03_FFFFFFFF (H'03_40000000 to H'03_BFFFFFFF)	DBSC3 (DDR0) shadow	DBSC3 (up to 2 Gbytes)	√	√	√	√
H'04_00000000 to H'04_FFFFFFFF	DDR0 shadow	DBSC3 [H, M, N, E]	√	√	√	√
H'05_00000000 to H'05_FFFFFFFF	DDR1 shadow*	[H, M]	√	√	—	—
	Reserved	[M, N, E]	—	—	√	√
H'06_00000000 to H'06_FFFFFFFF	Reserved	[H, M, N]	√	√	√	—
	DDR0 shadow	[E]	—	—	—	√
H'07_00000000 to H'07_FFFFFFFF	Reserved	—	√	√	√	√
H'08_00000000 to H'08_FFFFFFFF	CCI-AXI	CCI-AXI	√	√	√	√
H'09_00000000 to H'09_FFFFFFFF	Reserved	—	√	√	√	√
H'0A_00000000 to H'0A_FFFFFFFF	Reserved	—	√	√	√	√
H'0B_00000000 to H'0B_FFFFFFFF	Reserved	—	√	√	√	√
H'0C_00000000 to H'0C_FFFFFFFF	Reserved	—	√	√	√	√
H'0D_00000000 to H'0D_FFFFFFFF	Reserved	—	√	√	√	√
H'0E_00000000 to H'0E_FFFFFFFF	Reserved	—	√	√	√	√
H'0F_00000000 to H'0F_0FFFFFFF	uTLB (IPMMUS0 slave)	IPMMUv7 slave for uTLB (SYS0)	√	√	√	√
H'0F_10000000 to H'0F_1FFFFFFF	uTLB (IPMMUS1 slave)	IPMMUv7 slave for uTLB (SYS1)	√	√	√	√
H'0F_20000000 to H'0F_2FFFFFFF	uTLB (IPMMUMP slave)	IPMMUv7 slave for uTLB (MP)	√	√	√	√
H'0F_30000000 to H'0F_3FFFFFFF	Reserved	—	√	√	√	√
H'0F_40000000 to H'0F_4FFFFFFF	uTLB (IPMMUDS slave)	IPMMUv7 slave for uTLB (SYS-DMA)	√	√	√	√
H'0F_50000000 to H'0F_5FFFFFFF	uTLB (IPMMUM slave)	IPMMUv7 slave for uTLB (Media)	√	√	√	√
H'FF_00000000 to H'FF_FFFFFFFF	Reserved	—	√	√	√	√

Notes: Access to the reserved spaces is prohibited.

- \* These DDR1 spaces cannot be accessed in 32-bit address mode regardless of the sizes of the memories. Access to these DDR1 spaces should always proceed in the 40-bit address mode of the Cortex-A15/Cortex-A7 or G6400 and other modules. For details, refer to section 15, External Bus Controller for DDR3-SDRAM (DBSC3).

Table 2.2 Address Space (Legacy 4-Gbyte Space)

Address	Space	Description	RZ/G Series Products			
			RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
H'00_0000000 to H'00_03FFFFFF	LBSC	Area 0 asynchronous memory	√	√	√	√
H'00_0400000 to H'00_07FFFFFF		Area 1 asynchronous memory	√	√	√	√
H'00_0800000 to H'00_0BFFFFFF		Reserved	√	√	√	√
H'00_0C00000 to H'00_0FFFFFFF		Reserved	√	√	√	√
H'00_1000000 to H'00_13FFFFFF		Reserved	√	√	√	√

## 3. Pin Assignment

See section 3, Pin Assignment in the user's manual for specifications of individual RZ/G series product.

## 4. Pin Multiplexing

See section 4, Pin Multiplexing in the user's manual for specifications of individual RZ/G series product.

## 5. Pin Function Controller (PFC)

See section 5, Pin Function Controller (PFC) in the user's manual for specifications of individual RZ/G series product.

## 6. General-Purpose Input/Output Ports (GPIO)

RZ/G1H	RZ/G1N
RZ/G1M	RZ/G1E

### 6.1 Overview

The RZ/G series products have up to eight GPIO blocks\*<sup>1</sup>, each of which is a functional block that supports up to 32 port pins for general input/output and interrupt input. (A maximum of 188 to 244 ports\*<sup>2</sup> pins in total can be used. Note that the port pins are multiplexed.) When the relevant register is written to, a signal is output via the corresponding general output port pin. When a signal is input via the general input port pin, the corresponding register indicates the value of the input signal; specifically, when an interrupt is input via a general port pin, the relevant register indicates that it is currently receiving an interrupt input, and an interrupt is also requested to the CPU core via the interrupt control block. The functions (modes) can be assigned to each port pin as desired by some setting the corresponding registers. It is also possible to select the signal polarity (positive or negative logic) and the interrupt detection condition (one edge/both edge or level) for each port. In this LSI, general output data mode of GPIO can be set in normal mode (outputting data as normal) or high/low level data output mode. Particularly, a filtering function to prevent external chattering is also available for port pins 0 to 3 in input modes for each GPIO block.

- Notes: 1. The number of the dedicated GPIO blocks varies depending on the product; 6 in the RZ/G1H, 8 in the RZ/G1M and RZ/G1N, and 7 in the RZ/G1E.
2. 188 ports [RZ/G1H], 244 ports [RZ/G1M and RZ/G1N], 208 ports. [RZ/G1E]

6.1.1 GPIO Block Diagram (block n)

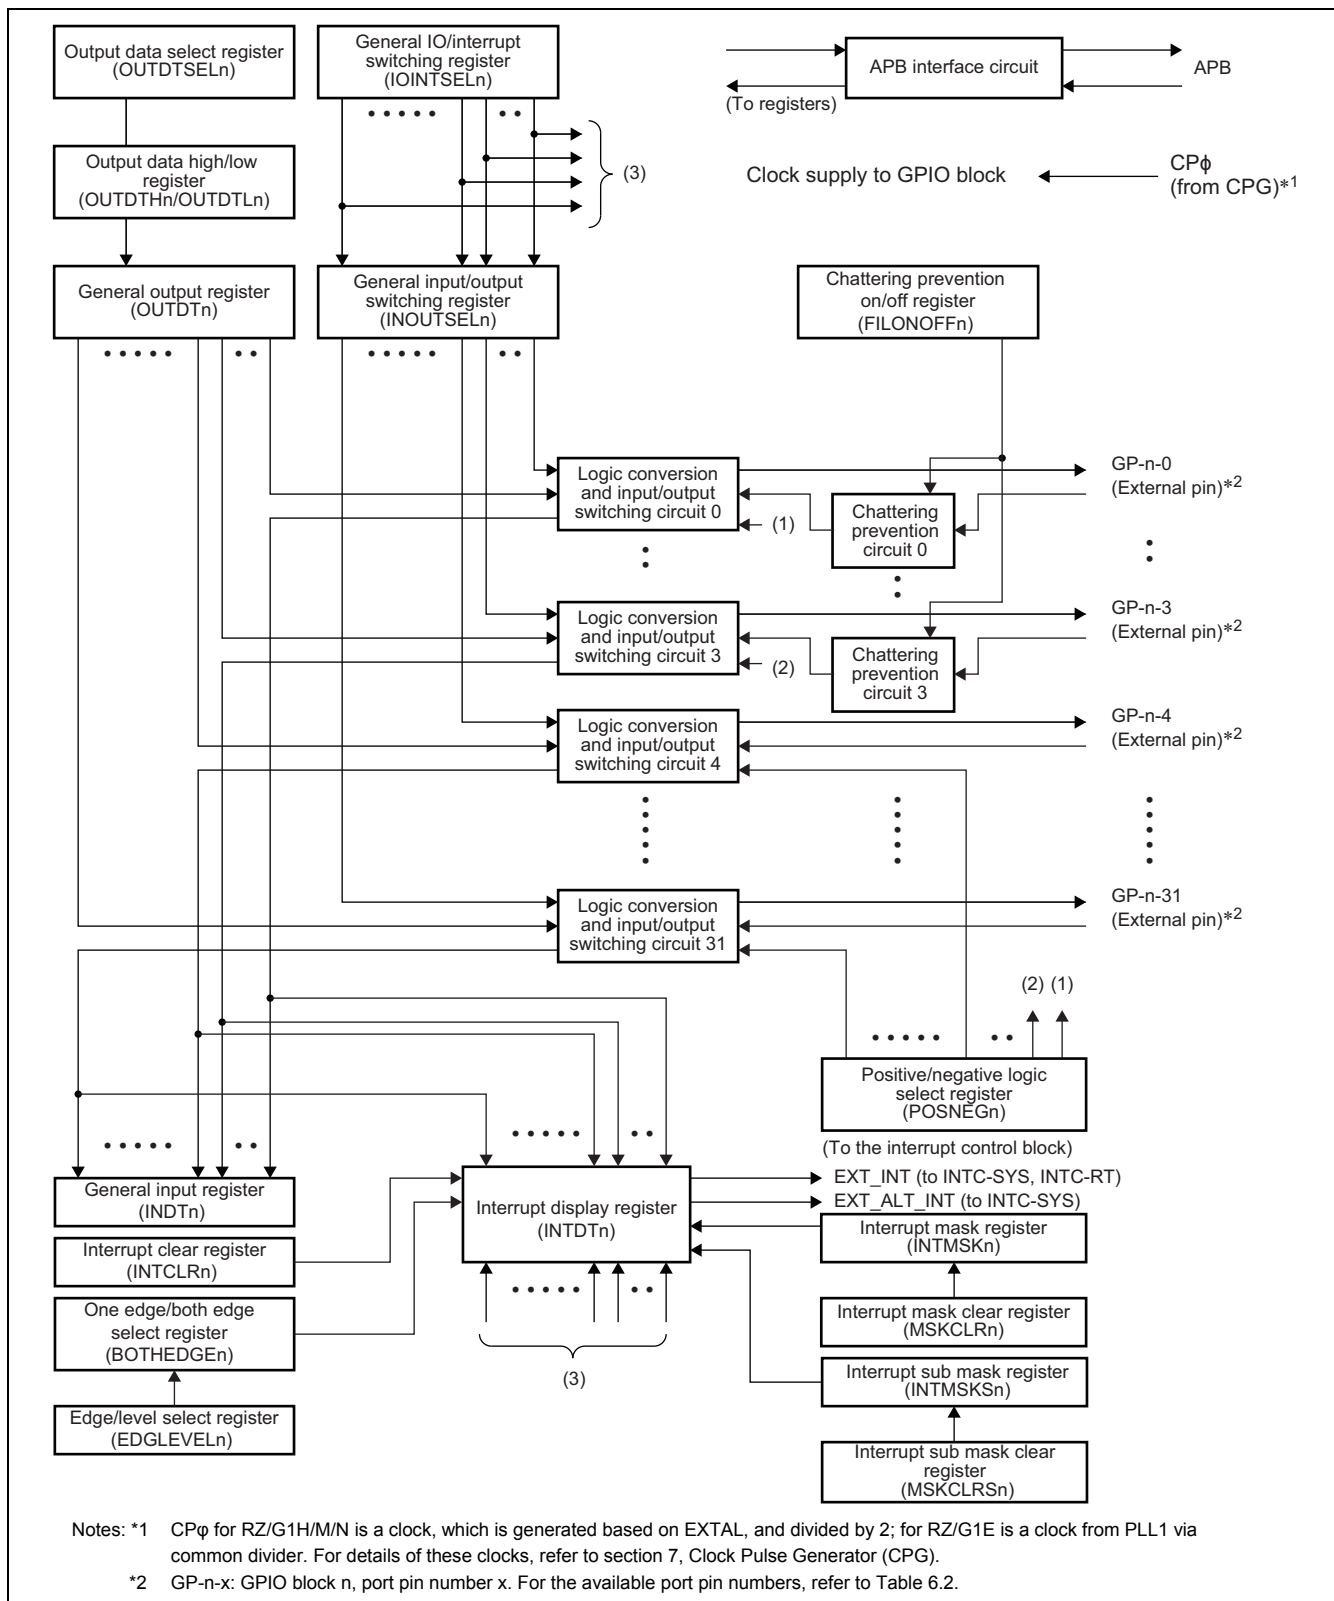

Figure 6.1 GPIO Block Configuration

### 6.1.2 I/O Pins

Table 6.1 shows the pin configuration of the GPIO.

**Table 6.1 Pin Configuration**

Function	Pin Name	I/O	Descriptions	RZ/G Series Products			
				RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
IO/interrupt input ports	GP-0-0 to GP-5-31	I/O	General input/output and interrupt input	√	–	–	–
IO/interrupt input ports	GP-0-0 to GP-7-25	I/O	General input/output and interrupt input	–	√	√	–
IO/interrupt input ports	GP-0-0 to GP-6-25	I/O	General input/output and interrupt input	–	–	–	√

## 6.2 Port Pin Specifications

Each GPIO block is provided with up to 32 port pins for general input/output and external interrupt input ports. Table 6.2 specifies these pins.

**Table 6.2 Port Pin Specifications (1)**

Note: "—" indicates the port pin is not in use.

## 6.3 Operations in Each Mode

### 6.3.1 Mode Switching

Two registers are used to switch modes of the general IO/interrupt input pins of the GPIO blocks. Each register is provided with up to 32 bits each controlling one of the GPIO<sub>n</sub>\* port pins. The general IO/interrupt switching register is first used to select either general input/output mode or interrupt input mode for each port pin. When general input/output mode is selected, the setting of the relevant bit in the second register, i.e., the general input/output switching register, is used. Specifically, when a bit in the general input/output switching register is set for general output mode, the corresponding port pin is turned to the output direction and the route is formed so that the set value in the corresponding bit in the general output register should be output via the pin. Likewise, when set for the general input mode, the corresponding port pin is turned to the input direction and the route is formed so that the value received via the pin should be indicated by the corresponding bit in the general input register. When interrupt input mode is selected, the corresponding port pin is turned to the input direction and the route is formed so that the reception of the signal input via the pin should be indicated by the interrupt display register. Here, the setting of the second register, i.e., the general input/output switching register, is invalid.

Note: \* n = 0 to 5 [RZ/G1H], n = 0 to 7 [RZ/G1M and RZ/G1N], n = 0 to 6 [RZ/G1E]

### 6.3.2 General Input/Output Mode

When a port is set for general input/output mode using the corresponding bit in the general IO/interrupt switching register, the corresponding port serves as a general input/output pin. In general input/output mode, either mode can be selected using the corresponding bit in the general input/output switching register. When a port is set for general output mode, the port outputs the value set in the corresponding bit in the general output register or output data high/output data low register with appropriate configuring in output data select register. Here, the polarity of the actual output signal is determined by the setting of the corresponding bit in the positive/negative logic select register. When a port is set for general input mode, the polarity of the input signal is also determined by the setting of the corresponding bit in the positive/negative logic select register. The general input register indicates the value accordingly. Note that the general input register does not hold the input signal using the FF.

### 6.3.3 Interrupt Input Mode

When a port is set for interrupt input mode using the corresponding bit in the general IO/interrupt switching register, the corresponding port serves as an interrupt input pin. In interrupt input mode, when the port receives an external interrupt, the corresponding bit in the interrupt display register indicates the input of an interrupt signal on the corresponding port pin, and an interrupt signal is output to the interrupt control block. In this mode, the polarity and detection conditions (edge or level) of the external input signal can be set for each port. The corresponding bits in the positive/negative logic select register and edge/level select register, one edge/both edge select register should be used to set the polarity and detection conditions, respectively.

If a port is set for edge detection using the corresponding bit in the edge/level select register, even when an external pulse interrupt signal is input, the corresponding bit in the interrupt display register holds the input using the FF and allows the level interrupt signal to be output to the interrupt control block. To stop all the interrupt signal outputs, all the bits in the interrupt clear register corresponding to the bits in the interrupt display register currently indicating the reception of the corresponding interrupt signals should be cleared to 0. Note that if a port is set for level detection using the corresponding bit in the edge/level select register and an external level interrupt signal is input, the corresponding bit in the interrupt display register does not use the FF to hold the input.

Interrupts indicated by the interrupt display register can be separately masked using the corresponding bits in the interrupt mask register and the interrupt sub mask register. When all the bits currently indicating the reception of the interrupt signals are masked, no interrupt signals are output to the interrupt control block. Masks can be canceled by writing 1 to the corresponding bits in the interrupt mask clear register or the interrupt sub mask clear register depending on the interrupt mask register or the interrupt sub mask register is used.

## 6.4 Registers in GPIO Blocks

Each GPIO block incorporates seventeen 32-bit registers. These registers can be accessed via the APB interface. Table 6.3 describes all the GPIO block registers.

Do not write to any addresses other than listed below. Operations cannot be guaranteed if writing is attempted. Values read from addresses other than those listed below are undefined.

**Table 6.3 Register Configuration**

Output data low register 7	OUTDTL7	R/W	H'0000 0000	H'E6055848	32	—	√	√	√
One edge/both edge select register 7	BOTHEDGE7	R/W	H'0000 0000	H'E605584C	32	—	√	√	√

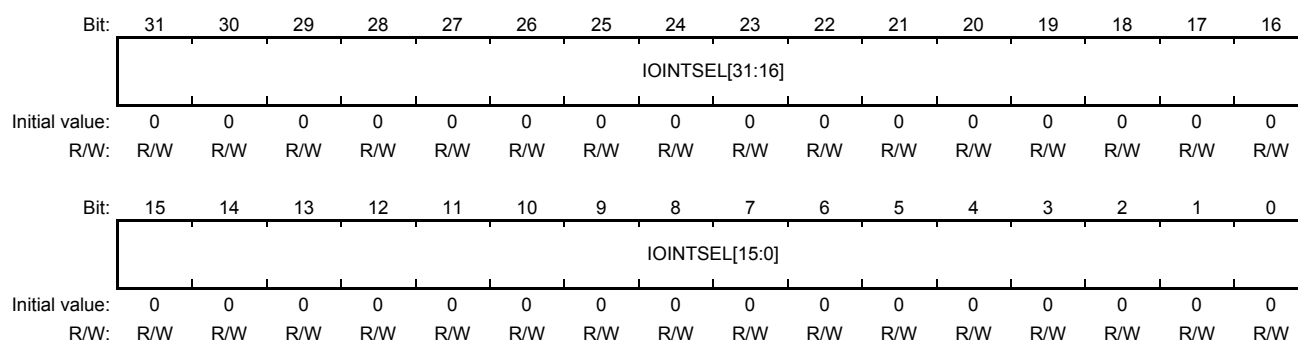

### 6.4.1 General IO/Interrupt Switching Register n (IOINTSEL0 to IOINTSELn)

Note: n = 5 [RZ/G1H], n = 7 [RZ/G1M/N], n = 6 [RZ/G1E]

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

IOINTSEL selects either general input/output mode or interrupt input mode for each of the port pins 0 to 31 of the GPIO block. When general input/output mode is selected for a port, it is also necessary to select either input or output mode for the port using the corresponding bit in the general input/output switching register. When interrupt input mode is selected for a port, the setting of the general input/output switching register for the port is ignored.

[Hardware default value: H'00000000 = general input/output mode is selected for all the ports.]

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	IOINTSEL [31:0]	All 0	R/W	Selects either general input/output mode or interrupt input mode for each port using the bits corresponding to the port numbers. 0: General input/output mode. 1: Interrupt input mode.

Note: Unused bits should be set to the initial values.

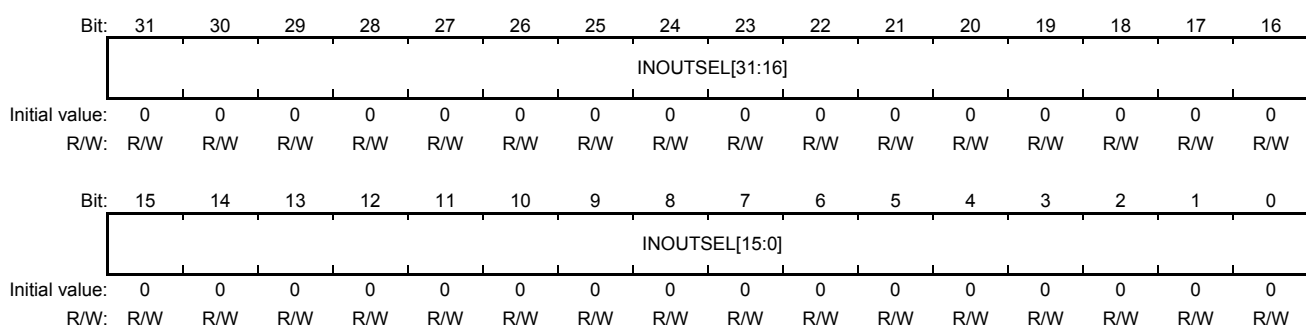

### 6.4.2 General Input/Output Switching Register n (INOUTSEL0 to INOUTSELn)

Note: n = 5 [RZ/G1H], n = 7 [RZ/G1M/N], n = 6 [RZ/G1E]

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

INOUTSEL is valid only for the ports for which general input/output mode is selected by the general IO/interrupt switching register. Specifically, INOUTSEL selects either general input or general output mode for a port using the bit corresponding to the port number. The INOUTSEL bits can be written to only when the corresponding bits in the general IO/interrupt switching register are 0. Note that after general input/output mode is changed to interrupt input mode, INOUTSEL retains the setting but is read as 0.

[Hardware default value: H'00000000 = general input mode is selected for all the ports.]

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	INOUTSEL [31:0]	All 0	R/W	Selects either general input mode or general output mode for each port using the bits corresponding to the port numbers. 0: General input mode 1: General output mode

Note: Unused bits should be set to the initial values.

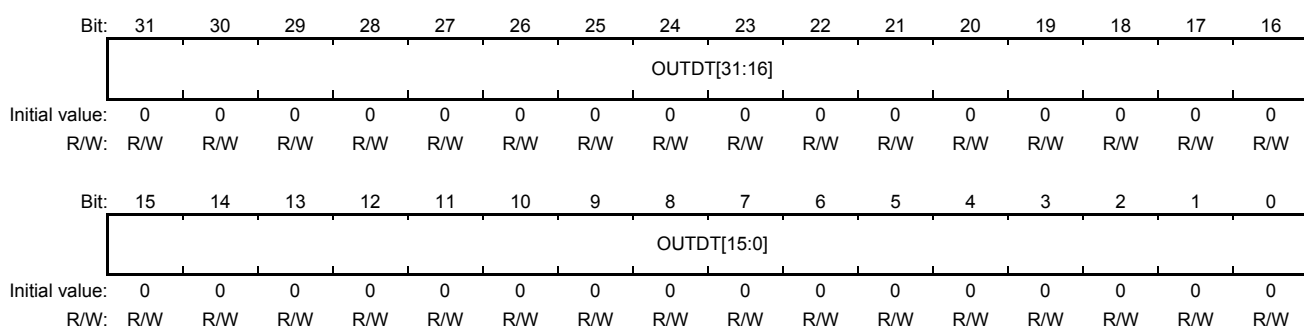

### 6.4.3 General Output Register n (OUTDT0 to OUTDTn)

Note: n = 5 [RZ/G1H], n = 7 [RZ/G1M/N], n = 6 [RZ/G1E]

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

OUTDT is valid only for the ports for which general input/output mode is selected by the general IO/interrupt switching register and then general output mode is selected by the general input/output switching register. Specifically, the value of the bit in OUTDT corresponding to the port number is inverted or not inverted depending on the setting of the positive/negative logic select register before being output from the corresponding port pin. Note that the polarity of the output signal should previously be set using the corresponding bit in the positive/negative logic select register. This register must be set after the output data select register is appropriately set to choose level of output data.

[Hardware default value: H'00000000 = 0 is output from all the ports.]

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	OUTDT[31:0]	All 0	R/W	Allows the port to output the value set in the bit corresponding to the port number when the port is appropriately set by IOINTSEL0 to IOINTSELn, INOUTSEL0 to INOUTSELn and OUTDTSEL0 to OUTDTSELn. (n = 5 [H], n = 7 [M/N], n = 6 [E]) 0: 0 is output. 1: 1 is output.

Note: The values set in OUTDT are not directly output from the GPIO pins; the above set values are processed according to the settings of the positive/negative logic select register before being output. Unused bits should be set to the initial values.

### 6.4.4 General Input Register n (INDT0 to INDTn)

Note: n = 5 [RZ/G1H], n = 7 [RZ/G1M/N], n = 6 [RZ/G1E]

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

INDT is valid only for the ports for which general input/output mode is selected by the general IO/interrupt switching register and then general input mode is selected by the general input/output switching register. Each bit reflects the value received through the corresponding port pin.

Note that when a bit in the positive/negative logic select register is 1, the corresponding bit in INDT indicates the inverted value of the input signal.

[Hardware default value: state of the signals input to the port pins.]

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	INDT[31:0]	*	R	Each bit reflects the value received through the corresponding port pin. 0: Input is 0. (assuming positive logic) 1: Input is 1. (assuming positive logic)

Note: Unused bits should be set to the initial values.  
\* State of the signals input to the port pins.

Usage Note: The GPIO input function is still enabled even if after the pin function has been set for any modules other than the GPIO; if the module pin setting is input, the input signal is also propagated to the GPIO block and the GPIO input related registers are updated by the latest input of the corresponding pin. An unexpected GPIO interrupt may occur unless the GPIO interrupt is masked.

### 6.4.5 Interrupt Display Register n (INTDT0 to INTDTn)

Note: n = 5 [RZ/G1H], n = 7 [RZ/G1M/N], n = 6 [RZ/G1E]

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

INTDT is valid only when interrupt input mode is selected by the general IO/interrupt switching register. Specifically, when an interrupt is input via a port pin when INTDT is valid, the bit in INTDT corresponding to the port indicates whether the port has received an interrupt input or not. In interrupt input mode, the polarity and detection conditions (one edge/both edge or level) of the external input signal can be set for each port pin. Before using a port pin for interrupt input, the corresponding bits in the positive/negative logic select register and edge/level select register (one edge/both edge register should be appropriately configured if edge detection mode is selected) should be set, respectively.

If a port is set for edge detection using the corresponding bit in the edge/level select register, even when an external pulse interrupt signal is input, the corresponding bit in INTDT holds the input using the FF and allows the level interrupt signal to be output to the interrupt control block.

To stop all the interrupt signal outputs, all the bits in the interrupt clear register corresponding to the bits in INTDT currently indicating the reception of the corresponding interrupt signals should be cleared to 0. Note that if a port is set for level detection using the corresponding bit in the edge/level select register and an external level interrupt signal is input, the corresponding bit in INTDT does not use the FF to hold the input. Therefore, when an external input signal is stopped, the corresponding bit in INTDT is cleared automatically. When all the bits in INTDT are turned off (= 0), the GPIO stops outputting all the interrupt signals.

[Hardware default value: H'00000000 = no interrupt signals are input from ports.]

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	INTDT[31:0]	All 0	R	Each bit indicates the input of an interrupt signal on the corresponding port pin. 0: No interrupt signal has been input. 1: Interrupt signal has been input.

Conditions of Indicating Interrupt Input:

- For level-sensitive interrupt input (EDGLEVEL = 0)
  - External input signals are constantly monitored and indicated. (When the negative logic is selected, the inverted value of the external input signal is indicated.)
- For edge-sensitive interrupt input (EDGLEVEL = 1)
  - Clearing condition: When the interrupt clear register is cleared, indication is cleared regardless of the positive/negative logic select register.

- Setting condition: With the positive logic (POSNEG = 0), when the rising edge of an external interrupt signal is detected, the interrupt input is indicated. With the negative logic (POSNEG = 1), when the falling edge is detected, the interrupt input is indicated. With both edge mode (BOTHEDGE = 1), when either the rising or falling edge, the interrupt input is indicated.

Usage Note: The GPIO input function is still enabled even if after the pin function has been set for any modules other than the GPIO; if the module pin setting is input, the input signal is also propagated to the GPIO block and the GPIO input related registers are updated by the latest input of the corresponding pin. An unexpected GPIO interrupt may occur unless the GPIO interrupt is masked.

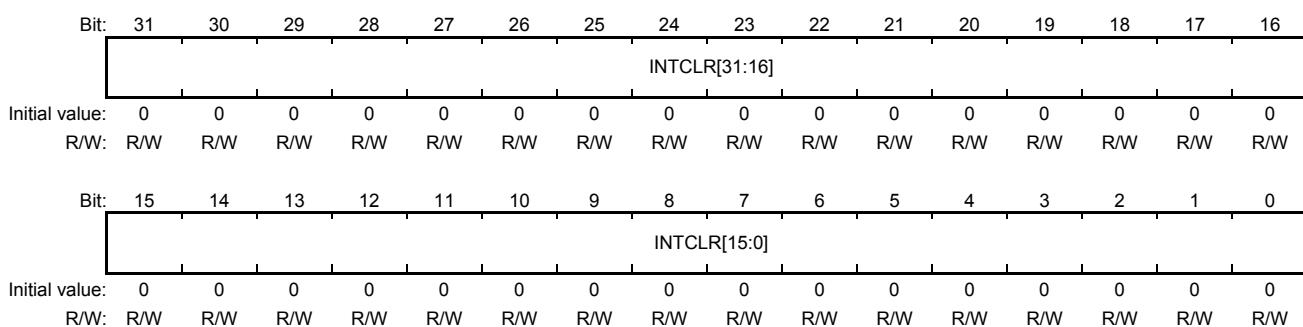

### 6.4.6 Interrupt Clear Register n (INTCLR0 to INTCLRn)

Note: n = 5 [RZ/G1H], n = 7 [RZ/G1M/N], n = 6 [RZ/G1E]

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

When the interrupt display register is currently indicates the reception of the interrupt input on the port for which the edge detection is selected by the edge/level select register (with configuring for one edge/both edge select register) in interrupt input mode, INTCLR clears the indication. Specifically, writing 1 to the bits in INTCLR corresponding to port numbers can clear the corresponding bits in the interrupt display register. However, when the interrupt display register is currently indicates the reception of the interrupt input on the port for which the level detection is selected by the edge/level select register, writing 1 to the corresponding bits in INTCLR cannot clear the corresponding bits in the interrupt display register. Only writing 1 to INTCLR is effective; INTCLR is always read as 0.

[Hardware default value: H'00000000 = interrupt indication is cleared for no ports.]

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	INTCLR [31:0]	All 0	R/W	Writing 1 to bits corresponding to port numbers clears the corresponding bits in the interrupt display register. 0: No effect 1: Interrupt display register bit is cleared.

Note: Unused bits should be set to the initial values.

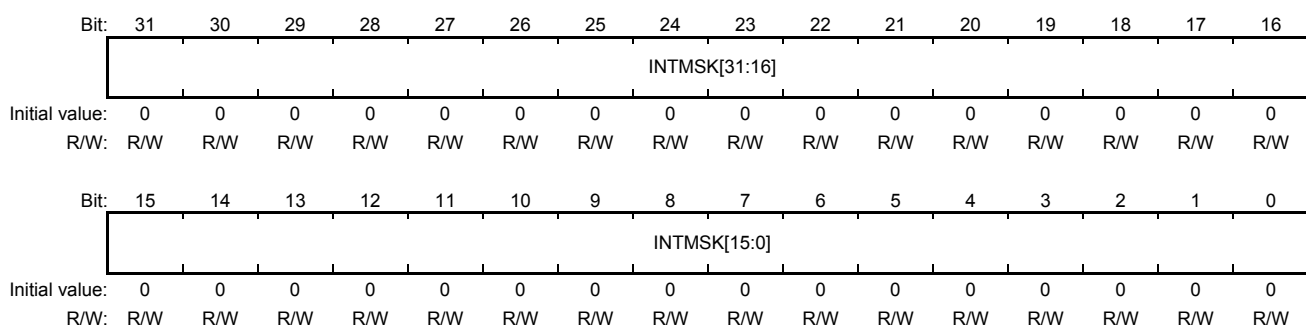

### 6.4.7 Interrupt Mask Register n (INTMSK0 to INTMSKn)

Note: n = 5 [RZ/G1H], n = 7 [RZ/G1M/N], n = 6 [RZ/G1E]

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

INTMSK masks the interrupt requests indicated by the interrupt display register. Interrupts can be separately masked using the corresponding bits in INTMSK. When all the bits currently indicating the reception of the interrupt signals are masked, no interrupt signals are output to the interrupt control block. Masks can be canceled by writing 1 to the corresponding bits in the interrupt mask clear register. Only writing 0 to this register is effective.

[Hardware default value: H'00000000 = all the ports are masked.]

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	INTMSK [31:0]	All 0	R/W	Setting a mask to the bit disables the corresponding interrupt signal to be output to the interrupt control block. 0: Interrupt is masked. 1: Interrupt is not masked.

Note: Unused bits should be set to the initial values.

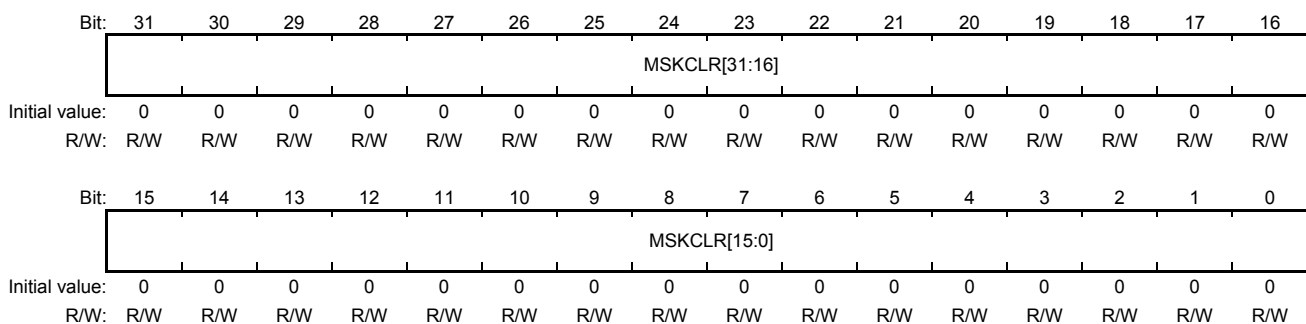

**6.4.8 Interrupt Mask Clear Register n (MSKCLR0 to MSKCLRn)**

Note: n = 5 [RZ/G1H], n = 7 [RZ/G1M/N], n = 6 [RZ/G1E]

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

MSKCLR cancels masks that are set by the interrupt mask register. Each mask can be canceled (cleared) by writing 1 to the corresponding bit in MSKCLR. Only writing 1 to MSKCLR is effective; MSKCLR is always read as 0.

[Hardware default value: H'00000000 = interrupt masks are cleared for no ports.]

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	MSKCLR [31:0]	All 0	R/W	Setting a mask to the bit disables the corresponding interrupt signal to be output to the interrupt control block. 0: No effect 1: Interrupt is not masked.

Note: Unused bits should be set to the initial values. (When GPIO is not selected by the pin multiplex settings, do not cancel the interrupt mask.)

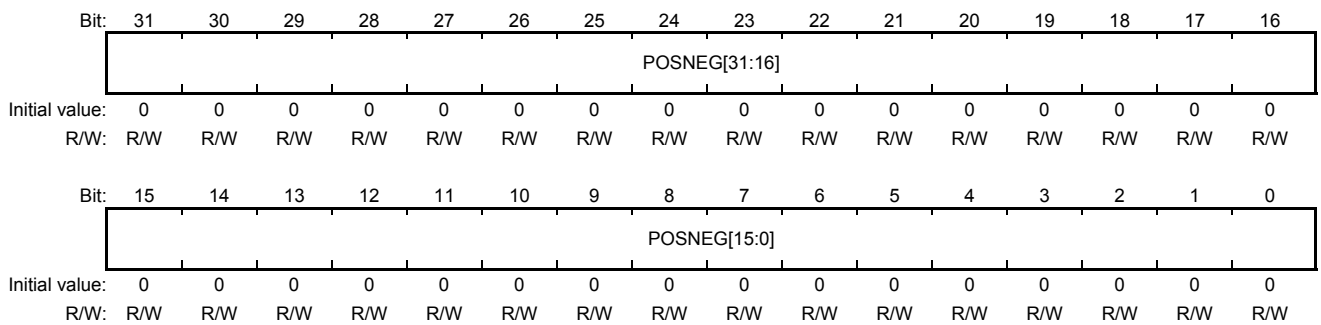

**6.4.9 Positive/Negative Logic Select Register n (POSNEG0 to POSNEGn)**

Note: n = 5 [RZ/G1H], n = 7 [RZ/G1M/N], n = 6 [RZ/G1E]

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

POSNEG selects the polarity (positive or negative logic) of each port pin in general input mode, general output mode, or interrupt input mode. POSNEG should be set before mode selection.

[Hardware default value: H'00000000 = positive logic is selected for all the ports.]

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	POSNEG [31:0]	All 0	R/W	Selects the polarity (positive or negative logic) of each port pin. 0: Positive logic 1: Negative logic

Note: Unused bits should be set to the initial values.

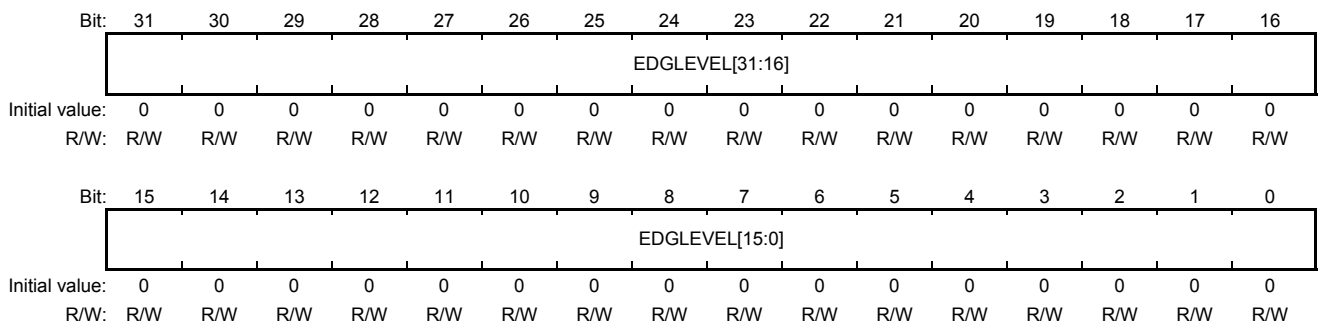

**6.4.10 Edge/level Select Register n (EDGLEVEL0 to EDGLEVELn)**

Note: n = 5 [RZ/G1H], n = 7 [RZ/G1M/N], n = 6 [RZ/G1E]

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

EDGLEVEL is valid only for the ports for which interrupt input mode is selected by the general IO/interrupt switching register. Specifically, EDGLEVEL selects the detection conditions (edge or level) of the interrupt input signal on each port pin for which interrupt input mode is selected. EDGLEVEL should be set before selection of interrupt input mode.

[Hardware default value: H'00000000 = level detection is selected for all the ports.]

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	EDGLEVEL [31:0]	All 0	R/W	Selects the level or edge as detection conditions of the interrupt input signal on each port pin for which interrupt input mode is selected. 0: Level 1: Edge

Note: Unused bits should be set to the initial values.

### 6.4.11 Chattering Prevention On/Off Register n (FILONOFF0 to FILONOFFn)

Note: n = 5 [RZ/G1H], n = 7 [RZ/G1M/N], n = 6 [RZ/G1E]

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√*	√	√	√

Note: \* Some restrictions apply.

FILONOFF prevents chattering input to the port pins 0 to 3 of each GPIO block and controls frequency of filter clock (generated from peripheral clock CP $\phi$ ) for chattering prevention function. For details, refer to section 6.5, Handling of Input Signals on Port Pins.

[Hardware default value: H'00000000 = chattering prevention function is turned off for all the ports.]

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CLKSEL[1:0]		—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	FILONOFF[3:0]			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31, 30	CLKSEL[1:0]	00	R/W	Filter clock frequency setting. 00: CP $\phi$ /2500. ([H], [M/N], [E]) 01: CP $\phi$ /1250. ([M/N], [E]). Setting prohibited. ([H]) 10: CP $\phi$ /625. ([M/N], [E]). Setting prohibited. ([H]) 11: CP $\phi$ /312.5. ([M/N], [E]). Setting prohibited. ([H])
29 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3 to 0	FILONOFF [3:0]	All 0	R/W	Enables or disables the chattering prevention function. 0: Chattering prevention function is disabled. 1: Chattering prevention function is enabled. The bits FILONOFF[n] (n = 0 to 3) are used to control the port pin n.

Note: Unused bits should be set to the initial values.

### 6.4.12 Interrupt Sub Mask Register n (INTMSKS0 to INTMSKSn)

Note: n = 5 [RZ/G1H], n = 7 [RZ/G1M/N], n = 6 [RZ/G1E]

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

INTMSKS masks the alternative interrupt requests indicated by the interrupt display register. Interrupts can be separately masked using the corresponding bits in INTMSKS. When all the bits currently indicating the reception of the interrupt signals are masked, no alternative interrupt signals are output to the interrupt control block. Masks can be canceled by writing 1 to the corresponding bits in the interrupt sub mask clear register. Only writing 0 to this register is effective.

[Hardware default value: H'00000000 = all the ports are masked.]

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	INTMSKS [31:0]	All 0	R/W	Setting a mask to the bit disables the corresponding alternative interrupt signal to be output to the interrupt control block. 0: Interrupt is masked. 1: Interrupt is not masked.

Note: Unused bits should be set to the initial values.

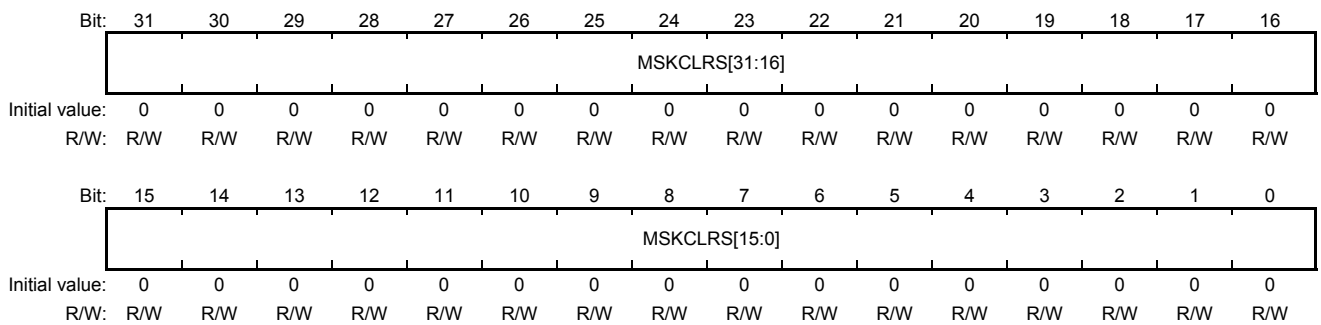

**6.4.13 Interrupt Sub Mask Clear Register n (MSKCLRS0 to MSKCLRSn)**

Note: n = 5 [RZ/G1H], n = 7 [RZ/G1M/N], n = 6 [RZ/G1E]

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

MSKCLRS cancels masks that are set by the interrupt sub mask register. Each mask can be canceled (cleared) by writing 1 to the corresponding bit in MSKCLRS. Only writing 1 to MSKCLRS is effective; MSKCLRS is always read as 0.

[Hardware default value: H'00000000 = alternative interrupt masks are cleared for no ports.]

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	MSKCLRS [31:0]	All 0	R/W	Setting a mask to the bit disables the corresponding alternative interrupt signal to be output to the interrupt control block. 0: No effect 1: Interrupt is not masked.

Note: Unused bits should be set to the initial values. (When GPIO is not selected by the pin multiplex settings, do not cancel the alternative interrupt mask.)

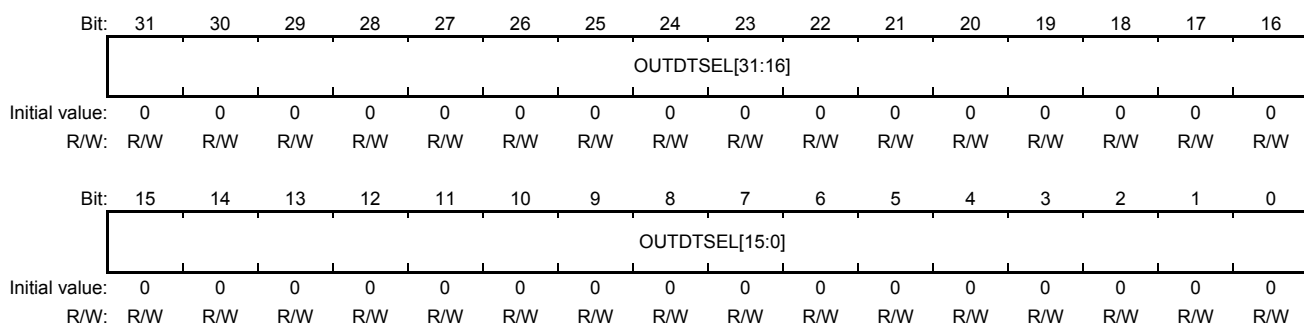

### 6.4.14 Output Data Select Register n (OUTDTSEL0 to OUTDTSELn)

Note: n = 5 [RZ/G1H], n = 7 [RZ/G1M/N], n = 6 [RZ/G1E]

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

OUTDTSEL is valid only for the ports for which general input/output mode is selected by the general IO/interrupt switching register and then general output mode is selected by the general input/output switching register. OUTDTSEL selects if OUTDT or OUTDTH/OUTDTL will be the output data of GPIO. When choosing OUTDT, configuration is performed as described in section 6.4.3, General Output Register n (OUTDT0 to OUTDTn). When choosing OUTDTH/OUTDTL, output data will be output by writing the appropriate data to the corresponding bits in OUTDTH or OUTDTL. Note that the polarity of the output signal should be previously set using the corresponding bit in the positive/negative logic select register. Furthermore, this register should be set before writing data to OUTDTH/OUTDTL registers.

[Hardware default value: H'00000000 = Out data register is used to output data.]

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	OUTDTSEL [31:0]	All 0	R/W	Choosing whether output data is output by general output register OUTDT or output data high register OUTDTH/output data low register OUTDTL.  0: General output register is used to output the data. 1: Output data high register and output data low register is used to output the data.

Note: Unused bits should be set to the initial values.

### 6.4.15 Output Data High Register n (OUTDTH0 to OUTDTHn)

Note: n = 5 [RZ/G1H], n = 7 [RZ/G1M/N], n = 6 [RZ/G1E]

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

OUTDTH is valid only for the ports for which general input/output mode is selected by the general IO/interrupt switching register and then general output mode is selected by the general input/output switching register, and the output data select register OUTDTSSEL is configured to choose OUTDTH/OUTDTL register to output the data of GPIO. Only writing 1 to OUTDTH is effective. Otherwise, setting makes no changes. Reading OUTDTH returns the values of the latest data set to OUTDTH or OUTDTL right before that. Note that the polarity of the output signal should be previously set using the corresponding bit in the positive/negative logic select register. Furthermore, this register should be written and read after output data select register OUTDTSSEL is set. Reading OUTDTH without appropriately configuring OUTDTSSEL can return value of OUTDT register.

[Hardware default value: H'00000000 = 0 is output from all the ports with setting OUTDTSSEL.]

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	OUTDTH [31:0]	All 0	R/W	Outputting high value data. 0: Invalid data. 1: Valid data.

Note: Unused bits should be set to the initial values.

### 6.4.16 Output Data Low Register n (OUTDTL0 to OUTDTLn)

Note: n = 5 [RZ/G1H], n = 7 [RZ/G1M/N], n = 6 [RZ/G1E]

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

OUTDTL is valid only for the ports for which general input/output mode is selected by the general IO/interrupt switching register and then general output mode is selected by the general input/output switching register, and the output data select register OUTDTSSEL is configured to choose OUTDTH/OUTDTL register to output the data of GPIO. Only writing 0 to OUTDTL is effective. Otherwise, setting makes no changes. Reading OUTDTL returns the values of the latest data set to OUTDTL or OUTDTH right before that. Note that the polarity of the output signal should be previously set using the corresponding bit in the positive/negative logic select register. Furthermore, this register should be written or read after output data select registers OUTDTSSEL is set. Reading OUTDTH without appropriately configuring OUTDTSSEL can return value of OUTDT register.

[Hardware default value: H'00000000 = 0 is output from all the ports with setting OUTDTSSEL.]

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	OUTDTL [31:0]	All 0	R/W	Outputting low value data. 0: Valid data. 1: Invalid data.

Note: Unused bits should be set to the initial values.

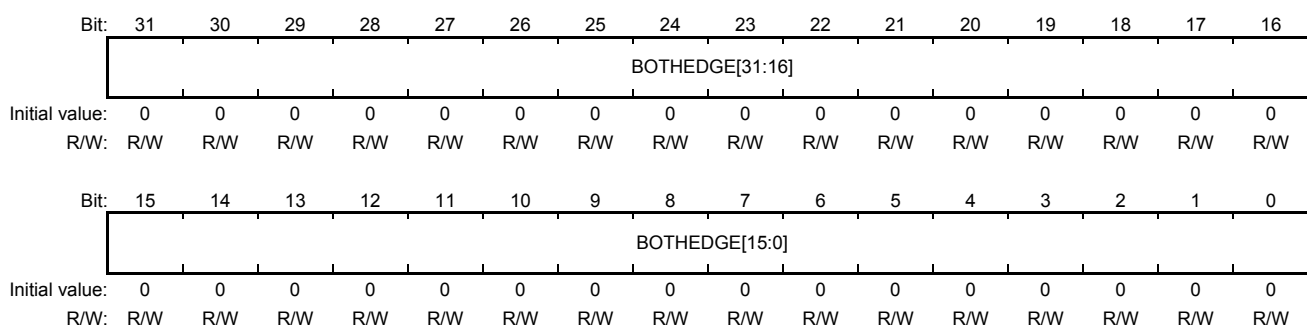

### 6.4.17 One Edge/Both Edge Select Register n (BOTHEDGE0 to BOTHEDGEN)

Note: n = 5 [RZ/G1H], n = 7 [RZ/G1M/N], n = 6 [RZ/G1E]

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

BOTHEDGE is valid only when the edge detection mode is selected by the edge/level select registers. Specially, BOTHEDGE selects the detection condition (one edge or both edges) of the interrupt input signal on each port pin for which interrupt input mode (selected by the general IO/interrupt switching registers) and edge detection mode are selected. BOTHEDGE should be set before selection of interrupt input mode.

[Hardware default value: H'00000000 = both edge detection mode is disabled for all the ports.]

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	BOTHEDGE [31:0]	All 0	R/W	Selecting one edge or both edge detection condition of the interrupt input signal on each port pin for which interrupt input mode and edge detection mode are selected. 0: One edge. 1: Both edges.

Note: Unused bits should be set to the initial values.

## 6.5 Handling of Input Signals on Port Pins

### 6.5.1 Chattering

In general input mode and interrupt input modes, a filtering function can be used for the port pins 0 to 3 of each GPIO block to prevent external chattering input. Specifically, when a bit in the chattering prevention on/off register is set to use the function, the external input to the corresponding port pin is sampled four consecutive times based on the filter clock signal, which is internally generated by the GPIO. The external input is canceled except when the active input is detected four consecutive times. Therefore, when a filtering function is used, input to the port pins 0 to 3 of each GPIO block need to be at least four sampling clock cycles long (with the peripheral clock (CP $\phi$ )).

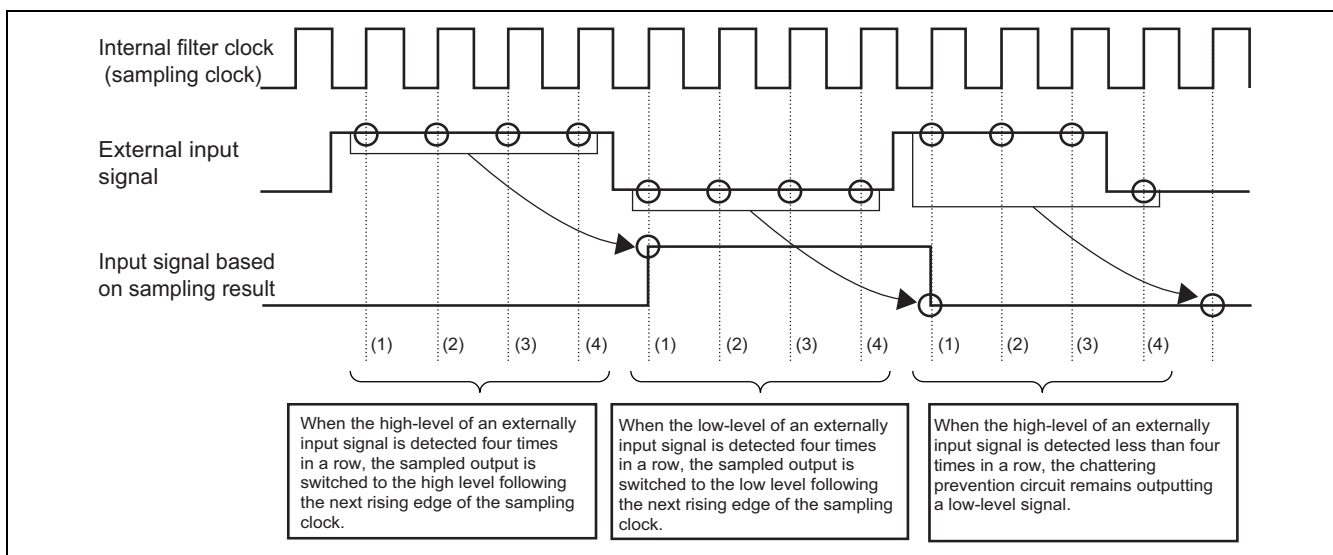

Figure 6.2 Sampling Timing Chart

### 6.5.2 Input Signal Synchronization

In general input mode and interrupt input mode, external input signals on all port pins are synchronized with the GPIO clock (CP $\phi$ ).

### 6.6 Interrupt Display Timing Charts

Figure 6.3 shows the interrupt display timing and Figure 6.4 shows the note on the timing. In both figures, the positive logic and edge-sensitive input are assumed.

Figure 6.3 Interrupt Display Timing

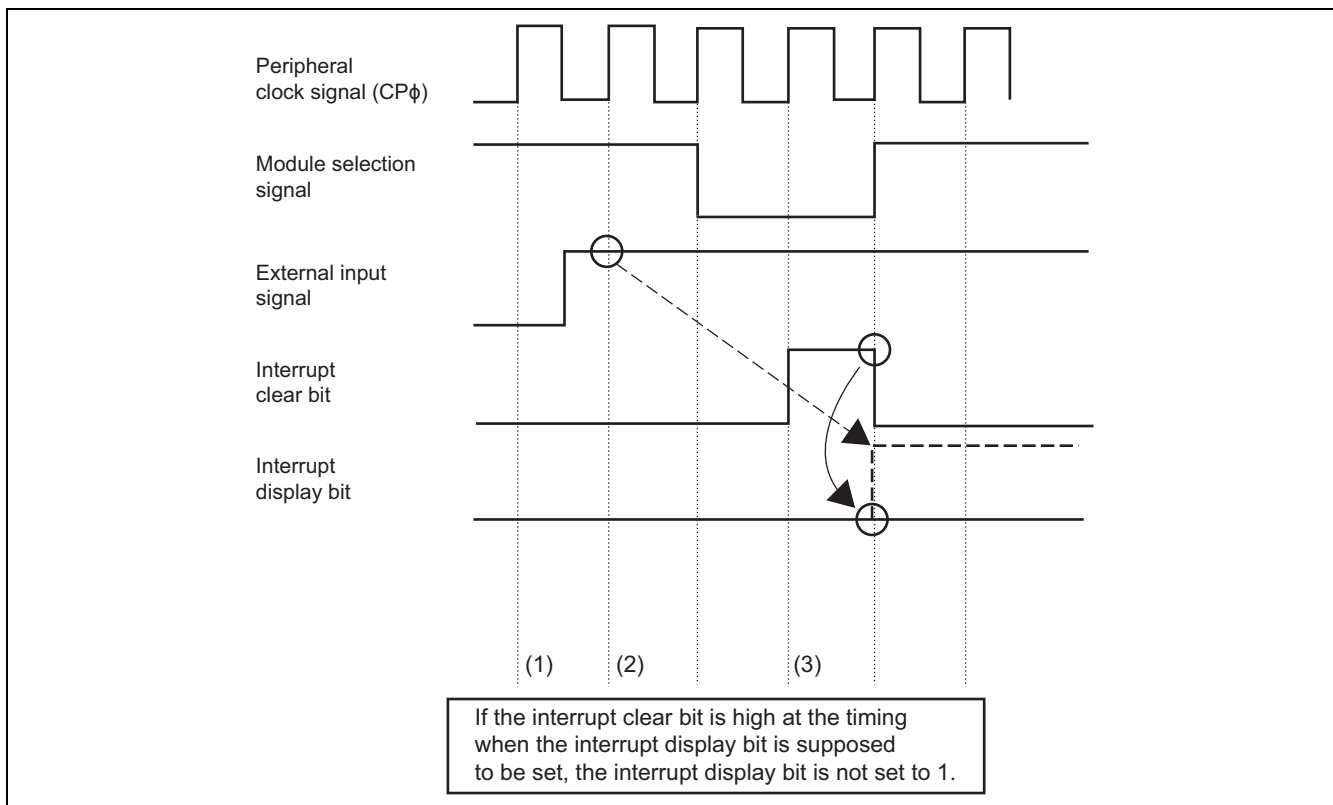

Figure 6.4 Note on Interrupt Display Timing

## 6.7 Using GPIO

RZ/G1H

RZ/G1N

RZ/G1M

RZ/G1E

The following sections describe how to use the GPIO. If the GPIO is not used according to the procedures shown here, operations are not guaranteed.

### 6.7.1 Setting Edge-Sensitive Interrupt Input Mode

For setting edge-sensitive interrupt input mode, refer to the procedure shown in Figure 6.5.

Note that an unexpected interrupt might be generated in the module if setting (1), (2), (3) or (4) in the flowchart is changed. When changing the setting, (5) and (6) should be done.

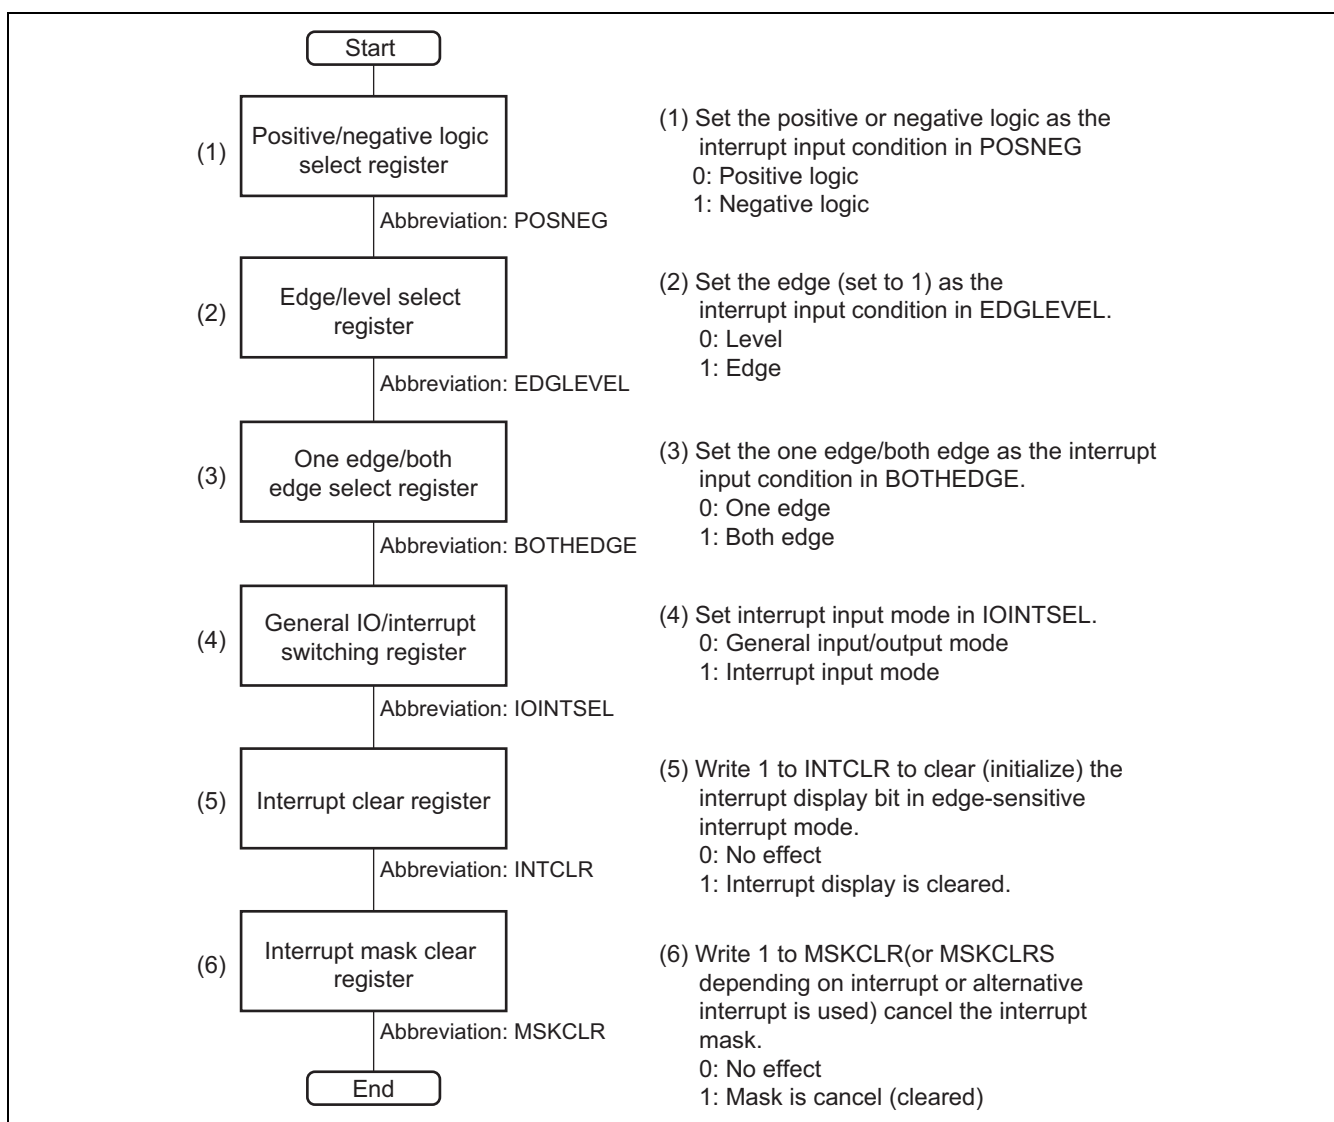

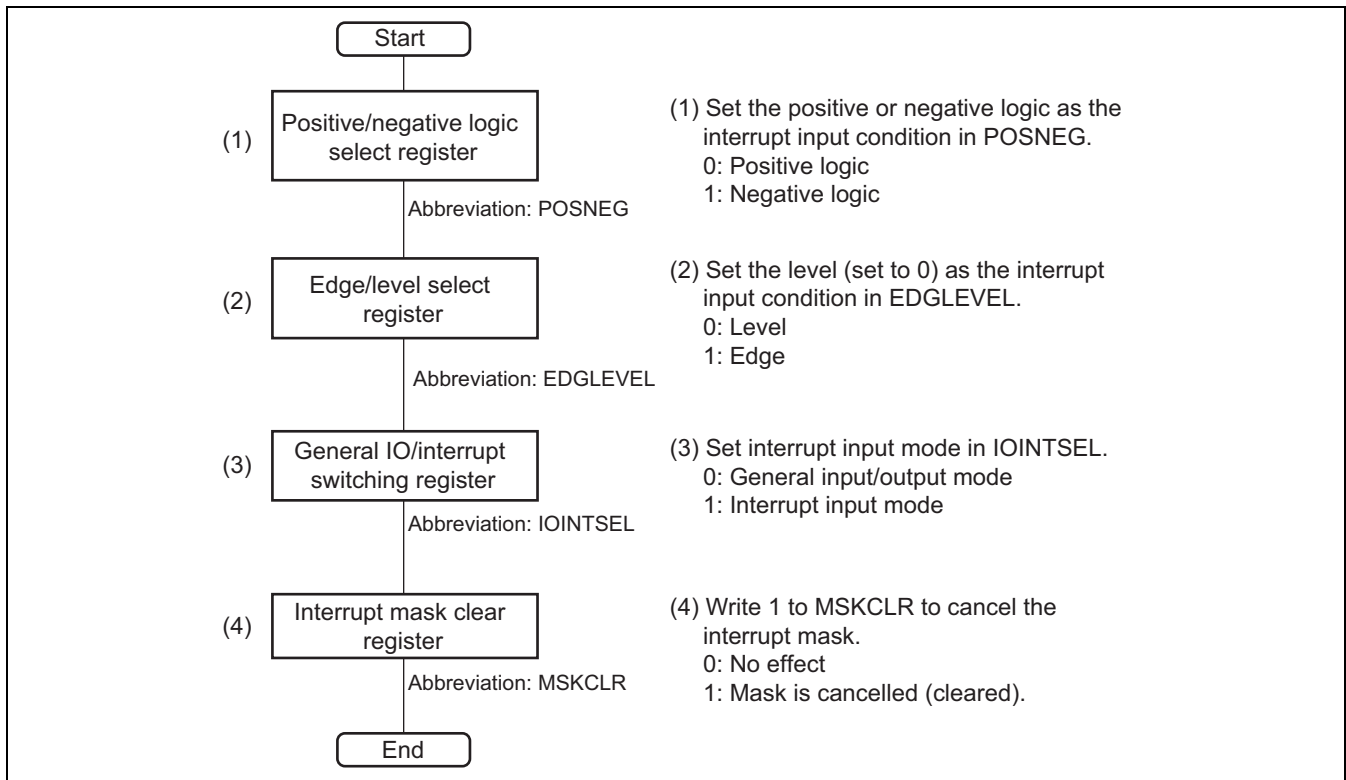

Figure 6.5 Flowchart of Setting the GPIO to Edge-Sensitive Interrupt Input Mode

### 6.7.2 Setting Level-Sensitive Interrupt Input Mode

For setting level-sensitive interrupt input mode, refer to the procedure shown in Figure 6.6.

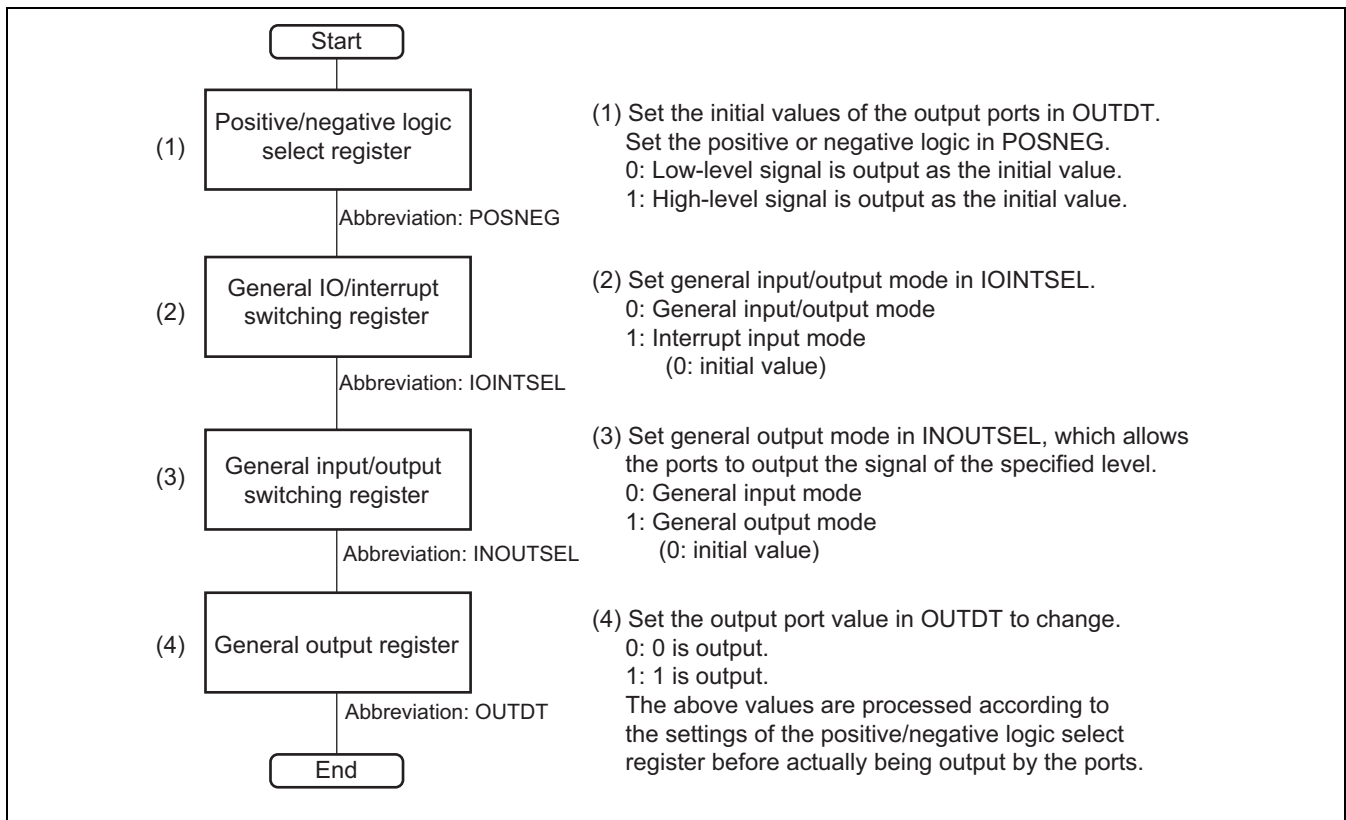

Note that when an external level-sensitive interrupt input signal is stopped, the corresponding interrupt is canceled automatically. In level-sensitive interrupt input mode, the interrupt clear register is invalid.

**Figure 6.6 Flowchart of Setting the GPIO to Level-Sensitive Interrupt Input Mode**

### 6.7.3 Setting General Output Mode

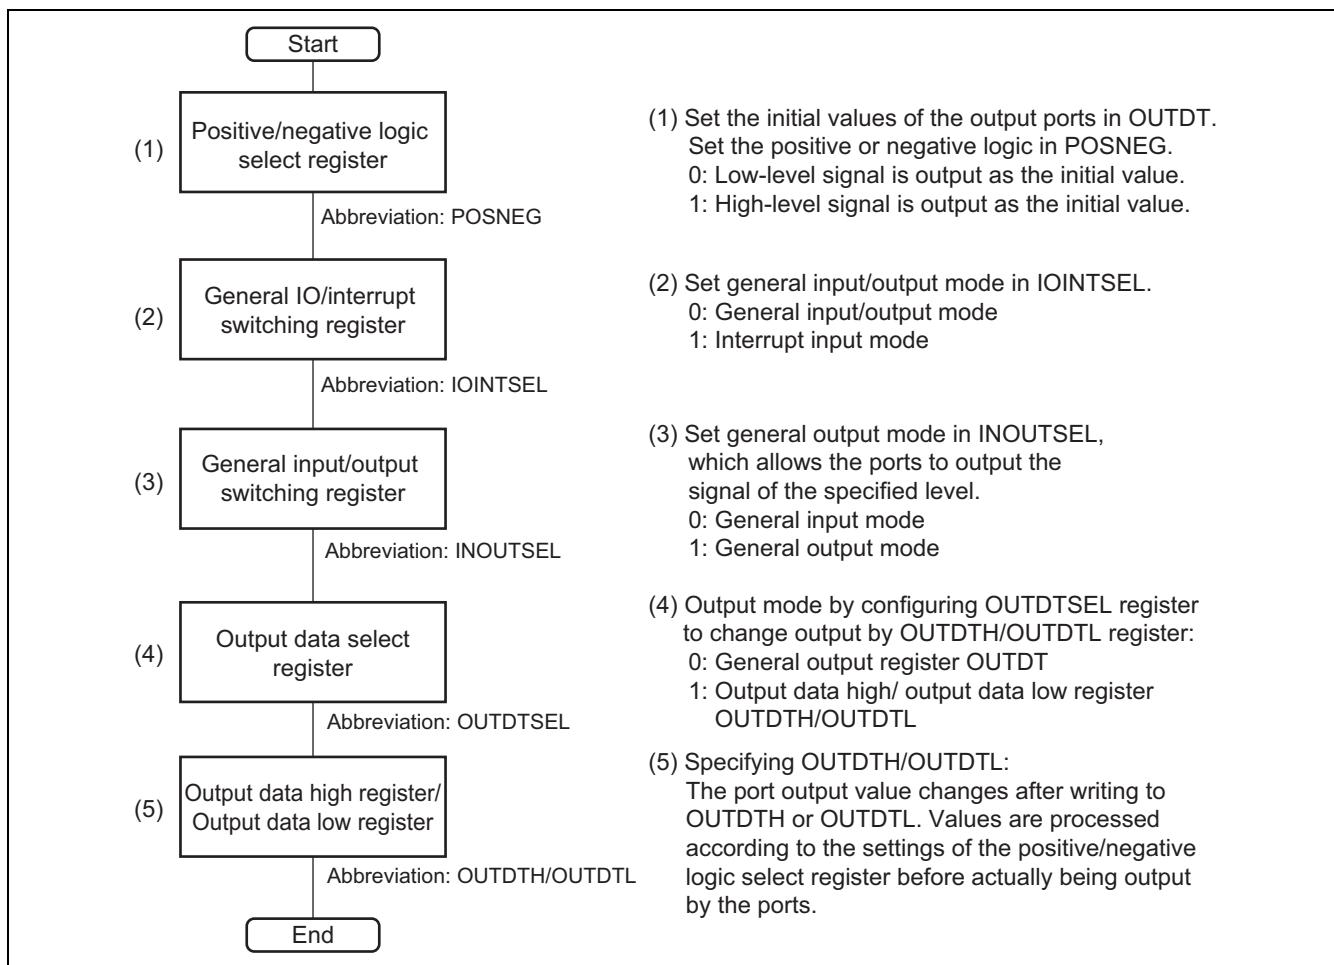

For setting general output mode, refer to the procedure shown in Figure 6.7.

**Figure 6.7 Flowchart of Setting the GPIO to General Output Mode**

### 6.7.4 Setting Output data high/Output data low Mode

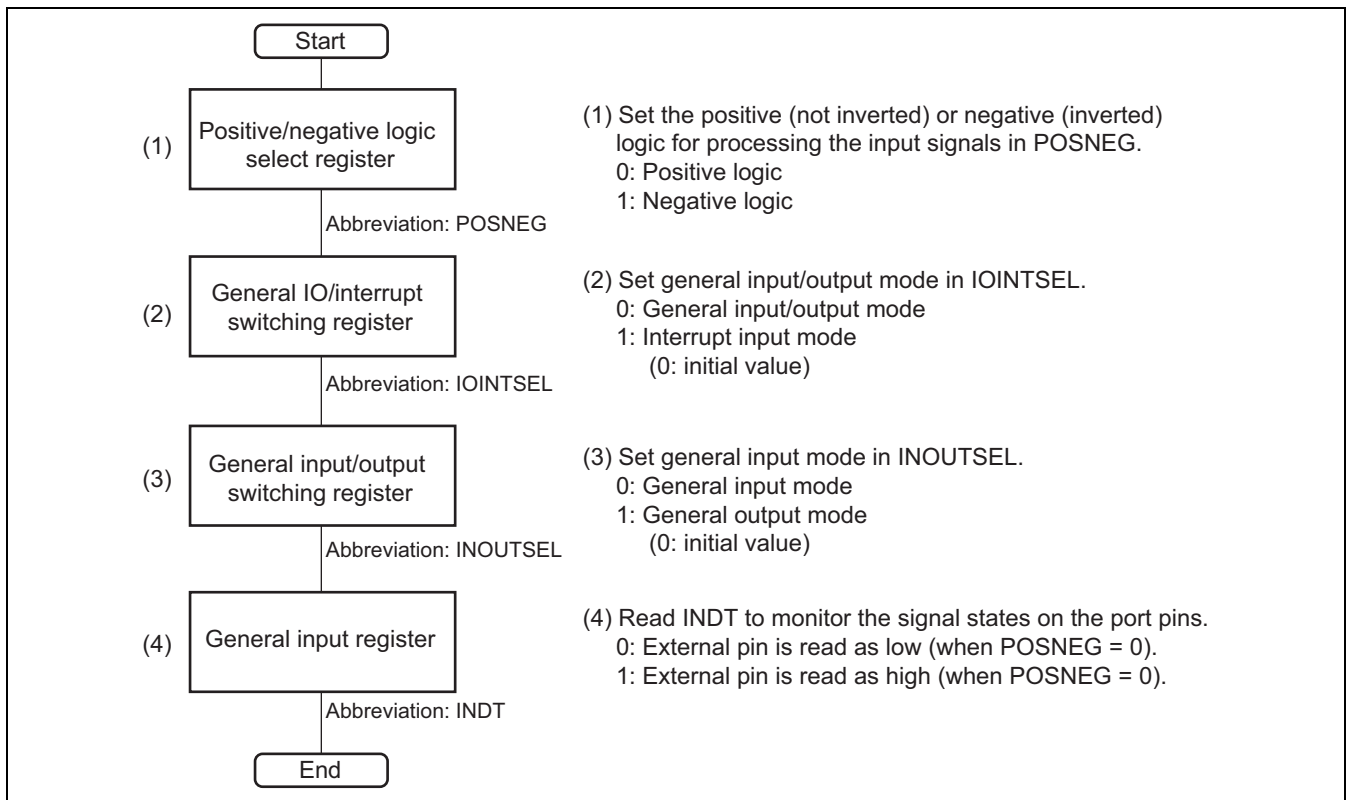

For setting output data high/output data low mode, refer to the procedure shown in Figure 6.8.

**Figure 6.8 Flowchart of Setting the GPIO to Output data high/ Output data low Mode**

### 6.7.5 Setting General Input Mode

For setting general input mode, refer to the procedure shown in Figure 6.9.

**Figure 6.9 Flowchart of Setting the GPIO to General Input Mode**

## 7. Clock Pulse Generator (CPG)

RZ/G1H

RZ/G1N

RZ/G1M

RZ/G1E

This LSI has a clock pulse generator (CPG). The CPG consists of oscillators, PLL circuit 0, PLL circuit 1, PLL circuit 3, clock dividers, and the control circuit. The CPG generates various clocks used by this LSI.

### 7.1 Features

- Generates various clocks for LSI internal operation.
  - 3 PLLs for common/application part modules
  - SYS-CPU divider, common divider and DDR divider for system basic operation.
  - Dedicated dividers for special clock
- Controls clock supply to modules according to the module status (power supply status, etc.)

A block diagram of the CPG is shown in Figure 7.1.

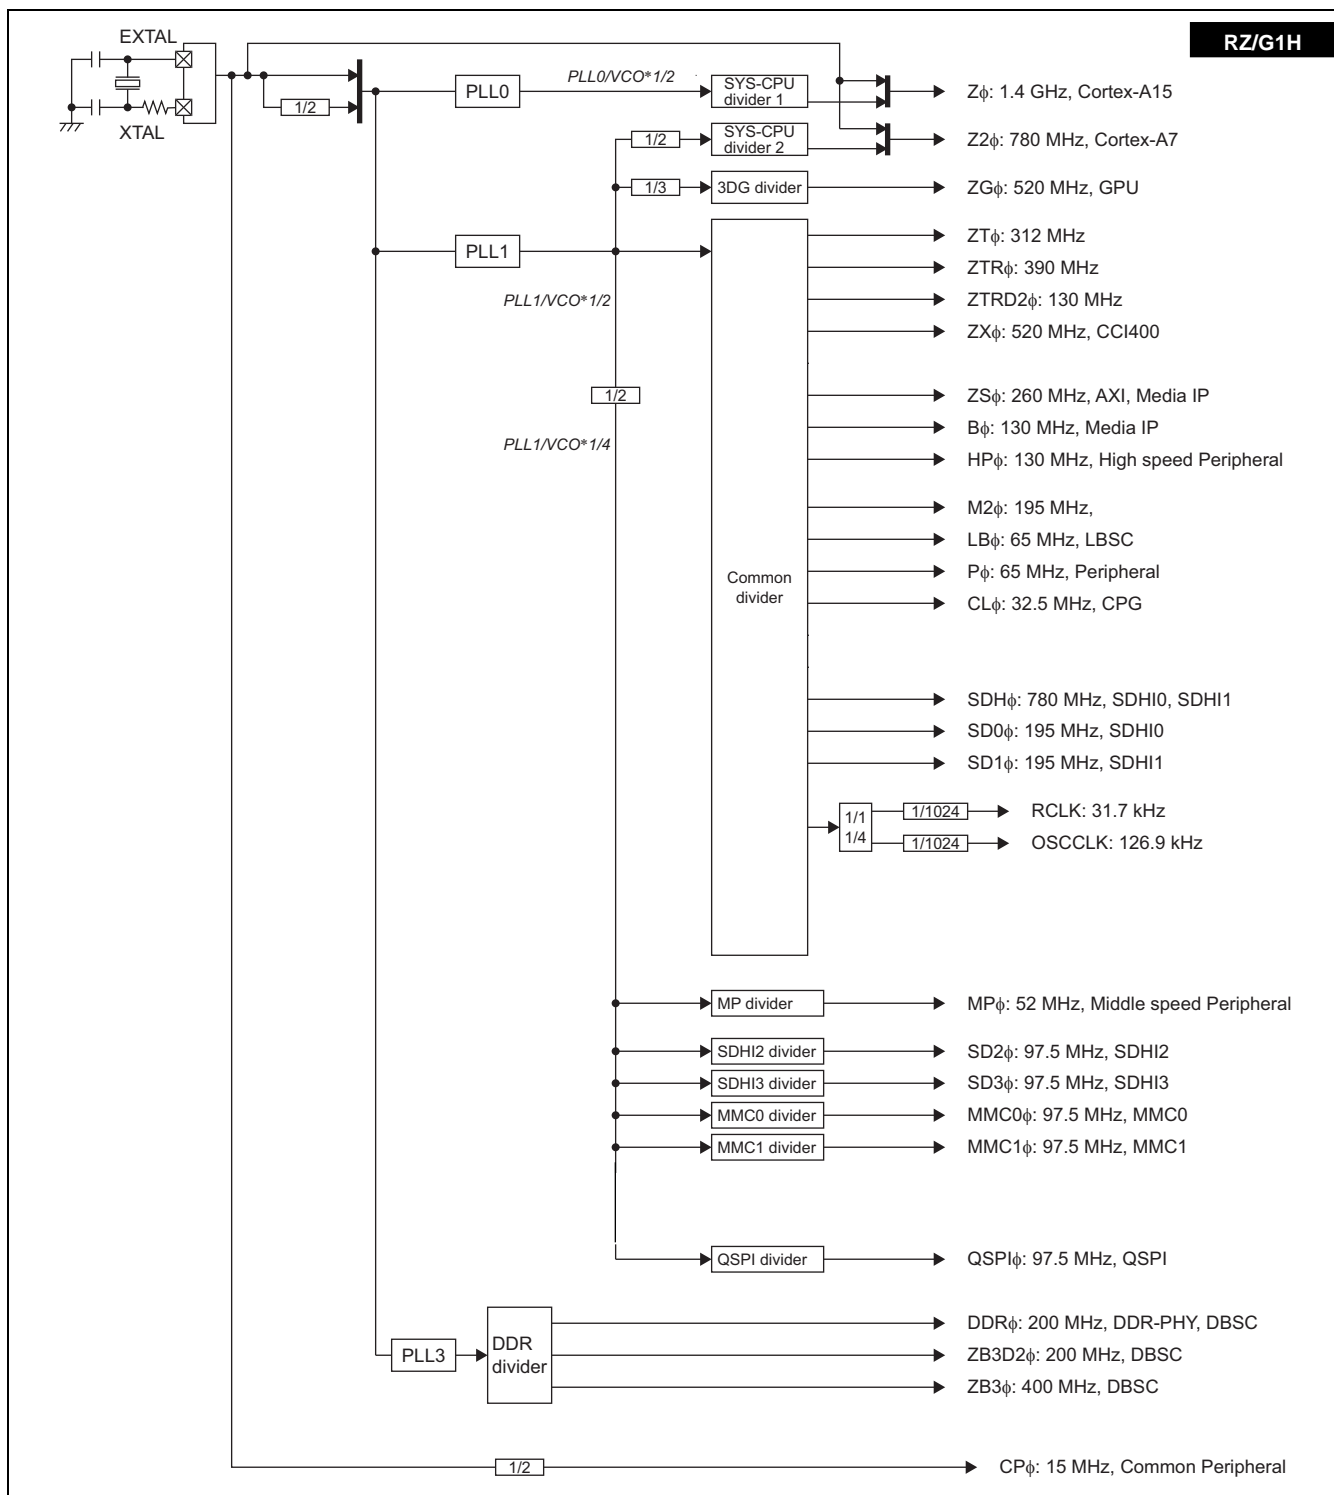

Figure 7.1a Block Diagram of CPG [RZ/G1H]

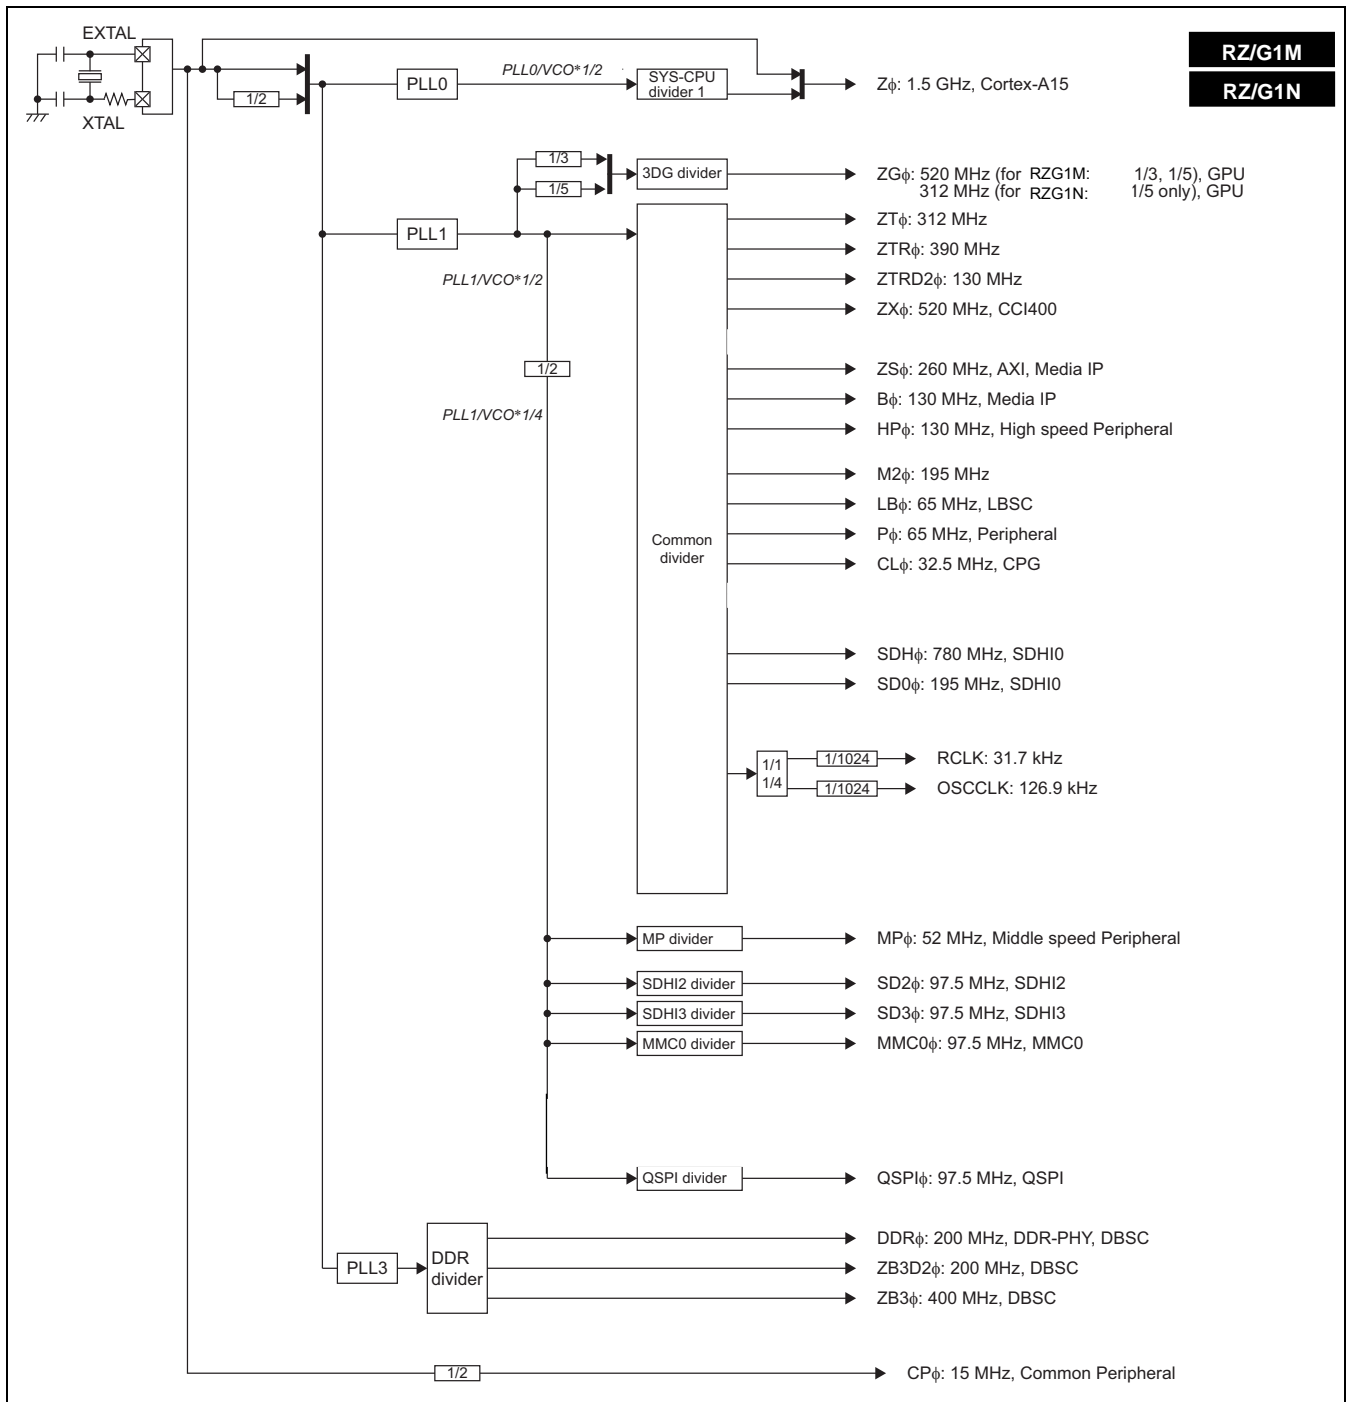

Figure 7.1b Block Diagram of CPG [RZ/G1M/N]

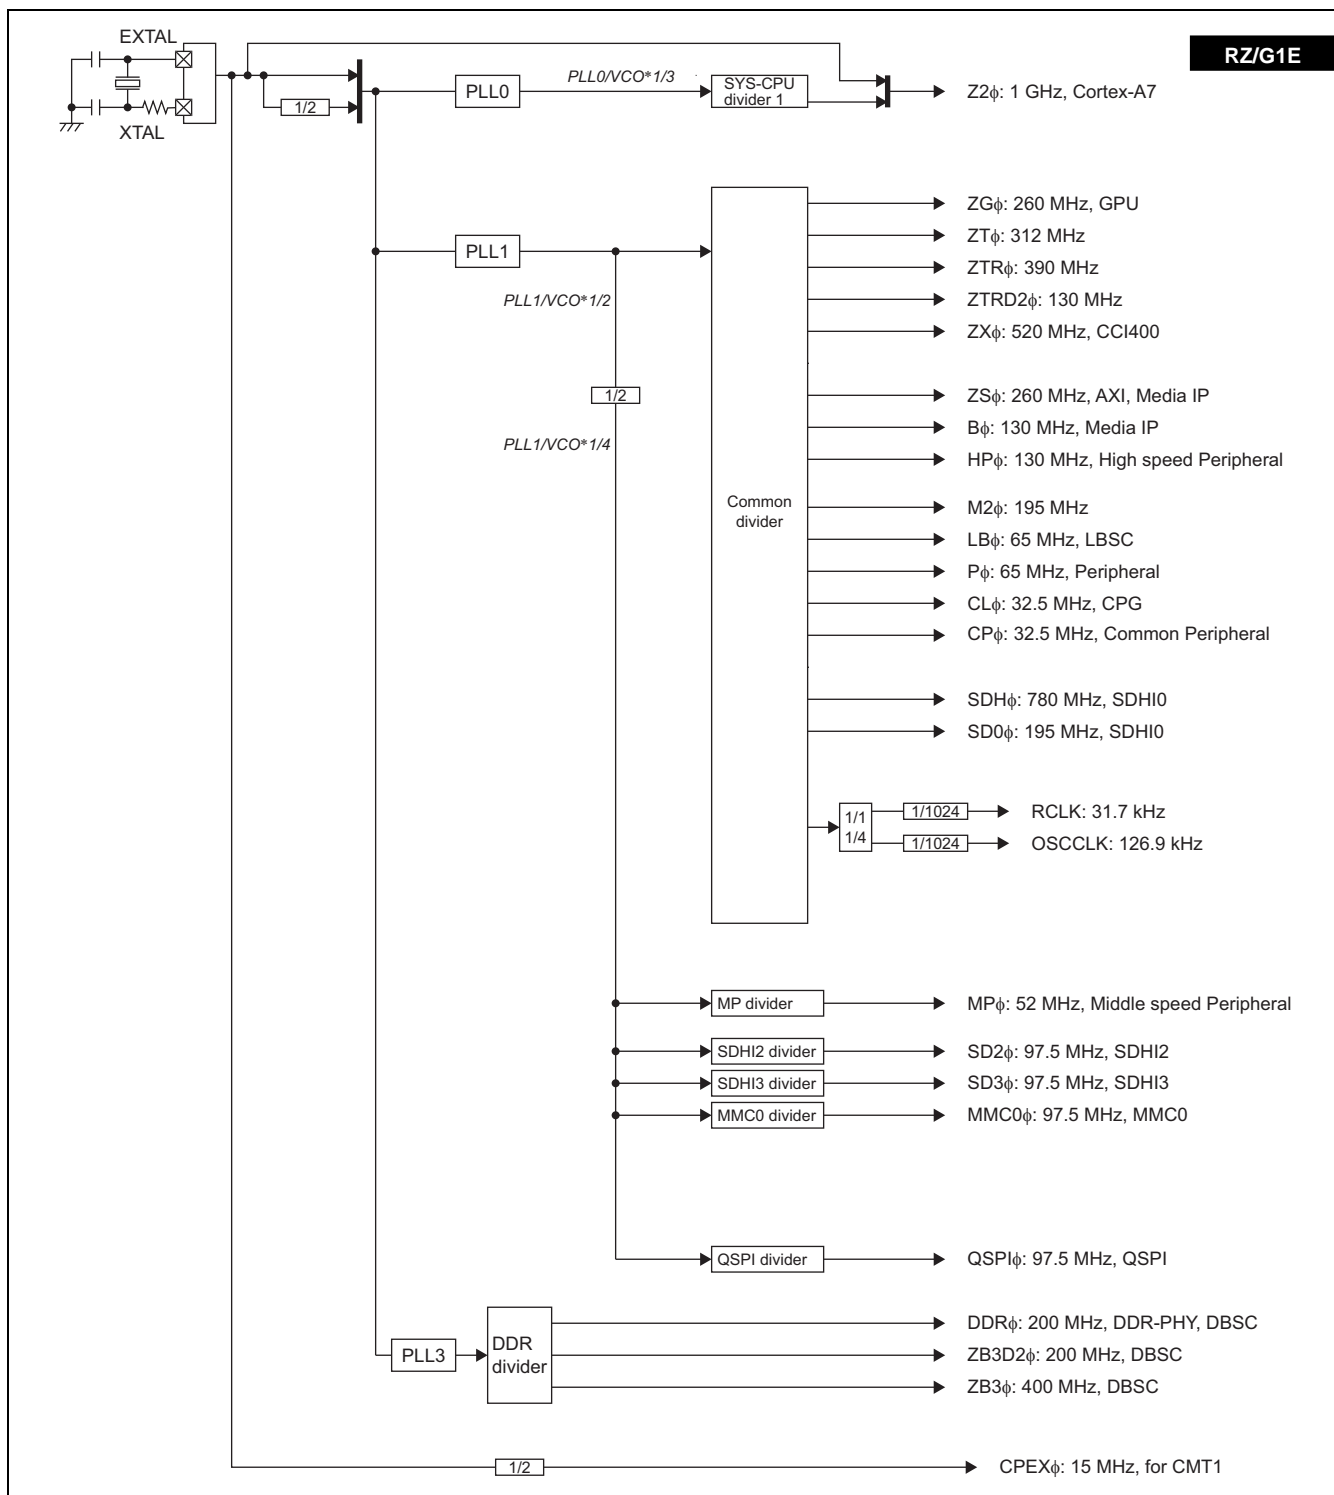

Figure 7.1c Block Diagram of CPG [RZ/G1E]

Followings are the functions of each block of CPG.

<b>RZ/G1H</b>	<b>RZ/G1N</b>
<b>RZ/G1M</b>	<b>RZ/G1E</b>

**(1) PLL circuit 0 (PLL0)**

**[RZ/G1H/M/N]:**

PLL circuit 0 multiplies EXTAL or EXTAL/2 clock. The multiplication ratio is set by the PLL0CR.

**[RZ/G1E]:**

PLL circuit 0 multiplies EXTAL or EXTAL/2 clock.

**(2) PLL circuit 1 (PLL1)**

PLL circuit 1 multiplies the input clock from EXTAL (EXTAL or EXTAL/2) by the multiplication ratio shown in Table 7.5 (Tables 7.5a, and 7.5b).

**(3) PLL Circuit 3 (PLL3)**

PLL circuit 3 multiplies the input clock from EXTAL (EXTAL or EXTAL/2) by the multiplication ratio shown in Table 7.5 (Tables 7.5a, and 7.5b).

**(4) SYS-CPU clock divider 1**

**[RZ/G1H/M/N]:**

The SYS-CPU clock divider 1 divides PLL0 output clock. This divider generates the AP-System core clocks ( $Z\phi$ ). The division ratio is set by the frequency control register C (FRQCRC).

**[RZ/G1E]:**

The SYS-CPU clock divider 1 divides PLL0 output clock. This divider generates the AP-System core clocks ( $Z2\phi$ ).

**(5) SYS-CPU clock divider 2 [RZ/G1H]**

The SYS-CPU clock divider 2 divides PLL1 output clock. This divider generates the AP-System core clocks ( $Z2\phi$ ).

**(6) GPU clock divider [RZ/G1H/M/N]**

The GPU clock divider divides PLL1 output clock. This divider generates the system GPU clock ( $ZG\phi$ ).

**(7) Common clock divider**

The common clock divider divides PLL1 output clock. This divider generates various system clocks. The division ratio is set by the frequency control register B (FRQCRB).

**(8) DDR clock divider**

The DDR clock divider divides PLL3 output clock, and generates DDR-PHY clock and DBSC clock.

**(9) Dedicated dividers**

The each dedicated divider generates special clock for the related modules.

## 7.2 Input/Output Pins

Table 7.1 lists the CPG pin configuration.

**Table 7.1 Pin Configuration and Functions of CPG**

Pin Name	Function	I/O	Description
XTAL	Clock input pins	Output	Outputs amplified negative feedback of EXTAL
EXTAL		Input	Used as an external clock input pin
CLKOUT	External Bus Clock output pin	Output	Used as an external clock output pin
MD0	Mode 0	Input	Free running mode/Step up mode
MD9	Mode 9	Input	EXTAL/XTAL pin setting
MD13	Mode 13	Input	PLL multiplication ratio setting
MD14	Mode 14	Input	PLL multiplication ratio setting
MD19	Mode 19	Input	DDR clock frequency setting
MD18 [RZ/G1H/E]	Mode 18	Input	[RZ/G1H]: External bus clock frequency setting [RZ/G1E]: DDR clock frequency setting Be sure to set MD18 to 0 (MD18 doesn't have external pin).
MD15 [RZ/G1H]	Mode 15	Input	Be sure to set MD15 to 0.

### 7.3 List of Clock Outputs

RZ/G1H	RZ/G1N
RZ/G1M	RZ/G1E

Table 7.2 lists the clock output of CPG.

**Table 7.2a List of Clocks [RZ/G1H]**

Name	Clock Source	Frequency			Clock Domain, Function
		Dividing ratio	Maximum	Initial	
Z $\phi$	SYS-CPU divider 1	Variable	1.4 GHz	~1.3 GHz	System CPU (Cortex-A15) clock
Z2 $\phi$	SYS-CPU divider 2	Fixed	780 MHz	780 MHz	System CPU (Cortex-A7) clock
ZG $\phi$	3DG divider	Fixed	520 MHz	520 MHz	GPU clock
ZTR $\phi$	Common divider	Variable	390 MHz	260 MHz	Trace interface clock
ZTRD2 $\phi$	Common divider	Variable	130 MHz	130 MHz	System trace interface clock
ZT $\phi$	Common divider	Variable	312 MHz	312 MHz	Internal trace clock
ZX $\phi$	Common divider	Fixed	520 MHz	520 MHz	Cache coherent interconnect clock
ZS $\phi$	Common divider	Fixed	260 MHz	260 MHz	AXI clock/media IP clock
HP $\phi$	Common divider	Fixed	130 MHz	130 MHz	High-speed peripheral clock
B $\phi$	Common divider	Fixed	130 MHz	130 MHz	Media clock
LB $\phi$	Common divider	Fixed	65 MHz	*1	LBSC clock
P $\phi$	Common divider	Fixed	65 MHz	65 MHz	Peripheral clock
CL $\phi$	Common divider	Fixed	32.5 MHz	32.5 MHz	
M2 $\phi$	Common divider	Fixed	195 MHz	195 MHz	Media clock 2
ZB3 $\phi$	DDR divider	Fixed	400 MHz	400 MHz *6	DBSC clock
ZB3D2 $\phi$	DDR divider	Fixed	200 MHz	200 MHz *6	DBSC clock
DDR $\phi$	DDR divider	Fixed	200 MHz	200 MHz *6	DDR-PHY clock
SDH $\phi$	Common divider	Variable	780 MHz	780 MHz	SDHI clock H
SD0 $\phi$	Common divider	Variable	195 MHz	97.5 MHz	SDHI clock 0
SD1 $\phi$	Common divider	Variable	195 MHz	97.5 MHz	SDHI clock 1
SD2 $\phi$	SDHI2 divider	Variable	97.5 MHz	48.75 MHz	SDHI clock 2
SD3 $\phi$	SDHI3 divider	Variable	97.5 MHz	48.75 MHz	SDHI clock 3
MMC0 $\phi$	MMC0 divider	Variable	97.5 MHz	12.18 MHz	MMC clock 0
MMC1 $\phi$	MMC1 divider	Variable	97.5 MHz	12.18 MHz	MMC clock 1
MP $\phi$	MP divider	Fixed	52 MHz	52 MHz	MP clock
QSPI $\phi$	QSPI divider	Variable	97.5 MHz	*2	QSPI clock
CP $\phi$	EXTAL	Fixed	15 MHz	*3	Common peripheral clock, EXTAL $\times$ 1/2
RCAN $\phi$	USB_EXTAL	Fixed	8 MHz *5	*4	RCAN clock USB_EXTAL $\times$ 1/6
RCLK	Common divider	Fixed	31.7 kHz	31.7 kHz	
OSCCLK	Common divider	Fixed	126.9 kHz	126.9 kHz	

- Notes:
1. The frequency of  $LB\phi$  depends on the value of MD18.
  2. The frequency of  $QSPI\phi$  depends on the value of MD3, MD2 and MD1.  
When MD3 = L, MD2 = H, MD1 = L,  $QSPI\phi = 97.5$  MHz.  
In the other cases of MD3, MD2 and MD1 setting,  $QSPI\phi = 78$  MHz.
  3. The frequency of  $CP\phi$  is equal to  $EXTAL \times 1/2$ . For example, when the frequency of EXTAL is equal to 20 MHz, the frequency of  $CP\phi$  is equal to 10 MHz.
  4. The frequency of  $RCAN\phi$  is equal to  $USB\_EXTAL \times 1/6$ .
  5. The maximum value of the RCAN clock frequency is derived by frequency-dividing the USB clock by 6. Note that input of an external clock signal through the USB\_EXTAL pin is not supported; use the crystal resonator for the USB clock. is not supported; use the crystal resonator for the USB clock.
  6. The initial frequency of  $ZB3\phi$ ,  $ZB3D2\phi$ , and  $DDR\phi$  depend the setting of MD19. The values shown in the above table corresponds to the case of MD19 = 0.

**Table 7.2b List of Clocks [RZ/G1M/N]**

Name	Clock Source	Frequency			Clock Domain, Function
		Dividing ratio	Maximum	Initial	
Z $\phi$	SYS-CPU divider 1	Variable	1.5 GHz	~1.3 GHz	System CPU (Cortex-A15) clock
ZG $\phi$	3DG divider	Selectable	520/312 MHz	520/312 MHz	GPU clock (520/312 MHz)
ZTR $\phi$	Common divider	Variable	390 MHz	260 MHz	Trace interface clock
ZTRD2 $\phi$	Common divider	Variable	130 MHz	130 MHz	System trace interface clock
ZT $\phi$	Common divider	Variable	312 MHz	312 MHz	Internal trace clock
ZX $\phi$	Common divider	Fixed	520 MHz	520 MHz	Cache coherent interconnect clock
ZS $\phi$	Common divider	Fixed	260 MHz	260 MHz	AXI clock/media IP clock
HP $\phi$	Common divider	Fixed	130 MHz	130 MHz	High-speed peripheral clock
B $\phi$	Common divider	Fixed	130 MHz	130 MHz	Media clock
LB $\phi$	Common divider	Fixed	65 MHz	65 MHz	LBSC clock
P $\phi$	Common divider	Fixed	65 MHz	65 MHz	Peripheral clock
CL $\phi$	Common divider	Fixed	32.5 MHz	32.5 MHz	
M2 $\phi$	Common divider	Fixed	195 MHz	195 MHz	Media clock 2
ZB3 $\phi$	DDR divider	Fixed	400 MHz	400 MHz* <sup>5</sup>	DBSC clock
ZB3D2 $\phi$	DDR divider	Fixed	200 MHz	200 MHz* <sup>5</sup>	DBSC clock
DDR $\phi$	DDR divider	Fixed	200 MHz	200 MHz* <sup>5</sup>	DDR-PHY clock
SDH $\phi$	Common divider	Variable	780 MHz	780 MHz	SDHI clock H
SD0 $\phi$	Common divider	Variable	195 MHz	97.5 MHz	SDHI clock 0
SD2 $\phi$	SDHI2 divider	Variable	97.5 MHz	48.75 MHz	SDHI clock 2
SD3 $\phi$	SDHI3 divider	Variable	97.5 MHz	48.75 MHz	SDHI clock 3
MMC0 $\phi$	MMC0 divider	Variable	97.5 MHz	12.18 MHz	MMC clock 0
MP $\phi$	MP divider	Fixed	52 MHz	52 MHz	MP clock
QSPI $\phi$	QSPI divider	Variable	97.5 MHz	* <sup>1</sup>	QSPI clock
CP $\phi$	EXTAL	Fixed	15 MHz	* <sup>2</sup>	Common peripheral clock, EXTAL $\times$ 1/2
RCAN $\phi$	USB_EXTAL	Fixed	8 MHz * <sup>4</sup>	* <sup>3</sup>	RCAN clock USB_EXTAL $\times$ 1/6
RCLK	Common divider	Fixed	31.7 kHz	31.7 kHz	
OSCCLK	Common divider	Fixed	126.9 kHz	126.9 kHz	

Notes: 1. The frequency of QSPI $\phi$  depends on the value of MD3, MD2 and MD1.

When MD3 = L, MD2 = H, MD1 = L, QSPI $\phi$  = 97.5 MHz.

In the other cases of MD3, MD2 and MD1 setting, QSPI $\phi$  = 78 MHz.

- The frequency of CP $\phi$  is equal to EXTAL  $\times$  1/2. For example, when the frequency of EXTAL is equal to 20 MHz, the frequency of CP $\phi$  is equal to 10 MHz.
- The frequency of RCAN $\phi$  is equal to USB\_EXTAL  $\times$  1/6.
- The maximum value of the RCAN clock frequency is derived by frequency-dividing the USB clock by 6. Note that input of an external clock signal through the USB\_EXTAL pin is not supported; use the crystal resonator for the USB clock.
- The initial frequency of ZB3 $\phi$ , ZB3D2 $\phi$ , and DDR $\phi$  depend the setting of MD19. The values shown in the above table corresponds to the case of MD19 = 0.

Table 7.2c List of Clocks [RZ/G1E]

Name	Clock Source	Frequency			Clock Domain, Function
		Dividing ratio	Maximum	Initial	
Z2 $\phi$	SYS-CPU divider 1	Fixed	1 GHz	~1 GHz	System CPU (Cortex-A7) clock
ZG $\phi$	3DG divider	Fixed	260 MHz	260 MHz	GPU clock
ZTR $\phi$	Common divider	Variable	390 MHz	260 MHz	Trace interface clock
ZTRD2 $\phi$	Common divider	Variable	130 MHz	130 MHz	System trace interface clock
ZT $\phi$	Common divider	Variable	312 MHz	312 MHz	Internal trace clock
ZX $\phi$	Common divider	Fixed	520 MHz	520 MHz	Cache coherent interconnect clock
ZS $\phi$	Common divider	Fixed	260 MHz	260 MHz	AXI clock/media IP clock
HP $\phi$	Common divider	Fixed	130 MHz	130 MHz	High-speed peripheral clock
B $\phi$	Common divider	Fixed	130 MHz	130 MHz	Media clock
LB $\phi$	Common divider	Fixed	65 MHz	65 MHz	LBSC clock
P $\phi$	Common divider	Fixed	65 MHz	65 MHz	Peripheral clock
CL $\phi$	Common divider	Fixed	32.5 MHz	32.5 MHz	
CP $\phi$	Common divider	Fixed	32.5 MHz	32.5 MHz	
M2 $\phi$	Common divider	Fixed	195 MHz	195 MHz	Media clock 2
ZB3 $\phi$	DDR divider	Fixed	400 MHz	400 MHz* <sup>1</sup>	DBSC clock
ZB3D2 $\phi$	DDR divider	Fixed	200 MHz	200 MHz* <sup>1</sup>	DBSC clock
DDR $\phi$	DDR divider	Fixed	200 MHz	200 MHz* <sup>1</sup>	DDR-PHY clock
SDH $\phi$	Common divider	Variable	780 MHz	780 MHz	SDHI clock H
SD0 $\phi$	Common divider	Variable	195 MHz	97.5 MHz	SDHI clock 0
SD2 $\phi$	SDHI2 divider	Variable	97.5 MHz	48.75 MHz	SDHI clock 2
SD3 $\phi$	SDHI3 divider	Variable	97.5 MHz	48.75 MHz	SDHI clock 3
MMC0 $\phi$	MMC0 divider	Variable	97.5 MHz	12.18 MHz	MMC clock 0
MP $\phi$	MP divider	Fixed	52 MHz	52 MHz	MP clock
QSPI $\phi$	QSPI divider	Variable	97.5 MHz	* <sup>2</sup>	QSPI clock
CPEX $\phi$	EXTAL	Fixed	15 MHz	* <sup>3</sup>	EXTAL $\times$ 1/2
RCAN $\phi$	USB_EXTAL	Fixed	8 MHz * <sup>5</sup>	* <sup>4</sup>	RCAN clock USB_EXTAL $\times$ 1/6
RCLK	Common divider	Fixed	31.7 kHz	31.7 kHz	
OSCCLK	Common divider	Fixed	126.9 kHz	126.9 kHz	

Notes: 1. The frequency of ZB3 $\phi$ , ZB3D2 $\phi$  and DDR $\phi$  depends on the value of MD19.

2. The frequency of QSPI $\phi$  depends on the value of MD3, MD2 and MD1.

When MD3=L, MD2 = H, MD1 = L, QSPI $\phi$  = 97.5 MHz.

In the other cases of MD3, MD2 and MD1 setting, QSPI $\phi$  = 78 MHz.

3. The frequency of CPEX $\phi$  is equal to EXTAL  $\times$  1/2. For example, when the frequency of EXTAL is equal to 20 MHz, the frequency of CPEX $\phi$  is equal to 10 MHz.

4. The frequency of RCAN $\phi$  is equal to USB\_EXTAL  $\times$  1/6.

5. The maximum value of the RCAN clock frequency is derived by frequency-dividing the USB clock by 6. Note that input of an external clock signal through the USB\_EXTAL pin is not supported; use the crystal resonator for the USB clock.

## 7.4 Clock Operating Modes

RZ/G1H	RZ/G1N
RZ/G1M	RZ/G1E

**Table 7.4 MD9 Settings**

MD9	EXTAL/XTAL Pin Settings
0	Inputs an external clock to the EXTAL pin.
1	Connects the crystal resonator to the EXTAL and XTAL pins.

**Table 7.5a PLL Multiplication Ratio [RZ/G1H/M/N]**

MD14	MD13	MD19	EXTAL Input Frequency (MHz)	Divider Setting of EXTAL Input	PLL0* <sup>1</sup> Multiplication Ratio	PLL1* <sup>3</sup> Multiplication Ratio	PLL3* <sup>2</sup> Multiplication Ratio
0	0	0	15	× 1	× 172	× 208	× 106
0	0	1	15	× 1	× 172	× 208	× 88
0	1	0	20	× 1	× 130	× 156	× 80
0	1	1	20	× 1	× 130	× 156	× 66
1	0	0	26	× 1/2	× 200	× 240	× 122
1	0	1	26	× 1/2	× 200	× 240	× 102
1	1	0	30	× 1/2	× 172	× 208	× 106
1	1	1	30	× 1/2	× 172	× 208	× 88

Notes: 1. PLL to create Z $\phi$  for Cortex-A15

Example of frequency calculation (in the case MD14 = H, MD13 = H)

VCO output frequency of PLL0 = 30 MHz × 1/2 × 172 = 2580 MHz

Maximum frequency of Z $\phi$  = 2580 MHz × 1/2 (fixed divider) × 32/32 = 1290 MHz

2. PLL to create clocks related to DBSC & DDR-PHY
3. PLL to create the other clocks

**Table 7.5b PLL Multiplication Ratio [RZ/G1E]**

MD14	MD13	MD19	MD18	EXTAL Input Frequency (MHz)	Divider Setting of EXTAL Input	PLL0* <sup>1</sup> Multiplication Ratio	PLL1* <sup>3</sup> Multiplication Ratio	PLL3* <sup>2</sup> Multiplication Ratio
0	0	1	0	15	× 1	× 200	× 208	× 88
0	1	1	0	20	× 1	× 150	× 156	× 66
1	0	1	0	26	× 1/2	× 230	× 240	× 102
1	1	1	0	30	× 1/2	× 200	× 208	× 88

Notes: 1. PLL to create Z2 $\phi$  for Cortex-A7.

Example of frequency calculation (in the case MD14 = H, MD13 = H)

VCO output frequency of PLL0 = 30 MHz × 1/2 × 200 = 3000 MHz

Maximum frequency of Z2 $\phi$  = 3000 MHz × 1/3 (fixed divider) = 1000 MHz

2. PLL to create clocks related to DBSC & DDR-PHY
3. PLL to create the other clocks
4. Be sure to set MD18 to 0.

**Table 7.6a MD19 Settings [RZ/G1H/M/N]**

MD19	DDR Clock Frequency Setting
0	DDR3-1600 mode
1	DDR3-1333 mode

Note: See Table 7.5 along with this table.

**Table 7.6b MD19 and MD18 Settings [RZ/G1E]**

MD19	MD18	DDR Clock Frequency Setting
0	0	Setting prohibited
1	0	DDR3-1333 mode
0	1	Setting prohibited
1	1	Setting prohibited

Note: See Table 7.5 along with this table.

**Table 7.7 MD18 Settings [RZ/G1H]**

MD18	External Bus Clock (CLKOUT) Frequency Setting
0	Division ratio = 1/24 of the PLL1 oscillation frequency
1	Division ratio = 1/36 of the PLL1 oscillation frequency

The MD0 pin selects either free-running mode or step-up mode. In step-up mode, the frequency of the LSI-internal clocks is increased step by step at booting up of the LSI by the PRESET# pin so that the power consumption increases gradually.

**Table 7.8 MD0 Settings**

MD0	Description
0	Free-running mode
1	Step-up mode*

Note: \* Not available in the RZ/G1H, M, and N when MD14 = 1 (high).

**Figure 7.2 Current Change in Step-Up Mode**

**Table 7.9 MD15 Settings [RZ/G1H]**

MD15	MD15 Settings
0	Be sure to set MD15 to 0.
1	Setting prohibited

## 7.5 Register Descriptions

Table 7.10 shows the CPG register configuration block. Table 7.11 shows the register states in each operating mode.

32bit-width access is only available when access to this register.

**Table 7.10 Register Configurations**

Register Name	Abbreviation	R/W	Address	Access Size	RZ/G Series Products			
					RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E

### 7.5.2 Frequency Control Register C (FRQCRC)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	—

FRQCRC is a 32-bit readable/writable register. This register specifies the frequency division ratios of the System CPU (Cortex-A15) clock ( $Z\phi$ ).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	ZFC[4:0]				—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
17	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
16 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

### 7.5.3 PLL Enable Control Register (PLLECR)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	—

PLLECR is a 32-bit readable register that indicates the state of PLL0.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	PLL0 T	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	1	0	1	1	0	0	0	0	1	0	1	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
11	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
10	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
9	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
8	PLL0ST	1	R	PLL circuit 0 status Displays PLL circuit 0 status (on or off). 0: PLL circuit 0 is turned off. The main clock is supplied as a clock output. 1: PLL circuit 0 is turned on. The output from PLL circuit 0 is supplied as a clock output.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
3	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
2	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
1	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
0	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.

## 7.5.4 PLL0 Control Register (PLL0CR)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	—

PLL0CR is a 32-bit readable/writable register. This register specifies the multiplication ratio of PLL circuit 0. When writing to this register, change only bits STC[6:0] (Read-modify-write).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	
	—	STC[6:0]						—	—	—	—	—	—	—	—	—	—
Initial value:	0	*1	*1	*1	*1	*1	*1	*1	0	0	0	0	0	0	0	0	
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R	
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	
Initial value:	0	0	0	MD14	0	0	0	1	0	0	0	0	0	0	0	0	
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
30 to 24	STC[6:0]	*1	R/W	PLL Circuit 0 Multiplication Ratio*2 PLL circuit 0 performs multiplication with a ratio of (setting + 1) The realized frequency has the following relationship. $(\text{PLL0}/\text{VCO}) = (\text{PLL0 reference clock}) \times (\text{setting} + 1) \times 2$ $(\text{PLL0 output}) = (\text{SYS-CPU divider1 input}) = \text{PLL0}/\text{VCO} \times 1/2$ $= (\text{PLL0 reference clock}) \times (\text{setting} + 1)$  0111111: $\times 64$ 1000000: $\times 65$ (Ex: 20 MHz $\times 65 = 1300$ MHz ) : 1000101: $\times 70$ (Ex: 20 MHz $\times 70 = 1400$ MHz ) 1001010: $\times 75$ ((Ex: 20 MHz $\times 75 = 1500$ MHz ) [RZ/G1M and RZ/G1N] 1101010: $\times 107$ (Ex: 13 MHz $\times 107 = 1391$ MHz )  [RZ/G1H] Set the PLL circuit 0 frequency (PLL0 output frequency) between 1250 MHz to 1400 MHz. [RZ/G1M and RZ/G1N] Set the PLL circuit 0 frequency (PLL0 output frequency) between 1250 MHz to 1500 MHz.
23 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12	—	MD14	R	Reserved This bit is always read as the same value with MD14. The write value should always be the same value with MD14.

Bit	Bit Name	Initial Value	R/W	Description
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	—	1	R	Reserved These bits are always read as 1. The write value should always be 1.
7 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

- Notes:
1. Initial value of STC[6:0] is determined by MD14 and MD13 as shown in Table 7.6.
  2. Actual multiplication ratio of PLL0 VCO to the reference clock of PLL0 is  $(\text{setting} + 1) \times 2$ . The factor "2" is derived from the fixed divider in the PLL feedback loop. The input clock to the SYS-CPU divider 1 is generated by dividing PLL0 VCO by 2. That is why the input clock frequency to the SYS-CPU divider 1 is expressed as  $(\text{STC}[6:0] + 1) \times (\text{reference clock of PLL0})$ .

### 7.5.5 RGX Control Register (RGXCR)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	—

RGXCR is a 32-bit readable/writable register. This register enables/disables the external logic for SGX Series5.

[Usage Note]

Bit 16 in RGXCR should be set to 1 before enabling the GPU (3DG/3DGE) of the RZ/G1H, M and N.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SGXEX
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	SGXEX	0	R/W	Disable external logic for SGX Series5 0: Enable external logic for SGX Series5 1: Disable external logic for SGX Series5 Note: When using the GPU, set this bit to 1 before enabling the GPU.
15 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

### 7.5.6 SDHI Clock Frequency Control Register (SDCKCR)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

SDCKCR is a 32-bit readable/writable register. This register controls SDH clock (SDH $\phi$ ), SDHI0 clock (SD0 $\phi$ ) and SDHI1 clock (SD1 $\phi$ ) frequency. This register should be set before SDHI modules are operated. Do not access SDHI0 and SDHI1 modules during changing the clock frequency of SDH $\phi$ , SD0 $\phi$ , and SD1 $\phi$  or stopping these clocks.

R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	CKSTP	1	R/W	Clock Stop 0: Supplies clock to RCAN 1: Stops clock to RCAN
7 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.

## 7.6 Changing Frequency

RZ/G1H

RZ/G1N

RZ/G1M

RZ/G1E

### [RZ/G1H/M/N]:

The clock frequencies controlled by the frequency control registers can be changed either by changing the multiplication ratio of PLL circuits 0 or by changing the division ratio of the dividers. They are controlled by software through the frequency control registers. The methods are described below.

### [RZ/G1E]:

The clock frequencies controlled by the frequency control registers can be changed by changing the division ratio of the dividers. They are controlled by software through the frequency control registers. The methods are described below.

### 7.6.1 Changing Multiplication Ratio of PLL circuit 0

#### [RZ/G1H/M/N]:

Changing the multiplication ratio of PLL circuit 0 can be done by modifying the STC [6:0] bits in PLL0CR. The PLL oscillation settling time is internally detected automatically. If the oscillation of PLL circuits is settled, 1 can be read through PLL0ST bit of PLLECR.

### 7.6.2 Changing Division Ratio

#### [RZ/G1H/M/N]:

Changing the frequency of  $Z\phi$ ,  $ZT\phi$ ,  $ZTR\phi$ , and  $ZTRD2\phi$  can be done by modifying each set of bits for setting the division ratio in FRQCRB and FRQCRC. After setting new ratio, write 1 to the KICK bit in FRQCRB to start the division ratio change. Before changing the division ratio, the KICK bit must be checked for 0. After 1 is written to the KICK bit in FRQCRB, 0 can be read when the change of new division ratio is completed. While the setting is being changed with the KICK bit being 1, do not modify FRQCRB and FRQCRC. When the KICK bit is read as 1, do not write 0 into the KICK bit.

#### [RZ/G1E]:

Changing the frequency of  $ZT\phi$ ,  $ZTR\phi$ , and  $ZTRD2\phi$  can be done by modifying each set of bits for setting the division ratio in FRQCRB. After setting new ratio, write 1 to the KICK bit in FRQCRB to start the division ratio change. Before changing the division ratio, the KICK bit must be checked for 0. After 1 is written to the KICK bit in FRQCRB, 0 can be read when the change of new division ratio is completed. While the setting is being changed with the KICK bit being 1, do not modify FRQCRB. When the KICK bit is read as 1, do not write 0 into the KICK bit.

## 7.7 Notes on Board Designing

RZ/G1H

RZ/G1N

RZ/G1M

RZ/G1E

### 7.7.1 Bypass Capacitor

Insert laminated ceramic capacitors as bypass capacitors for each  $V_{SS}/V_{CC}$  pair. Mount the bypass capacitor near the power supply pins of the LSI. Use components with a frequency characteristic suitable for the operating frequency of the LSI, as well as a suitable capacitance value.

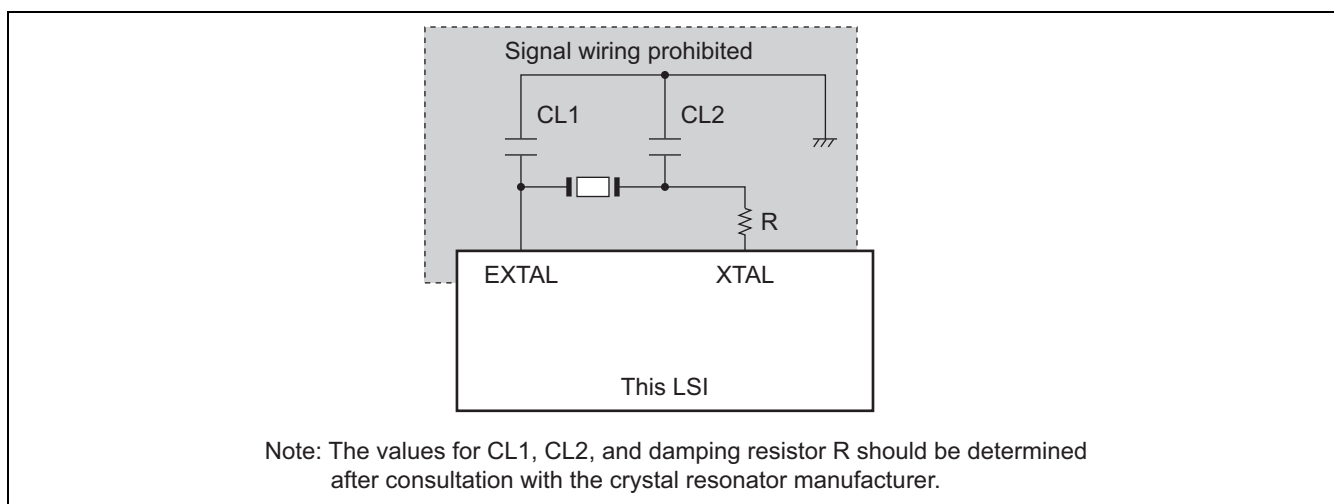

### 7.7.2 Notes on Using a PLL Oscillation Circuit

Keep the wiring from the PLL  $V_{DD}$  and  $V_{SS}$  connection pattern to the power supply pins short, and make the pattern width large, to minimize the inductance component.

The analog power supply system of the PLL circuits is sensitive to noise. Therefore system malfunction may occur by the intervention with another power supply. Do not supply the analog power supply with the same resource as the digital power supply of  $V_{DD}$  and  $V_{CCQ}$ .

### 7.7.3 When Using an External Crystal Resonator

Place the crystal resonator, capacitors CL1 and CL2, and damping resistor R as close to the XTAL, and EXTAL pins as possible. To minimize induction and thus obtain oscillation at the correct frequency, the capacitors to be attached to the resonator must be grounded to the same ground. Do not bring wiring patterns close to these components.

**Figure 7.3 Note on Using a Crystal Resonator**

### 7.7.4 When Supplying External Clock from EXTAL Pin

Leave the XTAL pin open.

## 7A. Module Standby and Software Reset

RZ/G1H	RZ/G1N
RZ/G1M	RZ/G1E

The CPG functions related to module control are explained in this section. Under software control, the CPG is capable of turning the supply of clock signals to individual modules on or off and of resetting individual modules.

### 7A.1 Features

- Module standby  
Clock supply to specified modules is stopped by setting the module stop control register bits.  
Two registers (MSTPSR and SMSTPCR) for one module, and supply of the clock signal to a module is stopped when all two register bits are set to 'stop'.
- Software Reset  
Initialize the specified module by setting the software reset register bit.

### 7A.2 Input/Output Pins

There is no input/output pin related with this function.

### 7A.3 Register Descriptions

Table 7A.1 lists of the CPG registers for module standby and software reset. Table 7A.2 lists the register states in response to a reset.

### 7A.3.1 Module Stop Status Register (MSTPSRn (n = 0 to 5, 7 to 11))

MSTPSRn is a 32-bit readable register that indicates whether the on-chip modules are in the module standby state.

Setting a bit in this register to 1 stops supply of the clock signal to the corresponding module and the setting a bit to 0 enables clock supply to the corresponding module.

Positions, names and initial values of each bit are shown below. The Tables from 7A.3 to 7A.13 show the assignment of modules to bits.

### 7A.3.2 Module Stop Control Register (SMSTPCRn (n = 0 to 5, 7 to 11))

SMSTPCRn is 32-bit readable/writable register which control supply of the clock signal to the modules assigned to the corresponding bits. SMSTPCRn register is for the AP system CPU core. When the control bit in SMSTPCRn is set to 1 (halt), input of the clock signal to the module is halted (the module is on standby). When a corresponding control bit in SMSTPCRn is 0, the clock signal is supplied. Whether the module is stopped or not can be checked through a corresponding bit in MSTPSRn register.

Setting a bit in this register to 1 requests that the module be placed on standby and setting a bit to 0 requests that the module operate.

The reserved bits should be set to the values read from the bits. Positions, names and initial values of each bit are shown below. The Tables from 7A.14 to 7A.24 show the assignment of modules to bits.

**7A.3.2.1 System Module Stop Control Register 0 (SMSTPCR0)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### 7A.3.3 Software Reset Register (SRCRn (n = 0 to 5, 7 to 11))

Each SRCRn is a 32-bit readable/writable register. Each effective bit is assigned to a module in the chip. Writing 1 to a given bit resets the corresponding module. Writing 1 to a given bit of the software reset clearing register (SRSTCLRn (n = 0 to 11)) clears the corresponding bit of SRCRn and releases the module from the reset state. SRCRn is written in a read-modify-write sequence but writing to SRSTCLRn can proceed by simply setting the target bits to 1. After writing 1 to a software reset bit in SRCRn, ensure that the module has actually been initialized by waiting for at least one cycle of the RCLK clock before writing 1 to the corresponding bit of SRSTCLRn to release the module from the reset state. Before applying a software reset to a module connected to the AXI, make sure that any data transfer to the module is complete.

Positions, names and initial values of each bit are shown below. The Tables from 7A.25 to 7A.35 show the assignment of modules to bits.

### 7A.3.4 Software Reset Clearing Register n (SRSTCLRn (n = 0 to 5, 7 to 11))

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Each SRSTCLRn is a 32-bit write-only register. Each effective bit is assigned to a module in this chip. Writing 1 to a given bit clears the corresponding bit of SRCRn and releases the corresponding module from the reset state in which it was placed by writing 1 to the bit of SRCRn. Write 0 to the reserved bits of these registers.

Positions, names and initial values of each bit are shown below. The Tables from 7A.35 to 7A.45 show the assignment of modules to bits.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

## 7B. Advanced Power Management Unit for AP-System Core (APMU)

RZ/G1H

RZ/G1N

RZ/G1M

RZ/G1E

### 7B.1 Overview

The AP-system core power management unit (APMU) is a module to control power supply and clock supply to the AP-system core.

This module includes the following function:

- Controls power supply to each CPU core and L2 cache area.

The APMU includes the following submodule:

- Power supply control unit (PCCU) which controls the power supply to each CPU core and L2 cache area.

### 7B.2 Input/Output Pins

There is no input/output pin related with this function.

### 7B.3 Register Descriptions

Table 7B.1 lists the registers of the APMU. All registers listed in this table are cleared by the reset.

**Table 7B.1 Register Configurations**

Register Name	Abbreviation	R/W	Address	Access Size	RZ/G Series Products

Notes: The register address map "H'E615 4xxx" is to share the same address between registers for Cortex-A15 and registers for Cortex-A7.

1. Cortex-A7 access to this address is access to this register for RZ/G1H.  
Cortex-A7 access to the address H'E615 4xxx is prohibited for RZ/G1E.  
Use the address H'E615 1xxx to access these registers for RZ/G1E.
2. Cortex-A15 access to this address is access to this register.

**7B.3.1 Cortex-A7/Cortex-A15 CPU<sub>n</sub> Power Status Control Register (CA7CPU<sub>n</sub>CR, CA15CPU<sub>n</sub>CR (n = 0 to 3))**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Cortex-A7/Cortex-A15 CPU<sub>n</sub> power status control registers are 32-bit readable/writable registers of PCCU. These registers define the operation of related CPU when the CPU<sub>n</sub> core issues WFI instruction. Please write to these registers while the power of related CPU is ON.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	CPUPWR	00	R/W	CPU <sub>n</sub> PWR Bit Defines the power supply of corresponding CPU <sub>n</sub> when the CPU <sub>n</sub> issues WFI instruction. 00: Sleep mode 11: CoreStandby mode (power-cut of CPU core, L1\$) Other than above: Setting prohibited These bits are automatically cleared to 00 when the PCCU completes CoreStandby instruction after 11 is written to these bits.

### 7B.3.2 Cortex-A7/Cortex-A15 Common Power Control Register (CA7CPUCMCR, CA15CPUCMCR)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Cortex-A7/Cortex-A15 common power control registers are 32-bit readable/writable registers. These registers define power supply control of CPU peripheral (SCU and L2 cache controller) of AP-system core (Cortex-A7) and CPU peripheral (SCU and L2 cache controller) of AP-system core (Cortex-A15). The CMPWR bits of this register define the operation when all CPU cores are in the CoreStandby state.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	L2RST	—	—	CMPWR	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	L2RST	0	R/W	CPU L2 Reset Control Bit Defines the power supply when all of the CPUs in the cluster are in CoreStandby mode (power-off). 0: Normal mode 1: L2 dormant mode
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	CMPWR	00	R/W	CPU Common Power Control Bit Defines the power supply when all of the CPUs in the cluster are in CoreStandby mode (power-off). 00: Normal mode, CPU peripheral (SCU and L2 cache controller) ON 01: Setting prohibited 10: L2 dormant mode, CPU peripheral (SCU and L2 cache controller) OFF 11: Setting prohibited

### 7B.3.3 Cortex-A7/Cortex-A15 CPU Wake Up Control Register (CA7WUPCR, CA15WUPCR)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Cortex-A7/Cortex-A15 CPU wake up control registers are 32-bit readable/writable registers of PCCU. These registers request power on of each CPU core. Writing 1 to the CPU<sub>n</sub>WUP bit wakes up the corresponding CPU<sub>n</sub>, and the CPU<sub>n</sub> starts operation from the reset vector. Each bit is automatically cleared to 0 after the wake up procedure is finished.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Bit Name	Initial Value	R/W	Description
13, 12	CPU3ST [1:0]	11	R	[RZ/G1H]: CPU3 Status Bit Displays CPU3 status. 00: Run mode 11: CoreStandby mode Other than above: Invalid [RZ/G1M/N/E]: Reserved These bits are always read as 11.
11, 10	—	All 0	R	Reserved These bits are always read as 0.
9, 8	CPU2ST [1:0]	11	R	[RZ/G1H]: CPU2 Status Bit Displays CPU2 status. 00: Run mode 11: CoreStandby mode Other than above: Invalid [RZ/G1M/N/E]: Reserved These bits are always read as 11.
7, 6	—	All 0	R	Reserved These bits are always read as 0.
5, 4	CPU1ST [1:0]	11	R	CPU1 Status Bit Displays CPU1 status. 00: Run mode 11: CoreStandby mode Other than above: Invalid
3, 2	—	All 0	R	Reserved These bits are always read as 0.
1, 0	CPU0ST [1:0]	00/11*	R	CPU0 Status Bit Displays CPU0 status. 00: Run mode 11: CoreStandby mode Other than above: Invalid

Note: \* RZ/G1H/CA7PSTR: The initial value is 00 when (MD7, MD6) = (L, H) for the Cortex-A7 booting.  
The initial value is 11 when (MD7, MD6) = (L, L) for the Cortex-A15 booting.  
RZ/G1H/CA15PSTR: The initial value is 00 when (MD7, MD6) = (L, L) for the Cortex-A15 booting.  
The initial value is 11 when (MD7, MD6) = (L, H) for the Cortex-A7 booting.  
RZ/G1M/CA15PSTR: The initial value is 00 when (MD7, MD6) = (L, L) for the Cortex-A15 booting.  
RZ/G1N/CA15PSTR: The initial value is 00 when (MD7, MD6) = (L, L) for the Cortex-A15 booting.  
RZ/G1E/CA7PSTR: The initial value is 00 when (MD7, MD6) = (L, H) for the Cortex-A7 booting.  
The MD[7:6] settings other than above are prohibited.

### 7B.3.5 Cortex-A7/Cortex-A15 Debug Resource Reset Control Register (CA7DBGRCR, CA15DBGRCR)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Cortex-A7/Cortex-A15 debug resource reset control registers are 32-bit readable/writable registers of PCCU. These registers enable the reset requests derived from power-shutoff to the AP-system CPU cores in the debug mode. When you write to these registers, please modify only the target bits you want to change (read-modify-write). In the debug mode, bits 24 to 19 must be set to all 1 before the AP-system cores first resume from power-shutoff. In the normal mode (i.e. not debug mode), writing all 1 to bits 24 to 19 doesn't disturb normal operation. Therefore the same code to write these registers can be applied for both debug mode and normal mode.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

## 7B.4 PCCU Function

RZ/G1H

RZ/G1N

RZ/G1M

RZ/G1E

### 7B.4.1 Power Control

The PCCU manages the CPU power supply when the CPU issues WFI instruction, and recovers from the low power state. Table 7B.2 shows power status of CPU.

**Table 7B.2 CPU Power Mode**

Power Mode	CPU# <i>n</i> Clock	CPU# <i>n</i> Power	CPU Peripheral (SCU and L2 Cache Controller) Power
Run mode	ON	ON	ON
Sleep mode	OFF	ON	ON
CoreStandby mode	OFF	OFF [RZ/G1H/M/N] ON (Pseudo Power OFF) [RZ/G1E]	ON
L2 dormant mode	OFF	OFF [RZ/G1H/M/N] ON (Pseudo Power OFF) [RZ/G1E]	OFF [RZ/G1H/M/N] ON (Pseudo Power OFF) [RZ/G1E]

**The following is method to enter each mode. [RZ/G1H]**

#### Sleep mode

Issue WFI instruction when the CPUPWR bits of CA7CPU<sub>n</sub>CR/CA15CPU<sub>n</sub>CR are B'00.

#### CoreStandby mode

Issue WFI instruction when the CPUPWR bits of CA7CPU<sub>n</sub>CR/CA15CPU<sub>n</sub>CR are B'11.

The CPUPWR bits of CA7CPU<sub>n</sub>CR/CA15CPU<sub>n</sub>CR are automatically cleared to B'00 when the PCCU completes CoreStandby operation. So the interrupt to CPU<sub>n</sub> is masked while CPUPWR bits of CA7CPU<sub>n</sub>CR/CA15CPU<sub>n</sub>CR are B'11. In the case of cancel, it is cancelled by setting B'00 to the CPUPWR bits of CA7CPU<sub>n</sub>CR/CA15CPU<sub>n</sub>CR.

#### L2 dormant mode

Issue WFI instruction when all of the conditions below are met:

Other CPU cores in the same CPU cluster are in the CoreStandby mode.

The CMPWR bits of CA7CPUCMCR/CA15CPUCMCR are B'10.

The L2RST bit of CA7CPUCMCR/CA15CPUCMCR is 1.

The CPUPWR bits of CA7CPU<sub>n</sub>CR/CA15CPU<sub>n</sub>CR are B'11, the other CPU

#### Run mode

Interrupt and reset of CPU recovers each CPU to the RUN mode.

**The following is method to enter each mode. [RZ/G1M/RZ/G1N]**

#### Sleep mode

Issue WFI instruction when the CPUPWR bits of CA15CPU<sub>n</sub>CR are B'00.

#### CoreStandby mode

Issue WFI instruction when the CPUPWR bits of CA15CPU<sub>n</sub>CR are B'11.

The CPUPWR bits of CA15CPUUnCR are automatically cleared to B'00 when the PCCU completes CoreStandby operation. So the interrupt to CPU is masked while CPUPWR bits of CA15CPUUnCR are B'11. In the case of cancel, it is cancelled by setting B'00 to the CPUPWR bits of CA15CPUUnCR.

#### L2 dormant mode

Issue WFI instruction when all of the conditions below are met:

Other CPU cores in the same CPU cluster are in the CoreStandby mode.

The CMPWR bits of CA15CPUCMCR are B'10.

The L2RST bit of CA15CPUCMCR is 1.

The CPUPWR bits of CA15CPUUnCR are B'11, the other CPU

#### Run mode

Interrupt and reset of CPU recovers each CPU to the RUN mode.

**The following is method to enter each mode. [RZ/G1E]**

#### Sleep mode

Issue WFI instruction when the CPUPWR bits of CA7CPUUnCR are B'00.

#### CoreStandby mode

Issue WFI instruction with the CPUPWR bits of CA7CPUUnCR are B'11.

The CPUPWR bits of CA7CPUUnCR are automatically cleared to B'00 when the PCCU completes CoreStandby operation. So the interrupt to CPU is masked while CPUPWR bits of CA7CPUUnCR are B'11. In the case of cancel, it is cancelled by setting B'00 to the CPUPWR bits of CA7CPUUnCR.

#### L2 dormant mode

Issue WFI instruction when all of the conditions below are met:

Other CPU cores in the same CPU cluster are in the CoreStandby mode.

The CMPWR bits of CA7CPUCMCR are B'10.

The L2RST bit of CA7CPUCMCR is 1.

The CPUPWR bits of CA7CPUUnCR are B'11, the other CPU

#### Run mode

Interrupt and reset of CPU recovers each CPU to the RUN mode.

# 8. Reset (RST)

RZ/G1H	RZ/G1N
RZ/G1M	RZ/G1E

The reset (RST) consists of the bus interface block and registers related to reset control. Timing of the bus interface block is based on CPφ.

## 8.1 Features

The following functions are implemented by RST.

- Register-based reset control for the Cortex-A15 (present in the RZ/G1H, RZ/G1M, and RZ/G1N), and Cortex-A7 (present in the RZ/G1H and RZ/G1E)
- Latching of the levels on mode pins when PRESET# is negated
- Mode monitoring register
- Boot address registers for the Cortex-A15, and Cortex-A7

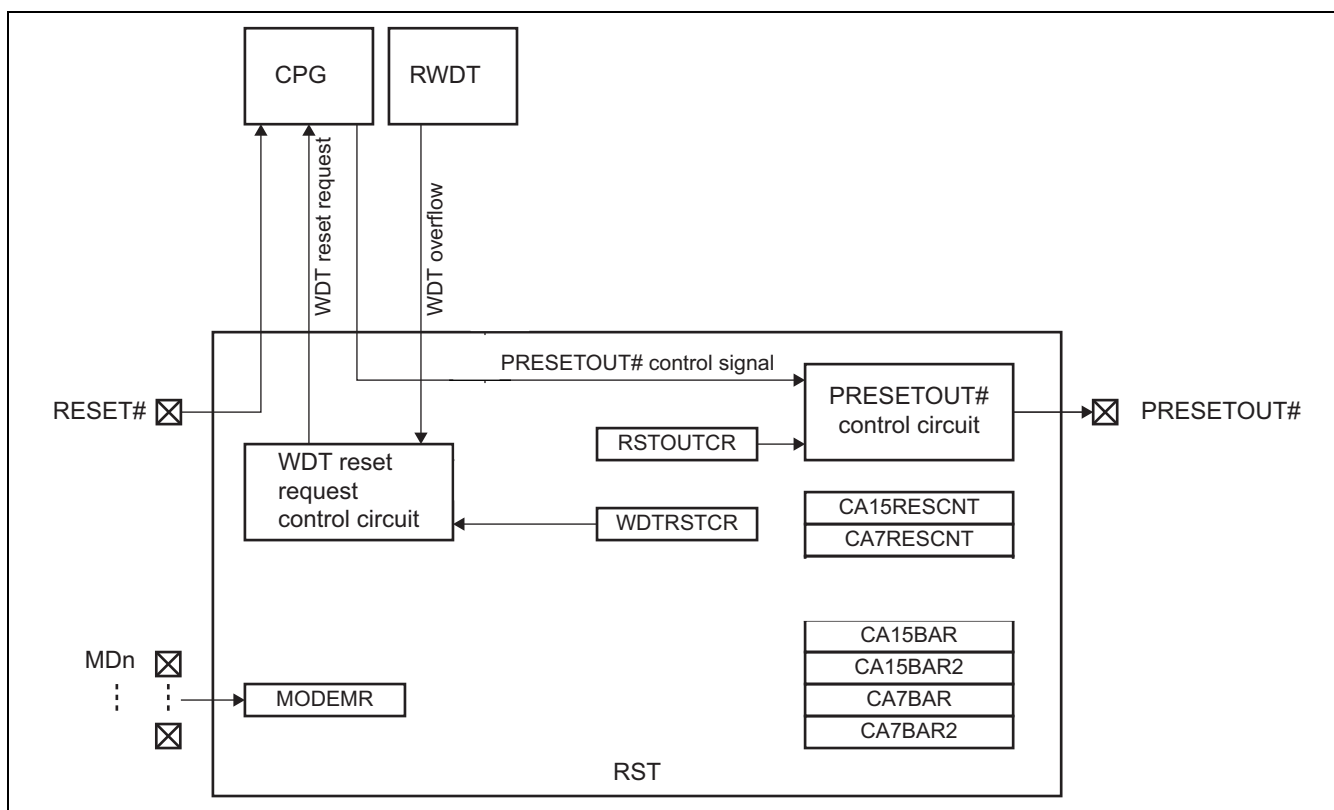

Figure 8.1 Block Diagram of RST

## 8.2 WDT reset

- WDT resets can be issued by the RWDT.
- WDRSTCR controls the permission or prohibition of WDT resets.
- The reset (RST) module is not initialized by a WDT reset.

### 8.3 LSI Pins Connected to RST

The following table lists the pins connected to the RST.

**Table 8.1 External Pins for RST**

Pin Name	Function	Direction	Remarks	RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
MD0 to MD14	Mode pins	IN	Mode pins	√	√	√	√

### 8.4.2 Cortex-A15 Reset Control Register (CA15RESCNT)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	—

CA15RESCNT is a 32-bit readable/writable register, which can be accessed only in longwords.

This register specifies whether the reset is issued to Cortex-A15 CPU<sub>n</sub> (n = 0 to 3) or not. The upper word of the write value should always be the code value H'A5A5. If the code value is read, it is always read as 0.

This register is initialized on power on reset caused by PRESET#.

1, 0	—	All 1	R	Reserved When read, returns 1. The write value should always be 1.

### 8.4.3 Cortex-A7 Reset Control Register (CA7RESCNT)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	—	—	√

CA7RESCNT is a 32-bit readable/writable register, which can be accessed only in longwords.

This register specifies whether the reset is issued to Cortex-A7 CPU<sub>n</sub> (n = 0 to 3) or not. The upper word of the write value should always be the code value H'5A5A. If the code value is read, it is always read as 0.

This register is initialized on power on reset caused by PRESET#.

#### [RZ/G1H]:

#### 8.4.4 Watchdog Timer Reset Control Register (WDTRSTCR)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

WDTRSTCR is a 32-bit readable/writable register, which can be accessed only in longwords.

This register specifies whether the watchdog timer overflow should be masked or not as a reset trigger. The upper word of the write value should always be the code value H'A55A. If the code value is read, it is always read as 0.

This register is initialized on power on reset caused by PRESET#.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Code value (H'A55A)															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	Code value	H'0000	R/W	Code value (H'A55A) When read, returns 0.
15 to 2	—	All 0	R	Reserved When read, returns 0. The write value should always be 0.
1	—	1	R	Reserved When read, returns 1. The write value should always be 1.
0	RWDT_ RSTMSK	1	R/W	RWDT Reset Mask This bit is used to mask the detection of RWDT overflow. 0: Reset request 1: Not reset request

### 8.4.5 PRESETOUT Control Register (RSTOUTCR)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

RSTOUTCR is a 32-bit readable/writable register, which can be accessed only in longwords.

This register controls the output level of external LSI pin RESETOUT# by software.

This register is initialized on power on reset caused by PRESET#.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RES OUT
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved When read, returns 0. The write value should always be 0.
0	RESOUT	1	R/W	PRESETOUT# control by software This bit is used to specify the output level of PRESETOUT#. 0: PRESETOUT# is asserted 1: PRESETOUT# is negated

#### 8.4.6 SYS Boot Address Register (SBAR)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	—

SBAR is a link to CA7BAR\* or CA15BAR\*. SBAR is write-only register. Therefore read access to SBAR is prohibited.

If System CPU (Cortex-A7\*) accesses to SBAR, System CPU (Cortex-A7\*) can write to CA7BAR\*.

If System CPU (Cortex-A15\*) accesses to SBAR, System CPU (Cortex-A15\*) can write to CA15BAR\*.

Note: \* Cortex-A7 is not supported by RZ/G1M, and RZ/G1N. Cortex-A15 is not supported by RZ/G1E.

#### 8.4.7 SYS Boot Address Register2 (SBAR2)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	—

SBAR2 is a link to CA7BAR2\* or CA15BAR2\*. SBAR2 is write-only register. Therefore read access to SBAR2 is prohibited.

If System CPU (Cortex-A7\*) accesses to SBAR2, System CPU (Cortex-A7\*) can write to CA7BAR2\*.

If System CPU (Cortex-A15\*) accesses to SBAR2, System CPU (Cortex-A15\*) can write to CA15BAR2\*.

Note: \* Cortex-A7 is not supported by RZ/G1M, and RZ/G1N. Cortex-A15 is not supported by RZ/G1E.

### 8.4.8 Cortex-A7 Boot Address Register (CA7BAR)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	—	—	√

CA7BAR is a 32-bit readable/writable register, which can be accessed only in longwords.

This register specifies the boot space of the System CPU (Cortex-A7).

This register is initialized on power on reset caused by PRESET#.

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	SBAR[39:18]	{H'00000, B'00}	R/W	System CPU (Cortex-A7) Boot Address When System CPU (Cortex-A7) accesses to the range of physical address from H'00 0000 0000 to H'00 0003 FFFF, the address bit in [39:18] is replaced by SBAR[39:18].
9 to 5	—	All 0	R	Reserved When read, returns 0. The write value should always be 0.
4	BAREN*2	0/1*1	R/W	BAREN bit 0: SBAR is not valid. 1: SBAR is valid.
3, 2	—	All 0	R	Reserved When read, returns 0. The write value should always be 0.
1, 0	BTMD[1:0]	00/10*1	R/W	Specifies the Boot area of System CPU (Cortex-A7) During Hardware Power On Reset the initial value of these bits depends upon MD3, MD2 and MD1 pin setting. 00: SBAR[39:18] is assigned to Boot address, set SBAR[17:0] to 0. 01: Prohibited. 10: Boots from Built-in memory. 11: Prohibited.

- Note:
- Initial value depends upon MD3, MD2 and MD1 pin setting.
  - Do not rewrite BAREN = 1 simultaneously with SBAR and BTMD. After completing the setting of SBAR and BTMD with BAREN = 0, set only BAREN = 1.  
For example: Change SBAR[39:18] from A to B, and BTMD[1:0] = 00  
Step 1: Write SBAR[39:18] = B, BAREN = 0, BTMD[1:0] = 00  
Step 2: Write SBAR[39:18] = B, BAREN = 1, BTMD[1:0] = 00

### 8.4.9 Cortex-A7 Boot Address Register2 (CA7BAR2)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	—	—	√

CA7BAR2 is a 32-bit readable/writable register, which can be accessed only in longwords. This register can be changed only in the secure mode.

This register specifies the boot space of the System CPU (Cortex-A7).

This register is initialized on power on reset caused by PRESET#.

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	SBAR2[39:18]	{H'00000, B'00}	R/W	System CPU (Cortex-A7) Boot Address2 When System CPU (Cortex-A7) accesses to the range of physical address from H'00 0000 0000 to H'00 0003 FFFF, the address bit in [39:18] is replaced by SBAR2[39:18].
9 to 5	—	All 0	R	Reserved When read, returns 0. The write value should always be 0.
4	BAREN*	0	R/W	BAREN bit 0: SBAR2 is not valid. 1: SBAR2 is valid.
3 to 1	—	All 0	R	Reserved When read, returns 0. The write value should always be 0.
0	VLD	0	R/W	VALID bit When 1 is set to this bit, System CPU (Cortex-A7) starts only from the address set to SBAR2. 0: System CPU (Cortex-A7) starts from the address set to SBAR. 1: System CPU (Cortex-A7) starts from the address set to SBAR2.

Note: \* Do not rewrite BAREN=1 simultaneously with SBAR2 and VLD. After completing the setting of SBAR2 and VLD with BAREN = 0, set only BAREN = 1.

For example: Change SBAR2[39:18] from A to B, and VLD = 1

Step 1: Write SBAR2[39:18] = B, BAREN = 0, VLD = 1

Step 2: Write SBAR2[39:18] = B, BAREN = 1, VLD = 1

### 8.4.10 Cortex-A15 Boot Address Register (CA15BAR)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	—

CA15BAR is a 32-bit readable/writable register, which can be accessed only in longwords.

This register specifies the boot space of the System CPU (Cortex-A15).

This register is initialized on power on reset caused by PRESET#.

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	SBAR[39:18]	{H'00000, B'00}	R/W	System CPU (Cortex-A15) Boot Address When System CPU (Cortex-A15) accesses to the range of physical address from H'00 0000 0000 to H'00 0003 FFFF, the address bit in [39:18] is replaced by SBAR[39:18].
9 to 5	—	All 0	R	Reserved When read, returns 0. The write value should always be 0.
4	BAREN*2	0/1*1	R/W	BAREN bit 0: SBAR is not valid. 1: SBAR is valid.
3, 2	—	All 0	R	Reserved When read, returns 0. The write value should always be 0.
1, 0	BTMD[1:0]	00/10*1	R/W	Specifies the Boot area of System CPU (Cortex-A15) During Hardware Power On Reset the initial value of these bits depends upon MD3, MD2 and MD1 pin setting. 00: SBAR[39:18] is assigned to Boot address, set SBAR[17:0] to 0. 01: Prohibited. 10: Boots from Built-in memory. 11: Prohibited.

- Note:
- Initial value depends upon MD3, MD2 and MD1 pin setting.
  - Do not rewrite BAREN = 1 simultaneously with SBAR and BTMD. After completing the setting of SBAR and BTMD with BAREN = 0, set only BAREN = 1.  
For example: Change SBAR[39:18] from A to B, and BTMD[1:0] = 00  
Step 1: Write SBAR[39:18] = B, BAREN = 0, BTMD[1:0] = 00  
Step 2: Write SBAR[39:18] = B, BAREN = 1, BTMD[1:0] = 00

### 8.4.11 Cortex-A15 Boot Address Register2 (CA15BAR2)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	—

CA15BAR2 is a 32-bit readable/writable register, which can be accessed only in longwords. This register can be changed only in the secure mode.

This register specifies the boot space of the System CPU (Cortex-A15).

This register is initialized on power on reset caused by PRESET#.

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	SBAR2[39:18]	{H'00000, B'00}	R/W	System CPU (Cortex-A15) Boot Address2 When System CPU (Cortex-A15) accesses to the range of physical address from H'00 0000 0000 to H'00 0003 FFFF, the address bit in [39:18] is replaced by SBAR2[39:18].
9 to 5	—	All 0	R	Reserved When read, returns 0. The write value should always be 0.
4	BAREN*1	0	R/W	BAREN bit 0: SBAR2 is not valid. 1: SBAR2 is valid.
3 to 1	—	All 0	R	Reserved When read, returns 0. The write value should always be 0.
0	VLD	0	R/W	VALID bit When 1 is set to this bit, System CPU (Cortex-A15) starts only from the address set to SBAR2. 0: System CPU (Cortex-A15) starts from the address set to SBAR. 1: System CPU (Cortex-A15) starts from the address set to SBAR2.

Note: \* Do not rewrite BAREN = 1 simultaneously with SBAR2 and VLD. After completing the setting of SBAR2 and VLD with BAREN = 0, set only BAREN = 1.  
For example: Change SBAR2[39:18] from A to B, and VLD = 1  
Step 1: Write SBAR2[39:18] = B, BAREN = 0, VLD = 1  
Step 2: Write SBAR2[39:18] = B, BAREN = 1, VLD = 1

## 8.5 Reset Timing

RZ/G1H	RZ/G1N
RZ/G1M	RZ/G1E

### 8.5.1 Power-On Reset by PRESET# Pin

Since the PLL circuit is initialized when the LSI enters the power-on reset state, the PLL oscillation settling time needs to be secured. This means that a high level must not be input to the PRESET# pin during the PLL oscillation settling time. For the power-on oscillation settling time ( $t_{OSC}$ ), see section 63, Electrical Characteristics.

After the state on the PRESET# pin input is changed from a low level to high level, the internal reset state continues until the flash ROM reset time (longer than 50  $\mu s$ ), the flash ROM holding time (longer than 5  $\mu s$ ) and the reset holding time elapse.

#### (1) Sequence for Turning on the Power

When the power is turned on, ensure that a low level is input to the PRESET# pin. A low level input is also needed on the TRST# pin.

Figure 8.2 Free-Running Mode

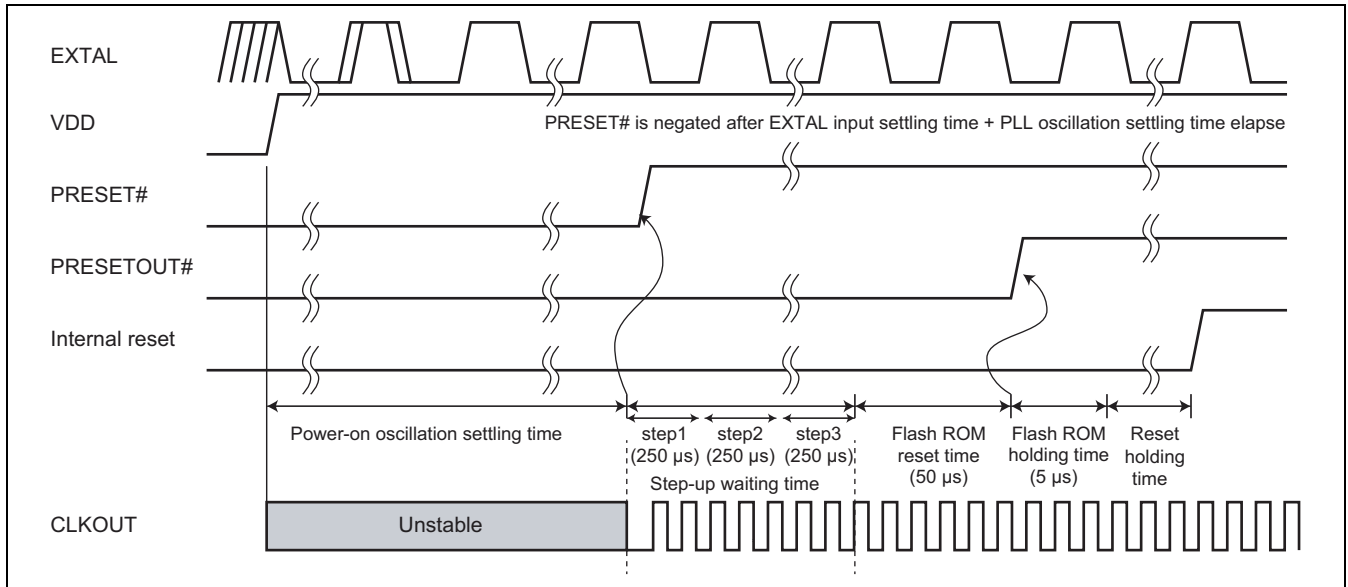

Figure 8.3 Step-Up Mode

## 8.6 Usage Notes

RZ/G1H	RZ/G1N
RZ/G1M	RZ/G1E

### 8.6.1 Usage of SYS Boot Address Register (SBAR) and SYS Boot Address Register 2 (SBAR2)

The SYS boot address register (SBAR) and SYS boot address register 2 (SBAR2) are write-only registers. Therefore read access to these registers is prohibited. Read CA7BAR\*/CA15BAR\* and CA7BAR2\*/CA15BAR2\*, if read access is required.

Note: \* Cortex-A7 is not supported by the RZ/G1M, and RZ/G1N. Cortex-A15 is not supported by the RZ/G1E.

### 8.6.2 Usage of Boot Address Register and Boot Address Register 2 (SBAR, SBAR2, CA15BAR, CA15BAR2, CA7BAR, and CA7BAR2)

The boot address register and boot address register 2 (SBAR, SBAR2, CA15BAR\*<sup>1</sup>, CA15BAR2\*<sup>1</sup>, CA7BAR\*<sup>1</sup> and CA7BAR2\*<sup>1</sup>) are not initialized by WDT reset. In the case of changing these boot address registers, the boot address must point to the address of internal RAMs. Because the internal RAMs are not initialized by WDT reset, the master boot processor can boot from them regardless of the selected boot device.

Notes: 1. Cortex-A7 is not supported by the RZ/G1M, and RZ/G1N. Cortex-A15 is not supported by the RZ/G1E.

Read WOVF bit in the register RWTCSSRA of RWDT by the program allocated on the internal RAMs pointed by the boot address registers and judge whether the cause of reset is WDT overflow or not. When the cause of reset is judged as WDT reset, apply appropriate processing, for example jump to the top address of mask ROM.

## 9. AP-System Core

RZ/G1H

RZ/G1N

RZ/G1M

RZ/G1E

### 9.1 Overview

The AP-System core is a core block equipped with ARM Cortex-A7\* and ARM Cortex-A15\*. For details on the functions of Cortex-A7 and Cortex-A15, see the relevant Technical Reference Manual.

**Table 9.1 Feature of the AP-System Core Block (Cortex-A15)**

	RZ/G1H	RZ/G1M/N
Version	r3p2	r3p2
Cluster Number	Cluster 0	Cluster 0

Note: Cortex-A7 is not supported by the RZ/G1M, and RZ/G1N.

## 9.2 Generic Counter

RZ/G1H

RZ/G1N

RZ/G1M

RZ/G1E

For the general explanation about Generic Counter, and the details of the relation between Generic Counter and Generic Timer, refer to the ARM manual. In this section, it is explained that the frequency for count-up of the Generic Counter.

### 9.2.1 Frequency for Counting Up

The generic timer counts up by one every clock edge of the following frequency continuously.

**Table 9.3** Frequency for count-up

	RZ/G1H	RZ/G1M/N	RZ/G1E
Count-up clock frequency	EXTAL × 1/2	EXTAL × 1/2	ZSφ × 1/8

The operating frequency of EXTAL is decided by mode pin setting. For details, see Table 7.5, PLL Multiplication Ratio in section 7, Clock Pulse Generator (CPG).

### 9.2.2 Counter Module Control and Status Registers

The base address of counter module control and status registers is H'E6080000.

For the details of these registers, refer to the ARM manual shown below.

DDI0406C2c\_arm\_architecture\_reference\_manual Appendix D.3 Counter module control and status registers.

### 9.2.3 How to Start a Generic Counter

Set bit 0 in CNTCR to 1 to start the Generic Counter when the CPU is placed in the secure mode.

### 9.2.4 Relation with a CoreSight Timestamp

The Generic Counter serves as the CoreSight Timestamp function.

For details, refer to the ARM manual shown below.

DDI0406C2c\_arm\_architecture\_reference\_manual Appendix D.1.2 Generic Timer relationship with CoreSight Timestamp counter.

## 9.3 Power-Down Mechanism

RZ/G1H

RZ/G1N

RZ/G1M

RZ/G1E

### 9.3.1 Overview

The AP-System core supports the following three power-down modes.

- AP-System core power down mode  
(CPUs and L2 Cache shutdown: A3SM = OFF (Cortex-A15)/A2KL = OFF (Cortex-A7))
- Core standby mode (each CPU)\*
- Sleep mode (clock stop, each CPU)
- L2 shutdown mode

In AP-System core power down mode, the power of the AP-System core area is shut down. This mode is intended to be used at long-time wait, and achieves the reduction of power consumption including leakage current cut-off. The system boots up from the reset vector at its return from AP-System core power down mode. For detail of the AP-system core power down control, see section 61, System Controller (SYSC).

In Core standby mode, all memories including L1 cache of the relevant CPU do not keep its contents, but the power of the SRAM of level 2 cache is supplied to keep its contents.

In L2 shutdown mode, all power of CPUs and L2 is shut down. So contents of both L1s and L2 are not to be retained.

For details of Core standby mode and L2 shutdown mode, see section 7B, Advanced Power Management Unit for AP-System Core (APMU).

Note: \* In RZ/G1E case, if each CPU enter into the core standby mode, the clock supply for each CPU is stopped even if CPU core is always supplied power. After the power-on reset, the CPU other than the master CPU is in the core standby mode. When using the CPU in the core standby mode, follow the power-on sequence in order to start supply of the clock.

## 9.4 Cache Coherent Interconnect (CCI-400)

RZ/G1H

RZ/G1N

RZ/G1M

RZ/G1E

Cache coherent interconnect combines interconnect and coherency function. It can connect two ACE masters, three ACE-Lite masters and three ACE-Lite slaves.

### 9.4.1 Functional Registers of CCI-400

Base address of the functional registers of CCI-400 is H'F0000000. For the details of these registers, refer to the following document.

CoreLink CCI-400 Cache Coherent Interconnect Revision r0p4 Technical Reference Manual  
(DDI0470D\_cci400\_r0p4\_trm.pdf).

### 9.4.2 Maximum Outstanding Setting

CCI-400 can adjust maximum number of outstanding request as shown in Table 9.4. You must set the same or lower value listed in Table 9.4.

**Table 9.4 Maximum Number of Outstanding Request**

		RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
Slave port 0	Read	32	32	32	32
	Write	32	16	16	16
Slave port 1	Read	32	32	32	32
	Write	32	16	16	16
Slave port 2	Read	32	32	32	32
	Write	32	32	32	32
Slave port 3	Read	16	16	16	16
	Write	16	16	16	16
Slave port 4	Read	32	32	32	32
	Write	32	32	32	32

### 9.4.3 System Address Map

The CCI-400 has the system address map. The address spaces defined in this map are split into 16 regions. The connection to each master port is defined by the value of ADDRMAPx[1:0] (x = 0 to 15) in advance. Table 9.5 shows System Address MAP of CCI-400. For the detail of address map, see the following document.

CoreLink CCI-400 Cache Coherent Interconnect Revision r0p4 Technical Reference Manual  
(DDI0470D\_cci400\_r0p4\_trm.pdf). 3.4 Address map

**Table 9.5 System Address Map for CCI-400**

Address Region	Address Range	Decode Value	Destination
ADDRMAP0	H'00_00000000 to H'00_1FFFFFFF	B'00	Master port 0 (SYS-AXI)
ADDRMAP1	H'00_20000000 to H'00_3FFFFFFF	B'00	Master port 0 (SYS-AXI)
ADDRMAP2	H'00_40000000 to H'00_5FFFFFFF	B'11	Master port 1/2 (DBSC3)
ADDRMAP3	H'00_60000000 to H'00_7FFFFFFF	B'11	Master port 1/2 (DBSC3)
ADDRMAP4	H'00_80000000 to H'00_9FFFFFFF	B'11	Master port 1/2 (DBSC3)
ADDRMAP5	H'00_A0000000 to H'00_BFFFFFFF	B'11	Master port 1/2 (DBSC3)
ADDRMAP6	H'00_C0000000 to H'00_DFFFFFFF	B'00	Master port 0 (SYS-AXI)
ADDRMAP7	H'00_E0000000 to H'00_FFFFFFFF	B'00	Master port 0 (SYS-AXI)
ADDRMAP8	H'01_00000000 to H'01_FFFFFFFF	B'11	Master port 1/2 (DBSC3)
ADDRMAP9	H'02_00000000 to H'03_FFFFFFFF	B'11	Master port 1/2 (DBSC3)
ADDRMAP10	H'04_00000000 to H'07_FFFFFFFF	B'11	Master port 1/2 (DBSC3)
ADDRMAP11	H'08_00000000 to H'0F_FFFFFFFF	B'00	Master port 0 (SYS-AXI)
ADDRMAP12	H'10_00000000 to H'1F_FFFFFFFF	B'00	Master port 0 (SYS-AXI)
ADDRMAP13	H'20_00000000 to H'3F_FFFFFFFF	B'00	Master port 0 (SYS-AXI)
ADDRMAP14	H'40_00000000 to H'7F_FFFFFFFF	B'00	Master port 0 (SYS-AXI)
ADDRMAP15	H'80_00000000 to H'FF_FFFFFFFF	B'00	Master port 0 (SYS-AXI)

## 9.5 Notes

RZ/G1H

RZ/G1N

RZ/G1M

RZ/G1E

### 9.5.1 L2 Cache Setting for Cortex-A15

Notes for L2 cache setting for Cortex-A15 are follows:

- The default value of “Tag RAM latency” is 2 cycles. You must change it to 3 cycles by accessing L2CTLR.
- The default value of “Data RAM setup” is 0 cycles. In case of RZ/G1H, you must change it to 1 cycle by accessing L2CTLR.
- The default value of “Data RAM latency” is 2 cycles. You must change it to 4 cycles by accessing L2CTLR.

**Table 9.6 L2 Cache Setting for Cortex-A15**

	RZ/G1H	RZ/G1M	RZ/G1N
Tag RAM latency (cycle)	3	3	3
Data RAM latency (cycle)	4	4	4
Data RAM setup (cycle)	1	0	0

Note: Cortex-A15 is not supported by the RZ/G1E.

## 10. Inter Connect RAM

RZ/G1H

RZ/G1N

RZ/G1M

RZ/G1E

### 10.1 Overview

Each RZ/G series products, RZ/G1H, RZ/G1M, RZ/G1N, and RZ/G1E provide a set of the Inter connect RAM.

### 10.2 Features

- Memory size:
  - Inter connect RAM0 : 72 Kbytes
  - Inter connect RAM1 : 4 Kbytes
  - Inter connect RAM2 : 256 Kbytes
- Undefined on power-on reset. Retained on other resets.
- Inter connect RAM take charge of buffer between CPUs.

**Table 10.1 Address Maps**

Register Name	R/W	Address	Access Size
Inter connect RAM2 direct access space	R/W	H'E630 0000 to H'E633 FFFF	8, 16, 32
Inter connect RAM0 direct access space	R/W	H'E63A 0000 to H'E63B 1FFF	8, 16, 32
Inter connect RAM1 direct access space	R/W	H'E63C 0000 to H'E63C 0FFF	8, 16, 32

Note: Do not write to any addresses other than listed above. Operations cannot be guaranteed if writing is attempted. Values read from addresses other than those listed above are undefined.

# 11. Interrupt Controller for AP-System Core (INTC-SYS)

RZ/G1H	RZ/G1N
RZ/G1M	RZ/G1E

This module handles system domain interrupt events.

## 11.1 Features

### (1) INTC-SYS

- Interrupt controller for AP-system core
- 32 programmable priority levels
- ARM-IRQ interrupt generation
- INTC-SYS peripheral interrupt

### (2) IRQC

- Common module to handle the external NMI/IRQ inputs
- Edge-triggered on rising, falling or both
- Level-sensitive on high or low values
- IRQ signal debouncing

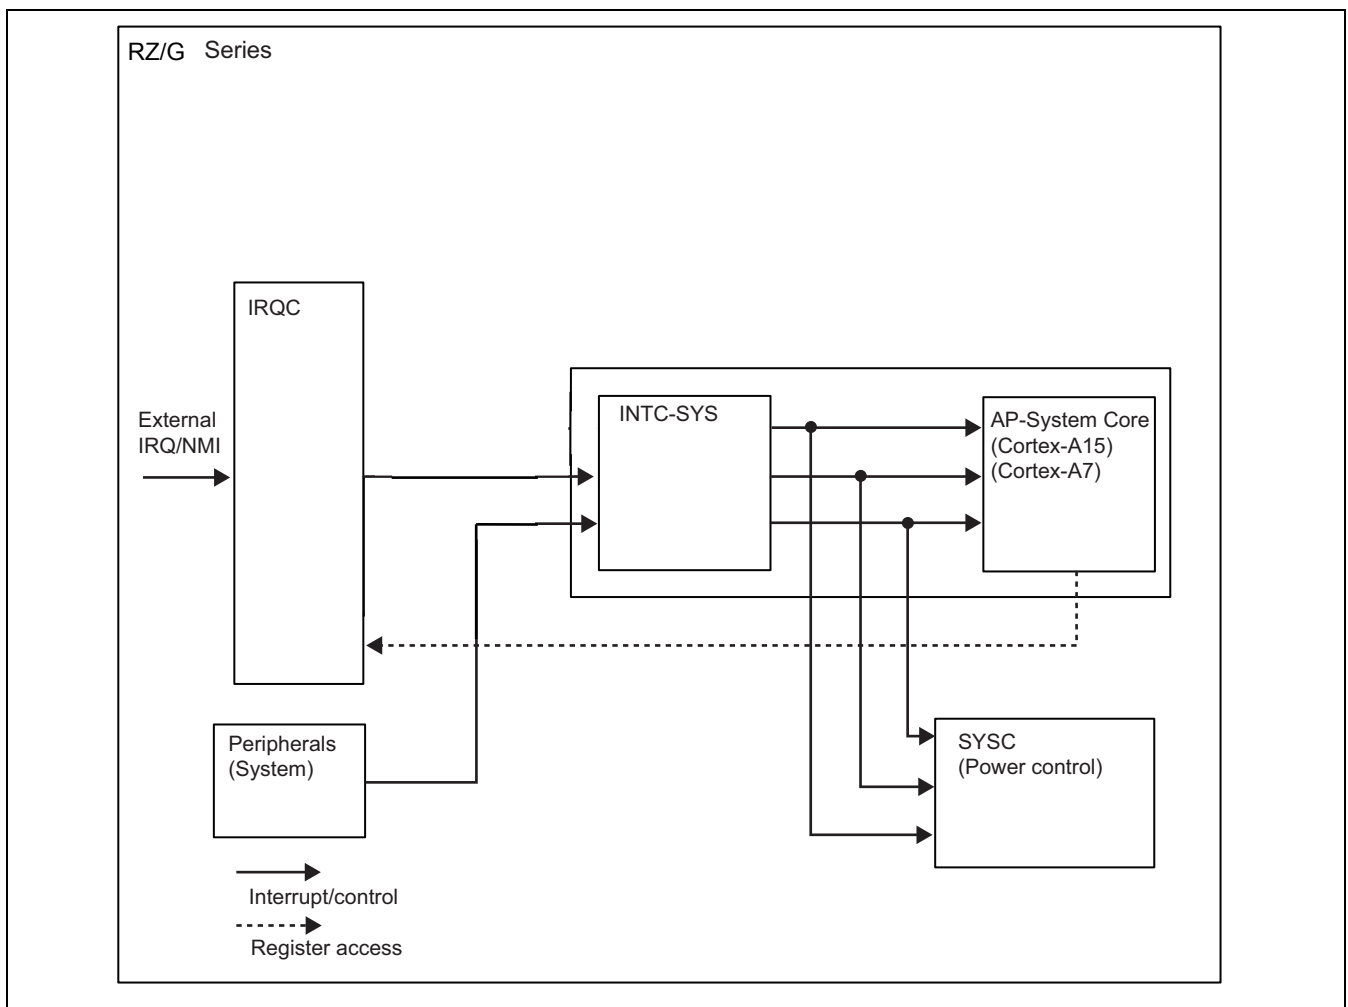

Figure 11.1 Block diagram of INTC

## 11.2 Interrupt Requests to AP-SYSTEM core

INTC-SYS is based on ARM Generic Interrupt Controller. For more information, see ARM Generic Interrupt Controller Architecture Specification and section 9, AP-System Core.

### 11.2.1 Interrupts Mapping

Table 11.1 shows the AP-system core interrupt controller (INTC-SYS) interrupt mapping.

Note: All interrupts should be level-sensitive configuration.

**Table 11.1 AP-System core (INTC-SYS) Interrupt Mapping**

## 11.3 Register Descriptions

This section describes the registers of INTC-SYS.

Module Name	Base Address
INTC-SYS CPU-IF	H'F100_2000
INTC-SYS Distributer-IF	H'F100_1000

### 11.3.1 INTC-SYS Register Configuration and Function Description

384 SPI interrupts are integrated into ID[415:32].

The INTC-SYS supports two CPU cores which are mapped as shown below.

	RZ/G1H	RZ/G1M/N	RZ/G1E
CPU0 interface	AP-System core (Cortex-A15) CPU0	AP-System core (Cortex-A15) CPU0	AP-System core (Cortex-A7) CPU0
CPU1 interface	AP-System core (Cortex-A15) CPU1	AP-System core (Cortex-A15) CPU1	AP-System core (Cortex-A7) CPU1
CPU2 interface	AP-System core (Cortex-A15) CPU2	Reserved	Reserved
CPU3 interface	AP-System core (Cortex-A15) CPU3	Reserved	Reserved
CPU4 interface	AP-System core (Cortex-A7) CPU0	Reserved	Reserved
CPU5 interface	AP-System core (Cortex-A7) CPU1	Reserved	Reserved
CPU6 interface	AP-System core (Cortex-A7) CPU2	Reserved	Reserved
CPU7 interface	AP-System core (Cortex-A7) CPU3	Reserved	Reserved

For more information of these registers, see ARM Cortex-A15/Cortex-A7 Technical Reference Manual and ARM GIC-400 Generic Interrupt Controller Technical Reference Manual.

## 11.4 External Interrupt Controller (IRQC)

RZ/G1H

RZ/G1N

RZ/G1M

RZ/G1E

The IRQC is a common sub-module of interrupt controllers. This sub-module provides interrupt from external device and inter-domain communication.

### 11.4.1 Input/Output Pins

Table 11.2 shows the INTC pin configuration.

**Table 11.2 Pin Configuration**

Pin Name	Function	I/O	Description
IRQn (n = 0 to 3) RZ/G1H (n = 0 to 9) RZ/G1M/N, E	External interrupt input pins	Input	Input of IRQn interrupt request signals from external device. All IRQ signals are always active.
NMI	External non maskable Interrupt input pins	Input	Input of NMI interrupt request signal from external device.

### 11.4.2 Clocking and Pulse Width

This module uses 2 clocks:

Module clock: CP $\phi$ .

Debounce clock: RCLK.

Because of sampling operation, the minimum pulse width on IRQ request signal is five module clock cycles.

### 11.4.3 Block Diagram

Figures 11.2 and 11.3 are block diagrams of IRQC.

The event detector block detects external IRQn, and supports noise reduction and edge detection.

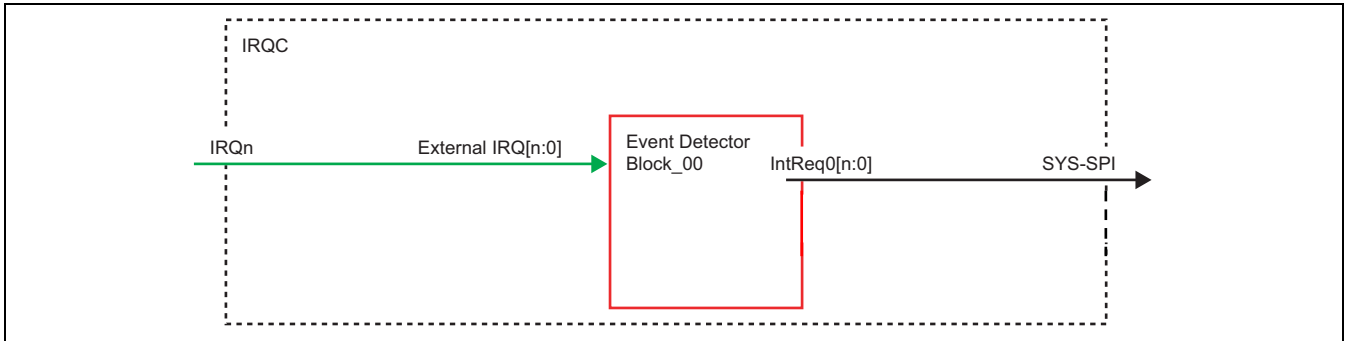

Figure 11.2 IRQC Block Diagram1

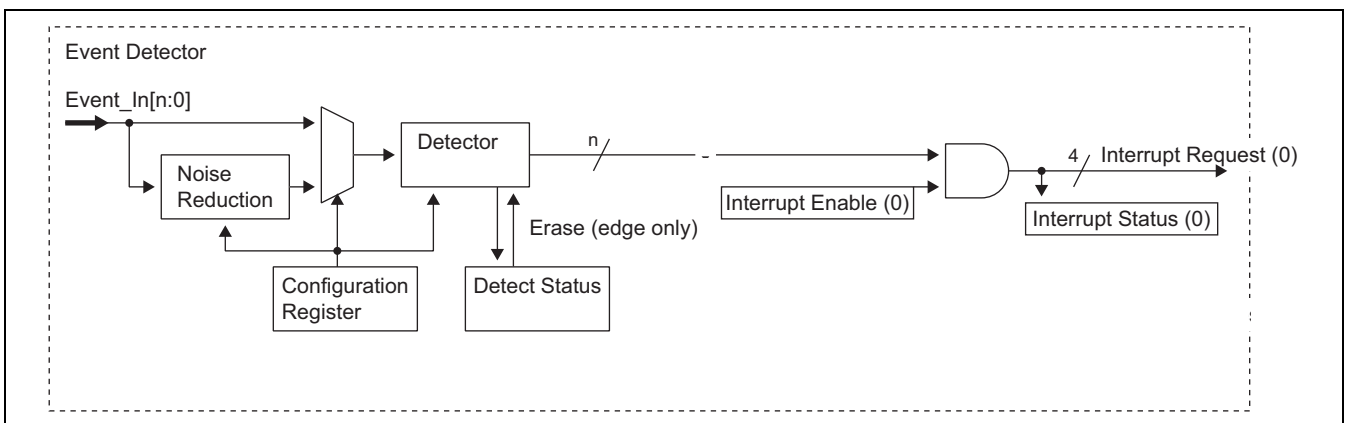

Figure 11.3 IRQC Event Detector

### 11.4.4 Register Descriptions

Table 11.3 shows the base address of each block and Tables 11.4 to 11.6 show register configuration.

**Table 11.3 IRQC Base Address**

Module Name	Base Address
IRQC	H'E61C 0000
IRQC event detector block	H'E61C 0000
NMI event detector block	H'E61C 0400
NMI mask lock block	H'E61C 0A00

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DBGCODE	All 0	R/W	NMI mask lock debug code setting

### 11.4.5 NMI Mask Lock Feature

NMI can be masked by setting NMI mask register. If you set the lock code to NMI lock code register and set the same lock code to NMI lock set register, then NMI cannot be masked by software (locked NMI mask). If you want to unlock NMI mask, you need to set DBGEN bit of NMI debug control register and set the unlock code to the NMI debug code register.

### 11.4.6 Procedure of NMI Mask Lock

- Lock feature
  1. Write the lock code to NMI lock code register  
ex) Write32 (IRQC\_BASE + H'0A04), H'00ACCE55
  2. Write the lock code to NMI mask lock set register  
ex) Write32 (IRQC\_BASE + H'0A00), H'00ACCE55
  3. Write access to NMI lock code register and NMI mask lock set register  
— Check whether these registers cannot be updated
- Unlock feature
  1. Set enable bit to NMI debug control register  
ex) Write32 (IRQC\_BASE + H'0A08), H'00000001
  2. Write unlock code to NMI debug code register  
ex) Write32 (IRQC\_BASE + H'0A0C), H'558CCAFF
  3. Write access to NMI lock code register and NMI mask lock register  
— Check whether these registers can be updated

## 11.5 Usage Note

### 11.5.1 Under the particular condition, there is a possibility to be delayed to enter into the interrupt handler for AP-System Core.

[Description]

Figure 11.4 shows the internal logic of INTC-SYS. When INTC-SYS receive the interrupt from each peripheral IPs or internal registers are accessed by software, the clock controller in INTC-SYS module can start the clock supply to the internal logic.

After sixteen cycles of starting clock supply, the clock controller stops clock supply automatically.

If both the timing of being stopped clock supply (after sixteen cycle of clock supply) in INTC-SYS, and the timing of receiving the asynchronous interrupt are conflicted, clock supply sometimes stops unnecessarily. Then the corresponding interrupt are blocked unless another interrupts are received. As a result, the timing entering into the interrupt handler for AP-System core is delayed.

[Alternative]

In order to avoid this condition, it is necessary to resume clock supply periodically by accessing the internal registers of INTC-SYS.

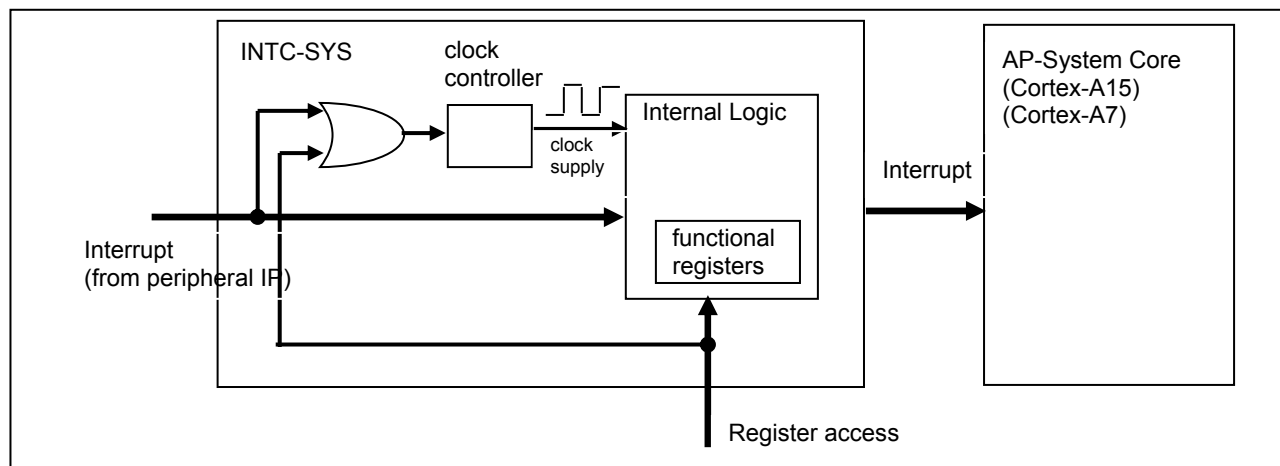

Figure 11.4 internal logic of INTC-SYS

## 12. AXI-bus

RZ/G1H

RZ/G1N

RZ/G1M

RZ/G1E

### 12.1 Overview

The AXI-bus is an on-chip interconnect bus based on the AMBA® Advanced eXtensible Interface (AXI) protocol specification. The AXI-bus has the following domains arranged in a hierarchical structure.

- Media domain AXI (MXI)
- Audio domain AXI
- System domain AXI
- CPU domain AXI
- DMA domain AXI

#### 12.1.1 Features

The AXI-bus has the following features.

- Frequency: 260 MHz
- Bus width: 256 bits or 128 bits
- High bandwidth and low latency
- Split transaction
- Separate data channels for reading and writing
- Quality-of-Service (QoS)
- Low-power function
- Secure access function

QoS is an extension to the standard AXI4 functionality, and allows control over the latency and bandwidth for the main memory.

### 12.1.2 Block Diagram

Figure 12.1 is a block diagram of the AXI-bus.

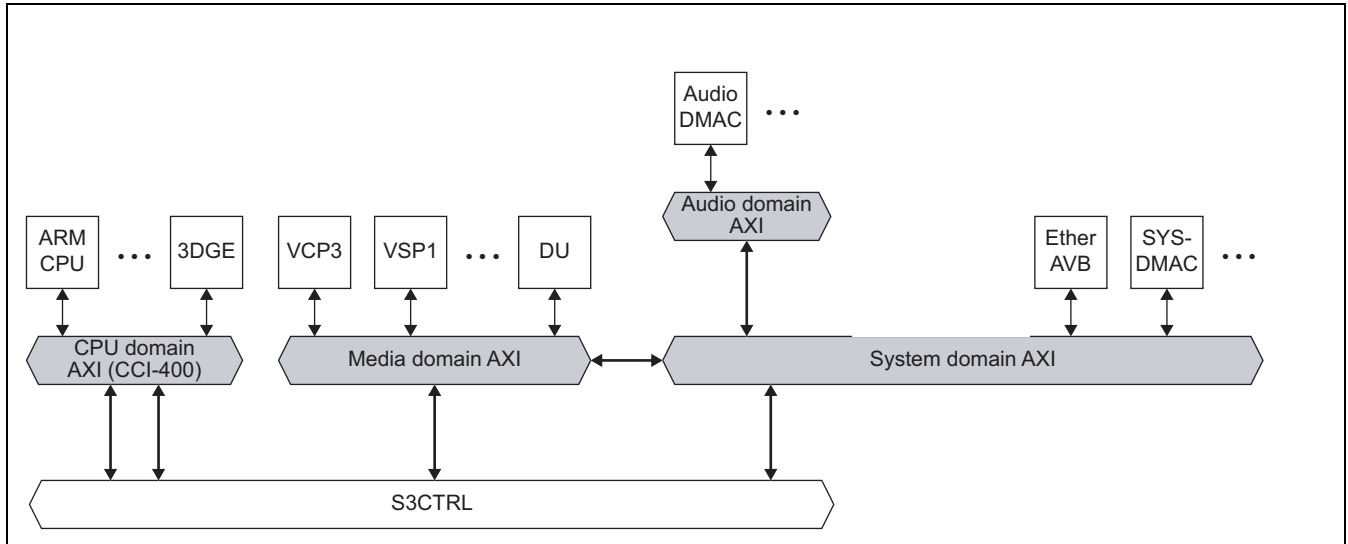

Figure 12.1 Block Diagram of AXI-bus

### 12.1.3 Input/Output Pins

No external pins are supported.

#### 12.1.4 Register Base Address of AXI-bus

Base address of registers is allocated to following address. The method of setting is provided separately.

- H'FF80\_0300 to H'FF80\_21FF (system domain)
- H'FF82\_0100 to H'FF82\_21FF (audio domain)
- H'FF84\_0100 to H'FF84\_21FF (DMA domain)
- H'FF85\_0100 to H'FF84\_21FF (DMA domain)
- H'FF86\_0100 to H'FF86\_21FF (system domain)
- H'FF87\_2000 to H'FF87\_21FF (media domain)
- H'FF88\_0100 to H'FF88\_21FF (CPU domain)
- H'FE96\_4100 to H'FE96\_7FFF (media domain)

### 12.1.5 Register Configuration

Table 12.1 shows a part of register configuration. Do not write to any addresses other than listed below. Operations cannot be guaranteed if writing is attempted. Values read from addresses other than those listed below are undefined. Access the register in longword (32-bit) units. Operation cannot be guaranteed if access to a register is not in longword units.

**Table 12.1 Register Configuration**

Name	Abbreviation	R/W	Address	Initial Value	Access Size	RZ/G Series Products			
						RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
MXI SDRAM address allocation register 0	MXSAAR0	R/W	H'FE96 0000	H'004000C0	32	√	√	√	√
MXI SDRAM address allocation register 1	MXSAAR1	R/W	H'FE96 0004	H'01000800	32	√	√	√	√
MXI read transaction control register	MXRTCR	R/W	H'FE96 0040	H'00000000	32	√	√	√	√
MXI write transaction control register	MXWTCCR	R/W	H'FE96 0044	H'00000000	32	√	√	√	√

## 12.2 Register Description

### Legend for Register Description

Initial value: Register value after a reset. H'xxxx represents a hexadecimal number. Others are represented in binary numbers.

—: Undefined value

R/W: Readable/writable. The written value can be read.

R: Read-only. The write value should always be 0.

R/WC0: Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.

R/WC1: Readable/writable. Writing 1 initializes the bit. Writing 0 is ignored.

W: Write-only. Reading this bit is prohibited. When the bit is reserved, the write value should always be 0.

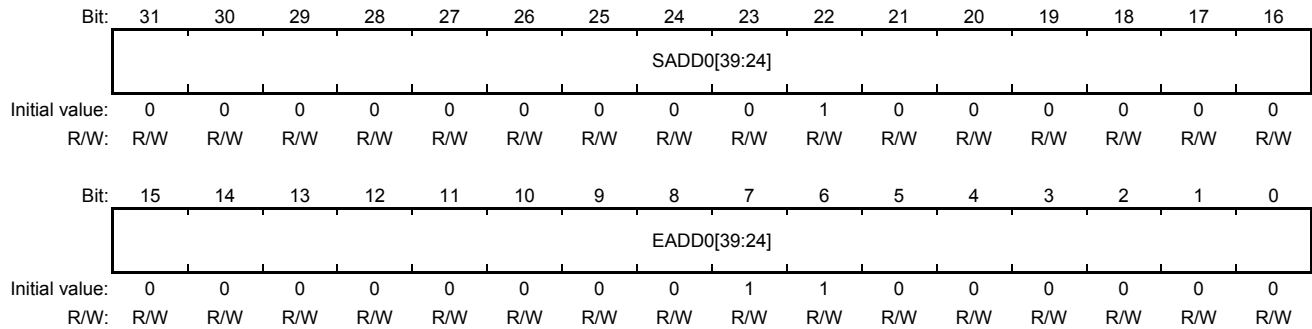

—/W: Write-only. The read value is undefined.

All access to registers must be in longword units.

### 12.2.1 MXI SDRAM Address Allocation Register 0 (MXSAAR0)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: The media domain AXI (MXI) can control the target port of transaction for DRAM access. The transaction of the address between SADD0 and EADD0 is issued to S3CTRL. Others are issued to the system domain AXI.

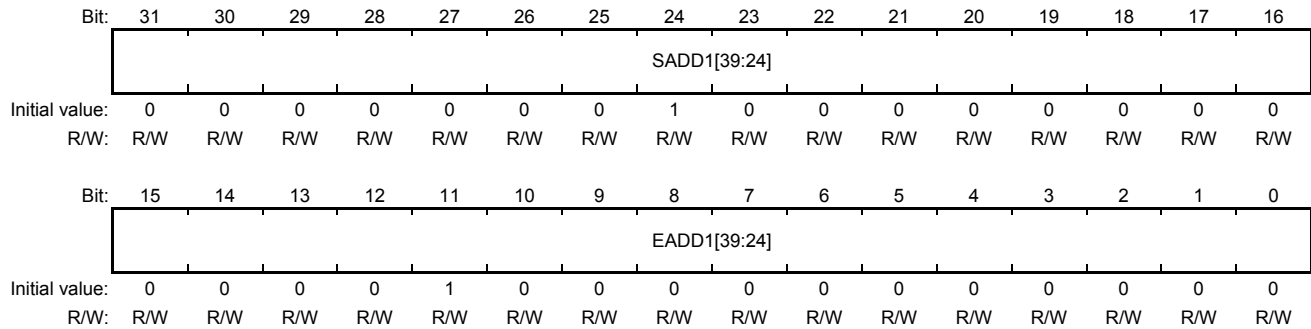

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	SADD0[39:24]	H'0040	R/W	Start Address 0 [39:24].
15 to 0	EADD0[39:24]	H'00C0	R/W	End Address 0 [39:24].

### 12.2.2 MXI SDRAM Address Allocation Register 1 (MXSAAR1)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: The media domain AXI (MXI) can control the target port of transaction for DRAM access. The transaction of the address between SADD1 and EADD1 is issued to S3CTRL. Others are issued to the system domain AXI.

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	SADD1[39:24]	H'0100	R/W	Start Address 1 [39:24].
15 to 0	EADD1[39:24]	H'0800	R/W	End Address 1 [39:24].

### 12.2.3 MXI Read Transaction Control Register (MXRTPCR)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: This register controls the read transaction of the media domain AXI (MXI).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	RQPUSHEN	—	RTHRES		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5	—	0	R/W	Reserved This bit is always read as 0. The write value should always be 0.
4	RQPUSHEN	0	R/W	This bit should be set to 1.
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	RTHRES	000	R/W	These bits specify the unit of transaction threshold at which QoS arbitration is performed. The appropriate configuration depends on the system. 000: No limit 001: 1 010: 2 011: 4 100: 8 101: 16 110: 32 111: Reserved

### 12.2.4 MXI Write Transaction Control Register (MXWTCCR)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: This register controls the write transaction of the media domain AXI (MXI).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	WQPUSHEN	—	WTHRES		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5	—	0	R/W	Reserved This bit is always read as 0. The write value should always be 0.
4	WQPUSHEN	0	R/W	This bit should be set to 1.
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	WTHRES	000	R/W	These bits specify the unit of transaction threshold at which QoS arbitration is performed. The appropriate configuration depends on the system. 000: No limit 001: 1 010: 2 011: 4 100: 8 101: 16 110: 32 111: Reserved

## 12.3 Operation

RZ/G1H

RZ/G1N

RZ/G1M

RZ/G1E

### 12.3.1 Media Domain AXI Access Control

The media domain AXI (MXI) can control the target port of transaction for DRAM access. One of the target ports of S3CTRL or system domain AXI can be chosen for DRAM access through MXSAAR0 and MXSAAR1 registers. The transaction of the address through MXSAAR0 or MXSAAR1 register is issued to S3CTRL port.

## 13. IPMMU

RZ/G1H

RZ/G1N

RZ/G1M

RZ/G1E

### 13.1 Overview

The IPMMU is a Memory Management Unit (MMU) which provides address translation and access protection functionalities to processing units and interconnect networks.

#### 13.1.1 Features

IPMMU includes the following main features.

- MMU architecture compatible with ARMv7 VMSA including the Large Physical Address Extension (LPAAE), the Security Extensions and the Multiprocessing Extensions
- PMB address translation
- Caching recently used page table entries in translation look-aside buffer (TLB)
- ACE-Lite support with Distributed Virtual Memory (DVM) messages through Cache Coherent Interconnect (CCI)
- Performance monitoring for ARMv7 LPAAE, VMSA and DVM operations

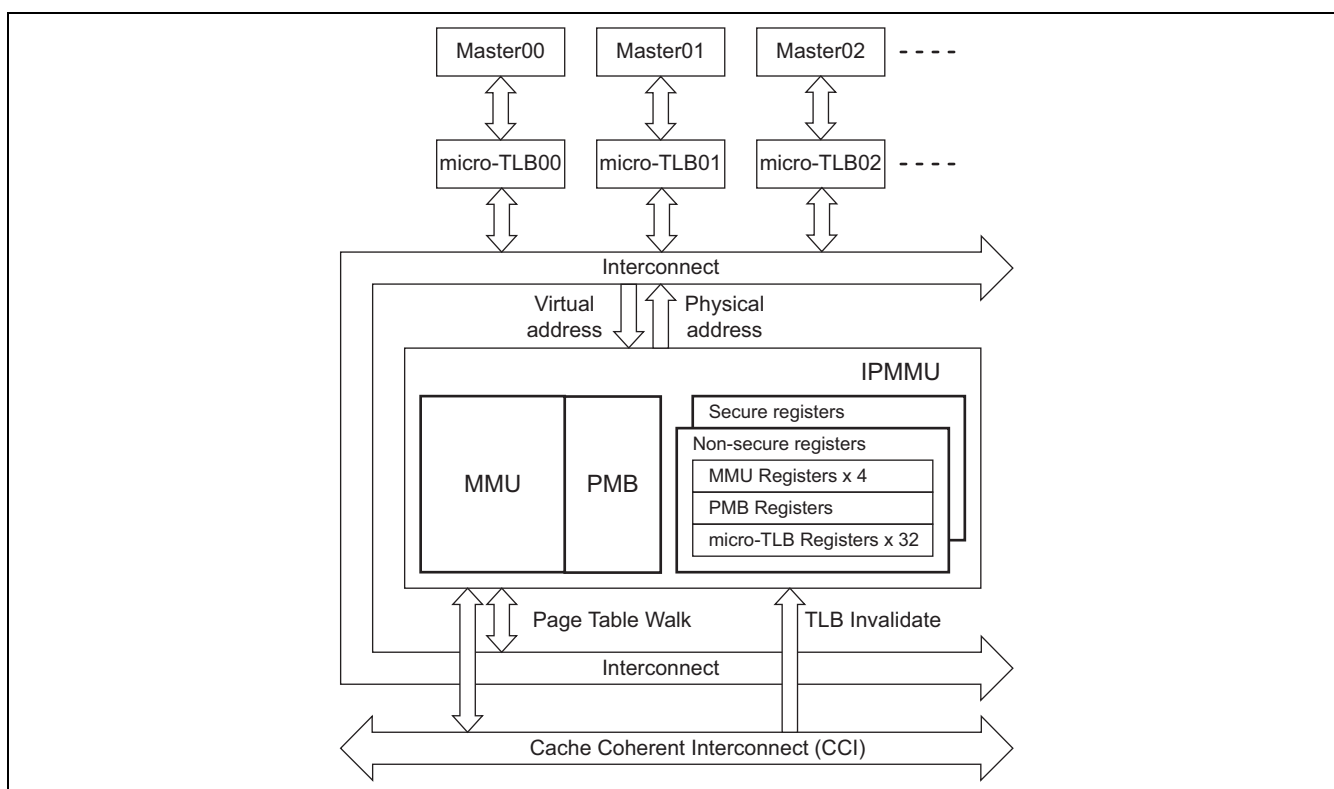

Note: All RZ/G series products other than the RZ/G1H support IPMMU for 3D graphics module (IPMMU-GP). IPMMU-GP supports the 40-bit translation system with the ARMv7 long-descriptor translation table format and the PMB address translation, and the IPMMU-GP doesn't support address translation of short-descriptor formats.

For more information about ARMv7 VMSA, see ARM Architecture Reference Manual ARMv7-A and ARMv7-R edition.

## 13.2 IPMMU System Integration

Figure 13.1 shows the IPMMU system integration. When a master (a processing unit or an interconnect) issues a transaction, a micro-TLB connected to the master sends a virtual address to the IPMMU. If the virtual address is not cached in a main TLB of the IPMMU, the IPMMU performs a page table walk through an interconnect or Cache Coherent Interconnect (CCI) and returns a physical address to the micro-TLB.

The IPMMU supports ACE-Lite protocol which makes it possible to share page table entries and keep coherency between System CPUs without software TLB maintenance.

**Figure 13.1 IPMMU System Integration**

Note: For IPMMU-GP, there is only path for a page table walk through the CCI.

### 13.3 Register Description

Table 13.1 shows the IPMMU registers.

These registers are 32-bit access registers. When modifying reserved bits or read-only bits, write 0 to the bits.

**Table 13.1 Register Configuration**

Register Name	Abbreviation	R/W	Address	RZ/G Series Products			
				RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
MMU Control Register N (N = 0 to 3: * For IPMMU-GP, only N = 0)	IMCTRn IMSCTRn	R/W	H'0000 + H'40 × n	√	√	√	√
MMU CCI Address Allocation Register N	IMCAARn IMSCAARn	R/W	H'0004 + H'40 × n	√	√	√	√
MMU Translation Table Base Control Register N	IMTTBCRn IMSTTBCRn	R/W	H'0008 + H'40 × n	√	√	√	√
MMU Bus Control Register N	IMBUSCRn IMSBUSCRn	R/W	H'000C + H'40 × n	√	√	√	√
MMU Translation Table Lower Base Register 0N	IMTTLBR0n IMSTTLBR0n	R/W	H'0010 + H'40 × n	√	√	√	√

### 13.3.1 MMU Control Register N (IMCTRn)

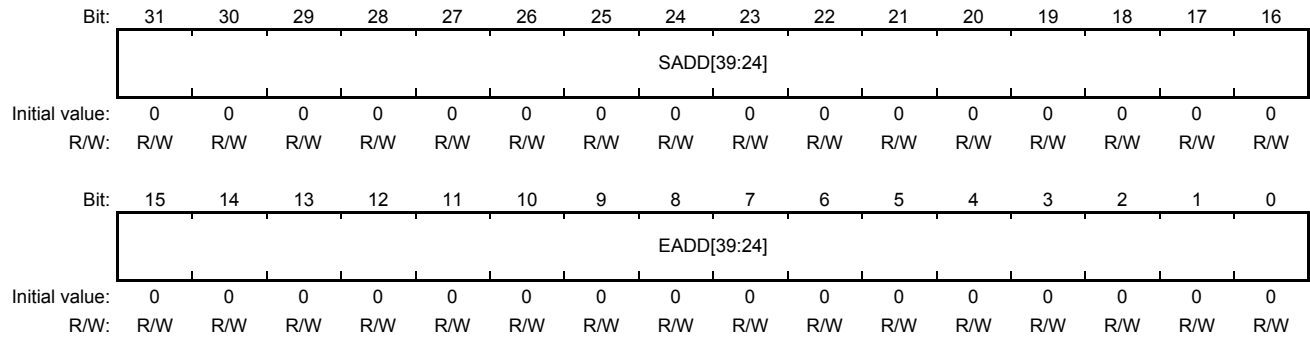

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TRE	AFE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	RTSEL[1:0]	TREN	INTEN	FLUSH	MMUE N	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
17	TRE	0	R/W	TEX Remap Enable This field is used when EAE is 0. 0: TEX remap disabled. 1: TEX remap enabled. Note: For IPMMUGP, set 0 to this bit
16	AFE	0	R/W	Access Flag Enable 0: Behave as if AF bit is always set to 1. 1: Enable software management of the Access Flag.
15 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5, 4	RTSEL[1:0]	00	R/W	Retranslation Table Select When TREN is 1, RTSEL indicates the table number to retranslate. Note: For IPMMUGP, set 0 to this bit
3	TREN	0	R/W	MMU Retranslation Enable 0: Output PA as a physical address. 1: Output PA as an intermediate physical address to retranslate through 40-bit TLB. Note: For IPMMUGP, set 0 to this bit
2	INTEN	0	R/W	Interrupt Enable 0: Don't assert an interrupt when an error occurs. 1: Assert an interrupt when an error occurs.
1	FLUSH	0	R/W	TLB Invalidate This bit is automatically cleared to 0. 1: Invalidate all TLB entries.
0	MMUEN	0	R/W	MMU Enable 0: MMU disabled 1: MMU enabled

### 13.3.2 MMU CCI Address Allocation Register N (IMCAARn)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	SADD[39:24]	H'0000	R/W	A start physical address via CCI interconnect
15 to 0	EADD[39:24]	H'0000	R/W	A end physical address via CCI interconnect

### 13.3.3 MMU Bus Control Register N (IMBUSCRn)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	1	1	0	0	1	1	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	DVM	BUSSEL[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
29, 28	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
27, 26	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
25 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2	DVM	0	R/W	Broadcast TLB maintenance operations through CCI 0: This table is not managed by DVM messages. 1: This table is managed by DVM messages.
1, 0	BUSSEL [1:0]	00	R/W	Bus Select 00: Always issue a page table walk request to a system interconnect. 01: Issue a page table walk request to CCI when its memory attribute is shareable. 10: Issue a page table walk request in the range of IMCAARn. 11: Issue a page table walk request to CCI in the range of IMCAARn and when its memory attribute is shareable.

### 13.3.4 MMU Translation Table Base Control Register N (IMTTBCRn)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

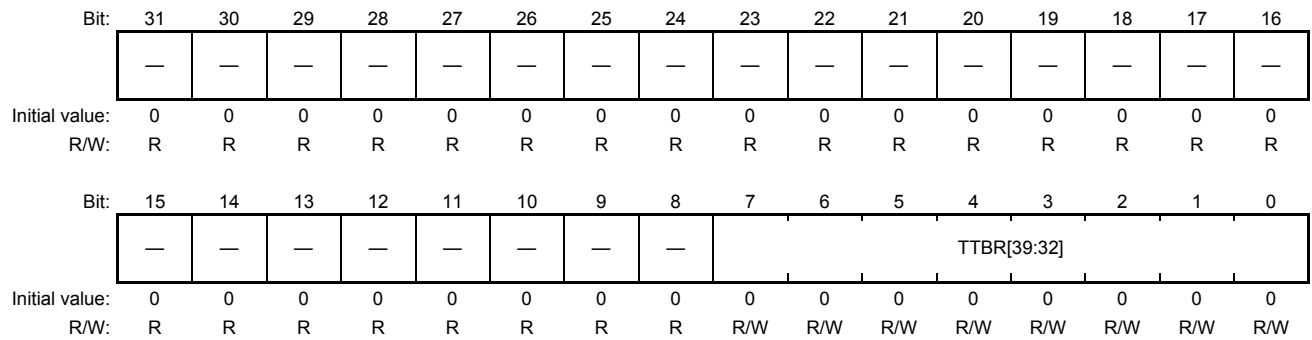

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	EAE	PMB	SH1[1:0]		ORGN1[1:0]		IRGN1[1:0]		—	—	—	—	—	TSZ1[2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	SH0[1:0]		ORGN0[1:0]		IRGN0[1:0]		—	—	—	SL0	—	TSZ0[2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	EAE	0	R/W	Extended Address Enable 0: Enable the 32-bit translation system with the ARMv7 Short-descriptor translation table format or PMB address translation. 1: Enable the 40-bit translation System with the ARMv7 Long-descriptor translation table format. Note: IPMMU-GP, set this bit to 1 (default).
30	PMB	0	R/W	PMB Enable 0: Disable PMB address translation. 1: Enable PMB address translation in the virtual address range from H'80000000 to H'BFFFFFFF. This field is used when EAE is 0.
29, 28	SH1[1:0]	00	R/W	Share ability attributes for the memory associated with the translation table walks using TTBR1n. 00: Non-shareable 01: Reserved 10: Outer shareable 11: Inner shareable
27, 26	ORGN1[1:0]	00	R/W	Outer Cache ability attributes for the memory associated with the translation table walks using TTBR1n. 00: Normal memory, Outer Non-cacheable 01: Normal memory, Outer Write-Back Write-Allocate Cacheable 10: Normal memory, Outer Write-Through Cacheable 11: Normal memory, Outer Write-Back no Write-Allocate Cacheable
25, 24	IRGN1[1:0]	00	R/W	Inner Cache ability attributes for the memory associated with the translation table walks using TTBR1n. 00: Normal memory, Inner Non-cacheable 01: Normal memory, Inner Write-Back Write-Allocate Cacheable 10: Normal memory, Inner Write-Through Cacheable 11: Normal memory, Inner Write-Back no Write-Allocate Cacheable
23 to 19	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
18 to 16	TSZ1[2:0]	000	R/W	The size offset of the TTBR1n addressed region, encoded as a 3-bit unsigned number, giving the size of the region as $2^{(32-TSZ1)}$ .

Bit	Bit Name	Initial Value	R/W	Description
15, 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13, 12	SH0[1:0]	00	R/W	Share ability attributes for the memory associated with the translation table walks using TTBR0n. 00: Non-shareable 01: Reserved 10: Outer shareable 11: Inner shareable
11, 10	ORGN0[1:0]	00	R/W	Outer Cache ability attributes for the memory associated with the translation table walks using TTBR0n. 00: Normal memory, Outer Non-cacheable 01: Normal memory, Outer Write-Back Write-Allocate Cacheable 10: Normal memory, Outer Write-Through Cacheable 11: Normal memory, Outer Write-Back no Write-Allocate Cacheable
9, 8	IRGN0[1:0]	00	R/W	Inner Cache ability attributes for the memory associated with the translation table walks using TTBR0n.. 00: Normal memory, Inner Non-cacheable 01: Normal memory, Inner Write-Back Write-Allocate Cacheable 10: Normal memory, Inner Write-Through Cacheable 11: Normal memory, Inner Write-Back no Write-Allocate Cacheable
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	SL0	0	R/W	Starting level for translation table walks. 0: Start at second level 1: Start at first level
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	TSZ0[2:0]	000	R/W	The size offset of the TTBR0n addressed region, encoded as a 3-bit unsigned number, giving the size of the region as $2^{(32-TSZ0)}$ .

**13.3.5 MMU Translation Table Upper Base Register 0/1N (IMTTUBR0/1n)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7 to 0	TTBR[39:32]	H'00	R/W	Bits [39:32] of translation table base address This field is used when EAE is 1.

**13.3.6 MMU Translation Table Lower Base Register 0/1N (IMTTLBR0/1n)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

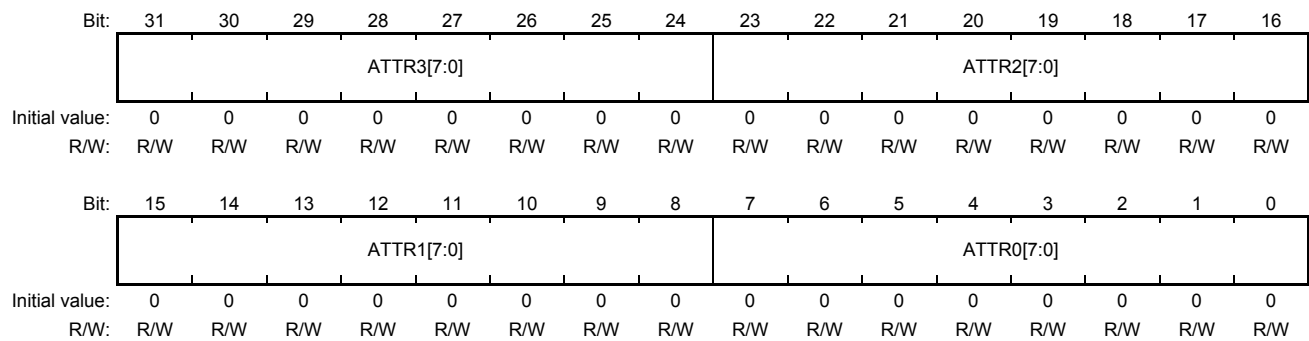

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	TTBR[31:4]	All 0	R/W	Bits [31:4] of translation table base address
3 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

### 13.3.7 MMU Memory Attribute Indirection Register 0N (IMMAIR0n)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

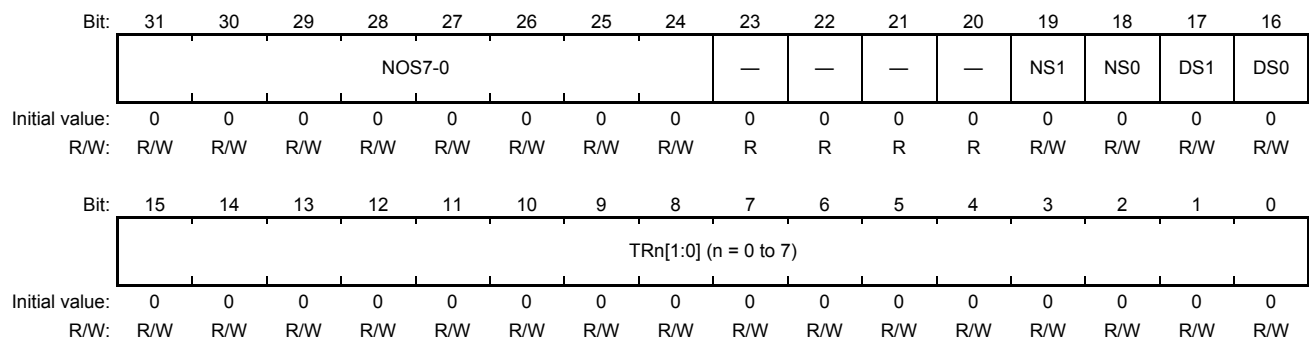

When using the Long-descriptor translation format, this register works as MAIR0, Memory Attribute Indirection Register in ARMv7 VMSA. When using the Short-descriptor translation format, this register works as PRRR, Primary Region Remap Register in ARMv7 VMSA.

(Long-descriptor translation format)

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	ATTR3[7:0]	H'00	R/W	The memory attribute encoding for an AttrIdx[2:0] entry.
23 to 16	ATTR2[7:0]	H'00	R/W	
15 to 8	ATTR1[7:0]	H'00	R/W	
7 to 0	ATTR0[7:0]	H'00	R/W	

(Short-descriptor translation format)

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	NOS7-0	All 0	R/W	Outer Shareable property mapping for memory attributes n. 0: Memory region is outer shareable. 1: Memory region is inner shareable.
23 to 20	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
19	NS1	0	R/W	Mapping of S = 1 attribute for Normal memory. 0: Region is not shareable. 1: Region is shareable.
18	NS0	0	R/W	Mapping of S = 0 attribute for Normal memory. 0: Region is not shareable. 1: Region is shareable.
17	DS1	0	R/W	Mapping of S = 1 attribute for Device memory. 0: Region is not shareable. 1: Region is shareable.
16	DS0	0	R/W	Mapping of S = 0 attribute for Device memory. 0: Region is not shareable. 1: Region is shareable.
15 to 0	TRn[1:0] (n = 0 to 7)	All 0	R/W	Primary TEX mapping for memory attributes n. n is the value of TEX[0], C and B bits. 00: Strongly-ordered 01: Device 10: Normal memory 11: Reserved

### 13.3.8 MMU Memory Attribute Indirection Register 1N (IMMAIR1n)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

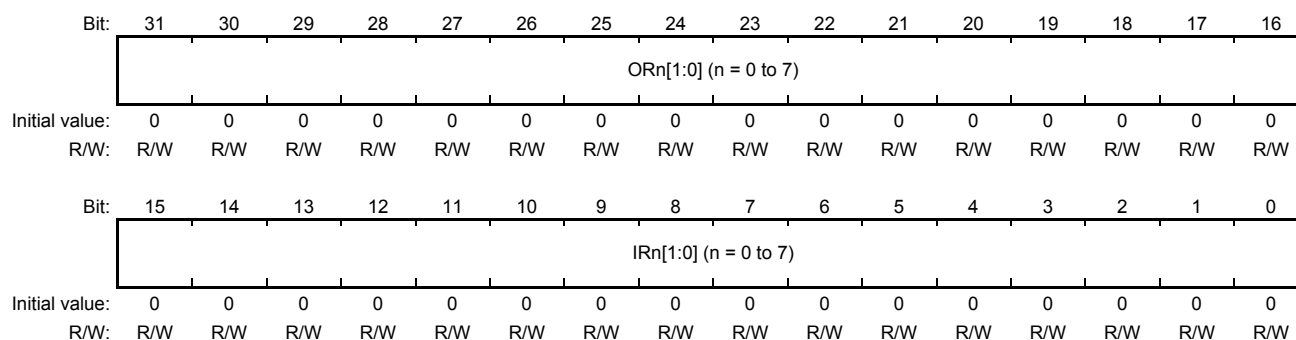

When using the Long-descriptor translation format, this register works as MAIR1, Memory Attribute Indirection Register in ARMv7 VMSA. When using the Short-descriptor translation format, this register works as NMRR, Normal Memory Remap Register in ARMv7 VMSA.

(Long-descriptor translation format)

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	ATTR7[7:0]	H'00	R/W	The memory attribute encoding for an AttrIdx[2:0] entry.
23 to 16	ATTR6[7:0]	H'00	R/W	
15 to 8	ATTR5[7:0]	H'00	R/W	
7 to 0	ATTR4[7:0]	H'00	R/W	

(Short-descriptor translation format)

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	ORn[1:0] (n = 0 to 7)	All 0	R/W	Outer Cacheable property mapping for memory attributes n. 00: Region is non-cacheable. 01: Region is write-back, write-allocate. 10: Region is write-through, no write-allocate. 11: Region is write-back, no write-allocate.

---

<b>Bit</b>	<b>Bit Name</b>	<b>Initial Value</b>	<b>R/W</b>	<b>Description</b>
15 to 0	IRn[1:0] (n = 0 to 7)	All 0	R/W	Inner Cacheable property mapping for memory attributes n. 00: Region is non-cacheable. 01: Region is write-back, write-allocate. 10: Region is write-through, no write-allocate. 11: Region is write-back, no write-allocate.

---

### 13.3.9 MMU Error Status Register N (IMSTRn)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	ERRLVL[1:0]	—	ERRCODE[2:0]			—	—	—	MHIT	—	ABORT	PF	TF	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13, 12	ERRLVL [1:0]	00	R	indicate which level of page table walk caused the error
11	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
10 to 8	ERRCODE [2:0]	000	R	Indicate error type 001: TLB format error (except “block” or “table” ) 100: access permission error 101: secure access error Others: reserved
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	MHIT	0	R/W	Indicate that multiple TLB hits occurred.
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2	ABORT	0	R/W	This bit is set to 1 when the IPMMU received an error response during a page table walk.
1	PF	0	R/W	Page Fault This bit is set to 1 when an access right violation occurred.
0	TF	0	R/W	Translation Fault This bit is set to 1 when a translation fault occurred during a page table walk.

**13.3.10 MMU Error Address Register N (IMEARn)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	EAR[31:0]	All 0	R/W	The faulting virtual address is set when an address translation error occurred.

### 13.3.11 PMB Control Register (IMPCTR)

—	—	—	√

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	ARADDR1 [31:0]	H'0000 0000	R/W	Display the 2nd ARADDR[31:0] of the last TLB Invalidate when the last TLB Invalidate operation is a multi-part DVM Message.

RZ/G1H	RZ/G1N
RZ/G1M	RZ/G1E

## 13.4 Operation

### 13.4.1 Address Translation Sequence in micro-TLBs

Each micro-TLB has independent entries and can translate from a virtual address to a physical address without sending translation requests to the IPMMU if the virtual address is cached in the micro-TLB.

When a translation error occurred in address translation, the micro-TLB blocks subsequent transactions until a valid page entry is registered. Set IMUCTRn.FLUSH = 1 after the entry registration.

Figure 13.2 shows the micro-TLB address translation sequence.

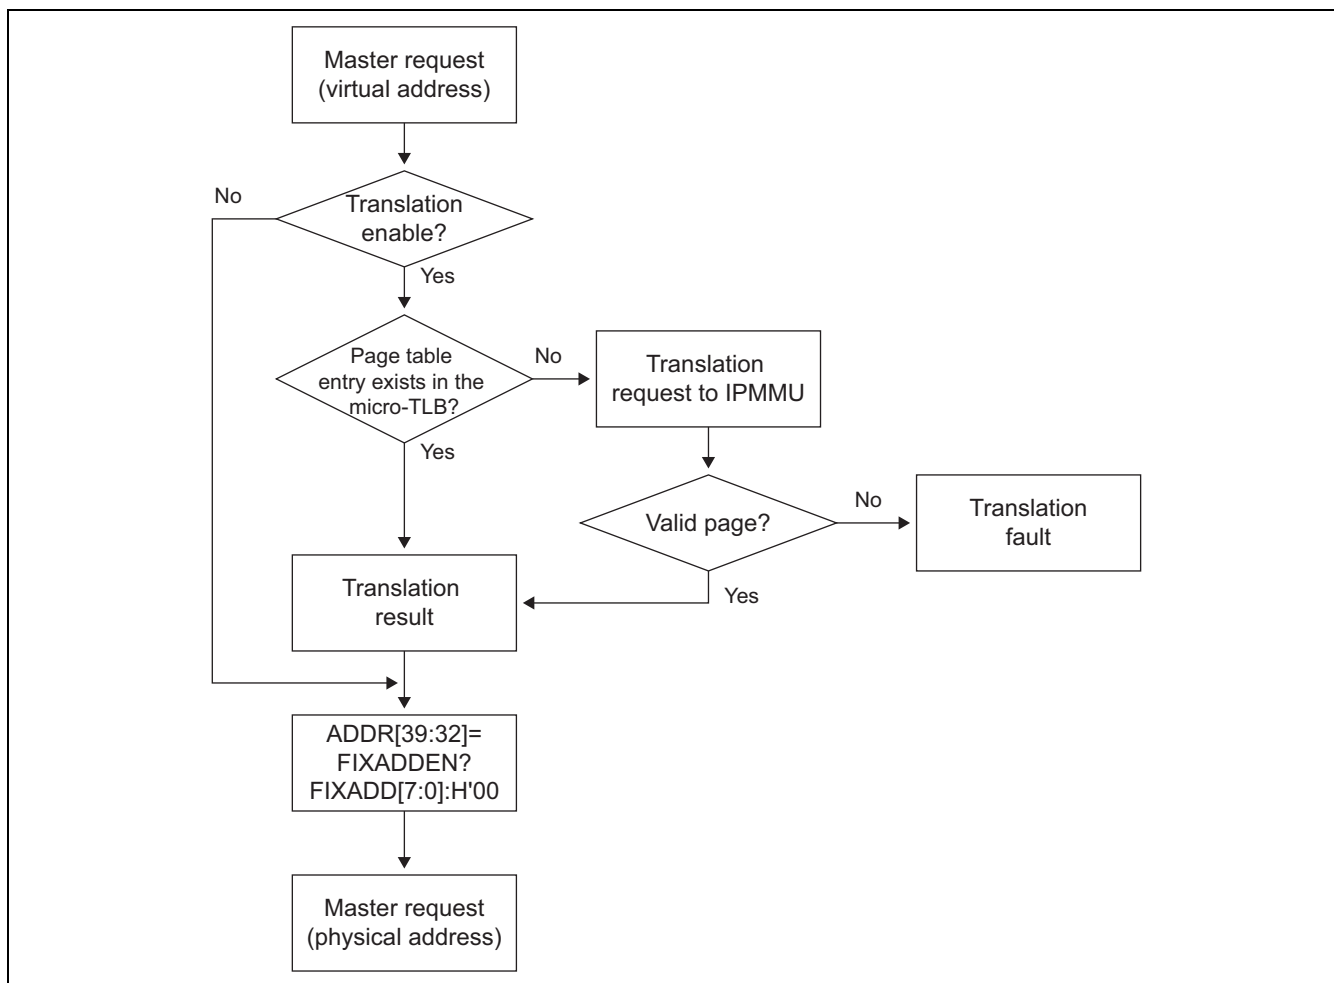

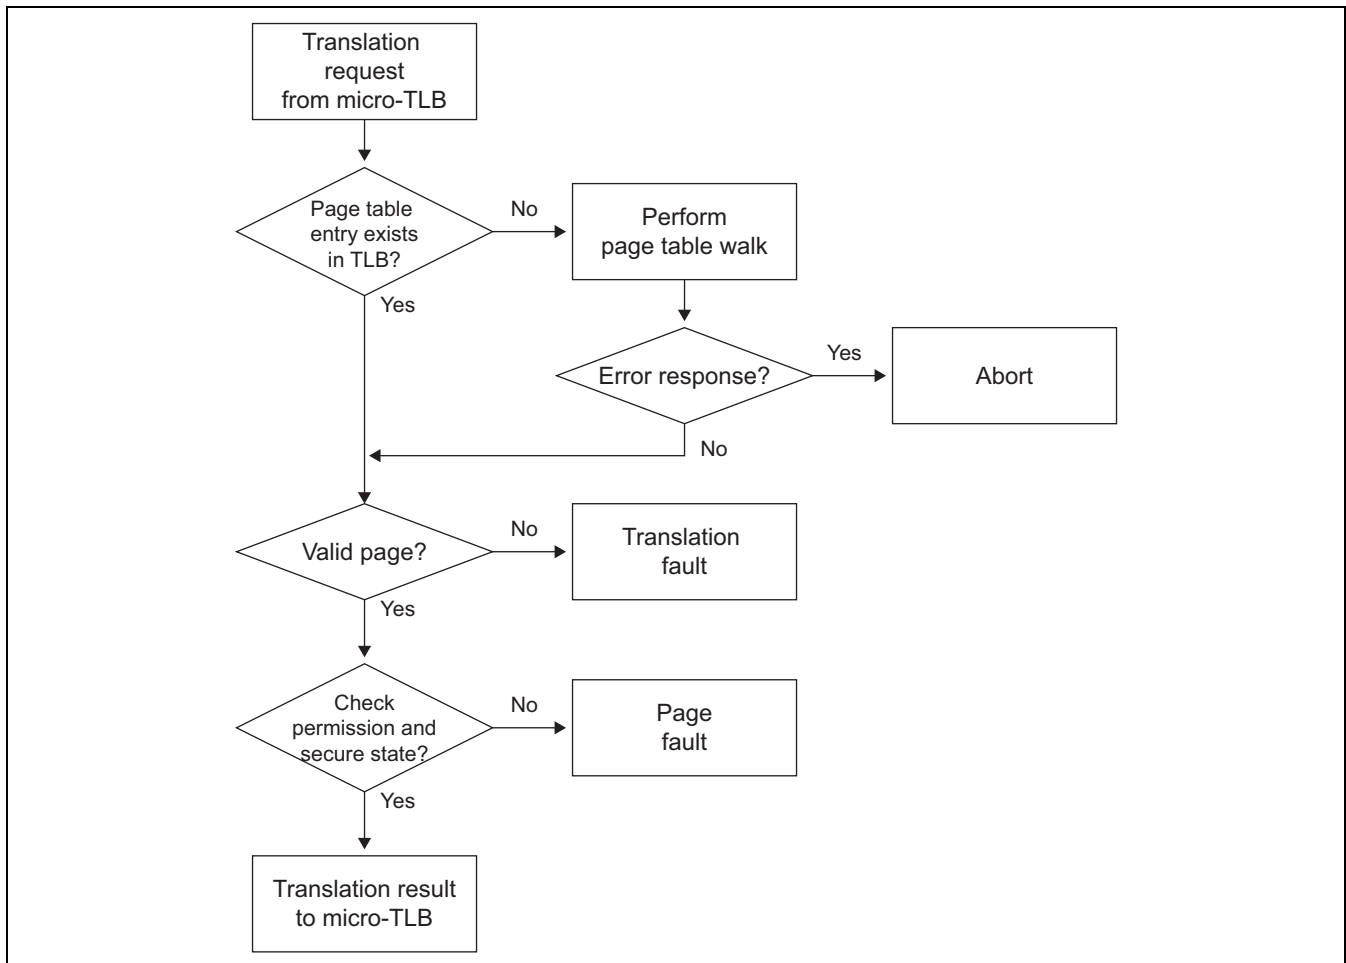

Figure 13.2 micro-TLB Address Translation Sequence

### 13.4.2 Address Translation Sequence in the IPMMU

#### (1) MMU Address Translation

The IPMMU has independent four non-secure page tables and four secure page tables which support two page table formats, the Short-descriptor format and the Long-descriptor format. When the IPMMU receives an address translation request from a micro-TLB, the IPMMU starts address translation sequence based on the page table specified by IMUCTRn.TTSEL.

Figure 13.3 shows the MMU address translation sequence.

**Figure 13.3 MMU Address Translation Sequence**

## (2) PMB Address Translation

PMB address translation is performed in two ways. When PMB address translation is chosen in IMUCTRn.TTSEL, all virtual addresses are translated by PMB. When PMB address translation is performed in a part of MMU translation (IMTTBCRn.PMB = 1), virtual addresses within H'80000000 to H'BFFFFFFF are translated to physical addresses by PMB.

Figure 13.4 shows the PMB translation flow.

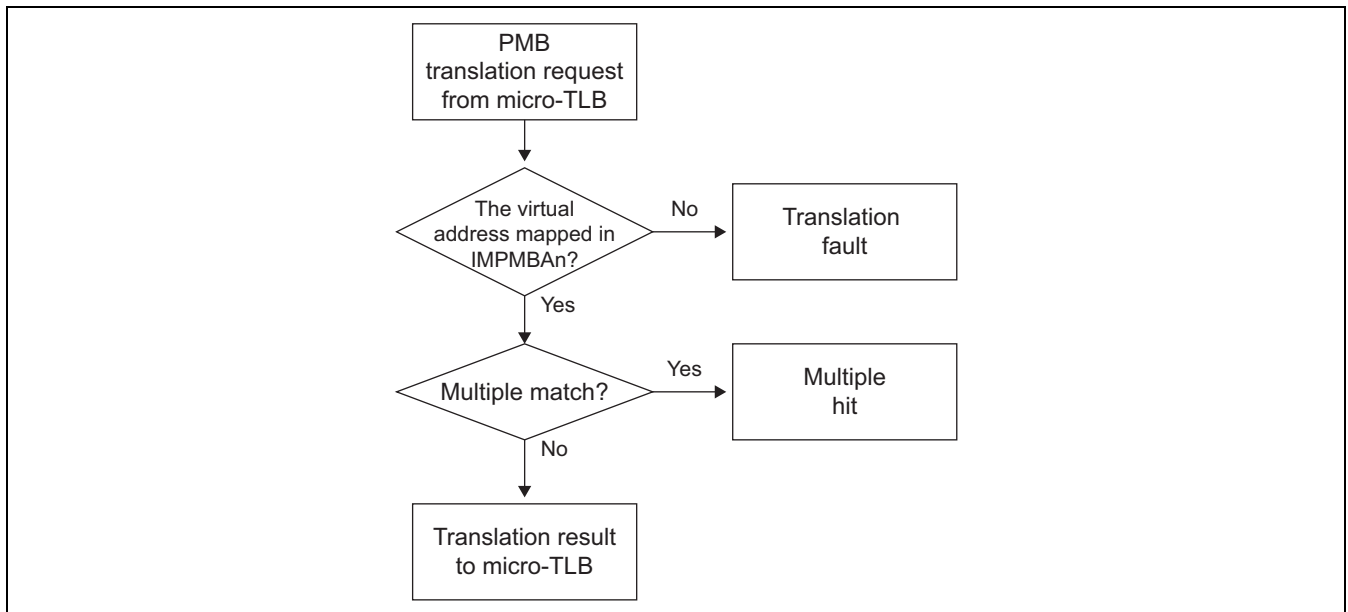

Figure 13.4 PMB Translation Flow

### 13.4.3 Address Space

#### (1) Short-descriptor

In the short-descriptor format, 32-bit virtual address space is translated to 32-bit physical address space managed by TTBR0/1. When IMTTBCRn.PMB = 1, translation address space is compatible with our previous products. In this mode, a virtual address within H'80000000 to H'BFFFFFFF is translated by PMB and a virtual address within H'C0000000 to H'FFFFFFF is mapped to a physical address of the same value.

Note: IPMMU-GP doesn't support the Short-descriptor translation format.

Figure 13.5 shows the Short-descriptor address space.

Figure 13.5 Short-descriptor Address Space

#### (2) Long-descriptor

In the long-descriptor format, 32-bit virtual address space is translated to 40-bit physical address space managed by TTBR0/1. The IPMMU supports the Secure PL1 and PL0 stage 1 translation and the Non-secure PL1 and PL0 stage 1 translation. The IPMMU doesn't support the Virtualization Extensions.

Figure 13.6 shows the Long-descriptor address space.

Figure 13.6 Long-descriptor Address Space

(3) PMB

The IPMMU supports the PMB address translation system. Figure 13.7 shows the PMB address space.

Figure 13.7 PMB Address Space

#### (4) 2-Stage Translation

The IPMMU supports 2-stage translation. At the 1st-stage, 32-bit address space is translated to 32-bit intermediate physical address (IPA) space. At the 2nd-stage, 32-bit IPA space is translated to 40-bit physical address space. In order to enable the 2-stage translation, set 1 to IMCTRn.TREN and set its 2nd-stage page table to IMCTRn.RTSEL.

Note: IPMMU-GP doesn't support the 2-stage translation.

Figure 13.8 shows the 2-stage translation address space.

Figure 13.8 2-Stage Translation Address Space

### 13.4.4 Initialization Sequence

This section describes the initialization sequence of the IPMMU.

#### (1) Module Stop

The IPMMU doesn't support module stop control. The IPMMU can be used whenever a master requires address translation through the IPMMU. When a master doesn't require address translation, the corresponding IMUCTRn MMUEN must be disabled.

#### (2) micro-TLB

Before a master access, the corresponding micro-TLB registers which includes the translation mode and ASIDs must be configured.

### 13.4.5 TLB Maintenance

Some TLB maintenances between an IPMMU and the connected micro-TLBs are performed automatically by hardware. When DVM operation is permitted (IMBUSCRn.DVM = 1), coherency between System CPUs and IPMMUs can be maintained automatically through CCI.

**Table 13.4 TLB Maintenance**

Category	Software operation	TLB maintenance in IPMMU	TLB maintenance in micro-TLB
MMU Page Table (DVM is disabled)	First entry registration	Not required	Not required
	Entry update	Invalidate the target TLB (IMCTRn.FLUSH = 1)	Automatically invalidated
	Entry release	Invalidate the target TLB (IMCTRn.FLUSH = 1)	Automatically invalidated
MMU Page Table (DVM is enabled)	First entry registration	Not required	Not required
	Entry update	Automatically invalidated	Automatically invalidated
	Entry release	Automatically invalidated	Automatically invalidated
ASID	ASID update	Automatically invalidated	Automatically invalidated
MMU registers	MMU register values update	Invalidate the target TLB (IMCTRn.FLUSH = 1)	Automatically invalidated
PMB	PMB entry registration	Not required	Not required
	PMB entry update	Not required	Invalidate the target micro-TLB
	PMB entry release	Not required	Invalidate the target micro-TLB

### 13.4.6 Security Extensions

The IPMMU supports the ARMv7 Security Extensions and additional extensions.

#### (1) Banked Registers

The IPMMU has two copies of a register at the same address. They are banked with secure and non-secure. A Non-secure access can read and write only non-secure registers and a secure access can read and write secure registers. A secure access can also read and write non-secure registers through the alias address space to non-secure registers (from H'0800 to H'0FFF).

#### (2) Secure-Group

Besides Secure access, some IPMMUs support another secure access called accelerator. The IPMMU which supports Accelerator treats it as secure and performs its page table walk in secure mode. Table 13.5 shows the supported secure mode of IPMMU.

**Table 13.5 Supported Secure Mode**

IPMMU	Secure	Accelerator
IPMMUSY0	√	√
IPMMUSY1	√	√
IPMMUDS	√	√
IPMMUMP	√	√
IPMMUMX	√	√
IPMMUGP	√	√

#### (3) Address Translation

When a Secure/Accelerator master sends a translation request to an IPMMU through a micro-TLB, Secure MMU registers are referred to perform its page table walk. The Secure page table walk can read secure page table entries (NS = 0). In the case of a Non-secure translation request, Non-secure MMU registers are referred and the access to secure page table entries is ignored.

### 13.4.7 Coherency Support

The IPMMU provides the two ways to keep TLB coherency between System CPUs. They are controlled by IMBUSCRn registers.

#### (1) Shared Page Table Access

When IMBUSCRn.BUSSEL = 1 and the memory attribute of page table is shareable, the IPMMU issues transactions to perform page table walk through CCI which ensures to keep TLB coherency between System CPUs. If data hits in the CPU cache, then its response is returned directly to the IPMMU without SDRAM access. It also allows system CPUs not to flush their cache.

#### (2) Distributed Virtual Memory (DVM) Messages

DVM messages are the broadcast messages which send the information of TLB Invalidation. DVM messages are issued by system CPUs through CCI when they no longer use a TLB entry and invalidate it. When IMBUSCRn.DVM = 1 and the IPMMU has the entry specified by the DVM operation, the IPMMU invalidate it in its main TLB and the connected micro-TLBs' entries. It allows system CPUs to keep TLB coherency without software TLB maintenance.

### 13.4.8 Error Handling

#### (1) IPMMU Interrupt Requests

Table 13.6 shows the error events which can cause interrupts. The errors in secure access are set in IMSSTRn registers and the errors in non-secure access are set in IMSTRn registers.

**Table 13.6 IPMMU Error Events**

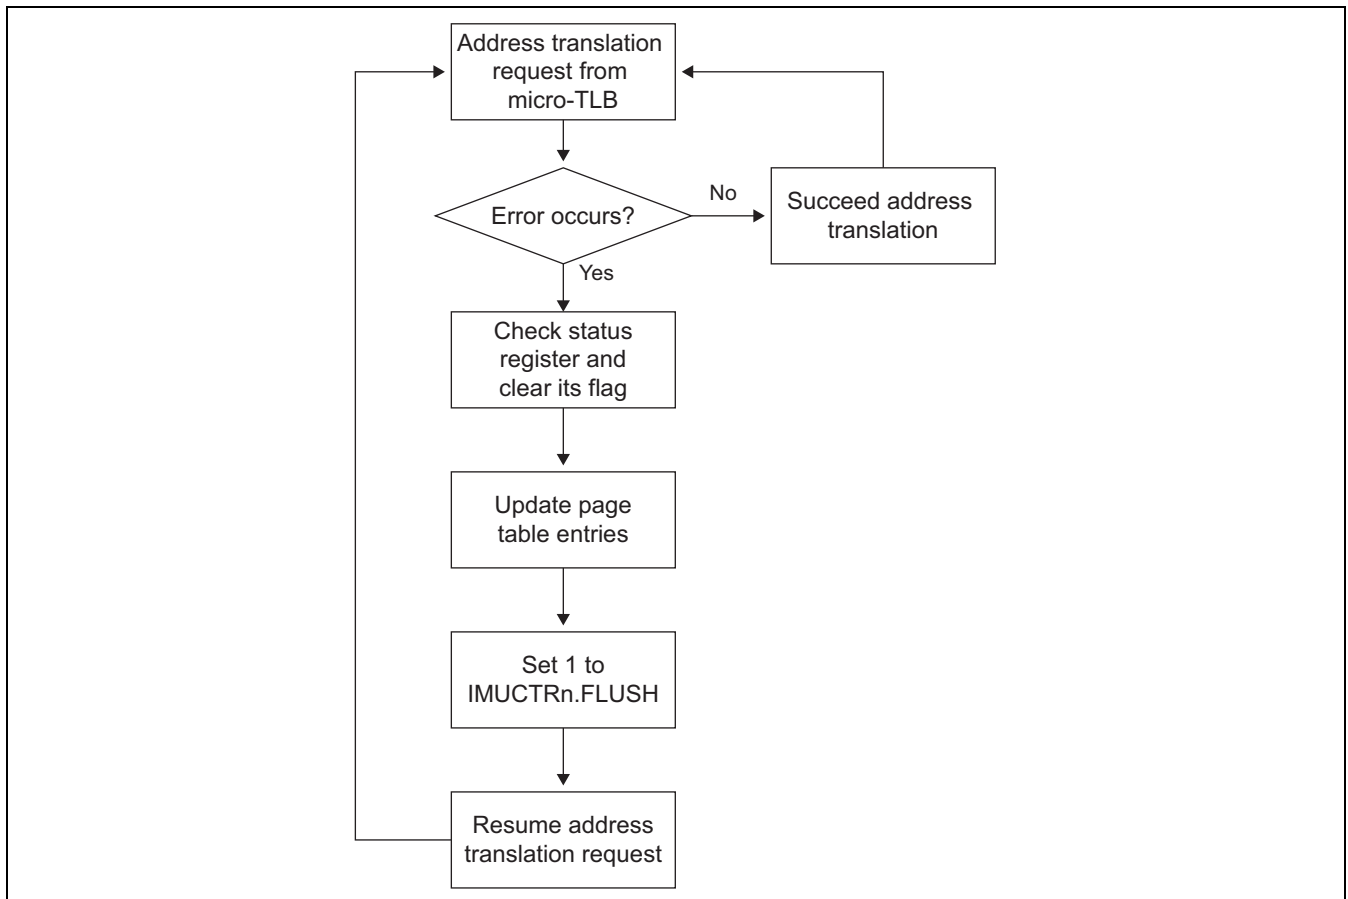

Category	Error	Description
Long-descriptor Short-descriptor	Translation Fault	A virtual address was not mapped in the region defined by TTBR0 and TTBR1.*
		A descriptor was neither Table nor Block format
	Page Fault	AP (access permissions) / AF (access flag) bit mismatch occurred. NS bit mismatch occurred. Non-secure master read a Secure page table entry.
	Abort	The IPMMU got an error response from an Interconnect during a page table walk.
PMB	Multiple Hit (MHIT)	Multiple TLB hits occurred.
	Translation Fault	A virtual address was not mapped in IMPMBAn.
	Multiple Hit (MHIT)	Multiple PMB hits occurred.

Note: \* This factor is only for long-descriptor.

## (2) Error Handling Flow

When the micro-TLB cannot translate its virtual address because of some IPMMU errors, the micro-TLB stops to issue the following transactions. When the IPMMU detects an error, IMCTRn.FLUSH must be set after the IMSTRn/IMSSTRn register is cleared and page table entries are updated. After the TLB invalidation, the micro-TLB resumes to issue transactions.

Figure 13.9 shows the error handling flow.

**Figure 13.9 Error Handling Flow**

## 13.5 micro-TLB Assignment

RZ/G1H

RZ/G1N

RZ/G1M

RZ/G1E

The assignment of micro-TLB varies with the RZ/G series products. Refer to the following sections.

## 14. LBSC within Bus Bridge

RZ/G1H

RZ/G1N

RZ/G1M

RZ/G1E

### 14.1 Overview

The LBSC performs bus arbitration and necessary interface conversion for the accesses from the CPU (AXI bus) and DMA accesses from LBSC-DMAC channels 0 to 2 and outputs them to the external buses. Further, for external bus access, various settings can be specified in the LBSC control registers for the selection of a connection interface type for each area on the external bus or for the adjustment of number of setup/hold cycles on addresses and chip select signals with respect to read/write enable signals. Thus, the LBSC configuration allows diversity in methodology for accessing various external devices that are assigned to their corresponding areas.

The frequency of the external bus clock CLKOUT signal is up to 65.0 MHz. The LBSC outputs bus signals in synchronization with the external bus clock.

### 14.2 Features

The key features of the LBSC include:

- Support for areas 0, 1, and 6
  - Each area is allocated to EX-BUS, and SRAM, ATA, or byte-control SRAM bus protocol can be selected.
  - Controls 64 Mbytes of area 6 divided into up to six areas (each area capacity is variable).
  - Interface, bus size, and wait-cycle insertion can be controlled in each area.
  - Provides bus signals in synchronization with the CLKOUT signal (65.0 MHz/43.33 MHz).
    - Note: Both of clocks at 65.0 MHz and 43.33 MHz are available only for the RZ/G1H.
- External DMA transfer (for details on DMAC, refer to section 17, LBSC-DMAC).
  - Three channels
  - Support of devices with the DACK signal
  - Support of edge-detection and level-detection external request signals
  - Synchronous/asynchronous DREQ and the polarity of DREQ, DACK, and DRACK can be inverted through register settings.
- SRAM interface
  - Wait-cycle insertion can be controlled through register settings.
  - Wait cycles can be inserted with the EX\_WAIT pins.
  - Connectable bus size: 16 or 8 bits.
- Burst ROM interface (area 0 and CPU access only)
  - Wait-cycle insertion can be controlled through register settings.
  - Burst count can be specified through register settings (cases where this reaches an address branching point are automatically detected, after which the access is broken off).
  - Connectable bus size: 16 or 8 bits
- Byte-control SRAM interface (areas 1 and 6 only)
  - SRAM interface with byte control
  - Wait-cycle insertion can be controlled through register settings.
  - Wait cycles can be inserted with the EX\_WAIT pins.
  - Connectable bus size: 16 or 8 bits

- ATA interface (areas 1 and 6 only)
  - Two ports
  - Wait-cycle insertion can be controlled through register settings.
  - Support for PIO modes 0 to 4
  - Support for multi-word transfer
  - Ready timeout detection (detection time in ns = period in ns at EX-BUS operating frequency × 100 clock cycles)
- Wait timeout
  - Wait timeout detection
    - Detection time in ns = period in ns at EX-BUS operating frequency × (the time specified in the EX-BUS wait timeout base counter register (EXBCT) and EX-BUS wait timeout detection counter register (EXTCT))

### 14.3 Block Diagram

Figure 14.1 is a block diagram of the LBSC. Placed on the AXI bus, the LBSC outputs accesses from the CPU in sequence to an external bus according to the settings that are provided in internal registers of the LBSC. For the external bus EX-BUS, either of the SRAM or ATA bus protocol can be selected. In addition, the LBSC incorporates three LBSC-DMAC channels that control DMA transfers between an external bus and the DDR3-SDRAM. For details on the LBSC-DMAC, see the relevant section. Since the CPU and the LBSC-DMAC generate access contention for an external bus, the BSC uses an arbiter unit to arbitrate such access requests. The access request that was selected by means of arbitration is converted into an external bus waveform by the bus interface unit before being output. The LBSC has an external wait control input that controls the pulse width. When a request for access is received by an external device, the external device uses this to control the wait for a response to suit the situation at the time of access-request reception.

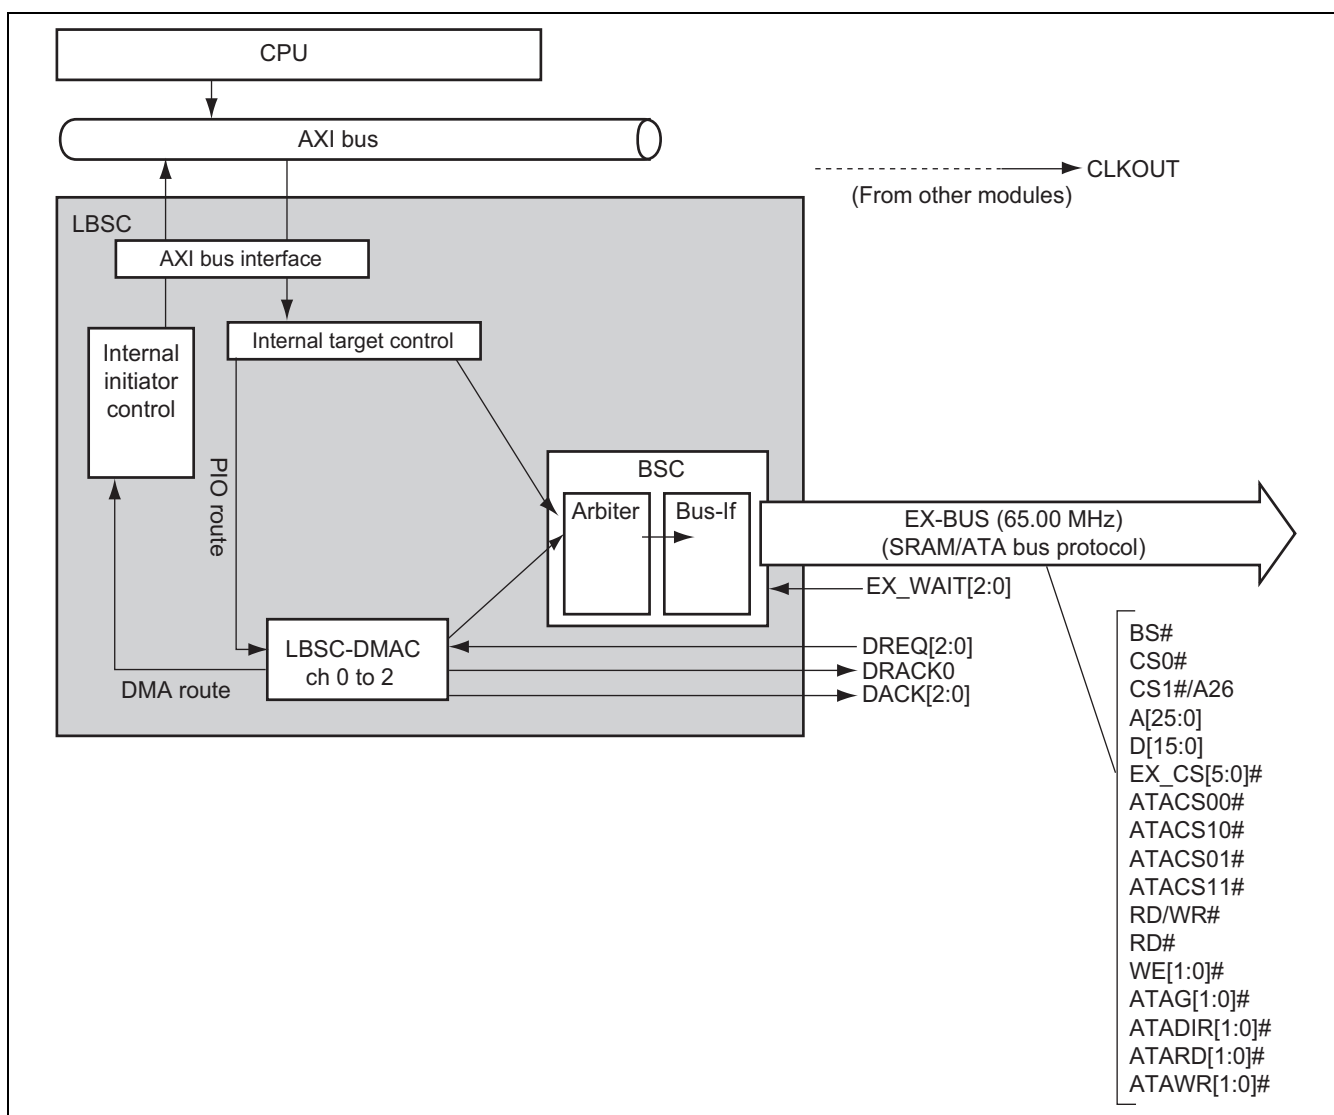

Figure 14.1 Block Diagram of LBSC

## 14.4 LBSC Areas

### 14.4.1 LBSC Support Areas

Figure 14.2 shows LBSC response support areas from the CPU.

The basic configuration of the LBSC supports area 0 and area 1 as external spaces; and area 6 as an expansion I/O space. Area 6 can be subdivided into a maximum of six units, each having a maximum of 64 Mbytes as determined by register settings. The total capacity for area 6 is also up to 64 Mbytes. For area 0 can be made into a 128-Mbyte space depending on the specific LSI startup mode (MD4 mode pin) in use (the MD4 mode pin = 1). In this case, however, area 1 is completely allocated as a space in area 0, and the CS1# signal is changed to the signal equivalent to A[26] in a bus address (addition of one bit to the address signal changes the capacity from 64 Mbytes to 128 Mbytes).

Registers of the BSC and LBSC-DMAC are provided in the internal register space of the LBSC.

LBSC response support area		[MD4 = 0]		[MD4 = 1]	
H'0000 0000 to	Area 0 CS0 64 Mbytes	Area 0 CS0 128 Mbytes			
H'03FF FFFF					
H'0400 0000 to H'07FF FFFF	Area 1 CS1 64 Mbytes				
H'0800 0000 to H'17FF FFFF	Other module space		Other module space		
H'1800 0000 to	Area 6 Expansion area 0 EX_CS0 0 to 64 Mbytes	Area 6 Expansion area 0 EX_CS0 0 to 64 Mbytes	Expansion area 1 EX_CS1 0 to 64 Mbytes	Expansion area 1 EX_CS1 0 to 64 Mbytes	Expansion area 2 EX_CS2 0 to 64 Mbytes
	External expansion I/O area	External expansion I/O area	Expansion area 3 EX_CS3 0 to 64 Mbytes	Expansion area 3 EX_CS3 0 to 64 Mbytes	Expansion area 4 EX_CS4 0 to 64 Mbytes
	Expansion area 4 EX_CS4 0 to 64 Mbytes	Expansion area 5 EX_CS5 0 to 64 Mbytes	Expansion area 5 EX_CS5 0 to 64 Mbytes		
H'1BFF FFFF	64 Mbytes	64 Mbytes			
H'1C00 0000 to H'FEFB FFFF	Other module space		Other module space		
H'FEC0 0000 to H'FEFF FFFF	Space for LBSC internal registers		BSC: from H'FEC0 0000, LBSC-DMAC: from H'FEC0 1000		

Figure 14.2 LBSC Response Support Areas from the CPU

### 14.4.2 Functionality Supported in Each Area

Table 14.1 lists the functions supported by the LBSC in each area on the EX-BUS.

**Table 14.1 Functions Supported in Each Area on EX-BUS**

Area	Bus	Capacity	Operating Mode	Guard interval	WAIT Function	
0	8/16 bits	64/128 Mbytes selectable Area 0 divided MD4 pin specified	SRAM DMA Burst ROM	Disabled	Enabled	
1	8/16 bits	Fixed to 64 Mbytes When area 0 = 128 Mbytes, no space exists.	SRAM DMA ATA (PIO) Byte-control SRAM	Enabled	Enabled	
Expansion area	0	8/16 bits	0 to 64 Mbytes Total capacity of expansion areas: 64 Mbytes	SRAM DMA ATA (PIO) Byte-control SRAM	Enabled	Enabled
	1	8/16 bits	0 to 64 Mbytes Total capacity of expansion areas: 64 Mbytes	SRAM DMA ATA (PIO) Byte-control SRAM	Enabled	Enabled
	2	8/16 bits	0 to 64 Mbytes Total capacity of expansion areas: 64 Mbytes	SRAM DMA ATA (PIO) Byte-control SRAM	Enabled	Enabled
	3	8/16 bits	0 to 64 Mbytes Total capacity of expansion areas: 64 Mbytes	SRAM DMA ATA (PIO) Byte-control SRAM	Enabled	Enabled
	4	8/16 bits	0 to 64 Mbytes Total capacity of expansion areas: 64 Mbytes	SRAM DMA ATA (PIO) Byte-control SRAM	Enabled	Enabled
	5	8/16 bits	0 to 64 Mbytes Total capacity of expansion areas: 64 Mbytes	SRAM DMA ATA (PIO) Byte-control SRAM	Enabled	Enabled

- Notes:
1. The bus size for area 0 is specified with the LSI mode pins (MD8 = 0: 8 bits, MD8 = 1: 16 bits).
  2. When using area 0 in 128-Mbyte mode (MD4 = 1), no space exists for area 1.
  3. When accessing through EX-BUS, A[0] is output as byte address even if 16-bit bus is selected.
  4. One DMAC channel cannot be allocated to two areas simultaneously.
  5. The capacity of one expansion area is a maximum of 64 Mbytes. Total capacity of expansion areas is also a maximum of 64 Mbytes.

## 14.5 Register Descriptions

The LBSC set registers to control the interface, bus size, RD/WE# signal pulse cycles, and setup and hold cycles for the CS# signal with respect to the RD/WE# signal, for each of externally connected devices. Table 14.2 lists registers of the LBSC. Note that correct operation is not guaranteed in principle if each register is modified during external bus access (for register modification in other cases, refer to the note under specific register description).

**Table 14.2 LBSC Register Configuration**

Notes: Do not write to any addresses other than listed above. Operations cannot be guaranteed if writing is attempted. Values read from addresses other than those listed above are undefined.

#### [Legend]

Initial value: Register value after a reset

—: Undefined value

R/W: Readable/writable. The written value can be read.

R/WC1: Readable/writable. Writing 1 initializes the bit. Writing 0 is ignored.

- R: Read-only. The write value should always be 0.
- /W: Write-only. The read value is undefined.
- /WC1: Write-only. Writing 1 initializes the bit. Writing 0 is ignored.

Initial value:	1	0	0	0	0	0	0	—	0	0	—	—	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15	—	1	R	Reserved These bits are always read as 1. The write value should always be 1.
14 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	128B	—	R	Area 0 Capacity Indication (These bits indicate the value specified by the LSI mode pin MD4.) 0: 64 Mbytes 1: 128 Mbytes
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5, 4	CS0SZ	—	R	Area 0 Bus Size Indication (These bits indicate the value specified by the LSI mode pin MD8.) 00: Setting prohibited 01: 8 bits 10: 16 bits 11: Setting prohibited
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	CS0IF	00	R/W	Area 0 Interface Selection 00: Standard (SRAM) 01: Burst ROM 10: Setting prohibited 11: Setting prohibited

- Notes:
1. Even when the burst ROM interface is selected by setting CS0IF = B'01, burst ROM operation is not available unless appropriate setting is made in CS0BSTCTL. Be sure to specify both CS0BSTCTL and CS0BTPH before using the burst ROM interface.
  2. Setting of burst ROM is valid for CPU access only. For DMA transfer access to area 0, SRAM interface (enabled when EXDMAWCR/CSPWCR0 is valid) is usually selected.

### 14.5.3 Expansion Area x Control Register (ECSxCTRL (x = 0 to 5))

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

**Function:** ECSxCTRL specifies the interface and area capacity for expansion areas 0 to 5 (EX-BUS).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	ECSxCP						—	—	ECSxSZ		—	ECSxBRM	ECSxIF		
Initial value:	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	—	0	R/W	Reserved This bit is always read as 0. The write value should always be 0.
15	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
14 to 8	ECSxCP	H'00	R/W	Expansion Area x Capacity Setting (see the notes below.) The value set in these bits × 1 Mbyte is the capacity of the respective expansion area.
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5, 4	ECSxSZ	10	R/W	Expansion Area x Bus Size Selection 00: Setting prohibited 01: 8 bits 10: 16 bits 11: Setting prohibited
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2	ECSxBRM	0	R/W	Expansion Area x Byte-Control SRAM Mode Selection (valid only when ECSxIF = 01) 0: Same cycle as CS# 1: Same cycle as RD#
1, 0	ECSxIF	00	R/W	Expansion Area x Interface Selection 00: Standard (SRAM) 01: Byte-control SRAM 10: ATA 11: Setting prohibited

- Notes:
1. If the sum of all ECSxCP setting values exceeds 64 (= 64 Mbytes), the excess capacity is ignored.  
Example: When the registers are set to ECS0CP = 40 Mbytes, ECS1CP = 30 Mbytes, and ECS2CP = 20 Mbytes, the excess capacity is ignored. That is, ECS0CP = 40 Mbytes, ECS1CP = 24 Mbytes, and ECS2CP = 0 Mbytes.
  2. The area-capacity setting in the ECS5CTRL register (ECS5CP bits) has no effect. Regardless of the setting, the capacity of expansion area 5 will be 64 Mbytes – (sum of capacities for ECS0CP to ECS4CP). Accordingly, if the sum of the ECS0CP to ECS4CP settings exceeds 64 Mbytes, the capacity for expansion area 5 will be 0 Mbytes.
  3. Intermediate areas can be set to 0 Mbytes. Specify 0 Mbytes for the area where the CS# signal cannot be used by selecting the pin multiplex exclusive signal. If the capacity other than 0 Mbytes is specified for the area, the allocated area cannot be used.
  4. For the expansion area capacity setting and area division, refer to section 14.6.1 (1), Address Generation/Alignment.

### 14.5.4 Area 0 RD/WE Pulse Control Register (CSWCR0)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

**Function:** CSWCR0 specifies the RD/WE# pulse cycles and setup and hold cycles for the CS# signal and address during access to area 0 (EX-BUS). (The settings for read access are ignored when the burst ROM interface is selected.)

[RZ/G1H]

Bit	Bit Name	Initial Value	R/W	Description
26 to 24	WRITE CS SETUP CYCLE	111	R/W	These bits specify the CS# and address setup cycles with respect to the WE# signal during writing to area 0. 000: 0 cycle for setup period 001: 1 cycle for setup period 010: 2 cycles for setup period : 110: 6 cycles for setup period 111: 7 cycles for setup period
23	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
22 to 20	WRITE CS HOLD CYCLE	111	R/W	These bits specify the CS# and address hold cycles with respect to the WE# signal during writing to area 0. 000: 0 cycle for hold period 001: 1 cycle for hold period 010: 2 cycles for hold period : 110: 6 cycles for hold period 111: 7 cycles for hold period
19 to 16	WRITE PULSE CYCLE	1111	R/W	These bits specify the WE pulse cycles during writing to area 0. [RZ/G1H] 0000: Setting prohibited 0001: 1-cycle pulse 0010: 2-cycle pulse 0011: 3-cycle pulse 0100: 4-cycle pulse : 1110: 14-cycle pulse 1111: 15-cycle pulse
	—	0000	R	Reserved [RZ/G1M/N/E] These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
15 to 11	—	00000	R	Reserved [RZ/G1H] These bits are always read as 0. The write value should always be 0.
	READ PULSE CYCLE	11111	R/W	These bits specify the RD# pulse cycles during reading from area 0. [RZ/G1M/N/E] 00000: Setting prohibited 00001: 1-cycle pulse 00010: 2-cycle pulse 00011: 3-cycle pulse 00100: 4-cycle pulse : 11101: 29-cycle pulse 11110: 30-cycle pulse 11111: 31-cycle pulse
10 to 8	READ CS SETUP CYCLE	111	R/W	These bits specify the CS# and address setup cycles with respect to the RD# signal during reading from area 0. 000: 0 cycle for setup period 001: 1 cycle for setup period 010: 2 cycles for setup period : 110: 6 cycles for setup period 111: 7 cycles for setup period
7	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
6 to 4	READ CS HOLD CYCLE	111	R/W	These bits specify the CS# and address hold cycles with respect to the RD# signal during reading from area 0. 000: 0 cycle for hold period 001: 1 cycle for hold period 010: 2 cycles for hold period : 110: 6 cycles for hold period 111: 7 cycles for hold period
3 to 0	READ PULSE CYCLE	1111	R/W	These bits specify the RD# pulse cycles during reading from area 0. [RZ/G1H] 0000: Setting prohibited 0001: 1-cycle pulse 0010: 2-cycle pulse 0011: 3-cycle pulse 0100: 4-cycle pulse : 1110: 14-cycle pulse 1111: 15-cycle pulse
	—	0	R	Reserved [RZ/G1M/N/E] These bits are always read as 0. The write value should always be 0.

Notes: 1. A minimum of two clock cycles are required for one EX-BUS access cycle and therefore, the setting must satisfy this lower limit.  
Setting less than two clock cycles for one access cycle is not expected in the design of this LSI, and if attempted correct operation is not guaranteed.

Example: When CSSetupCycle = B'000, CSHoldCycle = B'000, and PulseCycle = B'00001, correct operation is not guaranteed.

2. When controlling wait insertion through LSI external pins (EX\_WAIT2 to EX\_WAIT0), set PulseCycle to B'00010 or a larger value. If B'00001 or a smaller value is specified, wait insertion through an external pin is disabled.
3. When the burst ROM interface is specified for area 0, the read access-related settings for area 0 in this register is ignored and settings in CS0BTPH are enabled.
4. DMA transfer access is performed according to the settings in the RD/WE pulse control register (EXDMAWCry (y = 0 to 2)) for the respective LBSC-DMAC channel.
5. For details, refer to section 14.6.1, SRAM Interface (Basic Functionality).

26 to 24	WRITE CS SETUP CYCLE	111	R/W	These bits specify the CS# and address setup cycles with respect to the WE# signal during writing to expansion area x. 000: 0 cycle for setup period 001: 1 cycle for setup period 010: 2 cycles for setup period : 110: 6 cycles for setup period 111: 7 cycles for setup period
23	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
22 to 20	WRITE CS HOLD CYCLE	111	R/W	These bits specify the CS# and address hold cycles with respect to the WE# signal during writing to expansion area x. 000: 0 cycle for hold period 001: 1 cycle for hold period 010: 2 cycles for hold period : 110: 6 cycles for hold period 111: 7 cycles for hold period
19 to 16	WRITE PULSE CYCLE	1111	R/W	These bits specify the WE# pulse cycles during writing to area 0. [RZ/G1H] 0000: Setting prohibited 0001: 1-cycle pulse 0010: 2-cycle pulse 0011: 3-cycle pulse 0100: 4-cycle pulse : 1110: 14-cycle pulse 1111: 15-cycle pulse
	—	0000	R	Reserved [RZ/G1M/N/E] These bits are always read as 0. The write value should always be 0.
15 to 11	—	00000	R	Reserved [RZ/G1H] These bits are always read as 0. The write value should always be 0.
	READ PULSE CYCLE	11111	R/W	These bits specify the RD# pulse cycles during reading from area 0. [RZ/G1M/N/E] 00000: Setting prohibited 00001: 1-cycle pulse 00010: 2-cycle pulse 00011: 3-cycle pulse 00100: 4-cycle pulse : 11101: 29-cycle pulse 11110: 30-cycle pulse 11111: 31-cycle pulse

Bit	Bit Name	Initial Value	R/W	Description
10 to 8	READ CS SETUP CYCLE	111	R/W	These bits specify the CS# and address setup cycles with respect to the RD# signal during reading from expansion area x. 000: 0 cycle for setup period 001: 1 cycle for setup period 010: 2 cycles for setup period : 110: 6 cycles for setup period 111: 7 cycles for setup period
7	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
6 to 4	READ CS HOLD CYCLE	111	R/W	These bits specify the CS# and address hold cycles with respect to the RD# signal during reading from expansion area x. 000: 0 cycle for hold period 001: 1 cycle for hold period 010: 2 cycles for hold period : 110: 6 cycles for hold period 111: 7 cycles for hold period
3 to 0	READ CS PULSE CYCLE	1111	R/W	These bits specify the RD# pulse cycles during reading from area 0. [RZ/G1H] 0000: Setting prohibited 0001: 1-cycle pulse 0010: 2-cycle pulse 0011: 3-cycle pulse 0100: 4-cycle pulse : 1110: 14-cycle pulse 1111: 15-cycle pulse
		0000	R	Reserved [RZ/G1M/N/E] These bits are always read as 0. The write value should always be 0.

- Notes:
1. A minimum of two clock cycles are required for one EX-BUS access cycle and therefore, the setting must satisfy this lower limit.  
Setting less than two clock cycles for one access cycle is not expected in the design of this LSI, and if attempted correct operation is not guaranteed.  
Example: When CSSetupCycle = B'000, CSHoldCycle = B'000, and PulseCycle = B'00001, correct operation is not guaranteed.
  2. When controlling wait insertion through LSI external pins (EX\_WAIT2 to EX\_WAIT0), set PulseCycle to B'00010 or a larger value. If B'00001 or a smaller value is specified, wait insertion through an external pin is disabled.
  3. DMA transfer access to expansion area x is performed according to the settings in the RD/WE pulse control register (EXDMAWCRy (y = 0 to 2)) for the respective LBSC-DMAC channel.
  4. For details, refer to section 14.6.1, SRAM Interface (Basic Functionality).

**14.5.7 LBSC-DMAC Channel y RD/WE Pulse Control Register (EXDMAWCry (y = 0 to 2))**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

**Function:** EXDMAWCry specifies the RD/WE# pulse cycles and setup and hold cycles for the CS# signal and address during access to EX-BUS in LBSC-DMAC channel y (y = 0 to 5).

Initial value:	0	0	0	0	0	0	0	0	1	1	1	1	0	1	1	1
R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	A0H	0	R/W	Specifies the CS# and address hold cycles with respect to the RD# signal for area 0 in the burst ROM interface. 0: 0 cycle for hold period 1: 1 cycle for hold period
7 to 4	A0W[3:0]	1111	R/W	These bits specify the burst pitch (wait cycles to be inserted) after the first burst cycle for area 0 in the burst ROM interface. 0000: Setting prohibited 0001: Setting prohibited 0010: 2 cycles 0011: 3 cycles 0100: 4 cycles : 1101: 13 cycles 1110: 14 cycles 1111: 15 cycles
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	A0B[2:0]	111	R/W	These bits specify the burst pitch (wait cycles to be inserted) after the second burst cycle for area 0 in the burst ROM interface. 000: Setting prohibited 001: 1 cycle 010: 2 cycles : 110: 6 cycles 111: 7 cycles

- Notes: 1. Be sure to specify this register before specifying CS0BSTCTL.  
2. For details, refer to section 14.6.2, CPU (AXI Bus) → Burst ROM Interface.

#### 14.5.14 Area 1 Guard Setting Register (CS1GDST)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

**Function:** CS1GDST specifies the guard interval (period of access prohibition) between sequential access cycles in area 1.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	CS1GD	TIMER_SET			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	CS1GD	0	R/W	0: Makes the TIMER_SET setting invalid. 1: Makes the TIMER_SET setting valid.
3 to 0	TIMER_SET	0000	R/W	Guard Interval (Period of Access Prohibition) between Sequential Access Cycles for Area 1 0000: 0 clock cycle 0001: 1 clock cycle 0010: 2 clock cycles 0011: 3 clock cycles 0100: 4 clock cycles : 1101: 13 clock cycles 1110: 14 clock cycles 1111: 15 clock cycles

- Notes: 1. The TIMER\_SET setting is ignored when CS1GD = 0.  
2. This register must not be dynamically modified regardless of whether area 1 is being accessed.  
3. The actual guard interval between sequential access cycles on the EX-BUS is (register setting) + (idle cycles due to hardware processing and EX-BUS arbitration).  
4. For details, refer to section 14.6.1 (4), Controlling Guard Intervals

**14.5.15 Expansion Area x Guard Setting Register (ECSxGDST (x = 0 to 5))**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

**Function:** ECSxGDST specifies the guard interval (period of access prohibition) between sequential access cycles in expansion area x (x = 0 to 5) (valid for both SRAM and MPX buses).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	ECSxGD	TIMER_SET			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	ECSxGD	0	R/W	0: Makes the TIMER_SET setting invalid. 1: Makes the TIMER_SET setting valid.
3 to 0	TIMER_SET	0000	R/W	Guard Interval (Period of Access Prohibition) between Sequential Access Cycles for Expansion Area x 0000: 0 clock cycle 0001: 1 clock cycle 0010: 2 clock cycles 0011: 3 clock cycles : 1101: 13 clock cycles 1110: 14 clock cycles 1111: 15 clock cycles

- Notes:
1. The TIMER\_SET setting is ignored when ECSxGD = 0.
  2. This register must not be dynamically modified regardless of whether the expansion area is being accessed.
  3. The actual guard interval between sequential access cycles on the EX-BUS is (register setting) + (idle cycles due to hardware processing and EX-BUS arbitration).
  4. For details, refer to section 14.6.1 (4), Controlling Guard Intervals.

### 14.5.16 LBSC-DMAC Channel y Area Assignment Register (EXDMASETy (y = 0 to 2))

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

**Function:** EXDMASETy specifies the area where LBSC-DMAC channel y is assigned (y = 0 to 2).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	DMyECS5	DMyECS4	DMyECS3	DMyECS2	DMyECS1	DMyECS0	DMyCS1	DMyCS0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7	DMyECS5	0	R/W	0: Does not assign LBSC-DMAC channel y to expansion area 5. 1: Assigns LBSC-DMAC channel y to expansion area 5.
6	DMyECS4	0	R/W	0: Does not assign LBSC-DMAC channel y to expansion area 4. 1: Assigns LBSC-DMAC channel y to expansion area 4.
5	DMyECS3	0	R/W	0: Does not assign LBSC-DMAC channel y to expansion area 3. 1: Assigns LBSC-DMAC channel y to expansion area 3.
4	DMyECS2	0	R/W	0: Does not assign LBSC-DMAC channel y to expansion area 2. 1: Assigns LBSC-DMAC channel y to expansion area 2.
3	DMyECS1	0	R/W	0: Does not assign LBSC-DMAC channel y to expansion area 1. 1: Assigns LBSC-DMAC channel y to expansion area 1.
2	DMyECS0	0	R/W	0: Does not assign LBSC-DMAC channel y to expansion area 0. 1: Assigns LBSC-DMAC channel y to expansion area 0.
1	DMyCS1	0	R/W	0: Does not assign LBSC-DMAC channel y to area 1. 1: Assigns LBSC-DMAC channel y to area 1.
0	DMyCS0	0	R/W	0: Does not assign LBSC-DMAC channel y to area 0. 1: Assigns LBSC-DMAC channel y to area 0.

- Notes:
- Setting more than one bit to 1 in this register is prohibited. Such a setting is not expected in the design of this LSI, and if attempted correct operation is not guaranteed.
  - For an expansion area whose capacity is 0 Mbytes, DMAC channel must not be assigned.
  - Be sure to specify this register before starting LBSC-DMAC access. If an LBSC-DMAC channel starts access before specifying this register, correct operation is not guaranteed (such access is not expected in the design of this LSI).
  - When CS0 area is used as a 128-Mbyte space, DMAC channel must not be assigned to CS1 area.
  - For details, refer to section 14.6.3, LBSC-DMAC → DMA Interface.

### 14.5.17 LBSC-DMAC Channel y Control Register (EXDMCRy (y = 0 to 2))

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

**Function:** EXDMCRy specifies conversion of DREQ[y], DACK[y], and DRACK[0] in the area where LBSC-DMAC channel y is assigned.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DRST	—	DSTS	DBST	—	EXQL	EXDY	EXDS	—	—	EXRS	EXRL	—	EXAL	DAKCTL	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	W	R	R	R/W	R	R/W	R/W	R/W	R	R	R/W	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15	DRST	0	W	DACK Signal Forcible Negation (Enabled when DBST = 1) 0: Writing 0 is ignored. 1: Forcibly negates the DACK signal being continuously asserted for 1 CLKOUT cycle.
14	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
13	DSTS	0	R	DACK Signal Assert State Indication 0: The DACK signal is not currently asserted. 1: The DACK signal is currently asserted.
12	DBST	0	R/W	Specifies whether or not to continuously assert the DACK signal if DREQ is continuously asserted during the intervals between DMA bus transfers (in ATA mode only). 0: Negates DACK after each bus transfer. 1: Continuously asserts DACK even during the intervals between bus transfers if DREQ is continuously asserted. (When negation of DREQ is detected, DACK is also negated.)
11	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
10	EXQL	0	R/W	0: Receives DREQ[y] signal at a low level. 1: Receives DREQ[y] signal at a high level.
9	EXDY	0	R/W	0: Does not synchronize the DREQ[y] signal. 1: Synchronizes the DREQ[y] signal.
8	EXDS	0	R/W	0: Detects DREQ[y] signal at a level. 1: Detects DREQ[y] signal at an edge.
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
5	EXRS	0	R/W	0: Asserts DRACK[0] one clock cycle before CS#/DACK[0] is asserted. 1: Asserts DRACK[0] two clock cycles before CS#/DACK[0] is asserted.
4	EXRL	0	R/W	0: Outputs DRACK[0] as a high-active signal. 1: Outputs DRACK[0] as a low-active signal.
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2	EXAL	0	R/W	0: Outputs DACK[y] as a high-active signal. 1: Outputs DACK[y] as a low-active signal.
1, 0	DAKCTL	00	R/W	Signals asserted for area where LBSC-DMAC channel y is assigned 00 and 11: Asserts the CS# signal and DACK[y] signal together for the area. 01: Asserts only the CS# signal for the area. 10: Asserts only the DACK[y] signal for the area.

- Notes:
1. This register except for DRST bit must not be dynamically modified regardless of whether the respective area is being accessed.
  2. The EXRL and EXRS settings are valid only for LBSC-DMAC channel 0 (DRACK[0]). LBSC-DMAC channels 1 and 2 do not have the DRACK signal.
  3. For details on the DMA interface, refer to section 14.6.3, LBSC-DMAC → DMA Interface.

**14.5.18 BSC Interrupt Source Status Register (BCINTSR)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

**Function:** BCINTSR indicates the status of the BSC interrupt source.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	EXWTE	ATTE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	EXWTE	0	R	EX-BUS Wait Timeout Error Status 0: The EX-BUS is working correctly. 1: An EX-BUS timeout error has occurred. (A timeout error occurs when an EX-BUS clock (CLKOUT) cycle of EXBCT and EXTCT setting values have elapsed.)
0	ATTE	0	R	ATA Wait Timeout Error Status 0: The ATA interface is working correctly. 1: A timeout error has occurred in the ATA interface. (A timeout error occurs when 100 EX-BUS clock (CLKOUT) cycles of wait time have elapsed.)

- Notes:
1. No interrupt signal is output with only the ATTE bit being set to 1 in this register. To output an interrupt signal, BCINTMR must be appropriately specified.
  2. For details on the ATA interface, refer to section 14.6.5, CPU (AXI Bus) → ATA Device Interface.

**14.5.19 BSC Interrupt Source Clear Register (BCINTCR)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: BCINTCR clears the state of the BSC interrupt indicator.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	EXWTE C	ATTEC
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	-/WC1	-/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	EXWTEC	0	-/WC1	EX-BUS Wait Timeout Error Status Clear 0: Writing 0 is ignored. 1: Clears the EX-BUS wait timeout error state.
0	ATTEC	0	-/WC1	ATA Wait Timeout Error Status Clear 0: Writing 0 is ignored. 1: Clears the ATA wait timeout error state.

- Notes: 1. This register is always read as 0.  
2. For details on the ATA interface, refer to section 14.6.5, CPU (AXI Bus) → ATA Device Interface.

**14.5.20 BSC Interrupt Enable Register (BCINTMR)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: BCINTMR enables or disables the BSC interrupt.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	EXWTE M	ATTEM
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	EXWTEM	0	R/W	EX-BUS Wait Timeout Error Interrupt Enable 0: Disables output of an interrupt signal for this interrupt source. 1: Enables output of an interrupt signal for this interrupt source.
0	ATTEM	0	R/W	ATA Wait Timeout Error Interrupt Enable 0: Disables output of an interrupt signal for this interrupt source. 1: Enables output of an interrupt signal for this interrupt source.

**14.5.21 EX-BUS Priority Level Set Register (EXBATLV)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

**Function:** Specifies the priority levels for EX-BUS arbitration.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	EX-BLV
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	EX-BLV	0	R/W	Priority Level Setting for EX-BUS Arbitration (Access Selection) 0: Higher priority: PIO (AXI access) Lower priority: LBSC-DMAC 1: Higher priority: LBSC-DMAC Lower priority: PIO (AXI access)

- Notes:
- EX-BLV sets a fixed priority between PIO and LBSC-DMAC.
  - This register must not be dynamically modified except for initial setting.
  - For details on external bus arbitration, refer to section 14.6.7, EX-BUS Arbitration.

**14.5.22 External Wait Status Register (EXWTSTS)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: EXWTSTS indicates the state of the external wait pins EX\_WAITn.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	EXWT2 STS	EXWT1 STS	EXWT0 STS
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2	EXWT2STS	—	R	Indicates the EX_WAIT2 pin state.
1	EXWT1STS	—	R	Indicates the EX_WAIT1 pin state.
0	EXWT0STS	—	R	Indicates the EX_WAIT0 pin state.

### 14.5.23 ATACS Control Register (ATACCTRL)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

**Function:** ATACCTRL specifies the ATA port 0 (pins ATACS00# and ATACS10#) and ATA port 1 (pins ATACS01# and ATACS11#) signal settings.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	ATAECS 5_EN	ATAECS 4_EN	ATAECS 3_EN	ATAECS 2_EN	ATAECS 1_EN	ATAECS 0_EN	ATACS1 _EN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 7	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
6	ATAECS5_EN	0	R/W	Setting of the ATACS signal when expansion area 5 is accessed in ATA mode 0: The ATACS0 signal (pins ATACS00# and ATACS10#) is asserted. 1: The ATACS1 signal (pins ATACS01# and ATACS11#) is asserted.
5	ATAECS4_EN	0	R/W	Setting of the ATACS signal when expansion area 4 is accessed in ATA mode 0: The ATACS0 signal (pins ATACS00# and ATACS10#) is asserted. 1: The ATACS1 signal (pins ATACS01# and ATACS11#) is asserted.
4	ATAECS3_EN	0	R/W	Setting of the ATACS signal when expansion area 3 is accessed in ATA mode 0: The ATACS0 signal (pins ATACS00# and ATACS10#) is asserted. 1: The ATACS1 signal (pins ATACS01# and ATACS11#) is asserted.
3	ATAECS2_EN	0	R/W	Setting of the ATACS signal when expansion area 2 is accessed in ATA mode 0: The ATACS0 signal (pins ATACS00# and ATACS10#) is asserted. 1: The ATACS1 signal (pins ATACS01# and ATACS11#) is asserted.

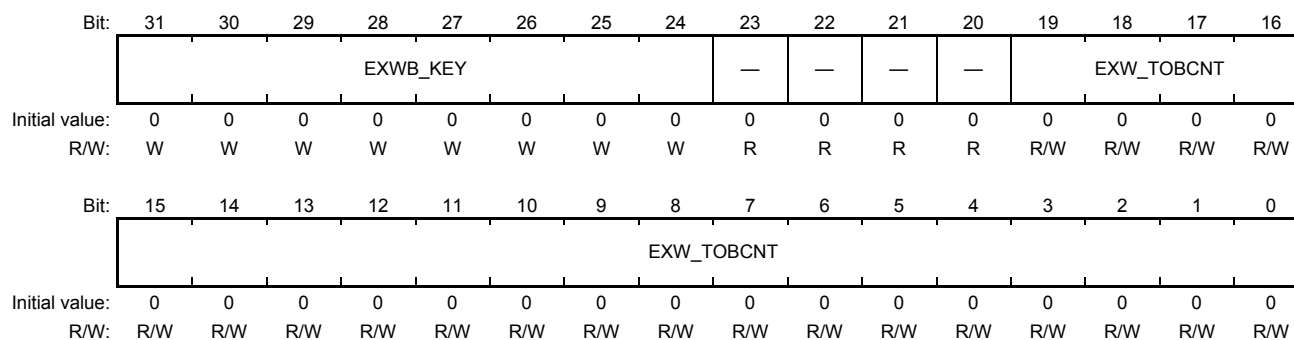

Bit	Bit Name	Initial Value	R/W	Description
2	ATAECS1_EN	0	R/W	Setting of the ATACS signal when expansion area 1 is accessed in ATA mode 0: The ATACS0 signal (pins (pins ATACS00# and ATACS10#) is asserted. 1: The ATACS1 signal (pins ATACS01# and ATACS11#) is asserted.
1	ATAECS0_EN	0	R/W	Setting of the ATACS signal when expansion area 0 is accessed in ATA mode 0: The ATACS0 signal (pins (pins ATACS00# and ATACS10#) is asserted. 1: The ATACS1 signal (pins ATACS01# and ATACS11#) is asserted.
0	ATACS1_EN	0	R/W	Setting of the ATACS signal when area 1 is accessed in ATA mode 0: The ATACS0 signal (pins (pins ATACS00# and ATACS10#) is asserted. 1: The ATACS1 signal (pins ATACS01# and ATACS11#) is asserted.

Note: If the ATA mode is selected with the CS1IF bit of the CS1CTRL register and the ECSxIF bit of the ECSxCTRL register, and the ATACS1\_EN and ATAECsx\_EN bits of this register are set to 1, ATACS00#, ATACS10#, ATACS01#, or ATACS11# is asserted in accord with the value being output as address bit 4 on the external bus. For details, refer to section 14.6.5, CPU (AXI Bus) → ATA Device Interface.

**14.5.24 EX-BUS Wait Timeout Detection Base Counter Register (EXBCT)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

**Function:** EXBCT specifies the lower-order part of the value for counting to detect a timeout in waiting for access to the EX-BUS, which is monitored through pins EX\_WAIT0, EX\_WAIT1, and EX\_WAIT2.

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	EXWB_KEY	H'00	W	EX-BUS Wait Timeout Detection Base Counter Register Write Key  For writing to this register to be effective, the value H'5A must be written to these bits. Values read from these bits are meaningless.
23 to 20	—	All 0	R	Reserved  These bits are always read as 0. The write value should always be 0.
19 to 0	EXW_TOBCNT	H'0 0000	R/W	EX-BUS Wait Timeout Counter Setting  Maximum value: H'0 0000 Minimum value: H'0 0001

**Note:** Counting to detect a timeout in waiting for access to the EX-BUS is handled by a 32-bit counter, which is formed by the EXW\_TOBCNT bits in the EXBCT register and the EXW\_TOCNT bits in the EXTCT register as shown below.

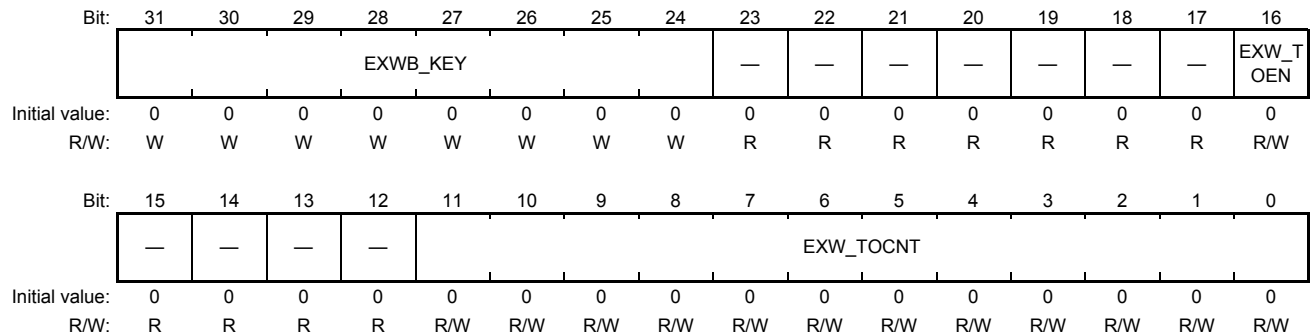

**14.5.25 EX-BUS Wait Timeout Detection Counter Register (EXTCT)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

**Function:** EXTCT specifies the higher-order part of the value for counting to detect a timeout in waiting for access to the EX-BUS, which is monitored through pins EX\_WAIT0, EX\_WAIT1, and EX\_WAIT2, and enables or disables the detection.

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	EXWB_KEY	H'00	W	EX-BUS Wait Timeout Detection Counter Register Write Key For writing to this register to be effective, the value H'5A must be written to these bits. Values read from these bits are meaningless.
23 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	EXW_TOEN	0	R/W	EX-BUS Wait Timeout Enable 0: Timeout in waiting for access to the EX-BUS has not been detected. 1: Timeout in waiting for access to the EX-BUS has been detected.
15 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 0	EXW_TOCNT	H'000	R/W	EX-BUS Wait Timeout Counter Setting Maximum value: H'000 Minimum value: H'001

**Note:** Counting to detect a timeout in waiting for access to the EX-BUS is handled by a 32-bit counter, which is formed by the EXW\_TOBCNT bits in the EXBCT register and the EXW\_TOCNT bits in the EXTCT register as shown below.

**14.5.26 EX-BUS Wait Timeout Detection Access Source Indication Register (EXTSR)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

**Function:** EXTSR indicates the source of attempted access to the EX-BUS that reached timeout as detected through the EX\_WAIT0, EX\_WAIT1, and EX\_WAIT2 pins.

16	EXW_TOSHW	0	R/WC1	Indication of timeout in waiting for access to the EX-BUS from the AXI bus. 0: Timeout has not been reached. 1: Timeout has been reached. To clear this bit, write 1 to it.
15 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2	EXW_TODC2	0	R/WC1	Indication of timeout in waiting for access to the EX-BUS by channel 2 of the LBSC-DMAC. 0: Timeout has not been reached. 1: Timeout has been reached. To clear this bit, write 1 to it.
1	EXW_TODC1	0	R/WC1	Indication of timeout in waiting for access to the EX-BUS by channel 1 of the LBSC-DMAC. 0: Timeout has not been reached. 1: Timeout has been reached. To clear this bit, write 1 to it.
0	EXW_TODC0	0	R/WC1	Indication of timeout in waiting for access to the EX-BUS by channel 0 of the LBSC-DMAC. 0: Timeout has not been reached. 1: Timeout has been reached. To clear this bit, write 1 to it.

**14.5.27 EX-BUS Wait Timeout Detection Address Indication Register (EXTADR)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

**Function:** EXTADR indicates the address at which access to the EX-BUS was attempted but timeout was detected through pins EX\_WAIT0, EX\_WAIT1, and EX\_WAIT2.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	EXW_ TOADR	H'0000 0000	R/W	Indication of the address for which attempted access to the EX-BUS by the AXI bus reached timeout

- Notes:
1. This register is readable and writable. To clear this register, write 0s to all bits.
  2. This register only indicates the address to which access was attempted if this was from the AXI bus (i.e. addresses are not indicated if access was attempted from the LBSC-DMAC).

## 14.6 Operation

RZ/G1H	RZ/G1N
RZ/G1M	RZ/G1E

### 14.6.1 SRAM Interface (Basic Functionality)

The BSC reads access requests from the CPU stored in the FIFO mounted in the LBSC module and writes them to the EX-BUS. By default, all spaces, areas 0 and 1, and expansion areas 0 to 5 are all set for SRAM interface. The pulse width for access signals in this SRAM access interface can be varied according to register settings. Thus, the SRAM interface has functionality for easily accommodating devices with various access specifications, connected on the EX-BUS. In addition, to support low-speed external devices, the guard-interval control functionality is provided for insertion of the appropriate interval for each bus access; and the SRAM interface receives wait-for-response requests (or access complete signals) from external devices on a synchronous/asynchronous-selectable and polarity-selectable basis, thus ensuring flexibility in bus design. Figures 14.3 and 14.4 show SRAM interface timing charts for AXI → EX-BUS conversions.

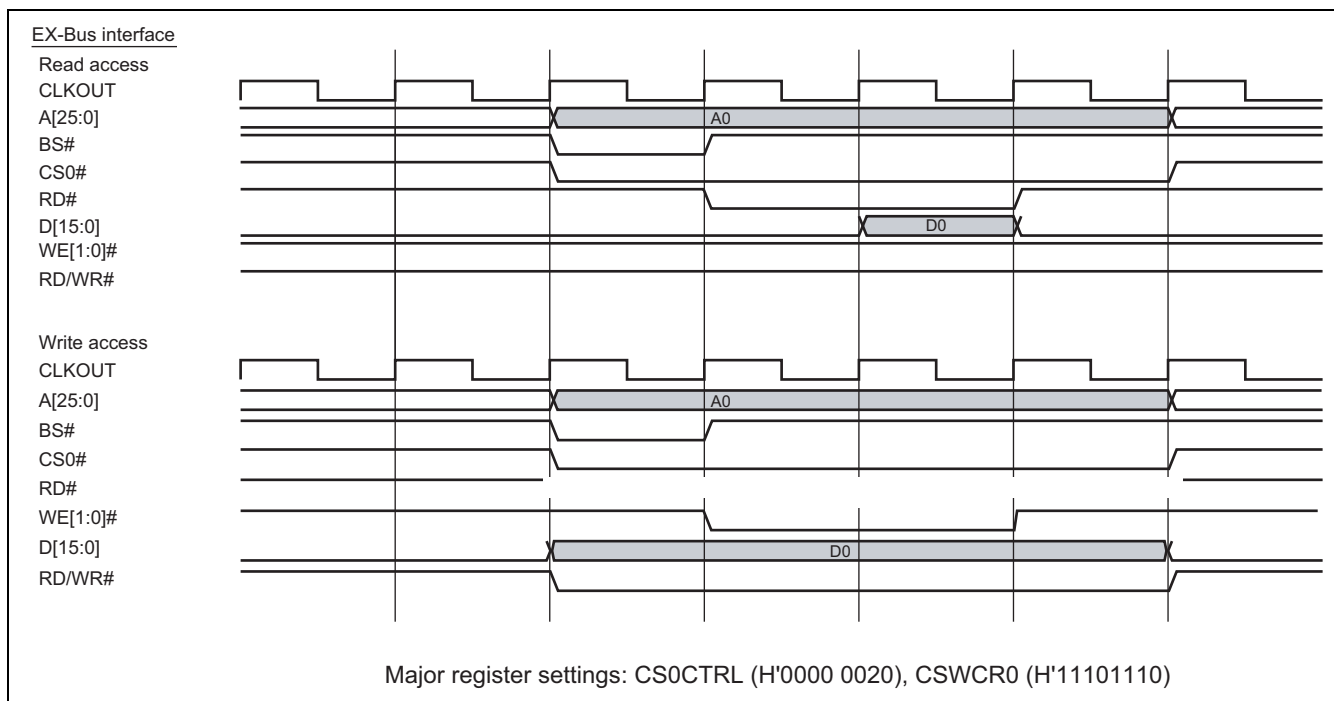

Figure 14.3 Basic Timing Chart for Access from AXI to SRAM (Area 0)

**Figure 14.4 Basic Timing Chart for Access from AXI to SRAM (Shortest Pulse Width × Shortest PIO Consecutive Accesses)**

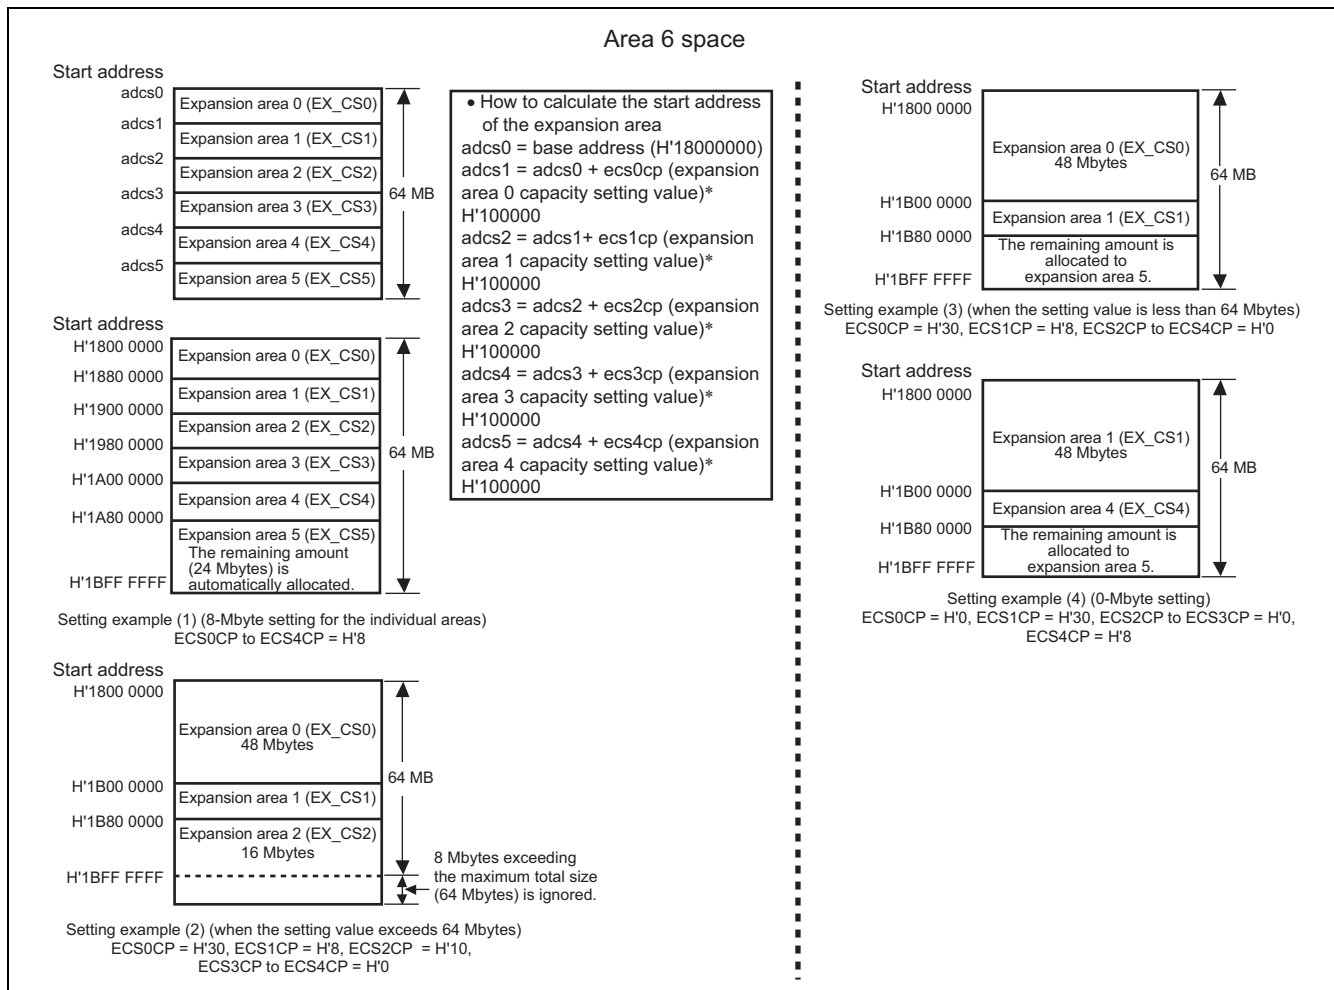

Figure 14.4 is an example of the basic SRAM interface waveform with the shortest pulse width, wherein the same waveform occurs twice in succession.

If consecutive PIO access requests are made from the CPU (AXI bus), the access interval will be 2 clock cycles, as indicated in the above waveforms, regardless of whether the preceding or succeeding access request is for the same area or for different areas. If a switching occurs, such as PIO → DMA or DMA → PIO, however, the access interval will be 1 clock cycle.

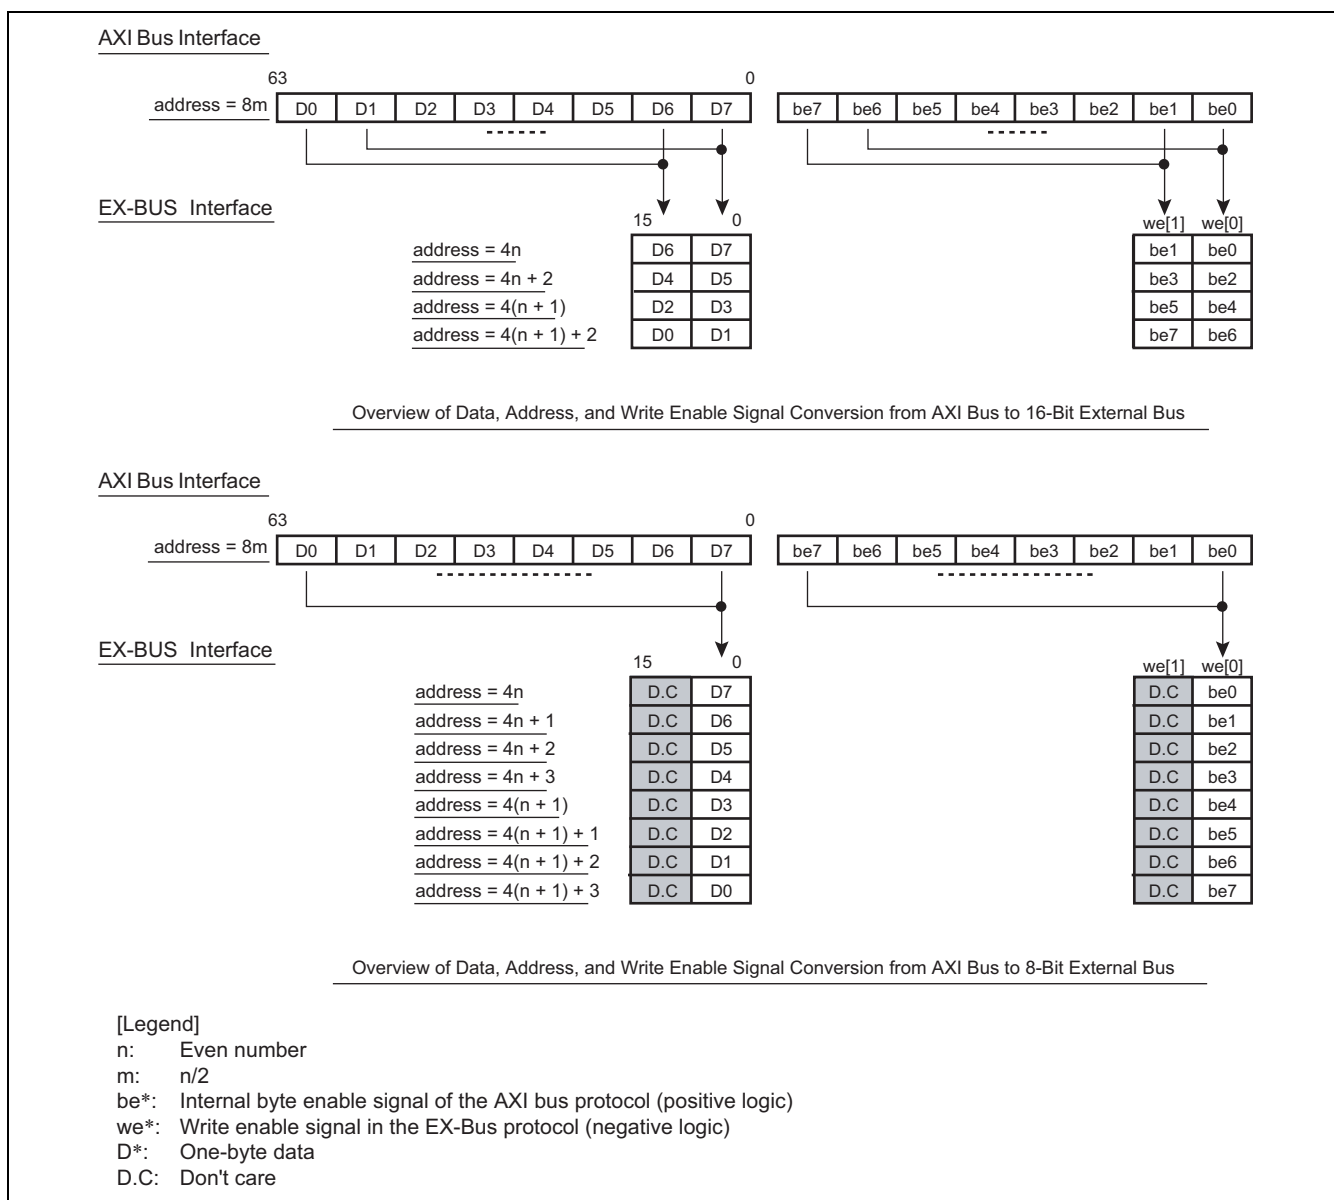

The access interval can be extended by means of the guard setting registers.

**(1) Address Generation/Alignment**

When making access to the EX-BUS as an SRAM interface, the LBSC generates addresses and performs data alignment conversions in addition to determining which area is to be accessed according to how the expansion area space is partitioned by register settings. Figure 14.5 shows the method by which the expansion area is partitioned. Figure 14.6 provides an overview of address generation and data alignment/write enable conversions.

**Figure 14.5 Expansion Area Partition**

**Figure 14.6 Overview of Data, Address, and Write Enable Signal Conversion from CPU (64-Bit AXI Bus) to External Bus**

**(2) Setting the Pulse Width for an Access Signal**

When making access to the EX-BUS, the LBSC can set the setup or hold time for addresses, RD/WR#, and CS# signals based on WE# signals and RD# signals, and the pulse width for WE# and RD# signals in units of clock cycles, according to the values that are set for each area by means of the CSWCR0, CSWCR1, or ECSWCRx (x = 0 to 5) registers. (During a burst ROM read operation, however, the LBSC conforms to CS0BTPH settings rather than CSWCR0 settings. Similarly, during a DMA operation, it conforms to EXDMAWCR0 to EXDMAWCR2 settings rather than CSWCR0, CSWCR1 or ECSWCRx (x = 0 to 5) settings.) The pulse width for WE# or RD# signal that is stored in a register can be extended by an externally supplied EX\_WAIT signal. The minimum total value that is set should be two clock cycles.

### (3) External Wait Control

The LBSC controls the external wait signal (EX\_WAIT) from a device connected to the EX-BUS based on settings that are provided on external wait control registers (CSPWCR0, CSPWCR1, or ECSPWCR<sub>x</sub> (x = 0 to 5)) and the external wait input control register (EXWTSYNC). The external wait control registers permit the selection of the four types of interfaces to accommodate various types of specifications, whether the wait signal input from an external device is based on the READY logic (posting a READY status) or BUSY logic (posting a BUSY status), or which signal polarity is in effect.

Figure 14.7 shows waveforms for the four wait signal patterns that can be input and the waveforms for the wait signals internal to the LBSC after conversion according to the register settings.

The external wait input control register allows the switching between the synchronous/asynchronous handling of external wait input signals. The default is to treat such signals on a synchronous basis. Figure 14.8 shows external wait input timings for synchronization/asynchronization. In the figure, the position indicated by the symbol \* represents the point at which the LBSC determines whether or not external wait is in effect. Specifically, for synchronization, the position is one clock cycle before the point at which the WE# and RD# signals would normally be negated by pulse width settings. If external wait is in effect at this position, the pulse width for the WE# or RD# signal continues to extend until the wait status becomes the ready status. If the pulse width for the WE# or RD# signal is extended by the EX\_WAIT signal, the address and the RD/WR# and CS# signals are negated when the hold time is satisfied. If the synchronization setting is switched to the asynchronization setting, any external wait is nullified unless there is an external wait two clock cycles before the \* position, or three clock cycles before the point in which the WE# and RD# signals would normally be negated.

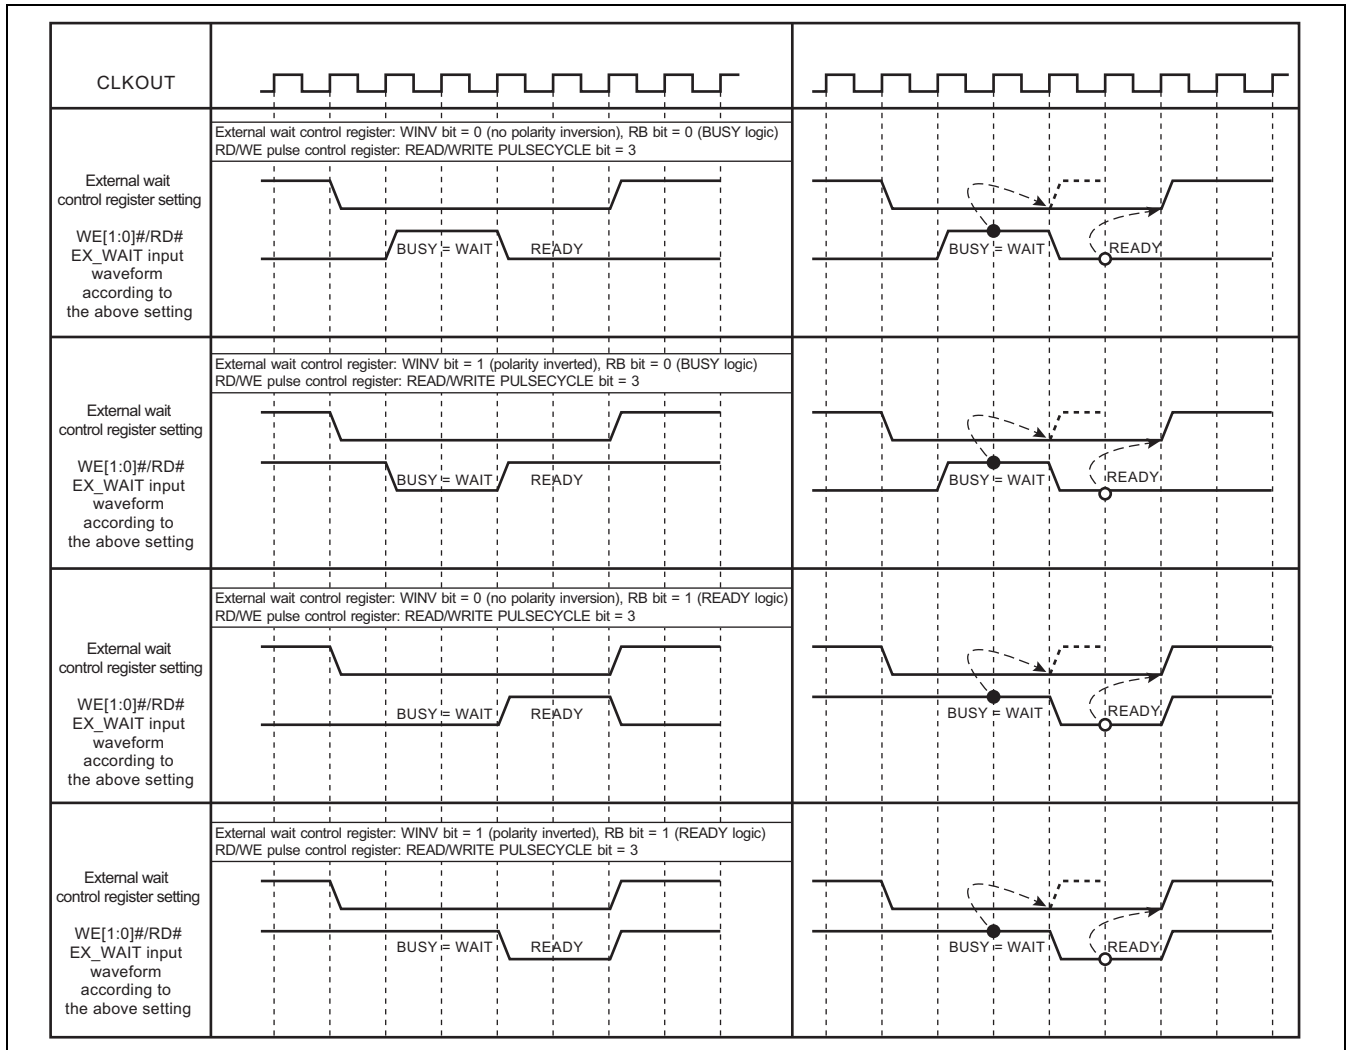

Figure 14.7 Waveforms of Converted External Wait Interface

Figure 14.8 Waveforms of External Wait Input Signals

#### (4) Controlling Guard Intervals

For some external devices, the transition of the data lines to the high-Z state after completion of read access takes a relatively long time. To prevent any contention for the data bus when further access over the EX-BUS proceeds immediately after a read operation for such a device, the LBSC supports a function to guard against further access over a given interval following each bus access. The function is also effective for external devices that have difficulty coping with consecutive reception of access requests. Specifically, set the number of clock cycles over which guarding against access applies in the guard setting register (CS1GDST, ECS0GDST to ECS5GDST) for the given area. (Even if the value assigned to the guard setting register is 0, hardware processing before a further bus access request is issued requires at least 2 clock cycles between PIO and PIO, and at least 1 clock cycle between PIO and DMA. Therefore, in PIO accesses, the actual interval on the EX-BUS is 2 clock cycles when value in the guard setting register is 0 or 1. And it is 1 clock cycles plus the setting for number of clock cycles in the guard setting register when the setting value is 2 or more.)

After access to a given area, the guard interval is assigned corresponding to the register for that area, regardless of the kind of access or target space of the next access request. Note, however, that there is no guard setting register for area 0. Therefore, guard intervals are not set up for access that immediately follows access to this area. Since area 0 is supposed to be for the connection of general-purpose memory such as ROM, SRAM, or flash-ROM, guard intervals should not be necessary for this area. Figure 14.9 is a basic timing chart to illustrate the concept of guard-interval control.

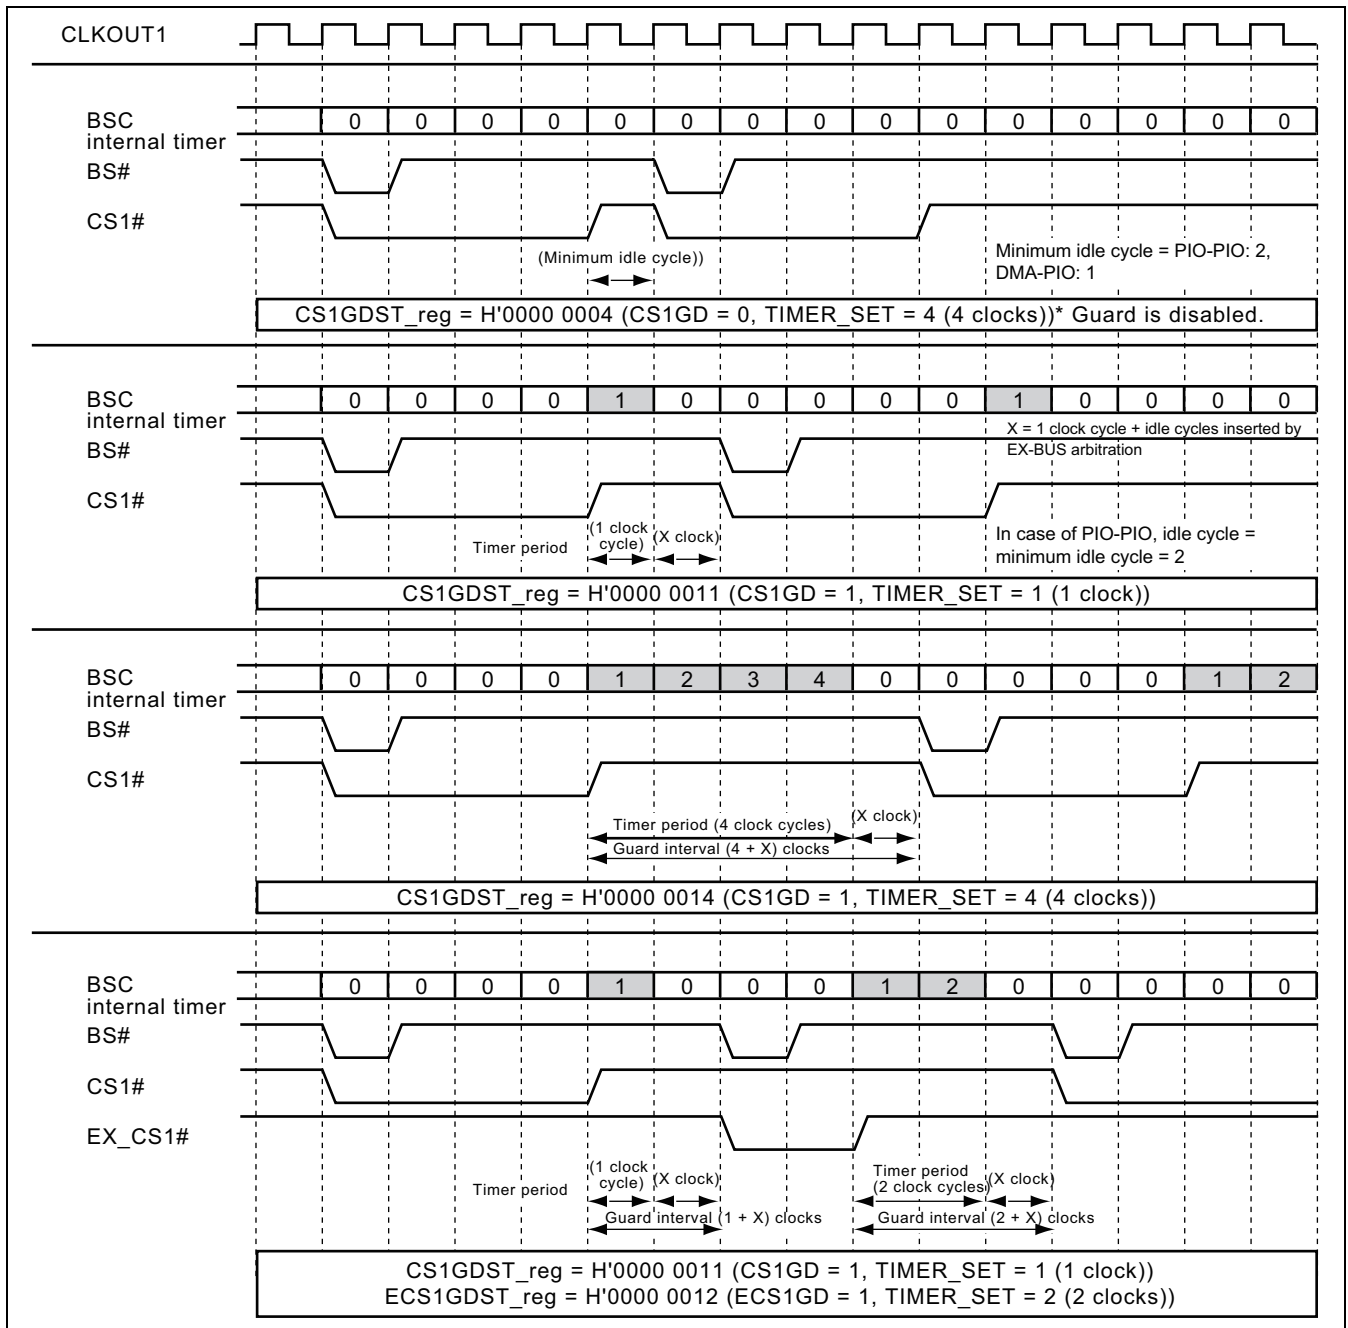

Figure 14.9 Concept of Guard-Interval Control

### 14.6.2 CPU (AXI Bus) → Burst ROM Interface

For area 0 on the EX-BUS, the BSC supports a page-mode read burst ROM interface. Switching to the burst ROM interface is performed by CS0CTRL settings. Because burst ROM access operations begin immediately after setting CS0CTRL, values must be pre-assigned to the CS0BTPH and CS0BSTCTL. In CS0BTPH, burst ROM access waveforms can be assigned, such as a first-cycle burst pitch, second and subsequent cycle burst pitches, and CS# signal hold cycles on the RD# signal. A burst access count (burst length) can be assigned to CS0BSTCTL. A burst access count should be assigned according to the component specifications for the actual external ROM that is connected.

In two kinds of exceptional cases, however, the BSC handles access with a burst count less than the specified burst count. The first are those cases where the CPU requests access to fewer data than the specified burst count. In such cases, access is terminated on completion of processing for the number of bytes requested by the CPU, even though the specified burst count has not been reached. The second are those cases where a variable burst address boundary is crossed in the midst of a specified burst count. In such cases, access is terminated immediately before the boundary is crossed, and the burst access is divided up, with the remainder of the access executed in a second round. The reason for this behavior is that the variable address boundaries for burst ROM devices, by which the LBSC must abide, are defined. Table 14.3 shows the LBSC's methodology for breaking off burst access.

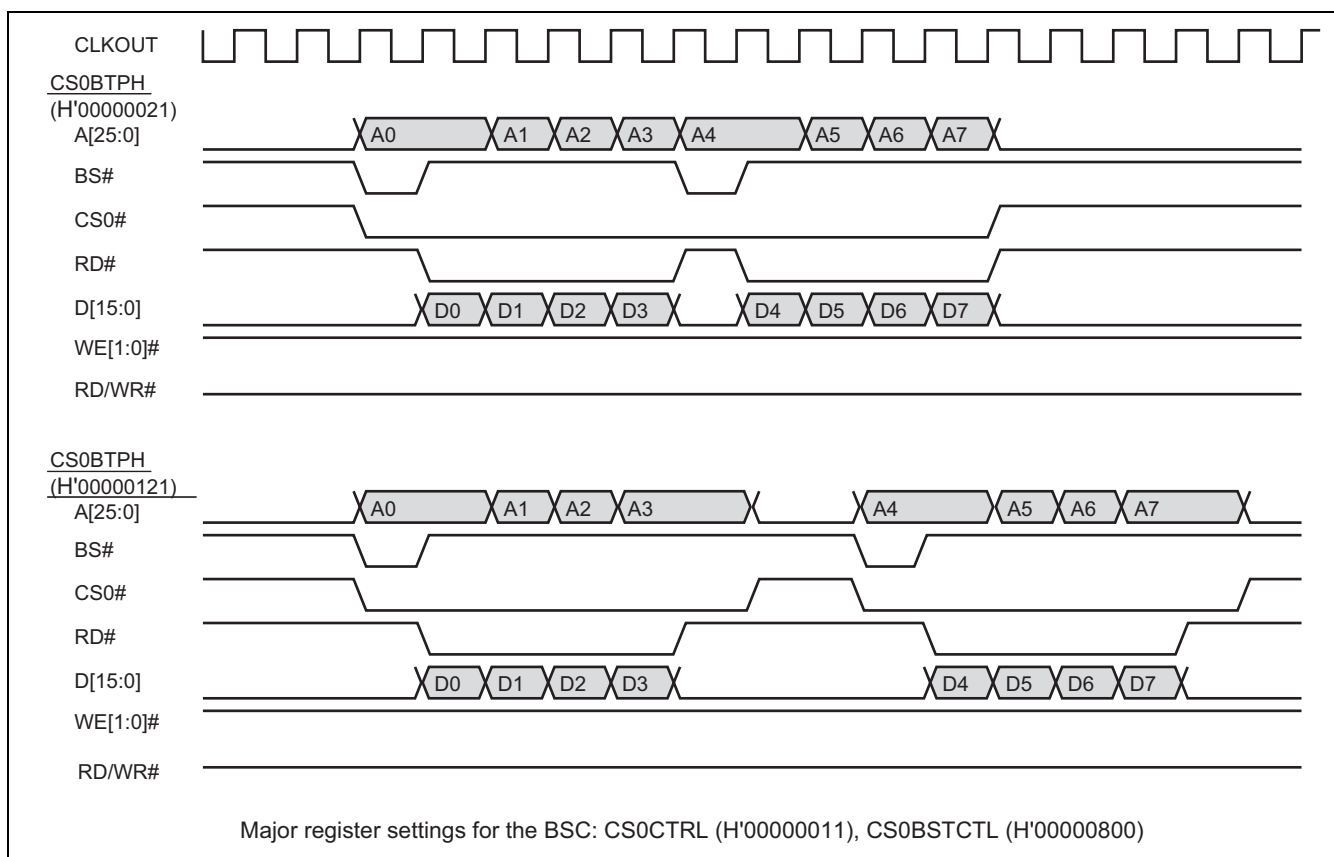

**Table 14.3 Methodology for Breaking off Bust Access**

Burst Count Assigned in CS0BSTCTL	Bus Width	
	8-Bit Bus Width	16-Bit Bus Width
4	Break at a change of A2	Break at a change of A3 (A0 not connected)
8	Break at a change of A3	Break at a change of A4 (A0 not connected)
16	Break at a change of A4	Break at a change of A5* (A0 not connected)
32	Break at a change of A5*	(Setting prohibited)

Note: \* Since A5 never changes in the midst of a 32-byte burst operation (a 32-byte boundary), access is not broken off in the case indicated by \*, and the specified number of access operations proceed.

As described above, in burst ROM access, the LBSC performs a maximum of 32-byte access to accommodate CPU cache fill while performing access breakup. However, because this operation involves access on 32-byte boundaries, for setting a burst ROM device, the user should specify wrap-around settings instead of continuous burst operations.

Depending on the mode of burst ROM connection, burst operations can also be accommodated in the synchronous burst mode. When using the LBSC in synchronous burst mode, the user should not receive the Wait signals that are output by the burst ROM. Instead, a first-word data output latency should be assigned to the configuration register of the burst ROM, and CS0BTPH should be set as the pitch for the first word and this latency. For the second and subsequent words, a pitch count of 2 should be assigned to both the configuration register of the burst ROM and CS0BTPH. Subject to the AC characteristics of the burst ROM and given frequency for the EX-BUS, if a pitch count of 1 is assigned to, data reception timing can lag behind due to the fact that the burst ROM has a data output delay of approximately 13ns. Figure 14.10 shows a basic timing chart for the burst ROM interface.

**Figure 14.10 Timing Chart for Burst ROM Interface**

**14.6.3 LBSC-DMAC → DMA Interface**

On the EX-BUS, three LBSC-DMAC channels (0 to 2) are assigned as DMACs that have external pins DREQ, DRACK, and DACK to support DMA transfer operations. Among these, channels 0 and 1 also support DMA with a burst length of 8.

All DMA channels operate in dual address mode. Table 14.4 provides a list of DMA pins by channel.

When operating a DMAC channel, first each DMAC should be assigned to the applicable area by using area assignment registers (EXDMASET0 to EXDMASET2) for the LBSC-DMAC channels. Also, in RD/WE pulse control registers (EXDMAWCR0 to EXDMAWCR2) for LBSC-DMAC channels, waveform pulse widths to be used during DMA bus access should be assigned (LBSC-DMAC channels 0 to 2 operate by the settings provided in EXDMAWCR0 to EXDMAWCR2, not by pulse width settings that are provided in CSWCR0, CSWCR1 or ECSWCR0 to ECSWCR5. In addition, methods by which DREQ, DACK, and DRACK signals are to be sent and received should be specified with the LBSC-DMAC channel control registers (EXDMCR0 to EXDMCR2).

**Table 14.4 List of DMA Pins by Channel**

DMAC Channel Number	Operating Mode	Pins			Remarks
		DREQ	DRACK	DACK	
Channel 0	Dual address mode (with 8-burst function)	DREQ0 (polarity and edge/level detection selectable)	DRACK0 (output timing adjustable and polarity selectable)	DACK0 (polarity selectable)	The burst count (8) does not depend on the access size; 8 consecutive bus accesses are executed for 8-bit and 16-bit bus widths equally.
Channel 1	Dual address mode (with 8-burst function)	DREQ1 (polarity and edge/level detection selectable)	—	DACK1 (polarity selectable)	DRACK1 does not exist as an LSI pin. The burst count (8) does not depend on the access size; 8 consecutive bus accesses are executed for 8-bit and 16-bit bus widths equally.
Channel 2	Dual address mode	DREQ2 (polarity and edge/level detection selectable)	—	DACK2 (polarity selectable)	DRACK2 does not exist as an LSI pin.

**(1) Data Alignment during LBSC-DMAC Access**

When receiving an access request from the LBSC-DMAC, the BSC translates the LBSC-DMAC interface into the EX-BUS protocol. During this operation, the BSC determines the area to be accessed based on the settings provided in the LBSC-DMAC area assignment registers (EXDMASET0 to EXDMASET2), and generates a chip select signal. For the data alignment of DMAC channels, one of two modes can be selected based on DMAC register settings.

- Fixed Alignment Mode

In this operating mode, when performing a DMA transfer with a device on the EX-BUS, the LBSC determines that the access size from the LBSC-DMAC is equal to the data width used by the external device (not bound by the bus width specified in the CS0CTRL, CS1CTRL or ECS0CTRL to ECS5CTRL). In the fixed alignment mode, no alignment translation is performed in the BSC. Instead, data is output using the alignment received from the LBSC-DMAC. The LBSC, however, generates the WE1# to WE0# signals, depending on the access size received from the LBSC-DMAC. In the initial state, the LBSC operates in this mode. Table 14.5 shows the relationship between data widths and access sizes.

**Table 14.5 Relationship between Data Widths and Access Sizes in Fixed Alignment Mode**

Access Size Set in DMAC (Assumed to be Bus Width)	Data Bus Read/Write Position		Write Enable Signal Output Position	
	D15 to D8	D7 to D0	WE1#	WE0#
16 bits	Data 15 to 8	Data 7 to 0	Assert	Assert
8 bits	—	Data 7 to 0	—	Assert

- Variable Alignment Mode

If the access size set in the DMAC is smaller than the bus width set in the BSC, variable alignment mode can be set up by DMAC register settings. In this case, the BSC changes byte lanes according to the specific access address to be serviced. Table 14.6 shows the relationship between data widths and access sizes in variable alignment mode. If the bus width set in the LBSC is equal to the DMAC access size, variable alignment mode operates in the same way as fixed mode.

**Table 14.6 Relationship between Data Widths and Access Sizes in Variable Alignment Mode (Little Endian)**

Bus Width Set in BSC	Access Size Set in DMAC	Data Bus Read/Write Position		Write Enable Signal Output Position	
		D15 to D8	D7 to D0	WE1#	WE0#
16 bits	16 bits	2n address		2n address	
	8 bits	2n+1 address	2n address	2n+1 address	2n address
8 bits	8 bits	—	n address	—	n address

**(2) External Device DMA Transfer Request Detection Function**

To provide generality, the LBSC supports a polarity and level/edge selection function as a method for the reception of external device DMA transfer request signals (DREQ). The selections are made by setting the relevant values in registers EXDMCR0 to EXDMCR2. In compliance with the settings, the BSC internally receives a DREQ signal and outputs the DMA transfer request signal from the BSC to the LBSC-DMAC. If level detection is selected, the BSC continues to output the DMA transfer request signal to the LBSC-DMAC as long as the DREQ signal from the external device is asserted. Conversely, if edge detection of the DREQ signal is selected, the BSC will not output a DMA transfer request signal to the LBSC-DMAC until an edge is detected, even if the DREQ signal from the external device continues to be asserted. In addition, even if more than one edge is detected during the period from the first edge detection to the start of DMA transfer, only one transfer request is issued.

**(3) Role of the BSC between the LBSC-DMAC and an External Device**

Figure 14.11 shows a basic timing chart for LBSC-DMAC-to-EX-BUS output translation. Upon receipt of an access request from the DMAC, the BSC first performs bus contention arbitration. When the LBSC-DMAC acquires the bus mastership, the BSC controls the pulse width of RD#, WE1# and WE0# that are output on the EX-BUS according to the settings provided in the LBSC-DMAC channel RD/WE pulse control registers (EXDMAWCR0 to EXDMAWCR2) that the BSC possesses, for the LBSC-DMAC access period.

**Figure 14.11 Basic Timing Chart for Access from LBSC-DMAC to EX-BUS**

**(4) LBSC-DMAC → EX-BUS Burst Access**

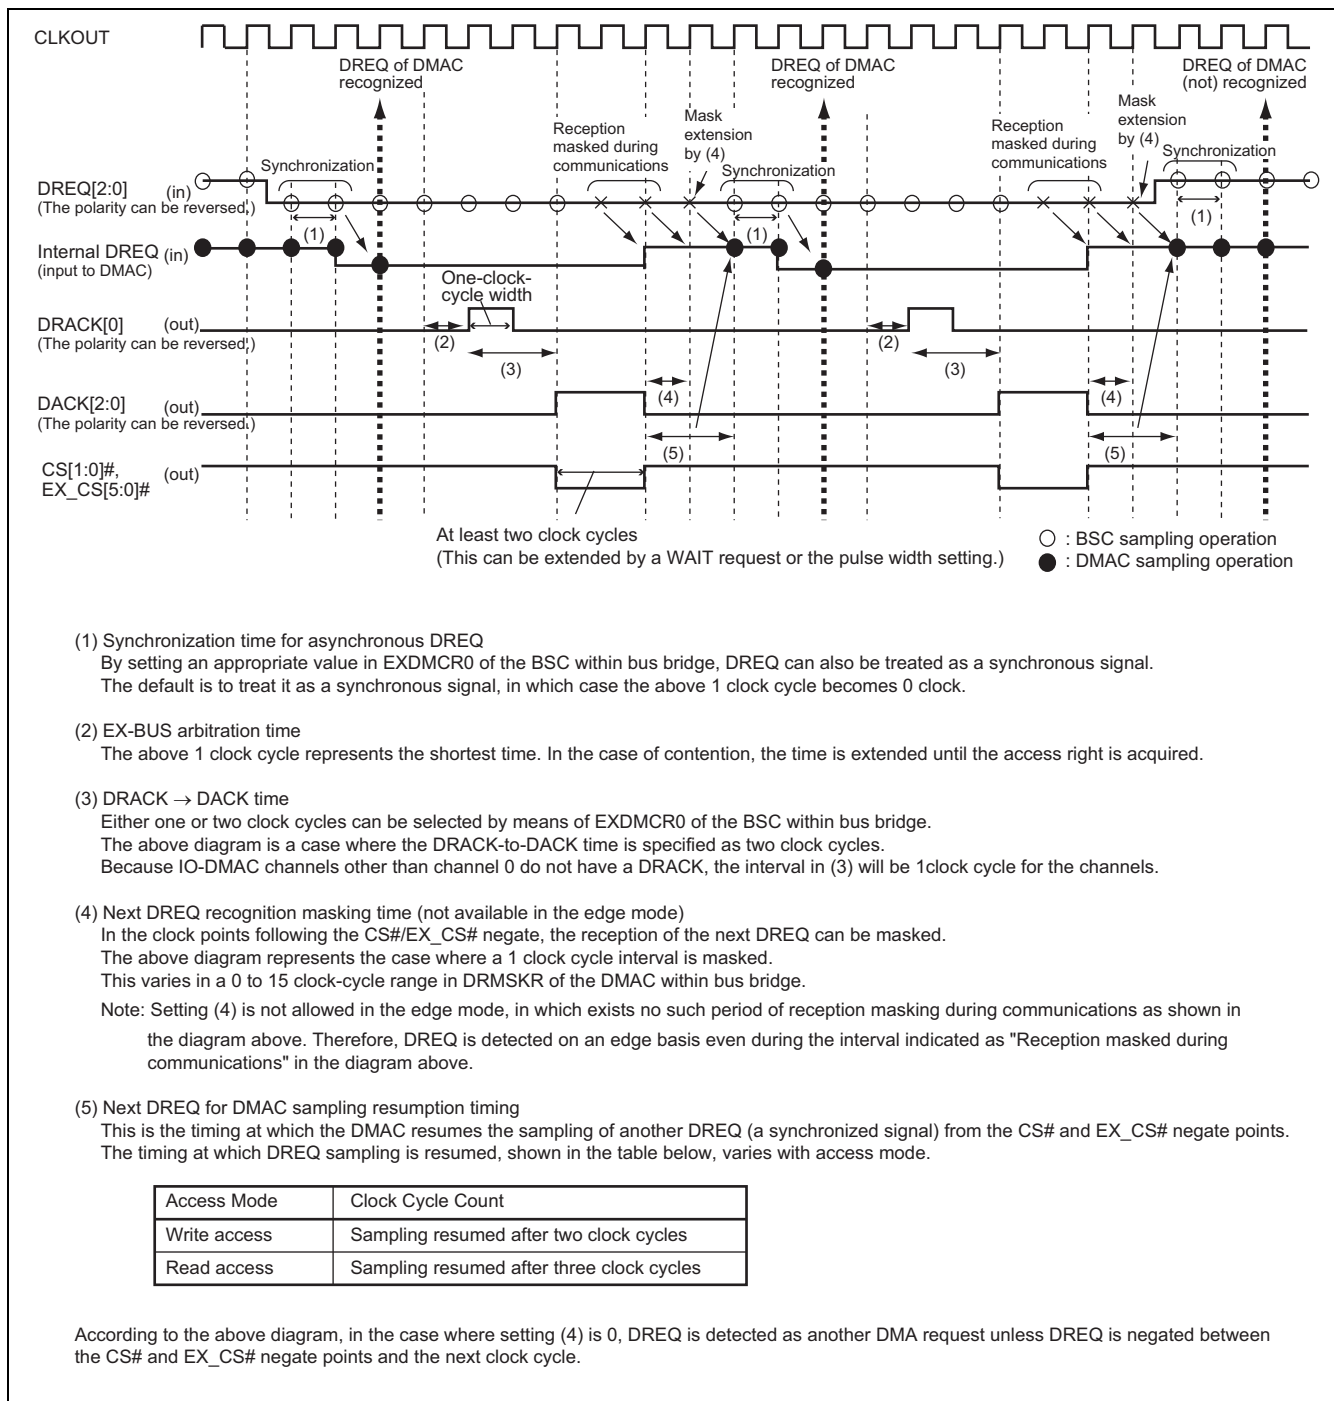

The BSC supports the EX-BUS output function for burst access operations from the LBSC-DMAC (eight consecutive transfers irrespective of the access size). Figure 14.12 shows a timing chart on LBSC-DMAC burst access. The waveform for LBSC-DMAC burst access basically takes the form of repeated single-access waveforms. However, because external DMAC bus access does not release the bus mastership until the burst access is finished, PIO access from the CPU (AXI) does not result in a cycle stealing. In addition, transfer performance is enhanced because the DMAC treats data involving 8 transfer operations as a single packet and performs transfer operations with the destination.

**Figure 14.12 Basic Timing Chart for Burst Access from LBSC- DMAC to EX-BUS**

**(5) DREQ Reception Timing**

Figure 14.13 shows the timing at which a DMA request (DREQ) signal is set in the level reception mode and any continuation of an asserted state is regarded as another DMA request. The figure also shows DREQ negate timing that prevents the above condition from being mistaken as another DREQ request.

**Figure 14.13 Next DREQ Signal Recognition Timing on EX-BUS**

#### 14.6.4 CPU (AXI Bus) → Byte-Control SRAM Interface

With respect to EX-BUS area 1 and expansion areas 0 to 5, the LBSC supports byte-control SRAM interface from the CPU (AXI bus) or LBSC-DMAC (area 0 is excluded). Byte-control SRAM interface is a memory interface in which byte select strobe signal WE# is output in both read and write cycles. Write timing for byte-control SRAM interface is the same as that for SRAM interface. In read access, however, WE# is output at a different timing. In read access, WE# is output for a read byte only. The assertion timing of WE# can be selected with the CS1BRM bit in the CS1CTRL register or the ECSxBRM bit in the ECSxCTRL register to be the same as that of CS# or RD#. In default setting, SRAM operating mode is set for each area. Accordingly, along with the setting of assertion timing, byte-control SRAM mode should be set in the registers corresponding to a given area (CS1CTRL or ECSxCTRL(x = 0 to 5)).

##### (1) Byte-control SRAM Interface

- The WE# assertion period can be selected by the CS1BRM bit or the ECSxBRM bit (x = 0 to 5) to be the same as that of CS# or RD#.
- In read access, WE# is asserted only for a valid access byte. (For example, when a byte is read from a device with the byte-control SRAM interface and a bus width of 16 bits, any one of the WE# bits is asserted.)
- The waveform in write access is the same as that for SRAM interface.

##### (2) Basic Timing Charts

Figure 14.14 shows the basic timing chart for byte-control SRAM interface.

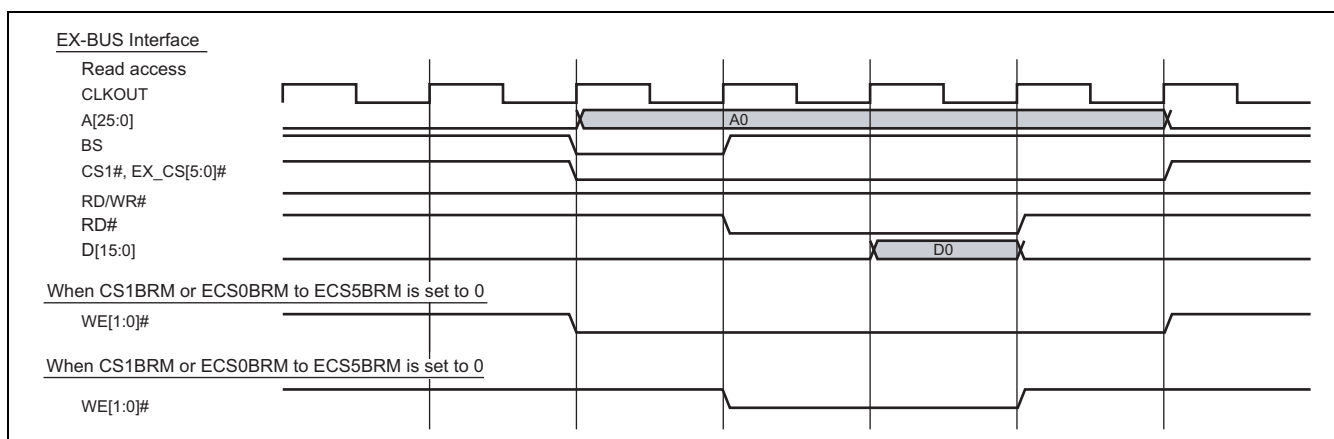

Figure 14.14 Waveforms for Byte-Control SRAM Interface

### 14.6.5 CPU (AXI Bus) → ATA Device Interface

With respect to EX-BUS area 1 and expansion areas 0 to 5, the LBSC supports an ATA device interface from the CPU (AXI bus) or LBSC-DMAC (area 0 is excluded). Since in each space the default is the SRAM operating mode, register settings for a given area from among CS1CTRL and ECS0CTRL to ECS5CTRL should be set for the ATA space. To perform multi-word DMA transfer in the ATA interface, set the DBST bit in the EXDMCRy (y = 0 to 2) register to 1.

ATACS00#, ATACS10#, ATACS01#, or ATACS11# can be asserted in synchronization with the access space CS# signal depending on the ATACS control register (ATACSCTRL) settings.

#### (1) ATACS00, ATACS10, ATACS01, and ATACS11 Signals

If ATACS1\_EN and ATAECSt\_EN (x = 0 to 5) of the ATACS control register are set to 0 or 1, and the ATA mode is selected with the CS1IF bit of the CS1CTRL register and ECSxIF bit of the ECSxCTRL register, ATACS00#, ATACS10#, ATACS01#, or ATACS11# signal is asserted in synchronization with the relevant space CS# signal when the relevant space is accessed (the relevant space CS# signal is also asserted at the same time).

ATACS00#, ATACS10#, ATACS01#, or ATACS11# is asserted in accord with the value being output as address bit 4 on the external bus (i.e., the A4 pin).

If, for example, the CS1 space is ATA interface, the conditions below should apply to ATACS00#, ATACS10#, ATACS01#, and ATACS11# assertion.

ATACS1_EN	A4	CS1#	ATACS00#	ATACS10#	ATACS01#	ATACS11#
0	0	√	—	√	—	—
0	1	√	√	—	—	—
1	0	√	—	—	—	√
1	1	√	—	—	√	—

Note: √: Assert, —: Deassert

**(2) ATA Interface Signals**

Table 14.7 shows the LBSC output signals when the area is set for ATA device interface.

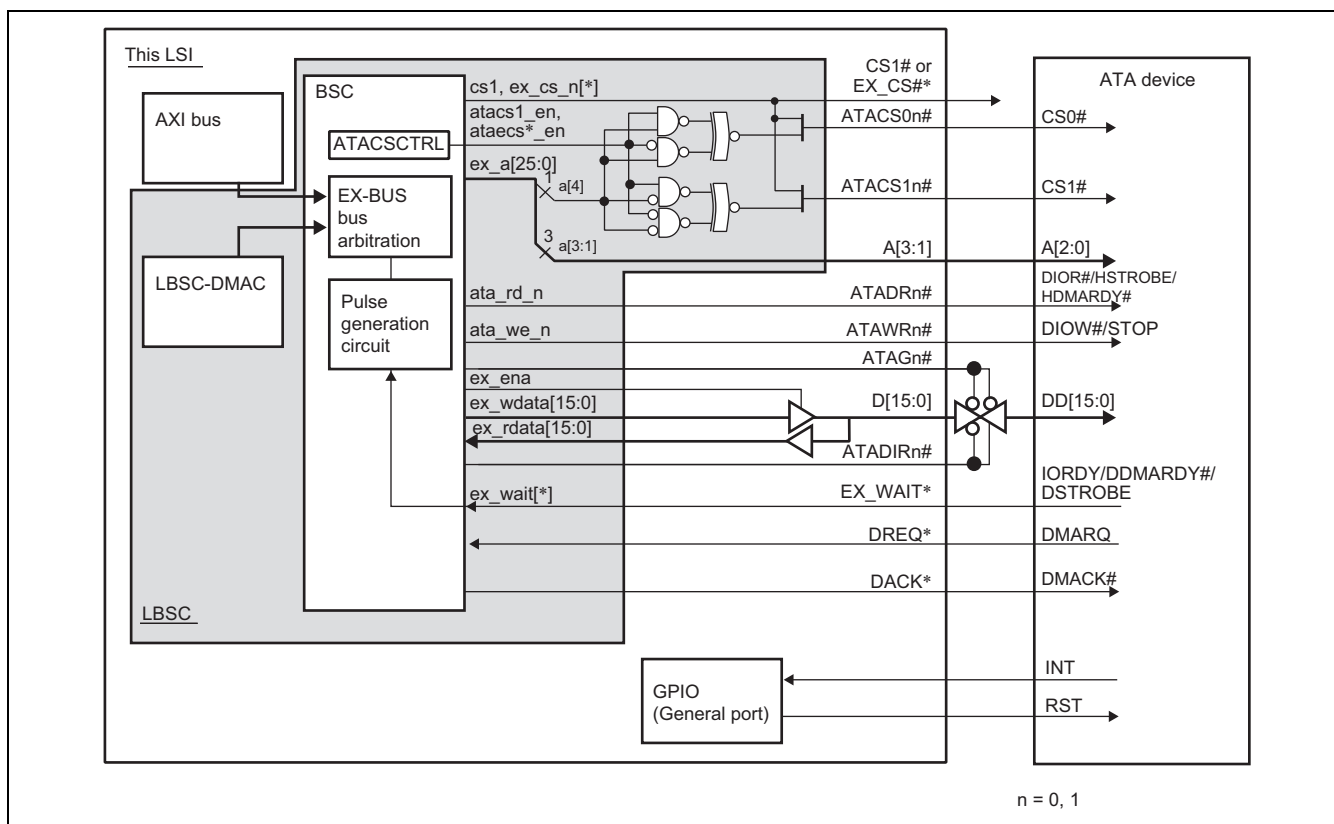

**Table 14.7 List of ATA Interface Signals**

No.	ATA I/F Signals	LBSC I/O Signal	I/O	Function	Remarks
1	CS0#	ATACS00#, ATACS01#	Output	Chip select (command block)	
2	CS1#	ATACS10#, ATACS11#	Output	Chip select (control block)	
3	DMARQ	DREQ[2:0] (the polarity can be reversed)	Input	DMA request	Polarity selectable Only pins DREQ[1:0] are used in Ultra DMA operation.
4	DMACK#	DACK[2:0]# (the polarity can be reversed)	Output	DMA acknowledge	Polarity selectable Only pins DREQ[1:0] are used in Ultra DMA operation.
5	A[2:0]	A[3:1]	Output	Address	
6	DD[15:0]	D[15:0]	I/O	Data	
7	DIOW#/STOP	ATAWR[1:0]#	Output	Write enable/STOP signal (for Ultra DMA operation)	
8	DIOR/HDMARDY#/ HSTROBE	ATARD[1:0]#	Output	Read enable/host DMA ready (for Ultra DMA read)/host data strobe (for Ultra DMA write)	
9	IORDY/DDMARDY#/ DSTROBE	Selected from EX_WAIT[2:0] (the polarity can be reversed)	Input	I/O ready/device DMA ready (for Ultra DMA write)/device data strobe (for Ultra DMA read)	
10	—	ATAG[1:0]#	Output	External buffer enable	
11	—	ATADIR[1:0]#	Output	External buffer direction control	Low output for write accesses

Note: The ATACSCTRL register should be set for use of ATACS00#, ATACS10#, ATACS01#, or ATACS11#.

**(3) ATA Interface Connection Configuration**

Figure 14.15 shows a sample connection between the ATA device and the LBSC when EX-BUS is set for ATA interface.

**Figure 14.15 EX-BUS ATA Device Configuration Example**

**(4) ATA Interface (PIO Mode, Multi-word Mode)**

The BSC provides the following ATA interface support functions:

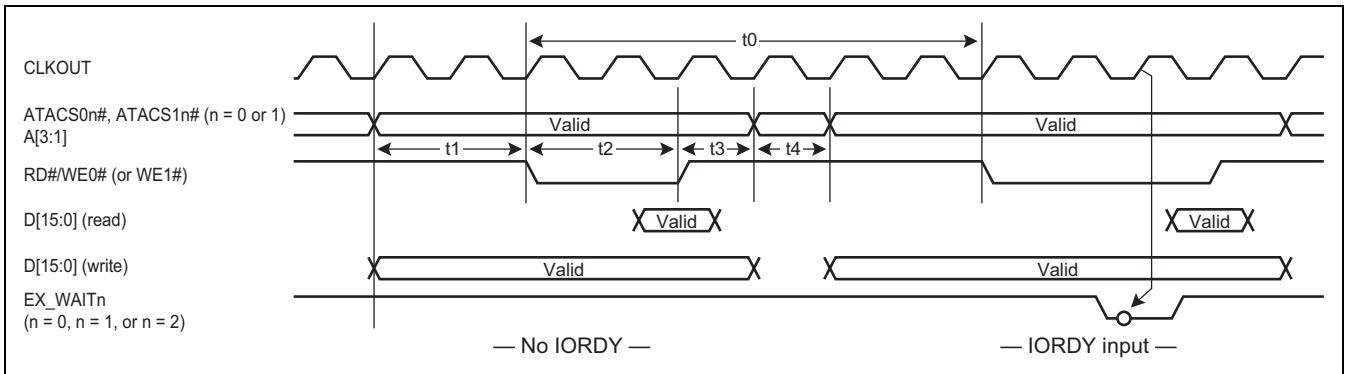

- Based on the IORDY signal received from an ATA device, the BSC performs wait control on the ATA interface.
- With an ATA interface, allocating the LBSC-DMAC makes multi-word DMA transfer possible. However, use the CPU to handle access to the ATA registers and the DMA controller to handle data transfer.
- For the detection of I/O ready timeout, the BSC monitors the state of the IORDY signal from ATA devices, and if an ATA device wait state lasting beyond a certain length of time is detected, the BSC indicates an ATA wait timeout error in a register within the BSC, and forces the termination of access to the ATA interface.

The required detection time depends on the EX-BUS operating frequency as defined in the following formula:

$$\text{Detection time in ns} = \text{period in ns at EX-BUS operating frequency} \times 100 \text{ clock cycles}$$

**(5) Basic Timing Charts (PIO Mode, Multi-word Mode)**

Figure 14.16 shows the basic timing chart for PIO transfer in the ATA interface.

**Figure 14.16 Waveforms for ATA Interface**

Table 14.8 shows sample settings for the RD/WE# pulse control register for PIO transfers in the ATA interface (when the EX-BUS operating frequency is 65 MHz).

**Table 14.8 Sample Settings for RD/WE# Pulse Control Register for PIO Transfers in ATA Interface (EX-BUS Operating Frequency: e.g. 65 MHz)**

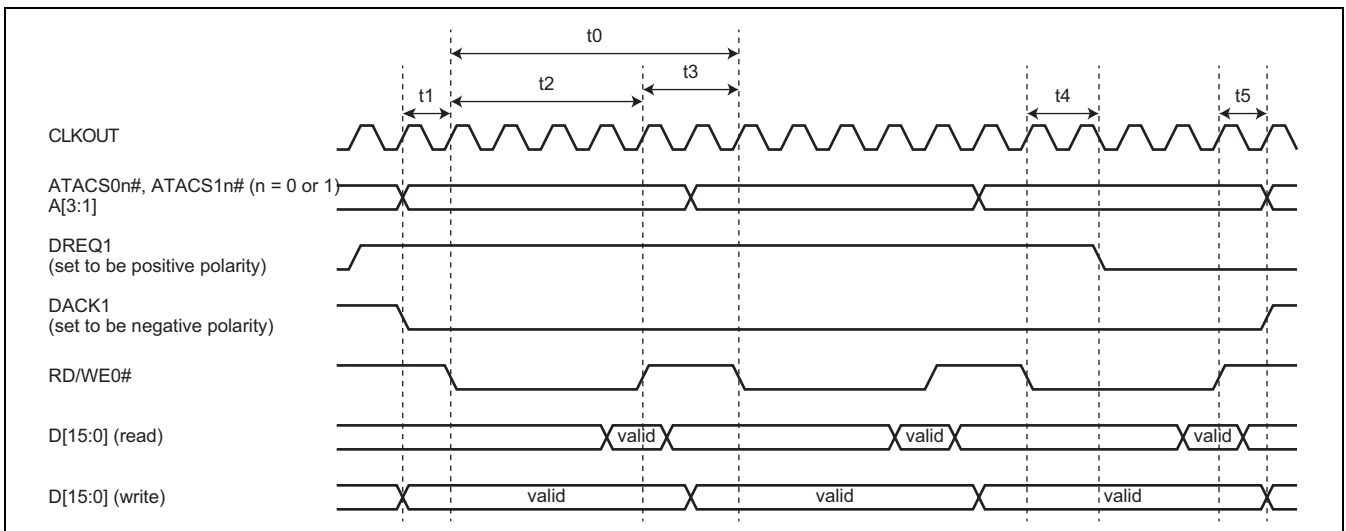

Mode	CSWCR Setting	Cycle Time (t0)	Address Setup (t1)	DIOR#/DIOW# Pulse Width (t2)	Address Hold (t3)	Idle Cycle (t4)
0	H'FF70FF70	691 (600)	107 (70)	477 (290)	107(20)	20 (-)
1	H'AA10AA10	400 (383)	62 (50)	323 (290)	15(15)	20 (-)
2	H'A210A210	347 (330)	31 (30)	301 (290)	15(10)	20 (-)
3	H'52105210	200 (180)	31 (30)	154 (80)	15(10)	20 (-)
4	H'2A102A10	123 (120)	31 (25)	77 (70)	15(10)	20 (-)

Units: ns

Values in parentheses indicate ATA prescribed values.

Note: The CSWCR setting must be such that the following condition is satisfied: ATA prescribed value  $\leq$  CSWCR set value  $\times$  EX-BUS clock (CLKOUT) width

Figure 14.17 shows the basic timing chart for multi-word DMA transfer in the ATA interface.

**Figure 14.17 Multi-Word DMA Waveforms for ATA Interface**

Table 14.9 shows sample settings for the RD/WE# pulse control register for multi-word DMA transfers in the ATA interface (when the EX-BUS operating frequency is 65 MHz).

**Table 14.9 Sample Settings for RD/WE# Pulse Control Register for Multi-Word DMA Transfers in ATA Interface (EX-BUS Operating Frequency: 65 MHz)**

Mode	EXDMAWCR Setting	Cycle Time (t0)	CS[1:0]# Setup (t1)	DIOR#/ DIOW# Pulse Width (t2)	DIOW# Negate Hold/DIOR# Negate Pulse Width (t3)	DIOW#/ DIOR# DREQ Delay Time (t4)	DACK Hold (t5)
0	H'97809780	508 (480)	108 (50)	277 (215)	231 (215/50)	– (120/40)	123 (20)
1	H'32203220	154 (150)	31 (30)	92 (80)	62 (50)	– (40)	31 (5)
2	H'2A202A20	139 (120)	31 (25)	77 (70)	62 (25)	– (35)	31 (5)

Units: ns

Values in parentheses indicate ATA prescribed values.

Note: The EXDMAWCR setting must be such that the following condition is satisfied: ATA prescribed value  $\leq$  EXDMAWCR set value  $\times$  EX-BUS clock (CLKOUT) width

#### (6) Ultra ATA DMA Mode

The Ultra ATA DMA mode differs from the PIO mode or multi-word mode with respect to the function of each signal interfacing with the ATA device. The LBSC operates with changing each interface signal function in Ultra ATA DMA mode as shown in Table 14.7. The connections between the LBSC and an ATA device on a board need not be changed from those shown in Figure 14.15.

For operation in Ultra ATA DMA mode, specify the ATA mode as the operating mode for the external bus area where an ATA device is connected. Specify LBSC-DMAC channel 0 or 1 as the DMAC assigned to the target area. After that, select the Ultra ATA DMA mode through UATMR in the LBSC-DMAC, make the necessary settings in the same way as for normal DMAC activation, and activate the DMA operation.

The following is a list of the features of the Ultra ATA DMA operation.

- Access to the registers in the ATA device such as initial settings, activation, or status read access can be done directly through PIO.
- Up to Ultra DMA mode 4 is supported.
- LBSC-DMAC channel 0 or 1 supports Ultra DMA.
- The A, DD, CS#, DIOR# or DIOW#, and EX\_WAIT signals are used for PIO R/W access to the area set to the ATA mode.
- For DMA write operation, the setup and hold periods of data relative to the HSTROBE (DIOR#) signal edge can be specified in units of output clock cycles.
- For DMA read operation, data is received in synchronization with the DSTROBE (IORDY) signal input. The HDMARDY signal is temporarily negated while reception is busy.
- Cycle-stealing is done for PIO transfer in other areas or transfer in other LBSC-DMAC channels even during Ultra DMA bus operation.
- Cycle-stealing occurs only when an external access request is generated within the LSI. It is executed while HDMARDY or DDMARDY is temporarily negated.
- The DMA transfer size is set to one sector, and a desired sector size can be specified. However, note that the base unit of transfer is 2 bytes  $\times$  16 burst, and this unit should be repeated an integral number of times (n) to obtain the desired transfer size.
- Cycle-stealing for PIO transfer in the current area is not allowed while one-sector DMA transfer is in progress.
- The CRC check function is supported.

- After one-sector DMA transfer, a CRC code (generation polynomial:  $X^{16} + X^{12} + X^5 + 1$ ) is output to the device.
- The output CRC code can be read from an LBSC-DMAC register (for debugging and evaluation use).
- The LBSC-DMAC provides a function for monitoring timeout during DMA transfer. When an overflow occurs, a timeout interrupt notification signal can be issued.

Figure 14.18 shows the Ultra ATA DMA operation timing.

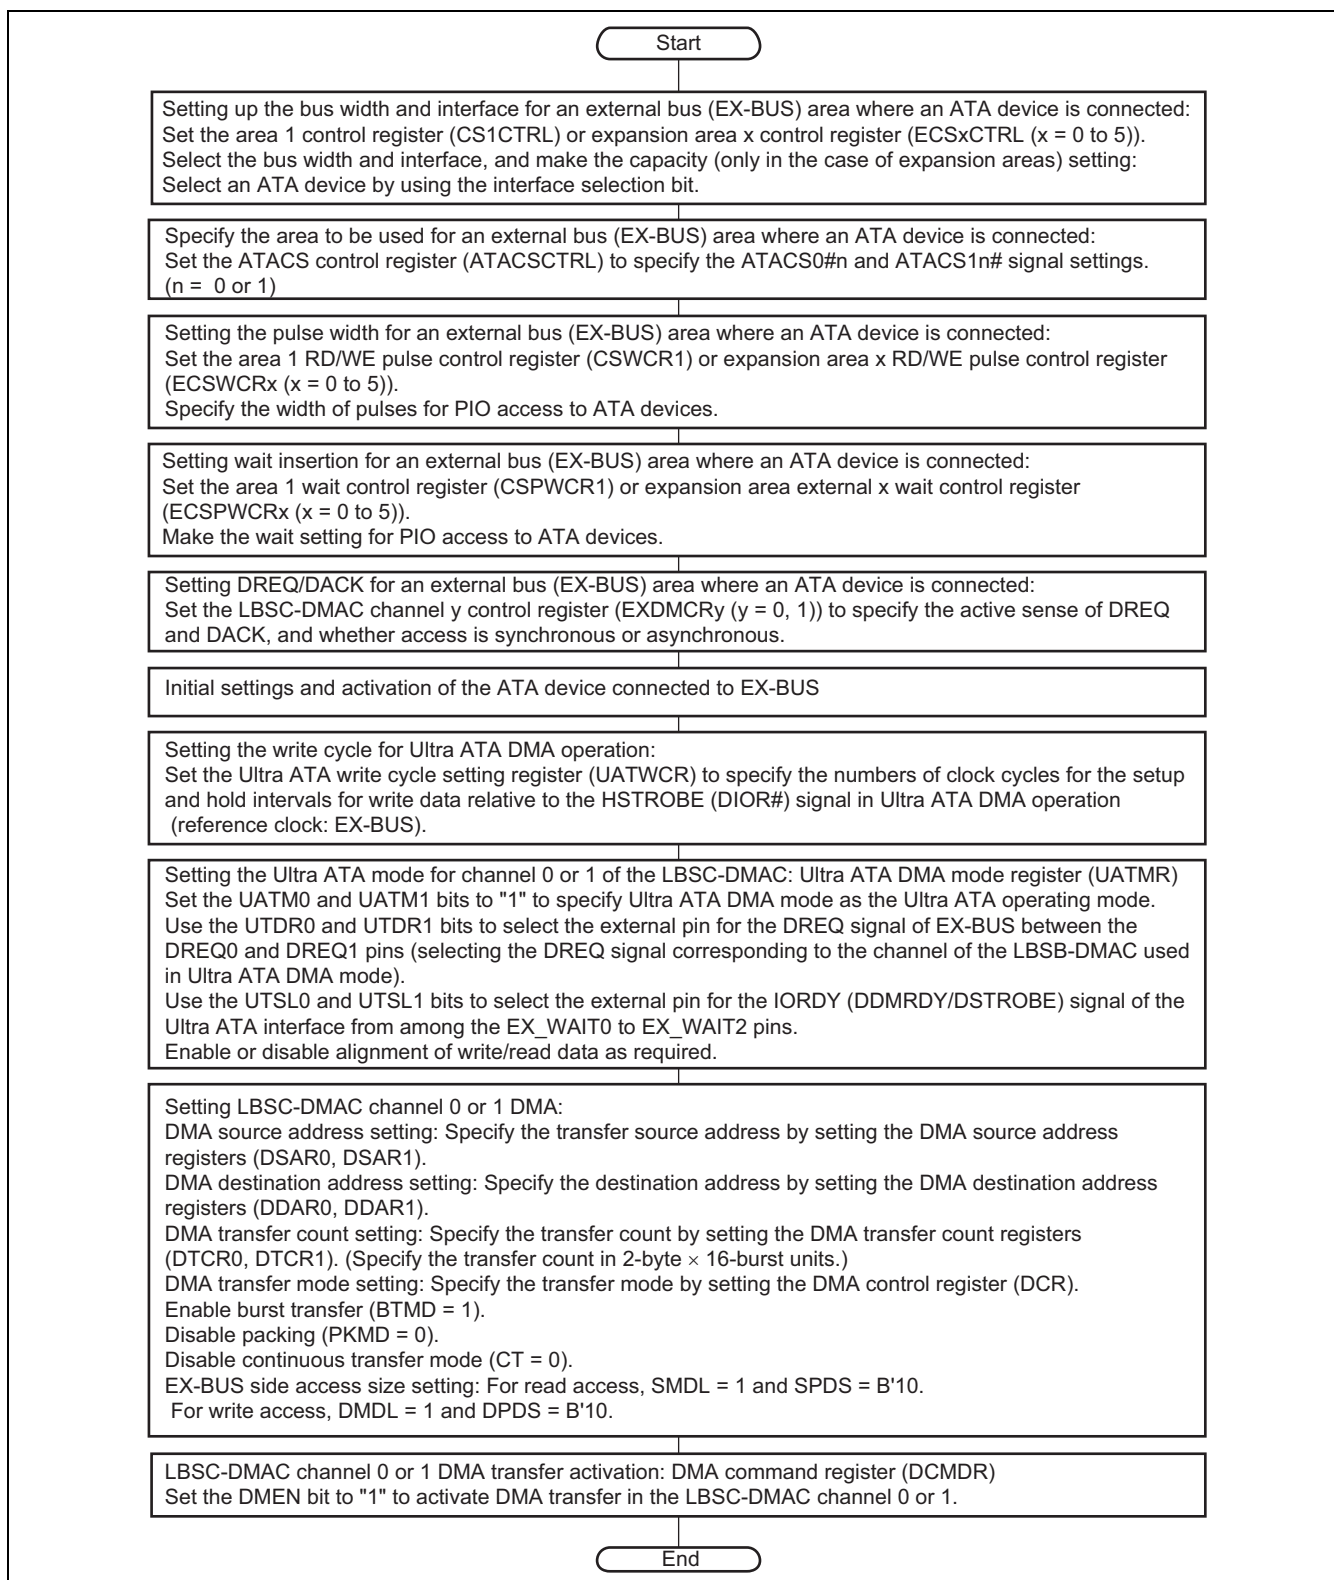

Figure 14.18 Ultra ATA DMA Operating Waveform

Figure 14.19 shows a setting procedure for the Ultra ATA DMA transfer.

**Figure 14.19 Setting Procedure for the Ultra ATA DMA Transfer**

### 14.6.6 Wait Timeout

For the detection of timeout in waiting for access to the EX-BUS, the BSC monitors the states of the EX\_WAIT2, EX\_WAIT1, and EX\_WAIT0 signals from external devices. When an external device is waiting for more than a certain length of time, this is detected as an EX-BUS wait timeout error. The error is reflected in a register within the BSC, and forces the termination of access to the EX-BUS interface.

The value of the timeout counter is specified in a total of 32 bits, consisting of the EXW\_TOBCNT bits in the EX-TIME wait timeout detection base counter register (EXBCT) and the EXW\_TOCNT bits in the EX-BUS wait timeout detection counter register (EXTCT). EXW\_TOBCNT is a 20-bit counter that operates at the EX-BUS operating frequency (CLKOUT). EXW\_TOCNT is a 12-bit counter that counts up by one every time the EXW\_TOBCNT bits overflow.

Writing 0s to all of the bits specifies the maximum time until overflow. The required detection time depends on the EX-BUS operating frequency as defined in the following formula.

$$\text{Detection time in ns} = \text{period in ns at EX-BUS operating frequency} \times \{\text{EXW\_TOCNT}, \text{EXW\_TOBCNT}\}$$

### 14.6.7 EX-BUS Arbitration

To deal with the conflicts between the access requests from the CPU (AXI bus) and LBSC-DMAC channels 0 to 2, the EXBATLV register in the LBSC can set the priority levels for these accesses. Furthermore, to deal with the conflicts among the LBSC-DMAC channels 0 to 2, the three channels are grouped into two groups by the DMA memory access priority level control register (DMLVLR) in the LBSC-DMAC, and the priority levels are determined according to the round-robin scheme in each group.

Figure 14.20 shows a concept diagram for EX-BUS arbitration.

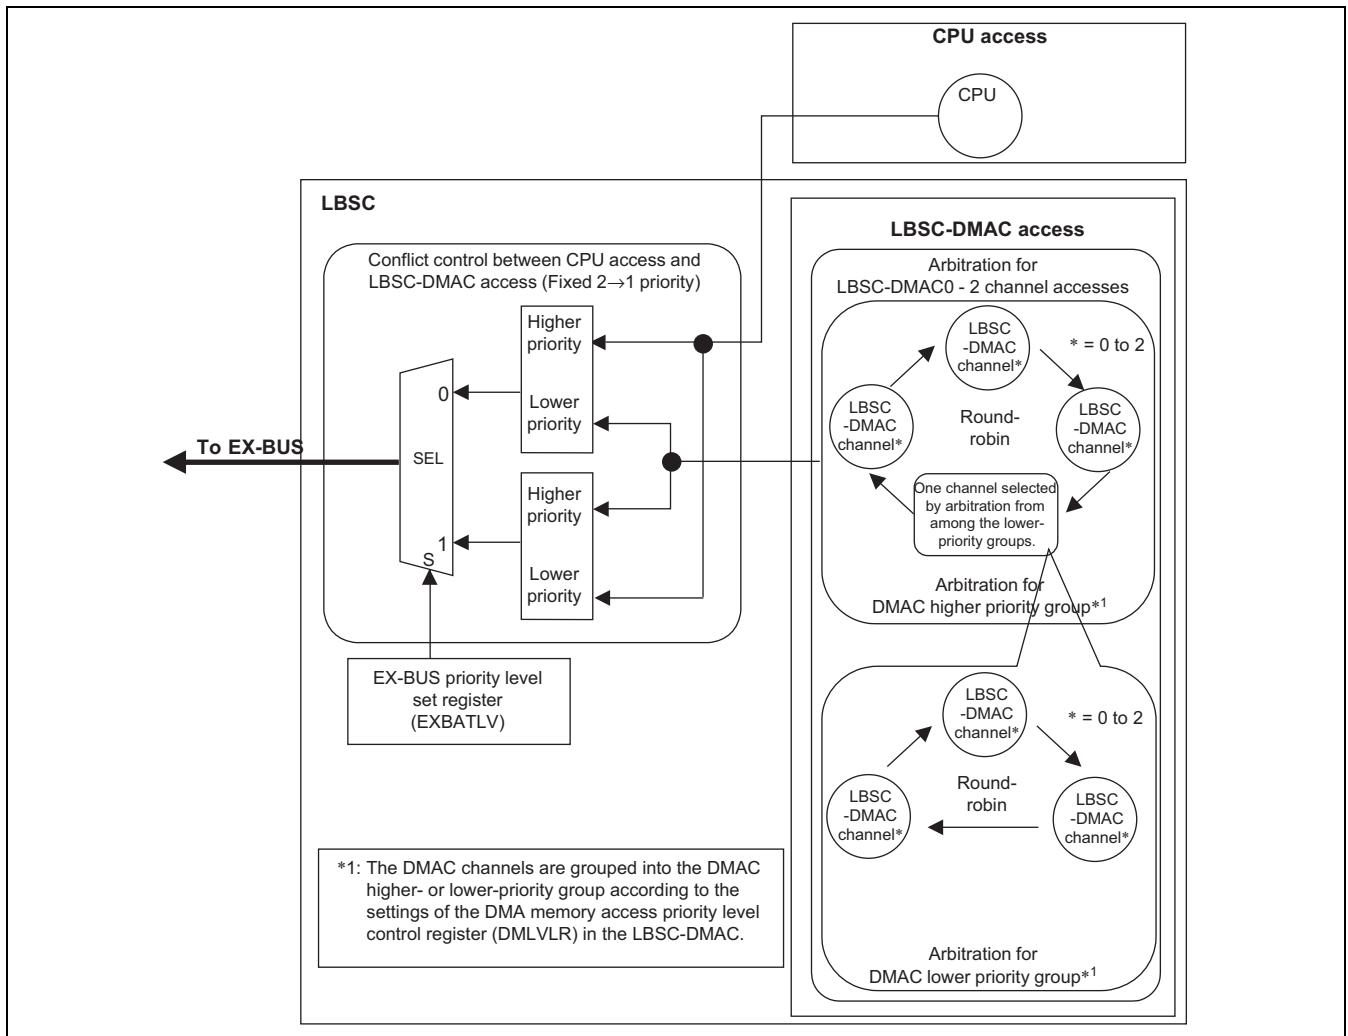

Figure 14.20 Concept Diagram for EX-BUS Arbitration

## 14.7 Usage Notes

<b>RZ/G1H</b>	<b>RZ/G1N</b>
<b>RZ/G1M</b>	<b>RZ/G1E</b>

Keep the following notes in mind when using this LBSC.

### 14.7.1 Pin Multiplexing

When starting this LSI, be sure to set multiplexed pins appropriately using the LSI pin multiplexing set register.

Also, make pull-up resistor settings using the LSI pin pull-up control registers.

For details on the specific set values, refer to section 5, Pin Function Controller (PFC).

### 14.7.2 Operations for Read Access by Ultra DMA

The LBSC and LBSC-DMAC handle Ultra DMA transfer to and from the ATA devices connected to EX-BUS.

Since the EX-BUS is for the connection of multiple external devices, if access to an external device by PIO or the LBSC-DMAC is attempted during Ultra DMA transfer, transfer over the bus is performed while controlling conflict with PIO and LBSC-DMAC access (transfer proceeds through acquisition and release of bus mastership). The operations are thus as described below.

#### (1) Operations for Read Access by Ultra DMA

1. The HDMARDY signal is negated (bus mastership is acquired and released per 32-byte unit of transfer). So that transfer can proceed while controlling conflicts with PIO and LBSC-DMAC access when PIO or LBSC-DMAC access to an external device is attempted, the bus mastership is released (the HDMARDY signal is negated) per 32-byte unit of transfer.

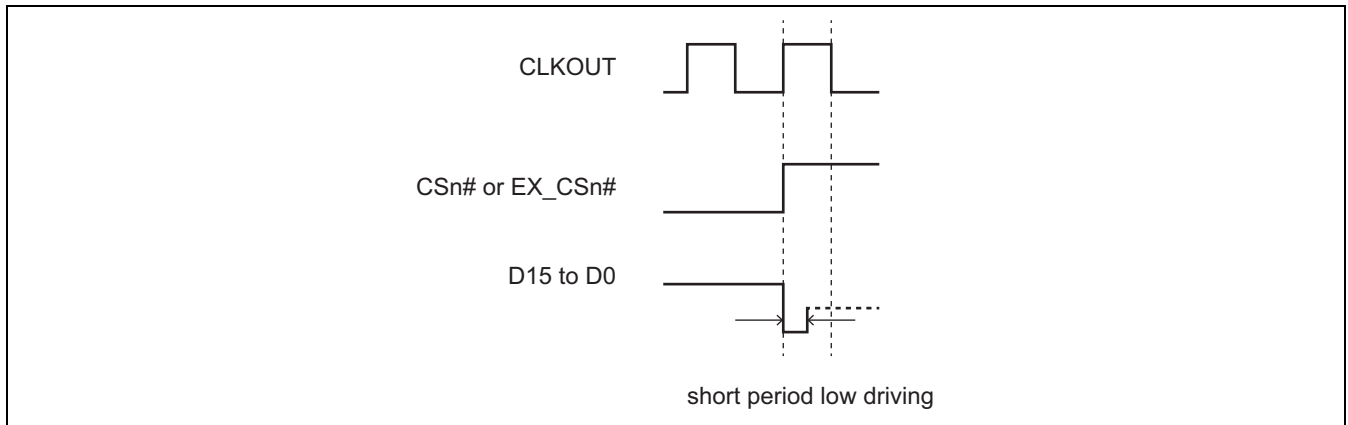

Figure 14.21 shows the operation of the HDMARDY# and DSTROBE signals during operations for read access.

**Figure 14.21 Operation of the HDMARDY# and DSTROBE Signals during Operations for Read Access**

### 14.7.3 Short period low driving at the end of SRAM write access

The external bus is instantaneously driven low at the end of SRAM write access with high write data as shown in Figure 14.22. If the external bus has high load due to system board composition, this short period low driving might cause overshoot on the external bus signals. In designing system board, note that this overshoot might cause voltage level that exceeds the input high voltage.

**Figure 14.22 Short period low driving at the end of SRAM write access**

### 14.7.4 Usage Note

When the QSPI or HSCIF is selected as a boot device by the MD[3:1] settings, the first 256-Kbyte space (H'00 0000 0000 to H'00 0003 FFFF) of the area 0 cannot be accessed from the LBSC even after the LSI is booted up.

## 15. External Bus Controller for DDR3-SDRAM (DBSC3)

RZ/G1H

RZ/G1N

RZ/G1M

RZ/G1E

### 15.1 Overview

The external bus controller for DDR3-SDRAM (DBSC3) supports DDR3-SDRAM and DDR3L-SDRAM\*. The DBSC3 contains bus control, device control, and register control units. The bus control unit receives requests from the bus and issues commands to the device control and register control units. The device control unit reads from and writes to the SDRAM according to the issued commands. Also, the device control unit refreshes the SDRAM. The register control unit reads from and writes to the control registers according to the issued commands.

Note: \* DDR3-SDRAM is supported only for RZ/G1H and RZ/G1E.

DDR3L-SDRAM is supported only for RZ/G1M and RZ/G1N.

#### 15.1.1 Features

The RZ/G1H and RZ/G1M each have two DBSC3 modules (DBSC3\_0 and DBSC3\_1) and determine which to use according to the area being accessed when operating as two independent 32-bit systems. Only DBSC3\_0 is used in operation as a single 64-bit system.

The DBSC3 enables the maximum use of SDRAM bus bandwidth using the following functions:

1. Multibank operation that improves the page hit rate.
2. DDR3-SDRAM operation with burst length 8 that reduces the number of SDRAM command issues.
3. Preceding execution of the bank precharge and activate commands for subsequent requests.

Table 15.1 shows the main functions of the DBSC3.

**Table 15.1 DBSC3 Functions**

Item	Function
Multibank supported	Supports 8-bank multibank operation
Number of banks	Supports eight banks
External bus width	[RZ/G1H and RZ/G1M]: 32 or 64 bits 64-bit bus is supported in 1-ch mode only (can be switched with the mode signal). [RZ/G1N]: 32 bits [RZ/G1E]: 16 or 32 bits
Preceding precharge/activate functions	Determines the content of subsequent requests in a request queue and performs preceding precharge/activate processing for the bank to be accessed during an empty command cycle upon page-miss.
Operating modes	Burst length: 8 (fixed) Burst type: Sequential (fixed) DLL-off mode for the DDR3-SDRAM is not supported.
Power-down mode	Supports self-refresh mode, precharged power-down mode, and active power-down mode. Combined use of the power-down mode and address translation function allows the SDRAM partial array self-refresh function to be effectively implemented.

Item	Function
Address order (address translation function)	<p>The addresses arranged in descending order are: rank address, row address, bank address, and column address.</p> <p>(The 3-bit bank address can be divided into two parts. One can be placed in the upper half of the row address and the other in the lower half. Register settings can be used to determine how to divide the bank address.)</p>
Timing setting	<p>The following timing settings can be specified:</p> <p>CAS latency, CAS write latency, ACT to READ or ACT to WRITE minimum period, PRE period, ACT to ACT or ACT to REF minimum period, ACT to PRE minimum period, ACT(A) to ACT(B) minimum period, four active window minimum period, READ to PRE minimum period, write recovery period, READ to WRITE minimum period, WRITE to READ minimum period, REF to ACT or REF to REF (all banks) minimum period, REF to ACT or REF to REF (per bank) minimum period, minimum period over which CKE is held high, and minimum period over which CKE is held low</p> <p>Only 0 is supported for additive latency (AL).</p>
Refreshes	<p>Average interval and the maximum post count are set by the register. If an empty cycle for request is found, preceding refresh can be performed.</p>
Auto power-down operation	<p>When there is no access for a specified period, power-down mode is automatically entered. The period before power-down mode is entered can be specified through register settings.</p>
ZQ calibration operation	<p>Supports the automatic ZQCS issuing function. After auto-refresh, the ZQCS command is issued to DDR3-SDRAM. The frequency of issuing ZQCS can be specified through register settings in units of the auto-refresh count. The intervals between auto-refresh and ZQCS and between ZQCS and auto-refresh can also be specified through register settings.</p>
PHY interface	<p>[RZ/G1H and RZ/G1M]:</p> <p>1-ch mode: 64-bit bus width 2-ch mode: 32-bit bus width Can be switched with the mode signal.</p> <p>[RZ/G1N]:</p> <p>1-ch mode: 32-bit bus width</p> <p>[RZ/G1E]:</p> <p>1-ch mode: 32-bit bus width 1-ch mode: 16-bit bus width</p>
Memory to be connected	<p>[RZ/G1H and RZ/G1E]:</p> <p>DDR3-SDRAM compliant with JEDEC JESD79-3E. (Supports memory with sizes from 512 Mbits to 8 Gbits. SDRAM with a data bus width of 4 bits is not supported.)</p> <p>[RZ/G1M and RZ/G1N]:</p> <p>DDR3L-SDRAM compliant with JEDEC JESD79-3E. (Supports memory with sizes from 512 Mbits to 8 Gbits. SDRAM with a data bus width of 4 bits is not supported.)</p>
ECC	Not supported.
Parity	Not supported.

### 15.1.2 Definition of Terms and Symbols

The following terms and symbols are used throughout the DBSC3 specifications:

- DDR3-SDRAM and DDR3L-SDRAM are abbreviated as SDRAM in some cases.
- DBSC3\_0 and DBSC3\_1 are collectively called the DBSC3 in some cases.
- "ceil(x)" is the smallest integer which is greater than or equal to real number x.
- "floor(x)" is the greatest integer which is less than or equal to real number x.

Note: DDR3-SDRAM is supported only for RZ/G1H and RZ/G1E.

DDR3L-SDRAM is supported only for RZ/G1M and RZ/G1N.

DBSC3\_1 is supported by RZ/G1H and RZ/G1M only.

### 15.1.4 Input/Output Pins

Tables 15.2 and 15.3 show the pin configuration of the DBSC3.

**Table 15.2 Pin Configuration of the DBSC3\_0 [RZ/G1H/M/N/E]**

Name	Pin Name	I/O	Function
DDR3-SDRAM clock	M0CK[1:0]	Output	Clock output signals for the DDR3-SDRAM
DDR3-SDRAM clock	M0CK[1:0]#	Output	Clock output signals for the DDR3-SDRAM or M0CK[1:0] inverted clock output signals
Addresses	M0A[15:0]	Output	Address output signals for the DDR3-SDRAM
Bank address	M0BA[2:0]	Output	Bank address output signals
Chip select	M0CS[1:0]#	Output	Chip select output signals
Row address strobe	M0RAS#	Output	Row address strobe output signal
Column address strobe	M0CAS#	Output	Column address strobe output signal
Write enable	M0WE#	Output	Write enable output signal
Clock enable	M0CKE[1:0]	Output	CKE output signals
ODT enable	M0ODT[1:0]	Output	ODT enable output signals in the SDRAM
Power backup reset	M0BKPRST#	Input	Used in power backup mode. When this pin is brought to the low level, M0CKE[1:0] pins are fixed to the low level and M0RESET# pin to the high level.
Reset	M0RESET#	Output	Reset output for the DDR3-SDRAM
Impedance matching	M0ZQ	I/O	Impedance matching Refer to section 15.5.1, Connection of M0ZQ or M1ZQ Pin.
Data mask	M0DM[3:0]	Output	Data mask output signals
I/O data strobe	M0DQS[3:0]	I/O	Data strobe I/O signals
I/O data strobe	M0DQS[3:0]#	I/O	Data strobe I/O signals or M0DQS[3:0] inverted signals
Data	M0DQ[31:0]	I/O	Data I/O signals
Reference voltage input	M0VREFCA	Input	Input reference voltage [RZ/G1E]
Reference voltage input	M0VREFDQ0	Input	Input reference voltage
Reference voltage input	M0VREFDQ1	Input	Input reference voltage

**Table 15.3 Pin Configuration of the DBSC3\_1 [RZ/G1H/M]**

Name	Pin Name	I/O	Function
DDR3-SDRAM clock	M1CK[1:0]	Output	Clock output signals for the DDR3-SDRAM
DDR3-SDRAM clock	M1CK[1:0]#	Output	Clock output signals for the DDR3-SDRAM or M1CK[1:0] inverted clock output signals
Addresses	M1A[15:0]	Output	Address output signals for the DDR3-SDRAM
Bank address	M1BA[2:0]	Output	Bank address output signals
Chip select	M1CS[1:0]#	Output	Chip select output signals
Row address strobe	M1RAS#	Output	Row address strobe output signal
Column address strobe	M1CAS#	Output	Column address strobe output signal
Write enable	M1WE#	Output	Write enable output signal
Clock enable	M1CKE[1:0]	Output	CKE output signals
ODT enable	M1ODT[1:0]	Output	ODT enable output signals in the SDRAM
Power backup reset	M1BKPRST#	Input	Used in power backup mode. When this pin is brought to the low level, M1CKE[1:0] is fixed to the low level and M1RESET# to the high level.
Reset	M1RESET#	Output	Reset output for the DDR3-SDRAM
Impedance matching	M1ZQ	I/O	Impedance matching Refer to section 15.5.1, Connection of M0ZQ or M1ZQ Pin.
Data mask	M1DM[3:0]	Output	Data mask output signals
I/O data strobe	M1DQS[3:0]	I/O	Data strobe I/O signals
I/O data strobe	M1DQS[3:0]#	I/O	Data strobe I/O signals or M1DQS[3:0] inverted signals
Data	M1DQ[31:0]	I/O	Data I/O signals
Reference voltage input	M1VREFCA	Input	Input reference voltage
Reference voltage input	M1VREFDQ0	Input	Input reference voltage
Reference voltage input	M1VREFDQ1	Input	Input reference voltage

## 15.2 Register Configuration

Table 15.4 shows the DBSC3 register mapping, followed by a description of each register. Register addresses are shown in the form of the sum of the DBSC3 register start address (DB\_ADDR for DBSC3\_0 or DBSC3\_1) and an offset (hexadecimal) from that start address.

Registers other than particular ones are initialized by power-on reset.

Access the DBSC3 registers 32 bits at a time. Otherwise, correct operation cannot be guaranteed.

DB\_ADDR (DBSC3\_0) = H'E679 0000 [RZ/G1H/M/N/E]

DB\_ADDR (DBSC3\_1) = H'E67A 0000 [RZ/G1H/M]

**Table 15.4 DBSC3 Register Configuration**

Register Name	Abbreviation	R/W	Address	Initial Value	Access Size (Bits)	RZ/G Series Products			
						RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
DBSC3 status register 1	DBSTATE1	R	DB_ADDR + H'00C	H'000X 0000	32	√	√	√	√

Note: Do not write to addresses other than the listed above. Otherwise, correct operation is not guaranteed.

### 15.3 Register Descriptions

The legends used in register descriptions have the following meanings.

Initial value: Register value after a reset

—: Undefined value

R/W: Readable/writable. The written value can be read.

R: Read-only. The write value should always be 0.

R/WC0: Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.

R/WC1: Readable/writable. Writing 1 initializes the bit. Writing 0 is ignored.

W: Write-only. Reading this bit is prohibited. When the bit is reserved, the write value should always be 0.

—/W: Write-only. The read value is undefined.

All access to registers is made in longword units.

Write 0 to the reserved bits.

**15.3.1 DBSC3 Status Register 1 (DBSTATE1)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
0	ACCEN	0	R/W	SDRAM Access Enable Bit This bit enables data access to the SDRAM. Make data access to the SDRAM after setting this bit to 1. When this bit is 0, do not access the SDRAM area. 0: Disables access to the SDRAM. 1: Enables access to the SDRAM.

Note: When making the setting to disable access (writing 0 to this register), a precharge all or precharge command for the SDRAM may be issued automatically.

**15.3.3 Auto-Refresh Enable Register (DBRFEN)**

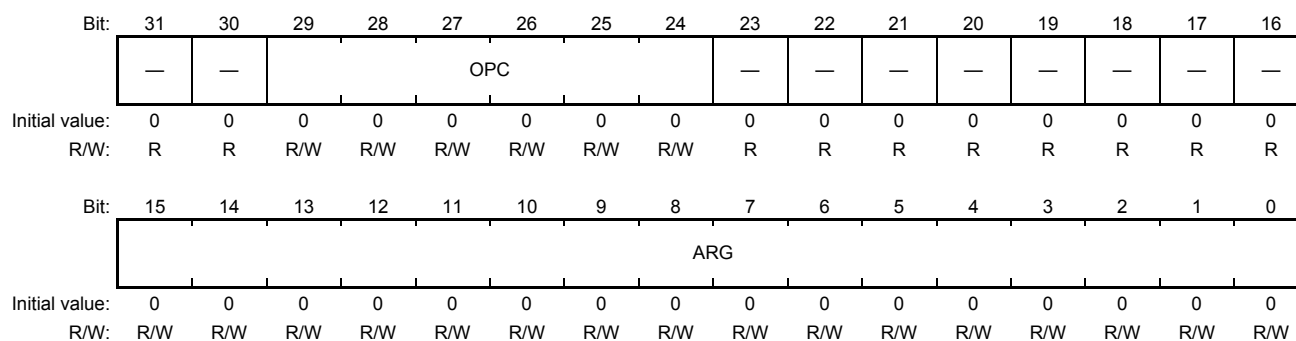

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ARFEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
0	ARFEN	0	R/W	Auto-Refresh Enable Bit This bit starts or stops the auto-refresh function. Writing 1 to this bit resets the refresh counter (refresh history) in the DBSC3 and starts the auto-refresh function. While this bit is 1, the DBSC3 issues a refresh command at regular intervals. The refresh cycle time and other settings depend on the values held in the refresh configuration registers 0 to 2 (DBRFCNF0 to DBRFCNF2) when 1 is written to this bit. 0: Stops the auto-refresh function. 1: Starts the auto-refresh function.

### 15.3.4 Manual Command-Issuing Register (DBCMD)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
29 to 24	OPC	000000	R/W	Operation Code Bits Specify the type of command to be issued. Refer to Table 15.5. If Wait is specified through these bits, valid SDRAM commands are not output and no processing is performed except reserving the time until the next operation. These bits are read as undefined values.
23 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
15 to 0	ARG	H'0000	R/W	Parameter Bits The meaning can differ according to the operation code indicated by the OPC bits. When OPC indicates Mode Register Set (MRS0 to MRS3), the ARG bits specify the value to be issued on the address pins (MA) of SDRAM. When OPC is any other value, the ARG bits specify the minimum interval to issuing of the next command in SDRAM cycles. When ARG = 0, however, the values default to those given in "Interval" column of Table 15.5. These bits are read as undefined values.

The manual command-issuing register (DBCMD) is used to issue the required commands for the sequence of initializing the SDRAM and of transitions to and from the self-refresh mode. The command corresponding to the OPC bits is issued once as a result of writing to this register. For instance, issuing the refresh command twice requires that "001100" be written to the OPC bits twice. Do not write to this register while access to the SDRAM is enabled (ACCEN = 1 in the DBACEN register). The timing with which an operation is complete (i.e. the timing with which the specified SDRAM command is output to the PHY unit from DBSC3) may be later than the response of DBSC3 to writing to this register. If you wish to wait until actual output of the specified SDRAM command to SDRAM; do this by reading the DBWAIT register (described later).

When this register is used to issue a command, the issuing of a subsequent SDRAM command is delayed by a certain period of time from the moment at which each operation is completed (i.e. from the time when the specified SDRAM

command is output to SDRAM). This facilitates securing of the required amounts of time between commands in the issuing of multiple consecutive commands.

These periods are given in the "Interval" column of Table 15.5. They can also be customized by using the ARG bits (except in cases where the OPC bits indicate MRS0 to MRS3).

**Table 15.5 Manual Command Issue Functions**

OPC	Code	Operation	Interval (Number of SDRAM Cycles)	ARG Function	
00 0000	Wait	Issue "Device Deselected" (and insert wait cycles)	4	Customizing the interval (for ARG = 0, the value is that given at left)	
00 0010	ZQCS	Issue "ZQ Calibration Short"	4		
00 0011	ZQCL	Issue "ZQ Calibration Long"	4		
00 1011	PREA	Issue "Precharge All"	TRPA		
00 1100	Ref	Issue "Refresh"	TRFC		
01 0000	PDEn	Power Down Entry	4		
01 0001	PDXt	Power Down Exit	4		
01 1000	SREn	Self-Refresh Entry	4		
01 1001	SRXt	Self-Refresh Exit	TRFC		
10 0000	RstL	Set Reset Pins to Low	4		
10 0001	RstH	Set Reset Pins to High	4		
10 1000	MRS0	Issue "ModeRegisterSet" (for MRS/MR0)"	TMOD		Specifying the setting for SDRAM mode register
10 1001	MRS1	Issue "ModeRegisterSet" (for EMRS1/MR1)	TMOD		
10 1010	MRS2	Issue "ModeRegisterSet" (for EMRS2/MR2)	TMOD		
10 1011	MRS3	Issue "ModeRegisterSet" (for EMRS3/MR3)	TMOD		

- Notes:
1. TRPA, TRFC, and TMOD in the "Interval" column of the above table indicate timing registers. The intervals in these cases are determined by the corresponding register settings.
  2. Only write to this register after having disabled SDRAM access (i.e. the ACCEN bit in the DBACEN register = 0).
  3. Only write to this register after having stopped the auto-refresh function (i.e. the ARFEN bit in the DBRFEN register = 0). However, sequences described in section 15.4, Operation, are not limited to these. If Wait is specified in the OPC bits in this register during auto-refresh operations, the auto-refresh function may issue a refresh command during the time secured for the Wait command.

### 15.3.5 Operation Completion Waiting Register (DBWAIT)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	WAIT
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
0	WAIT	0	R	Operation Completion Waiting Bit This value is meaningless. This bit is always read as 0.

When this register is read, a response is returned after all command issuing that has been specified by using the DBCMD register by that time is completed (i.e., after command output from the DBSC3 to the PHY unit).

This register can be used to guarantee correctness for the relationship between the timing with which SDRAM commands are issued by DBSC3 and timing that is not managed by DBSC3 (e.g. clock control).

### 15.3.6 SDRAM Type Setting Register (DBKIND)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	DDCG		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
2 to 0	DDCG	000	R/W	SDRAM Type Bits These bits can set the type of SDRAM. 111: DDR3-SDRAM Other settings are prohibited.

- Notes:
1. This register must only be written from within the initialization sequence (see section 15.4.3, Initialization Sequence).
  2. Writing to this register should only be performed when the following conditions are met.
    - Access to SDRAM is disabled (i.e. the ACCEN bit in the DBACEN register is 0)
    - Auto-refresh is disabled (i.e. the ARFEN bit in the DBRFEN register is 0)
  3. Set the defined value in each group.
  4. Specify the same SDRAM type as the SDRAM specified at power-on.

### 15.3.7 SDRAM Configuration Setting Register 0 (DBCONF0)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
28 to 24	AWRW0	00000	R/W	Row Address Bit Width Setting Bits These bits specify the width, in bits, of row addresses. 01100: 12 bits : 10000: 16 bits Other settings are prohibited.
23 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
20	AWRK0	0	R/W	Number of Ranks Setting Bits These bits specify the number of ranks. 0: One rank 1: Setting prohibited
19, 18	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
17, 16	AWBK0	00	R/W	Number of Banks Setting Bits These bits specify the number of banks. 11: Eight banks Other settings are prohibited.
15 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.

Bit	Bit Name	Initial Value	R/W	Description
11 to 8	AWCL0	0000	R/W	Column Address Bit Width Setting Bits These bits specify the width, in bits, of column addresses. 1010: 10 bits 1011: 11 bits Other settings are prohibited.
7 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
1, 0	DW0	00	R/W	External Data Bus Width Setting Bits These bits specify the width of the external bus. 01: 16 bits (for 1-ch mode only) 10: 32 bits (for 1ch, 2ch mode) Other settings are prohibited.

This register sets the memory configuration to be used.

Refer to section 15.4.11, Setting the SDRAM Configuration Setting Register, for details on the memory configurations supported by DBSC3. For details on the relationship between the chip select and address pins of the SDRAM and the logical addresses of this LSI, refer to section 15.4.12, Address Multiplexing.

Notes: 1. Memory Configuration Supported

- 32-bit bus configuration connected with two 16-bit wide SDRAM modules or four 8-bit wide SDRAM modules
2. Although DBSC3 supports the connection of multiple SDRAM modules, the electrical characteristics of some chips may impose a limitation on the number of connectable SDRAM modules.
  3. This register must only be written from within the initialization sequence (see section 15.4.3, Initialization Sequence).
  4. Writing to this register should only be performed when the following conditions are met:
    - Access to SDRAM is disabled (i.e. the ACCEN bit in the DBACEN register is 0)
    - Auto-refresh is disabled (i.e. the ARFEN bit in the DBRFEN register is 0)
  5. Specify predetermined bit values based on the product type.

**15.3.8 PHY Type Setting Register (DBPHYTYPE)**

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
3 to 0	CWL	0000	R/W	CAS Write Latency Setting Bits These bits are for setting the CAS-write latency of the SDRAM. 0010: 2 cycle : 1010: 10 cycles Other settings are prohibited.

DBTR1 is used to set a timing parameter for the SDRAM.

- Notes:
- The setting is in cycles of the SDRAM operating clock.
  - Writing to this register should only be performed when the following conditions are met.
    - Access to SDRAM is disabled (i.e. the ACCEN bit in the DBACEN register is 0)
    - Auto-refresh is disabled (i.e. the ARFEN bit in the DBRFEN register is 0)

### 15.3.11 SDRAM Timing Register 2 (DBTR2)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	AL			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
3 to 0	AL	0000	R/W	Additive Latency Setting Bits These bits are for setting the additive latency of the SDRAM. 0000: 0 cycles Other settings are prohibited.

DBTR2 is used to set a timing parameter for the SDRAM.

Notes: 1. The setting is in cycles of the SDRAM operating clock.

2. Writing to this register should only be performed when the following conditions are met.

- Access to SDRAM is disabled (i.e. the ACCEN bit in the DBACEN register is 0)
- Auto-refresh is disabled (i.e. the ARFEN bit in the DBRFEN register is 0)

**15.3.12 SDRAM Timing Register 3 (DBTR3)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	TRCD				
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
4 to 0	TRCD	00000	R/W	ACT to READ/ACT to WRITE Interval Setting Bits These bits set the minimum interval from an ACT command to a READ/WRITE command. 00011: 3 cycles : 11111: 31 cycles Other settings are prohibited.

DBTR3 is used to set a timing parameter for the SDRAM.

- Notes:
- The setting is in cycles of the SDRAM operating clock.
  - Writing to this register should only be performed when the following conditions are met.
    - Access to SDRAM is disabled (i.e. the ACCEN bit in the DBACEN register is 0)
    - Auto-refresh is disabled (i.e. the ARFEN bit in the DBRFEN register is 0)

### 15.3.13 SDRAM Timing Register 4 (DBTR4)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	TRPA				
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	TRP				
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
20 to 16	TRPA	00000	R/W	PREA Time Setting Bits These bits set the minimum interval from a PREA (precharge all banks) command to an ACT/REF command. The value set in these bits must be greater than or equal to that in the TRP bits. 00011: 3 cycles : 11111: 31 cycles Other settings are prohibited.
15 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
4 to 0	TRP	00000	R/W	PRE Time Setting Bits These bits set the minimum interval from a PRE (precharge) command to an ACT/REF command. 00011: 3 cycles : 11111: 31 cycles Other settings are prohibited.

DBTR4 is used to set timing parameters for the SDRAM.

- Notes:
- The setting is in cycles of the SDRAM operating clock.
  - The following conditions must be satisfied:
    - $TRPA \geq TRP$
    - $TRC - TRP < 32$
  - Writing to this register should only be performed when the following conditions are met.
    - Access to SDRAM is disabled (i.e. the ACCEN bit in the DBACEN register is 0)
    - Auto-refresh is disabled (i.e. the ARFEN bit in the DBRFEN register is 0)

**15.3.14 SDRAM Timing Register 5 (DBTR5)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
5 to 0	TRC	000000	R/W	ACT to ACT/ACT to REF Interval Setting Bits These bits set the minimum interval from one ACT command to another ACT command (for the same bank) or to a REF command. 000110: 6 cycles : 111111: 63 cycles Other settings are prohibited.

DBTR5 is used to set a timing parameter for the SDRAM.

- Notes:
- The setting is in cycles of the SDRAM operating clock.
  - The following condition must be satisfied: TRC – TRP < 32
  - Writing to this register should only be performed when the following conditions are met.
    - Access to SDRAM is disabled (i.e. the ACCEN bit in the DBACEN register is 0)
    - Auto-refresh is disabled (i.e. the ARFEN bit in the DBRFEN register is 0)

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
3 to 0	TRRD	0000	R/W	ACT(A) to ACT(B) Interval Setting Bits These bits set the minimum interval between ACT commands issued for different banks. 0010: 2 cycles : 1111: 15 cycles Other settings are prohibited.

DBTR7 is used to set a timing parameter for the SDRAM.

- Notes:
- The setting is in cycles of the SDRAM operating clock.
  - Writing to this register should only be performed when the following conditions are met.
    - Access to SDRAM is disabled (i.e. the ACCEN bit in the DBACEN register is 0)
    - Auto-refresh is disabled (i.e. the ARFEN bit in the DBRFEN register is 0)

**15.3.17 SDRAM Timing Register 8 (DBTR8)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
7 to 0	TFAW	00000000	R/W	Four Activate Window Length Setting Bits These bits set the length of the four activate window. The value of these bits must be at least four times as large as that of the TRRD bits in DBTR7. 00001000: 8 cycles : 00111111: 63 cycles Other settings are prohibited.

DBTR8 is used to set a timing parameter for the SDRAM.

- Notes:
- The setting is in cycles of the SDRAM operating clock.
  - The following condition must be satisfied:  $TFAW \geq 4 \times TRRD$ .
  - Writing to this register should only be performed when the following conditions are met.
    - Access to SDRAM is disabled (i.e. the ACCEN bit in the DBACEN register is 0)
    - Auto-refresh is disabled (i.e. the ARFEN bit in the DBRFEN register is 0)

**15.3.18 SDRAM Timing Register 9 (DBTR9)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
3 to 0	TRDPR	0000	R/W	READ-PRE Interval Setting Bits These bits set the minimum interval from a READ command to a PRE command. 0100: 4 cycles : 1111: 15 cycles Other settings are prohibited.

DBTR9 is used to set a timing parameter for the SDRAM.

- Notes:
- The setting is in cycles of the SDRAM operating clock.
  - The following condition must be satisfied:  $TRDPR \geq BL/2$ .
  - If the SDRAM in use conforms to the JEDEC standard, the value of the bits can be calculated from the following formula.  

$$TRDPR = \max \{4, \text{ceil}(tRTP / tCK)\}$$
  - Writing to this register should only be performed when the following conditions are met.
    - Access to SDRAM is disabled (i.e. the ACCEN bit in the DBACEN register is 0)
    - Auto-refresh is disabled (i.e. the ARFEN bit in the DBRFEN register is 0)

**15.3.19 SDRAM Timing Register 10 (DBTR10)**

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
3 to 0	TWR	0000	R/W	Write-Recovery Period Setting Bits These bits set the write-recovery period. 0011: 3 cycles 0100: 4 cycles : 1110: 14 cycles Other settings are prohibited.

DBTR10 is used to set a timing parameter for the SDRAM.

- Notes:
- The setting is in cycles of the SDRAM operating clock.
  - Writing to this register should only be performed when the following conditions are met.
    - Access to SDRAM is disabled (i.e. the ACCEN bit in the DBACEN register is 0)
    - Auto-refresh is disabled (i.e. the ARFEN bit in the DBRFEN register is 0)

### 15.3.20 SDRAM Timing Register 11 (DBTR11)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	TRDWR					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
5 to 0	TRDWR	000000	R/W	READ to WRITE Interval Setting Bits These bits set the minimum interval from a READ command to a WRITE command. 000110: 6 cycles 000111: 7 cycles : 001111: 15 cycles Other settings are prohibited.

DBTR11 is used to set a timing parameter for the SDRAM.

- Notes:
- The setting is in cycles of the SDRAM operating clock.
  - If the SDRAM in use conforms to the JEDEC standard, the value of the bits can be calculated from the following formula.

When the number of  $(CL + (BL/2) + 2 - CWL)$  is even:

$$TRDWR > CL + (BL/2) + 2 - CWL$$

Otherwise:

$$TRDWR \geq CL + (BL/2) + 2 - CWL$$

- Writing to this register should only be performed when the following conditions are met.
  - Access to SDRAM is disabled (i.e. the ACCEN bit in the DBACEN register is 0)
  - Auto-refresh is disabled (i.e. the ARFEN bit in the DBRFEN register is 0)

**15.3.21 SDRAM Timing Register 12 (DBTR12)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
5 to 0	TWRRD	000000	R/W	WRITE to READ Interval Setting Bits These bits set the minimum interval from a WRITE command to a READ command. 000110: 6 cycles : 011111: 31 cycles Other settings are prohibited.

DBTR12 is used to set a timing parameter for the SDRAM.

- Notes:
- The setting is in cycles of the SDRAM operating clock.
  - The following condition must be satisfied:  $TWRRD \geq CWL + BL/2$ .
  - If the SDRAM in use conforms to the JEDEC standard, the value of the bits can be calculated from the following formula.  

$$TWRRD = CWL + 4 + \text{ceil}(tWTR / tCK)$$
  - Writing to this register should only be performed when the following conditions are met.
    - Access to SDRAM is disabled (i.e. the ACCEN bit in the DBACEN register is 0)
    - Auto-refresh is disabled (i.e. the ARFEN bit in the DBRFEN register is 0)

R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
11 to 0	TRFC/TRFCAB	H'000	R/W	REF to ACT/REF or All Bank REF to ACT/REF Interval Setting Bits These bits set the minimum interval from a REF (refresh) command for all the banks to an ACT/REF command. H'008 : 8 cycles : H'1FF: 511 cycles Other settings are prohibited.

DBTR13 is used to set a timing parameter for the SDRAM.

- Notes:
- The setting is in cycles of the SDRAM operating clock.
  - Writing to this register should only be performed when the following conditions are met.
    - Access to SDRAM is disabled (i.e. the ACCEN bit in the DBACEN register is 0)
    - Auto-refresh is disabled (i.e. the ARFEN bit in the DBRFEN register is 0)

### 15.3.23 SDRAM Timing Register 14 (DBTR14)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	TCKEHDLL							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	TCKEH							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
23 to 16	TCKEHDLL	H'00	R/W	CKEH (DLL-LOCK) Period Setting Bits These bits set the minimum interval from the time the CKE signal goes high until the issuing of a further valid command that requires the DLL to be locked. H'02: 2 cycles : H'17: 23 cycles Other settings are prohibited.
15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
7 to 0	TCKEH	H'00	R/W	CKEH Period Setting Bits These bits set the minimum interval from the time the CKE signal goes high until the issuing of a further valid command. H'02: 2 cycles : H'0F: 15 cycles Other settings are prohibited.

DBTR14 is used to set timing parameters for the SDRAM.

- Notes:
- The setting is in cycles of the SDRAM operating clock.
  - The following condition must be satisfied:  $TCKEH \leq TCKEHDLL$ .
  - When the power-down mode is to be used, this register must be set accordingly.  
If the SDRAM in use conforms to the JEDEC standard, the value of the bits can be calculated from the following formula.  

$$TCKEHDLL = \text{ceil}(tXPDLL / tCK)$$

$$TCKEH = \text{ceil}(tXP / tCK)$$

4. Writing to this register should only be performed when the following conditions are met.
  - Access to SDRAM is disabled (i.e. the ACCEN bit in the DBACEN register is 0)
  - Auto-refresh is disabled (i.e. the ARFEN bit in the DBRFEN register is 0)

### 15.3.24 SDRAM Timing Register 15 (DBTR15)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	TCKESR			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	TCKEL			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
19 to 16	TCKESR	0000	R/W	CKESR Period Setting Bits These bits set the minimum time for self-refresh from the time the CKE signal goes low until it goes high. 0010: 2 cycles 0011: 3 cycles : 1111: 15 cycles Other settings are prohibited.
15 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
3 to 0	TCKEL	0000	R/W	CKEL Period Setting Bits These bits set the minimum time for power down from the time the CKE signal goes low until it goes high. 0010: 2 cycles 0011: 3 cycles : 1111: 15 cycles Other settings are prohibited.

DBTR15 is used to set a timing parameter for the SDRAM.

- Notes:
- The setting is in cycles of the SDRAM operating clock.
  - Writing to this register should only be performed when the following conditions are met.
    - Access to SDRAM is disabled (i.e. the ACCEN bit in the DBACEN register is 0)
    - Auto-refresh is disabled (i.e. the ARFEN bit in the DBRFEN register is 0)

## 15.3.25 SDRAM Timing Register 16 (DBTR16)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DQIENLTNCY				—	—	—	—	—	—	DQL					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

15 to 12	DQENLTNCY	0000	R/W	<p>dqenlncy Setting Bits</p> <p>These bits set the latency from issuing of a write command to the PHY unit until the dfi_wrdata_en signal is output. Set CWL - 4 when CWL is odd and CWL - 5 when CWL is even.</p> <p>0000: 0 cycles</p> <p>:</p> <p>0101: 5 cycles</p> <p>Other settings are prohibited.</p>
11 to 4	—	All 0	R	<p>Reserved</p> <p>These bits are always read as 0. The write value should always be 0.</p> <p>If a value other than 0 is written, correct operation cannot be guaranteed.</p>

Bit	Bit Name	Initial Value	R/W	Description
3 to 0	WDQL	0000	R/W	<p>wdqItncy Setting Bits</p> <p>These bits set the latency from issuing of a write command until the write data is output. Set DQENLTNCY + 2.</p> <p>0001: One cycle</p> <p>:</p> <p>1000: 8 cycles</p> <p>Other settings are prohibited.</p>

DBTR16 is used to set a timing parameter for the SDRAM.

- Notes:
- The setting is in cycles of the SDRAM operating clock.
  - Writing to this register should only be performed when the following conditions are met.
    - Access to SDRAM is disabled (i.e. the ACCEN bit in the DBACEN register is 0)
    - Auto-refresh is disabled (i.e. the ARFEN bit in the DBRFEN register is 0)

**15.3.26 SDRAM Timing Register 17 (DBTR17)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	TMOD					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 22	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
21 to 16	TMOD	000000	R/W	MRS Time Setting Bits These bits indicate the minimum interval from an MRS (mode register set) command to a subsequent command. 000010: 2 cycles : 001111: 15 cycles Other settings are prohibited.
15 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.

DBTR17 is used to set timing parameters for the SDRAM.

- Notes:
- The setting is in cycles of the SDRAM operating clock.
  - Writing to this register should only be performed when the following conditions are met.
    - Access to SDRAM is disabled (i.e. the ACCEN bit in the DBACEN register is 0)
    - Auto-refresh is disabled (i.e. the ARFEN bit in the DBRFEN register is 0)

## 15.3.27 SDRAM Timing Register 18 (DBTR18)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	RODTL			—	—	—	—	—	RODTA		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R	R	R	R	R	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	WODTL			—	—	—	—	—	WODTA		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
26 to 24	RODTL	000	R/W	Bits for ODT Assert Period Setting at Read These bits set the assert period of the ODT signal that is output when a read command is output. 000: BL/2 cycles 001: BL/2 + 1 cycle : 111: BL/2 + 7 cycles Other settings are prohibited.
23 to 19	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
18 to 16	RODTA	000	R/W	Bits for ODT Assert Start Timing Setting Bits Read These bits set the assert start timing for the ODT signal that is output when a read command is output. 000: Simultaneous with the read command 001: One cycle after the read command 010: Two cycles after the read command 011: Three cycles after the read command Other settings are prohibited.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.

Bit	Bit Name	Initial Value	R/W	Description
10 to 8	WODTL	000	R/W	<p>Bits for ODT Assert Period Setting at Write</p> <p>These bits set the assert period of the ODT signal that is output when a write command is output.</p> <p>000: BL/2 cycles            001: BL/2 cycles + 1 cycle            :            111: BL/2 cycles + 7 cycles            Other settings are prohibited.</p>
7 to 3	—	All 0	R	<p>Reserved</p> <p>These bits are always read as 0. The write value should always be 0.</p> <p>If a value other than 0 is written, correct operation cannot be guaranteed.</p>
2 to 0	WODTA	000	R/W	<p>Bits for ODT Assert Start Timing Setting at Write</p> <p>These bits set the assert start timing for the ODT signal that is output when a write command is output.</p> <p>000: Simultaneous with the write command            001: One cycle after the write command            010: Two cycles after the write command            011: Three cycles after the write command            Other settings are prohibited.</p>

DBTR18 is used to set timing parameters for the SDRAM.

- Notes:
- The setting is in cycles of the SDRAM operating clock.
  - Writing to this register should only be performed when the following conditions are met.
    - Access to SDRAM is disabled (i.e. the ACCEN bit in the DBACEN register is 0)
    - Auto-refresh is disabled (i.e. the ARFEN bit in the DBRFEN register is 0)
  - The following conditions must be satisfied when setting this register:
 
$$\text{RODTL} + \text{RODTA} \leq 7$$

$$\text{WODTL} + \text{WODTA} \leq 7$$

**15.3.28 SDRAM Timing Register 19 (DBTR19)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	TZQCS							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
7 to 0	TZQCS	00000000	R/W	Calibration Period Setting Bits These bits specify the minimum interval from a ZQCS (short calibration) command to the next command. 00000110: 6 cycles 00000111: 7 cycles : 01000000: 64 cycles : 11111111: 255 cycles Other settings are prohibited.

DBTR19 is used to set a timing parameter for the SDRAM.

- Notes:
- The setting is in cycles of the SDRAM operating clock.
  - The following condition must be satisfied:  
TZQCS ≥ T<sub>MOD</sub>
  - Writing to this register should only be performed when the following conditions are met.
    - Access to SDRAM is disabled (i.e. the ACCEN bit in the DBACEN register is 0)
    - Auto-refresh is disabled (i.e. the ARFEN bit in the DBRFEN register is 0)

### 15.3.29 SDRAM Operation Setting Register (DBBL)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	BL	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
1, 0	BL	00	R/W	Burst Length Setting Bits These bits specify the burst length of SDRAM. 00: Fixed to 8 Other settings are prohibited.

DBBL is used to set a burst operation mode of the memory.

- Notes:
- The setting is in cycles of the SDRAM operating clock.
  - Writing to this register should only be performed when the following conditions are met.
    - Access to SDRAM is disabled (i.e. the ACCEN bit in the DBACEN register is 0)
    - Auto-refresh is disabled (i.e. the ARFEN bit in the DBRFEN register is 0)

### 15.3.30 DBSC3 Operation Adjustment Register 0 (DBADJ0)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	FREQRATIO	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CAMODE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

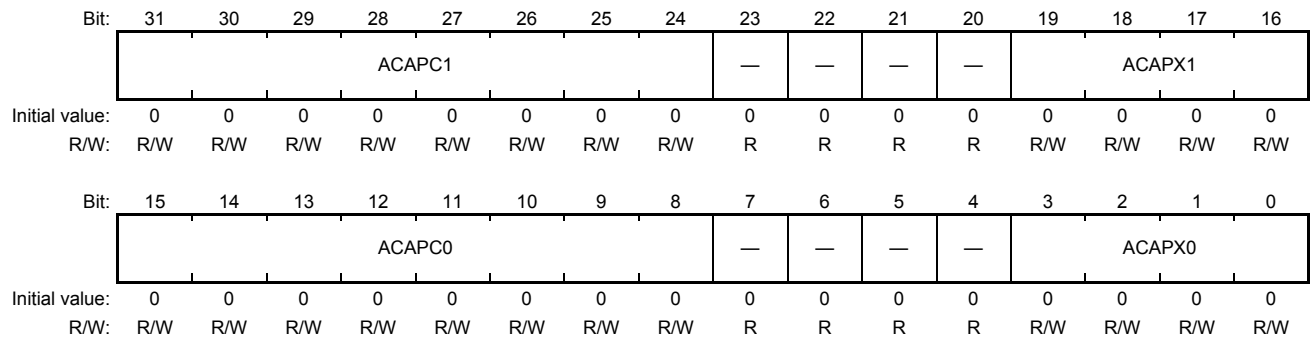

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
17, 16	FREQRATIO	00	R/W	PHY Frequency Ratio Setting Bits These bits should be set to 10 (1:4 operating mode). 10: DBSC3: PHY frequency ratio is 1:4. Other settings are prohibited.
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
0	CAMODE	0	R/W	Command/Address Output Mode Setting Bit When the CAMODE bit is 1, the DBSC3 outputs a single command per two clock cycles. In this case, command signals and address signals, except for the M0(/1)CS[1:0]# signals of SDRAM, are kept constant for two clock cycles. During this period, the CS# signal becomes low only in the latter one clock cycle. 0: Setting prohibited 1: One command output in two clock cycles

DBADJ0 adjusts the DBSC3 operation.

Note: Writing to this register should only be performed when access to the SDRAM is disabled (i.e. the ACCEN bit in the DBACEN register is 0).

**15.3.31 DBSC3 Operation Adjustment Register 2 (DBADJ2)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	ACAPC1	H'00	R/W	H'20 (fixed value) Other settings are prohibited.
23 to 20	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
19 to 16	ACAPX1	H'0	R/W	Bits for Setting Transaction Count Acceptable by Device Control Unit (for the High priority port) These bits set the number of requests acceptable by the device control unit (for the high priority port) in the DBSC3 in transaction units. H'4: fewer value H'8: default value Other settings are prohibited. If you want to reduce average access latency, please set this bit to H'8. If you want to reduce worst access latency, please set this bit to H'4.
15 to 8	ACAPC0	H'00	R/W	H'20 (fixed value) Other settings are prohibited.
7 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
3 to 0	ACAPX0	H'0	R/W	Bits for Setting Transaction Count Acceptable by Device Control Unit (for the low priority port) These bits set the number of requests acceptable by the device control unit (for the low priority port) in the DBSC3 in transaction units. H'4: fewer value H'8: default value Other settings are prohibited. If you want to reduce average access latency, please set this bit to H'8. If you want to reduce worst access latency, please set this bit to H'4.

DBADJ2 adjusts the DBSC3 operation.

- Notes:
1. Writing to this register should only be performed when access to the SDRAM is disabled (i.e. the ACCEN bit in the DBACEN register is 0).
  2. The display unit module requires to set ACAPX0 and ACAPX1 to H'4.

### 15.3.32 Refresh Configuration Register 0 (DBRFCNF0)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

	—	—	—	—	REFTHF											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
11 to 0	REFTHF	H'000	R/W	Forcible Auto-Refresh Threshold Setting Bits These bits set the timing for forcible refreshing regardless of bus requests. The value represented by these bits affects the amount of jitter in the refresh interval and performance in access to memory. A smaller value means less jitter in the refresh interval but may reduce performance in access. For details on the amount of jitter in the refresh interval, see section 15.3.33, Refresh Configuration Register 1 (DBRFCNF1). H'080: 128 cycles : H'1FF: 511 cycles Other settings are prohibited.

DBRFCNF0 is used to set the timing for refreshing of the SDRAM.

If you change the value of this register while auto-refresh is active (i.e. the ARFEN bit in the DBRFEN register is 1), the auto-refresh facility must be re-activated to reflect the new value in refreshing. To re-activate the auto-refresh facility, write 1 to the ARFEN bit in the DBRFEN register.

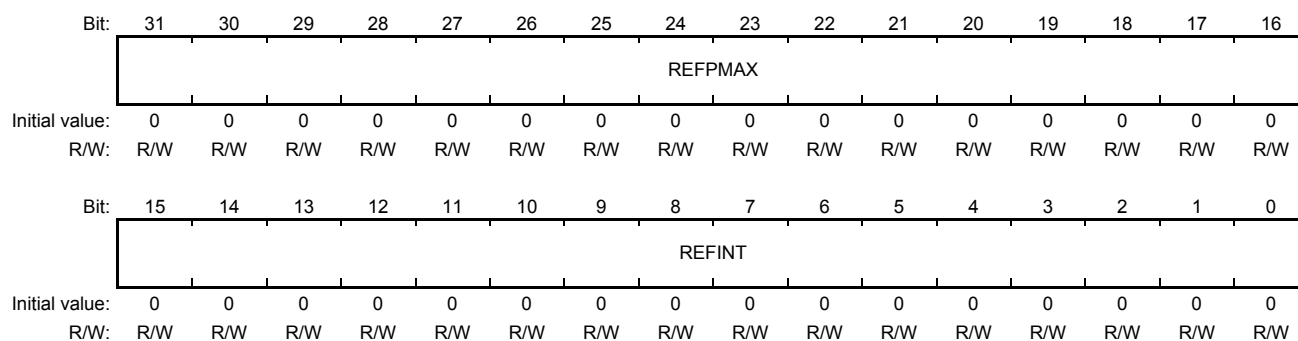

- Notes:
1. If auto-refresh is activated (i.e. the ARFEN bit in the DBRFEN register is set to 1) after a value smaller than the minimum value defined in the above table has been set in this register, correct operation cannot be guaranteed.
  2. The following conditions must be satisfied:  

$$\text{REFTHF} \geq (\text{TCKEL} + \text{TCKEH}) + \text{REFTH0}$$

$$(\text{REFTH0} = \max(\text{TRDPR}, \text{CWL} + (\text{BL}/2) + \text{TWR}, \text{TRAS}, \text{TRC} - \text{TRP}) + \text{TRPA} + 24)$$

### 15.3.33 Refresh Configuration Register 1 (DBRFCNF1)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	REFPMAX	H'0000	R/W	<p>Maximum Post Number of Refresh Commands Setting Bits</p> <p>These bits set the maximum number of refresh commands (post number) accumulated by auto-refresh. As long as the number of refresh commands that has been accumulated is smaller than REFPMAX, refresh commands are issued while there are no bus requests.</p> <p>H'0002: Two (minimum amount of jitter in the refresh interval)</p> <p>:</p> <p>H'0008: Eight cycles (maximum amount of jitter in the refresh interval)</p> <p>Other settings are prohibited.</p>
15 to 0	REFINT	H'0000	R/W	<p>Average Refresh Interval Setting Bits</p> <p>These bits set the average interval for issuing of refresh commands. When the REFINTS bit of the DBRFCNF2 register is 0, the average interval (in cycles) is REFINT. When the REFINTS bit of the DBRFCNF2 register is 1, on the other hand, the average interval (in cycles) is floor (REFINT/2). This average interval is hereafter referred to as REFINT_E. Thus, REFINT_E = REFINT &gt;&gt; REFINTS (&gt;&gt;: logical right-shift operator).</p> <p>H'0080: 128 cycles</p> <p>H'0081: 129 cycles</p> <p>:</p> <p>H'3FFF: 16383 cycles</p> <p>Other settings are prohibited.</p>

DBRFCNF1 is used to set the timing for refreshing of the SDRAM.

If you change the value of this register while auto-refresh is active (i.e. the ARFEN bit in the DBRFEN register is 1), the auto-refresh facility must be re-activated to reflect the new value in refreshing. To re-activate the auto-refresh facility, write 1 to the ARFEN bit in the DBRFEN register.

In the descriptions below, the "number of cycles" unless otherwise specified means the value measured with the SDRAM clock.

**(1) Register Settings and Refresh Generation Timing**

The following is an example of the settings in refresh configuration registers 1 and 2 and the timing of refresh generation.

In the explanations, "a ± b" indicates the range of values from a - b to a + b.

**(a) To make the refresh interval flexible**

Set REFPMAX to a value greater than or equal to 2.

REFINT holds the setting for the average refresh interval (tREFI in the normal range of operating temperatures), which is given in memory-vendor datasheets as an integer number of cycles. Set a value that has been rounded down from this integer. Set REFINTS to 0 or 1 according to the temperature at the time.

In this case, taking n as a positive integer, the time from one round of refresh generation to refresh generation n rounds later is (n × REFINT\_E + REFPMAX × REFINT\_E cycles) or shorter. However, this is on the assumption of no writing to the DBRFEN register during this period.

The following condition must be satisfied:

$$\text{REFINT} \geq (\text{TCALRZ} + \text{TCALZR} + \text{REFTHF} \times 2) \ll \text{REFINTS}$$

- Notes:
1. If auto-refresh is activated (i.e. the ARFEN bit in the DBRFEN register is set to 1) after a value smaller than the minimum value defined in the above table has been set in this register, correct operation cannot be guaranteed.
  2. Other restrictions not mentioned in the above may apply to some types of SDRAM according to the PHY unit specifications.

### 15.3.34 Refresh Configuration Register 2 (DBRFCNF2)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	REFPMIN			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	REF INTS
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

In the descriptions below, the number of cycles means the value measured with the SDRAM clock unless otherwise specified.

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
19 to 16	REFPMIN	H'0	R/W	Minimum Post Number of Refresh Commands Setting Bits These bits set the minimum number of refresh commands (post number) accumulated by auto-refresh. As long as the number of refresh commands that has been accumulated is smaller than REFPMIN, refresh commands are issued irrespective of the bus request state. H'1: 1 Other settings are prohibited.
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
0	REFINTS	0	R/W	Average Refresh Interval Adjustment Bit When this bit is 0, the average interval (in cycles) is the value set in the REFINT bits. When this bit is 1, on the other hand, the average interval (in cycles) is floor (REFINT/2). 0: Average interval is REFINT 1: Average interval is 1/2 REFINT

DBRFCNF2 is used to set the timing for refreshing of the SDRAM.

If you change the value of this register while auto-refresh is active (i.e. the ARFEN bit in the DBRFEN register is 1), the auto-refresh facility must be re-activated to reflect the new value in refreshing. To re-activate the auto-refresh facility, write 1 to the ARFEN bit in the DBRFEN register.

The following condition must be satisfied:

$$\text{REFPMAX} \geq \text{REFPMIN}$$

### 15.3.35 DDR3-SDRAM Calibration Configuration Register (DBCALCNF)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	CALEN	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CALINT															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
24	CALEN	0	R/W	DDR3-SDRAM Calibration Enable Bit While this bit is set to 1, calibration of DDR3-SDRAM is executed (ZQCS command is issued) at regular intervals. 0: DDR3-SDRAM calibration is disabled. 1: DDR3-SDRAM calibration is enabled.
23 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
15 to 0	CALINT	H'0000	R/W	DDR3-SDRAM Calibration Frequency Setting Bits These bits adjust the frequency of DDR3-SDRAM calibration. When the CALINT bits are set to n, the ZQCS command is issued once every time the refresh command has been issued for n times by the auto-refresh function. H'0000: Executed only once after auto-refresh executed immediately after the CALEN bit is set to 1. H'0001: Executed at every auto-refresh. H'0002: Executed at every two times of auto-refresh. : H'FFFF: Executed at every 65535 times of auto-refresh.

DBCALCNF controls the function for calibrating DDR3-SDRAM at regular intervals.

- Notes:
- When CALINT = 0, calibration is executed (ZQCS command is issued) only once after auto-refresh executed immediately after 1 is written to the CALEN bit; no calibration is executed after that. To execute calibration again, write 1 to the CALEN bit.
  - Even when the CALEN bit is set to 1, the ZQCS command is not issued when the auto-refresh function is stopped (i.e. the ARFEN bit in the DBRFEN register is 0).

3. Writing a value other than H'0100 0000 to this register should only be performed when the following conditions are met.
  - Access to SDRAM is disabled (i.e. the ACCEN bit in the DBACEN register is 0)
  - Auto-refresh is disabled (i.e. the ARFEN bit in the DBRFEN register is 0)
4. Writing H'0100 0000 to this register should only be performed when the following condition is met.
  - Auto-refresh is enabled (i.e. the ARFEN bit in the DBRFEN register is 1)

### 15.3.36 DDR3-SDRAM Calibration Timing Register (DBCALTR)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	TCALZR											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
27 to 16	TCALRZ	H'000	R/W	DDR3-SDRAM Calibration Timing Setting (REF to ZQCS Interval Setting) Bits These bits specify the minimum interval between a REF and ZQCS commands for calibration execution. H'080: 128 cycles : H'FFF: 4095 cycles Other settings are prohibited.
15 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
11 to 0	TCALZR	H'000	R/W	DDR3-SDRAM Calibration Timing Setting (ZQCS to REF Interval Setting) Bits These bits specify the minimum interval between a ZQCS command for calibration and a REF command for the next auto-refresh execution. H'080: 128 cycles : H'FFF: 4095 cycles Other settings are prohibited.

DBCALTR specifies the command interval limitations for DDR3-SDRAM calibration executed at regular intervals.

Notes: 1. This register value has no effect when CALEN = 0.

2. The setting is in cycles of the SDRAM operating clock.

3. The following conditions must be satisfied:

$$TCALRZ \geq \max(128, TRFC + (7 \times TFAW \div 4) + tACTANY + 32)$$

$$TCALZR \geq \max(128, TZQCS + (7 \times TFAW \div 4) + tACTANY + 32)$$

$REFINT \geq (TCALRZ + TCALZR + (REFTHF \times 2)) \ll REFINTS$   
( $tACTANY = \max (TRCD, TRAS, TRC - TRPA, TFAW)$ )

4. Writing to this register should only be performed when the following conditions are met.
  - Access to SDRAM is disabled (i.e. the ACCEN bit in the DBACEN register is 0)
  - Auto-refresh is disabled (i.e. the ARFEN bit in the DBRFEN register is 0)

## 15.3.37 ODT Operation Setting Register (DBRNK0)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
16	RODTOUT0	0	R/W	Bit for ODT Output Level Setting at Read This bit set the ODT output level at read. 0: ODT output level at read is set to 0. 1: ODT output level at read is set to 1.
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
0	WODTOUT0	0	R/W	Bit for ODT Output Level Setting at Write This bit set the ODT output level at write. 0: ODT output level at write is set to 0. 1: ODT output level at write is set to 1.

DBRNK0 specifies the ODT output level of SDRAM.

Note: Writing to this register should only be performed when the following conditions are met.

- Access to SDRAM is disabled (i.e. the ACCEN bit in the DBACEN register is 0)
- Auto-refresh is disabled (i.e. the ARFEN bit in the DBRFEN register is 0)

### 15.3.38 Power-Down Configuration Register (DBPDNCNF)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PDWAIT								—	—	—	PDDL	—	—	PDMODE	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
15 to 8	PDWAIT	H'00	R/W	Power-Down Wait Bits These bits set the number of cycles it takes to enter power-down mode after memory accesses no longer occur. H'10: 16 cycles : H'FF: 255 cycles Other settings are prohibited.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
4	PDDL	0	R/W	Power-Down DLL Control Bit This bit turns on or off the DLL of SDRAM when entering power-down mode. 0: DLL is turned off at a precharged power-down. DLL is turned on at an active power-down 1: DLL is turned on at a power-down.
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
1, 0	PDMODE	00	R/W	Power-Down/Self-Refresh Mode Bits When these bits are set to "01" and there has been no memory access for a certain period, the power-down entry command is issued to place the SDRAM in power-down mode. When these bits are set to "10" and there has been no memory access for a certain period, the self-refresh entry command is issued to place the SDRAM in self-refresh mode. 00: Auto power-down mode and auto self-refresh mode are off. 01: Auto power-down mode is on. Other settings are prohibited.

DBPDNCNF controls the auto power-down function.

- Notes:
1. The setting is in cycles of the SDRAM operating clock.
  2. Return from a power-down mode incurs a time penalty of  $\max(3, \text{TCKEH}) - 3$  cycles.
  3. Writing to this register should only be performed when the following conditions are met.
    - Access to SDRAM is disabled (i.e. the ACCEN bit in the DBACEN register is 0)
    - Auto-refresh is disabled (i.e. the ARFEN bit in the DBRFEN register is 0)

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
1, 0	BKADM	00	R/W	Bank Assignment Setting Bits These bits are used to set the method for assigning the SDRAM banks to the logical address space, i.e. whether and how logical addresses are divided into multiple blocks to which different SDRAM banks are assigned. For details on the relation between the logical addresses and SDRAM addresses, refer to section 15.4.12, Address Multiplexing. 00: The whole logical address space is regarded as one block. 01: The logical address space is divided into the following two blocks: One for banks 0 to 3 and one for banks 4 to 7. 10: The logical address space is divided into the following three blocks: One for banks 0 and 1, one for banks 2 and 3, and one for banks 4 to 7. 11: The logical address space is divided into the following four blocks: One for bank 0, one for bank 1, one for banks 2 and 3, and one for banks 4 to 7.

- Notes:
- This register must only be written from within the initialization sequence (see section 15.4.3, Initialization Sequence).
  - Writing to this register should only be performed when the following conditions are met.
    - Access to SDRAM is disabled (i.e. the ACCEN bit in the DBACEN register is 0)

RZ/G1E

### 15.4.1 Supported SDRAM Commands

Table 15.6 lists the SDRAM commands issued by the DBSC3. These commands are issued to the SDRAM in synchronously with the M0(1)CK[1:0] and M0(1)CK[1:0]# signals. In the table, "n-1" indicates the state of the signal applied to the SDRAM one cycle before SDRAM command issue; n indicates the state of the signal at the time of command issue.

**Table 15.6 SDRAM Commands Issued by the DBSC3**

Function	Symbol	MCKE[1:0]		MCS [1:0]#	MRAS#	MCAS#	MWE#	MBA [2:0]	MA [15:3]	MA12 /BC	MA10 /AP	MA11, MA[9:0]
		n-1	n									
Device deselected	DES	H	H	H	X	X	X	X	X	X	X	X
Read	READ	H	H	L	H	L	H	V	V	V	L	V
Write	WRITE	H	H	L	H	L	L	V	V	V	L	V
Bank activate	ACT	H	H	L	L	H	H	V	V	V	V	V
Precharge select bank	PRE	H	H	L	L	H	L	V	V	V	L	V
Precharge all banks	PREA	H	H	L	L	H	L	V	V	V	H	V
Auto-refresh	REF	H	H	L	L	L	H	V	V	V	V	V
Self-refresh entry	SRE	H	L	L	L	L	H	V	V	V	V	V
Self-refresh exit	SRX	L	H	H	V	V	V	V	V	V	V	V
Power down entry	PDE	H	L	L	H	H	H	V	V	V	V	V
Power down exit	PDX	L	H	L	H	H	H	V	V	V	V	V
Mode register set	MRS	H	H	L	L	L	L	V	V	V	V	V
ZQ calibration short issue	ZQCS	H	H	L	H	H	L	X	X	X	H	X
ZQ calibration long issue	ZQCL	H	H	L	H	H	L	X	X	X	L	X

[Legend]

H: High level

L: Low level

X: High or low level (don't e)

V: Valid data

In the table, corrective names are used for signals. For example, MCKE and MA indicate M0CKE/M1CKE and M0A/M1A signals, respectively.

The above DES command is issued when the SDRAM is not accessed, and so cannot be explicitly issued by the user.

## 15.4.2 SDRAM Command Issue

### (1) Basic Access

The DBSC3 stores in a queue the requests received via the AXI. The order for the start of request processing changes according to whether or not this is preceded by processing for precharging or activation, but processing is executed in the order allowed in AXI protocol to improve the memory efficiency.

When SDRAM initialization is completed, upon receiving a read/write request, a page miss occurs with all banks in the closed state. Hence the DBSC3 first issues an activate (ACT) command, to open the corresponding bank. After opening the bank, the read/write command of the SDRAM corresponding to the read/write request is issued. At this time, the number of issued read/write commands differs depending on the bus width and the request size (1/2/4/8/16/32 bytes), as indicated in Figure 15.4. For example, when performing 32-byte reading from the AXI bus with an external data bus width of 16 bits, two read commands are issued. When issuing the read command in the first cycle, data is read with a burst length of 8 (four DDR clock cycles), so that it is necessary to wait until the fifth cycle to issue the second read command.

When access ends, the DBSC3 leaves the bank open, without using a precharge (PRE) command. The bank is closed when (1) the following request is for the same bank with a different row address; (2) there is an auto-refresh request; or (3) the user issues a precharge-all (PREA) command using the SDRAM command control register, for self-refresh processing.

Thus in normal access other than self-refresh, the DBSC3 uses hardware for bank management, so that except for the register settings upon initialization, the user need not execute control.

Furthermore, the DBSC3 performs multibank operation of eight banks. Hence the maximum number of banks that can be opened simultaneously is eight. Refer to section 15.4.12, Address Multiplexing, for the correspondence between access addresses from the AXI and SDRAM bank/row addresses.

**Figure 15.4 Read/Write Command Issued to the SDRAM in Response to the Request from the AXI**

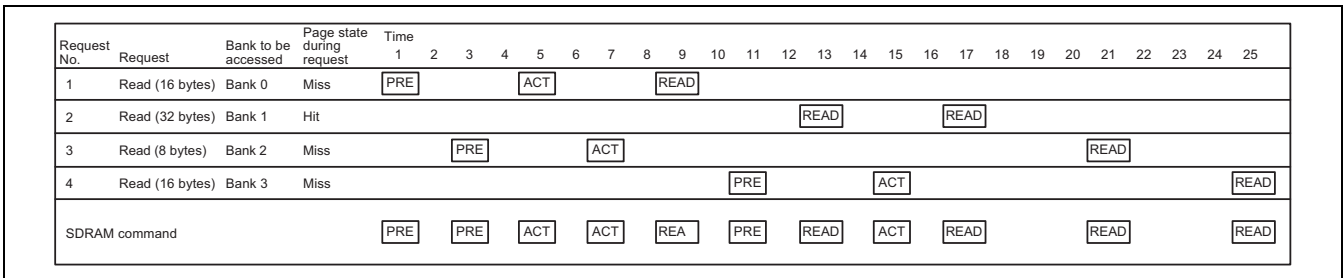

**(2) Preceding Precharge/Activate Processing**

In order to utilize SDRAM multibank functions to reduce SDRAM command vacant cycles insofar as possible and improve the efficiency of bus use, the DBSC3 issues in advance a PRE/ACT command corresponding to the following request queue page miss processing. Only the PRE/ACT command is issued in advance, so there is no change in the read/write order. A PRE/ACT command is issued in advance only when the following request (1) results in a page miss, and moreover (2) entails access of a bank different from that of the request currently being processed. Figure 15.5 shows an example of execution of preceding precharge/activate processing (as an example for operational description). This is an example of a command issued to the SDRAM when the external data bus width is 16 bits, the PRE-ACT minimum time constraint is 4 cycles, the ACT-READ/WRITE minimum time constraint is 4 cycles, and the ACT-ACT minimum time constraint is 2 cycles. In this example, the first through fourth requests are accumulated, and the first request is the request initially provided to the queue.

The DBSC3 issues one command each time it has received two memory clock pulses. Thus, there are always an even number of clock pulses between commands. At time 1, the DBSC3 issues to the SDRAM a PRE command for processing the first read (16-byte) request. Then, when determining the command to be issued at time 3, due to timing constraints it is not possible to issue at time 3 the ACT command necessary as request processing for the first read (16-byte) request, which has higher priority. Hence the DBSC3 searches for a command to be issued at time 3 from the following request queue. From the search results it is seen that preceding precharge processing can be executed for the third read (8-byte) request. Because the DBSC3 gives priority to preceding requests, it decides to perform preceding precharge processing for the third read (8-byte) request, and issues a PRE command to the SDRAM.

At time 5, the DBSC3 can process the first read (16-byte) request and it issues an ACT command to the SDRAM. At time 7, it issues an ACT command to the SDRAM for the first read (8-byte) request processing. After issuing the read command for the first read (16-byte) request processing, it issues a PRE command to the SDRAM for the fourth read (16-byte) request processing at time 11.

Thereafter, the processing described above is repeated.

**Figure 15.5 Example of Preceding Precharge/Activate Processing**

### 15.4.3 Initialization Sequence

The following shows examples of initialization sequence for each memory type. The initialization sequence should be executed to enable SDRAM access after power to the DBSC3 is turned on. Note that the sequence differs depending on the specifications of the target memory.

For detailed information such as the power supply and timing parameters, refer to the datasheet for the SDRAM being used. The procedure for starting the system differs from that for restoring it from the power-supply backup mode.

#### 15.4.3.1 Starting the System

##### (1) 64 Bits × 1-ch Mode [RZ/G1H/M]

##### (a) After power is turned on, apply a power-on reset and wait until the DBSC3 is released from the reset state.

If SDRAM Power-Supply Backup Function is not used, M0/1BKPRST# is driven high before starting Initialization. (Refer to 15.4.14 SDRAM Power-Supply Backup Function)

1. After release from the reset state, set the registers as follows:
  - Write H'0000A55A to the PHY unit lock register (DBPDLCK).  
This allows the access to the PHY unit registers.
  - Write H'0000A55A to DB\_ADDR + H'4000.
  - Write H'00000001 to DB\_ADDR + H'4008.
2. Here, the setting on the M0/1RESET# signals should be executed (The following 3 lines correspond to this setting):
  - Write H'21000000 to the manual command-issuing register (DBCMD).
  - Write H'11000000 to the manual command-issuing register (DBCMD).
  - Write H'10000000 to the manual command-issuing register (DBCMD).
3. Write H'00000001 to the PHY unit address register (DBPDRGA).
4. Write H'80000000 to the PHY unit access register (DBPDRGD).
5. Write H'00000004 to the PHY unit address register (DBPDRGA).
6. Read the PHY unit access register (DBPDRGD) and wait until 1 is read from bit 0.
7. Write H'00000006 to the PHY unit address register (DBPDRGA).
8. Write H'0001C000 to the PHY unit access register (DBPDRGD) (greater than or equal to 1440 MBps, MD19 = 0, refer to Tables 7.6a and 7.6b).  
Write H'0005C000 to the PHY unit access register (DBPDRGD) (less than 1440 MBps, MD19 = 1, refer to Tables 7.6a and 7.6b).
9. Write H'0000000F to the PHY unit address register (DBPDRGA).
10. Write H'00181224 to the PHY unit access register (DBPDRGD).
11. Write H'00000010 to the PHY unit address register (DBPDRGA).
12. Write H'F004649B to the PHY unit access register (DBPDRGD).
13. Write H'00000061 to the PHY unit address register (DBPDRGA).
14. Write H'0000006D to the PHY unit access register (DBPDRGD).
15. Write H'00000001 to the PHY unit address register (DBPDRGA).
16. Write H'00000073 to the PHY unit access register (DBPDRGD).

##### (b) DBSC3 Setting 1

Here, set the DBSC3\_0 side only.

1. SDRAM type setting register (DBKIND)
2. SDRAM configuration setting register 0 (DBCONF0)
3. PHY type setting register (DBPHYTYPE)

4. SDRAM operation setting register (DBBL)
5. SDRAM timing registers 0 to 19 (DBTR0 to DBTR19)
6. ODT operation setting register 0 (DBRNK0)
7. DBSC3 operation adjustment registers 0 and 2 (DBADJ0, DBADJ2)
8. AXI port setting registers 0 and 4 (DBWT0CNF0, DBWT0CNF4)

### (c) PHY Setting 1

#### DBSC3\_0 Setting:

1. Read the DBDFISTAT register and confirm that 1 is read from INITCOMPL (bit 0).  
When 1 is read, the RESET# pin goes low.
2. Write H'00000011 to the DBDFICNT register.  
This sets the clock frequency ratio and dfi\_init\_start.
3. Write H'00000003 to the PHY unit address register (DBPDRGA).
4. Write H'0300C4E1 to the PHY unit access register (DBPDRGD) (For DDR3).  
Write H'0300C561 to the PHY unit access register (DBPDRGD) (For DDR3L).  
Set IOM[2:1] of each buffer IO-Mode to the value for DDR3/DDR3L.
5. Write H'00000023 to the PHY unit address register (DBPDRGA).
6. Write H'00FCDB60 to the PHY unit access register (DBPDRGD).  
PHY Configuration Setting (Modify according to the memory connected to DDR.)  
[17:0]: tREFPRD ( $9 \times tREFI = 9 \times 7.8 \mu\text{s}$ , H'0DB60 at 1600 MHz)  
[18]: NOBUB (fixed to 1)  
[19]: FXDLAT (fixed to 1)  
[27:20]: PUBMODE (fixed to H'0F)  
[31:28]: Reserved (must be H'0 since these bits are not used)
7. Write H'00000011 to the PHY unit address register (DBPDRGA).
8. Write H'1000040B to the PHY unit access register (DBPDRGD).
9. Write H'00000012 to the PHY unit address register (DBPDRGA).
10. Write H'9D5CBB66 to the PHY unit access register (DBPDRGD).  
DRAM Timing Parameters Setting (Modify according to the memory connected to DDR.)  
[3:0]: tRTP (DDR3-1600 = H'6 (number of cycles equal to 7.5 ns or more))  
[7:4]: tWTR (DDR3-1600 = H'6 (number of cycles equal to 7.5 ns or more))  
[11:8]: tRP (DDR3-1600 = H'B (number of cycles equal to 13.75 ns or more (CL = 11)))  
[15:12]: tRCD (DDR3-1600 = H'B (number of cycles equal to 13.75 ns or more (CL = 11)))  
[21:16]: tRAS (DDR3-1600 = H'1C (number of cycles equal to 35 ns or more (CL = 11)))  
[25:22]: tRRD (DDR3-1600 = H'5 (number of cycles equal to 6 ns or more (1-KB page size)))  
[31:26]: tRC (DDR3-1600 = H'27 (number of cycles equal to 48.75 ns or more (CL = 11)))
11. Write H'00000013 to the PHY unit address register (DBPDRGA).
12. Write H'1A868300 to the PHY unit access register (DBPDRGD).  
DRAM Timing Parameters Setting (Modify according to the memory connected to DDR.)  
[1:0]: tMRD (For DDR3, enter the number of cycles to be added to the MIN value, that is 4 cycles.  
The set value is B'00 for using the MIN condition without additional cycles.)  
[4:2]: tMOD (For DDR3-1600, the set value should be 12 cycles equal to 15 ns or more. When the set value is H'0, 12 cycles is specified; as the set value increases by one, the number of cycles increases by one up to 5 cycles.)  
[10:5]: tFAW (DDR3-1600 = H'18 (number of cycles equal to 30 ns or more (1-KB page size)))  
[19:11]: tRFC (The set value is H'0D0 since the cycle is 260 ns for 4 GB.)

- [25:20]: tWLMRD (Minimum delay from when write leveling mode is programmed to the first DQS/DQS# rising edge, Default = H'28.)
- [29:26]: tWLO (Number of clock cycles from when write leveling DQS is driven high by the control block to when the results from the SDRAM on DQ is sampled by the control block, the set value is H'6 since the DDR3-1600 MAX value is 6.)
- [31:30]: tAOND/tAOFD (Default = B'00 since this is only for DDR2.)
13. Write H'00000014 to the PHY unit address register (DBPDRGA).
  14. Write H'300214D8 to the PHY unit access register (DBPDRGD).  
DRAM Timing Parameters Setting (Modify according to the memory connected to DDR.)  
[9:0]: tXS (Self refresh exit delay 5CK to 310 ns: H'005 to H'0F8)  
[14:10]: tXP (Power down exit delay 3CK to 6 ns: H'03 to H'05)  
[18:15]: tCKE (CKE minimum pulse width 3CK to 5 ns: H'3 to H'5)  
[28:19]: tDLLK (DLL locking time 512CK: H'200)  
[29]: tRTODT (Read to ODT delay: 1)  
[30]: Fixed to 0  
[31]: Fixed to 0
  15. Write H'00000015 to the PHY unit address register (DBPDRGA).
  16. Write H'00000D70 to the PHY unit access register (DBPDRGD).  
SDRAM Mode Register 0 Setting (Modify according to the memory connected to DDR.)  
[15:0]: set MR0 values.  
[31:16]: Reserved (must be 0 since these bits are not used)
  17. Write H'00000016 to the PHY unit address register (DBPDRGA).
  18. Write H'00000006 to the PHY unit access register (DBPDRGD).  
SDRAM Mode Register 1 Setting (Modify according to the memory connected to DDR.)  
[15:0]: set MR1 values.  
[31:16]: Reserved (must be 0 since these bits are not used)
  19. Write H'00000017 to the PHY unit address register (DBPDRGA).
  20. Write H'00000018 to the PHY unit access register (DBPDRGD).  
SDRAM Mode Register 2 Setting (Modify according to the memory connected to DDR.)  
[15:0]: set MR2 values.  
[31:16]: Reserved (must be 0 since these bits are not used)
  21. Write H'0000001A to the PHY unit address register (DBPDRGA).
  22. Write H'910035C7 to the PHY unit access register (DBPDRGD).  
Set the above values in DATA Training Configuration setting of DDR-PHY.
  23. Write H'00000004 to the PHY unit address register (DBPDRGA).
  24. Read the PHY unit access register (DBPDRGD) and wait until 1 is read from bit 0.
  25. Write H'00000001 to the PHY unit address register (DBPDRGA).
  26. Write H'00000181 to the PHY unit access register (DBPDRGD).
  27. Write H'11000000 to the manual command-issuing register (DBCMD).
  28. Write H'00000004 to the PHY unit address register (DBPDRGA).
  29. Read the PHY unit access register (DBPDRGD) and wait until 1 is read from bit 0.
  30. Write H'00000001 to the PHY unit address register (DBPDRGA).
  31. Write H'0000FE01 to the PHY unit access register (DBPDRGD).

#### (d) DBSC Setting 2

Here, set the DBSC3\_0 side only.

1. Bus control unit 0 control register 1 (DBBS0CNT1)

2. DDR3-SDRAM calibration configuration register (DBCALCNF)
3. DDR3-SDRAM calibration timing register (DBCALTR)
4. Refresh configuration registers 0 to 2 (DBRFCNF0 to DBRFCNF2)
5. Write H'00000004 to the PHY unit address register (DBPDRGA).  
Read the PHY unit access register (DBPDRGD) and wait until 1 is read from bit 0.
6. Set the ARFEN bit to 1 in the auto-refresh enable register (DBRFEN).
7. Write H'00000010 to the PHY unit address register (DBPDRGA).
8. Write HF00464DB to the PHY unit access register (DBPDRGD).
9. Write H'00000000 to DB\_ADDR + H'4008.
10. Write H'00000000 to DB\_ADDR + H'4000.
11. Set the ACCEN bit to 1 (access enabled) in the SDRAM access enable register (DBACEN).
12. Write H'00000000 to the PHY unit lock register (DBPDLCK).  
This locks the access to the PHY unit registers.

End of initialization sequence

### (2) 32 Bits × 2-ch Mode [RZ/G1H/M]

The initialization sequence for 32 bits × 2-ch mode can be executed by similar way for 64 bits × 1-ch mode. Differences between them are as follows.

In the section "(1) 64 Bits × 1-ch Mode", the DBSC3\_1 setting should also be executed in the flowing each subsection;

- (b) **DBSC3 Setting 1**
- (c) **PHY Setting 1**
- (d) **DBSC Setting 2**

### (3) 32 Bits × 1-ch Mode [RZ/G1N/E]

The initialization sequence for 32 bits × 1-ch mode can be executed by similar way for 64 bits × 1-ch mode.

### (4) 32 Bits × 1-ch Mode [RZ/G1H/M]

The initialization sequence for 32 bits × 1-ch mode can be executed by similar way for 64 bits × 1-ch mode. Differences between them are as follows.

The following sequence should be added below the line No.31 of subsection "(c) PHY Setting 1" in In the section "(1) 64 Bits × 1-ch Mode" to stop the DBSC3\_1 side macro of DDR-PHY;

32. Write H'000000B0 to the PHY unit address register (DBPDRGA).
33. Write H'7C020EB0 to the PHY unit access register (DBPDRGD).
34. Write H'000000C0 to the PHY unit address register (DBPDRGA).
35. Write H'7C020EB0 to the PHY unit access register (DBPDRGD).
36. Write H'000000D0 to the PHY unit address register (DBPDRGA).
37. Write H'7C020EB0 to the PHY unit access register (DBPDRGD).
38. Write H'000000E0 to the PHY unit address register (DBPDRGA).
39. Write H'7C020E80 to the PHY unit access register (DBPDRGD).

#### 15.4.4 Self-Refresh Operation

If it is not necessary to access the SDRAM, the SDRAM can be put in self-refresh mode to reduce power consumption while still retaining data contents.

Since access to the SDRAM is disabled in self-refresh mode, requesting an SDRAM data access to the DBSC3 will cause an error.

The following procedure should be used to enter or release self-refresh mode.

##### (1) Self-Refreshing (When the Clock is Not Stopped)

Use the following procedure to enter self-refresh mode.

1. Set the ACCEN bit to 0 (access disabled) in the SDRAM access enable register (DBACEN).
2. Use the manual command-issuing register (DBCMD) to issue the PREA (precharge all) command. The value written to this register should be OPC = PreA, ARG = 0.
3. Use the manual command-issuing register (DBCMD) to issue the Self-Refresh Entry command. The value written to this register should be OPC = SREn, ARG = 0.
4. Set the ARFEN bit to 0 in the auto-refresh enable register (DBRFEN).

Use the following procedure to release self-refresh mode.

1. Set the ARFEN bit to 1 in the auto-refresh enable register (DBRFEN).
2. Use the manual command-issuing register (DBCMD) to issue the Self-Refresh Exit command. The value written to this register should be OPC = SRXt, ARG = 0.
3. Use the manual command-issuing register (DBCMD) to insert wait cycles until access to the SDRAM is enabled. The value written to this register should be OPC = Wait, ARG = tXSDLL (normally, 512).
4. Set the ACCEN bit to 1 (access enabled) in the SDRAM access enable register (DBACEN).

##### (2) Self-Refreshing (When the Clock is Stopped or Clock Frequency is Changed)

Use the following procedure to enter self-refresh mode.

1. Set the ACCEN bit to 0 (access disabled) in the SDRAM access enable register (DBACEN).
2. Use the manual command-issuing register (DBCMD) to issue the PREA (precharge all) command. The value written to this register should be OPC = PreA, ARG = 0.
3. Use the manual command-issuing register (DBCMD) to issue the Self-Refresh Entry command. The value written to this register should be OPC = SREn, ARG = 0.
4. Set the ARFEN bit to 0 in the auto-refresh enable register (DBRFEN).
5. Use the manual command-issuing register (DBCMD) to insert wait cycles for the clock to stop. The value written to this register should be OPC = Wait, ARG = tCKSRE (normally, max {5, 10 ns}).
6. Read the operation completion waiting register (DBWAIT) and wait for the response.
7. The clock supplied to the DBSC3 can be stopped at this point

Use the following procedure to release self-refresh mode.

1. Restart the clock supply and wait until the clock settles.
2. Reconfigure the PHY unit.
3. Use the manual command-issuing register (DBCMD) to insert wait cycles until self-refresh mode is released. The value written to this register should be OPC = Wait, ARG = tCKSRX (normally, max {5, 10 ns}).
4. Set the ARFEN bit to 1 in the auto-refresh enable register (DBRFEN).
5. Use the manual command-issuing register (DBCMD) to issue the Self-Refresh Exit command. The value written to this register should be OPC = SRXt, ARG = 0.

6. Use the manual command-issuing register (DBCMD) to insert wait cycles until access to the SDRAM is enabled. The value written to this register should be OPC = Wait, ARG = tXSDLL (normally, 512).
7. Set the ACCEN bit to 1 (access enabled) in the SDRAM access enable register (DBACEN).

#### 15.4.5 Power-Down Operation

If there is no need to access SDRAM, entering the power-down mode can place the SDRAM internal clock in inactive state, which can effectively lower the power consumption in the device. Even in a power-down mode, the clock and power need to be supplied.

Use the following procedure to enter the power-down mode.

1. Set the ACCEN bit to 0 (access disabled) in the SDRAM access enable register (DBACEN).
2. Use the manual command-issuing register (DBCMD) to issue the Power Down Entry command. The value written to this register should be OPC = PDEn, ARG = 0.

Use the following procedure to release the power-down mode.

1. Use the manual command-issuing register (DBCMD) to issue the Power Down Exit command. The value written to this register should be OPC = PDXt, ARG = 0.
2. Set the ACCEN bit to 1 (access enabled) in the SDRAM access enable register (DBACEN).

To keep holding the SDRAM data in power-down mode, a refresh command needs to be issued at regular intervals in the same way as in normal operation. In the DBSC3, by entering the power-down mode with the auto-refresh function operating (ARFEN = 1 in the DBRFEN register), refresh is performed regularly and the SDRAM data is held even in the power-down mode.

Since access to the SDRAM is disabled in self-refresh mode, requesting an SDRAM data access to the DBSC3 will cause an error.

#### 15.4.6 Modifying Refresh Settings during Operation

In the DBSC3, refresh settings (such as refresh frequency) can be modified during operation. The following gives the procedure for it. Note that it is assumed that the ACCEN bit in the DBACEN register has been set to 1 (access is enabled) and the ARFEN bit in the DBRFEN register has been set to 1 (auto-refresh is active) in advance.

1. Write to refresh configuration registers 0 to 2 (DBRFCNF0 to DBRFCNF2) to modify settings.
2. Write 1 to the ARFEN bit in the auto-refresh enable register (DBRFEN).

After step 2, the new settings made in step 1 are applied to the refresh operation.

#### 15.4.7 Restrictions on AXI Bus Interface

This section describes the restrictions on the AXI bus interface.

##### (1) Fixed Burst Transfer

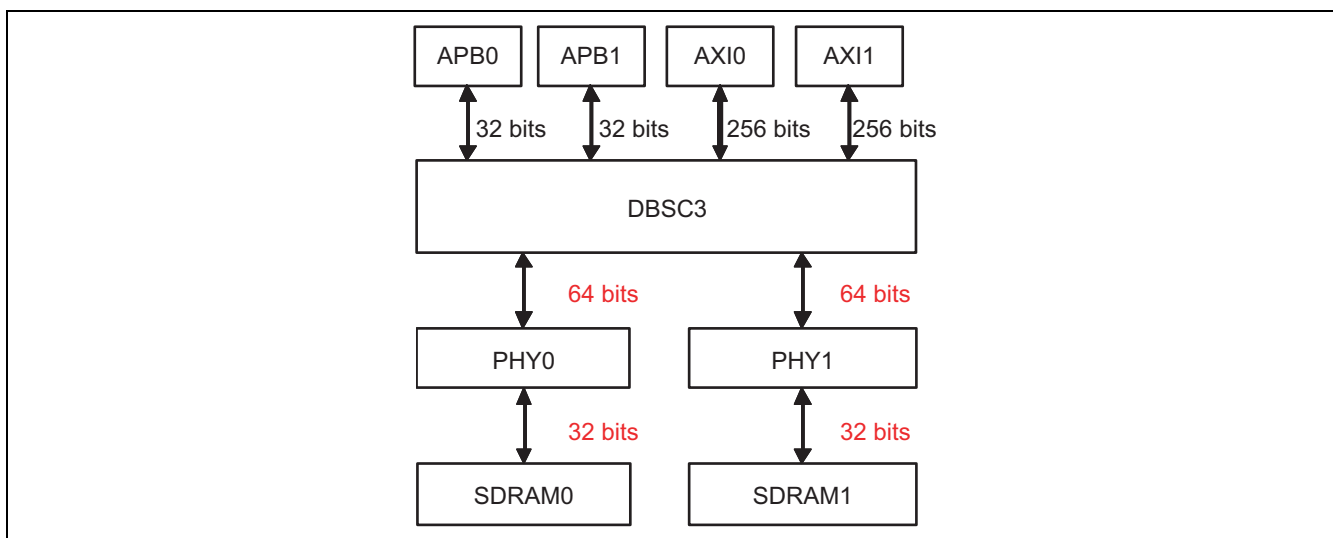

Only a burst length of 1 is supported for the fixed burst length transfer. The DBSC3 returns an error response to the transactions with the other burst length.

**15.4.8 Switching PHY Channel Count (between 32-bit SDRAM and 64-bit SDRAM) [RZ/G1H/M]**

The DBSC3 supports configurations of two 32-bit SDRAMs and one 64-bit SDRAM. By switching the number of PHY channels using the mode signal input to the DBSC3 allows a different SDRAM configuration to be used.

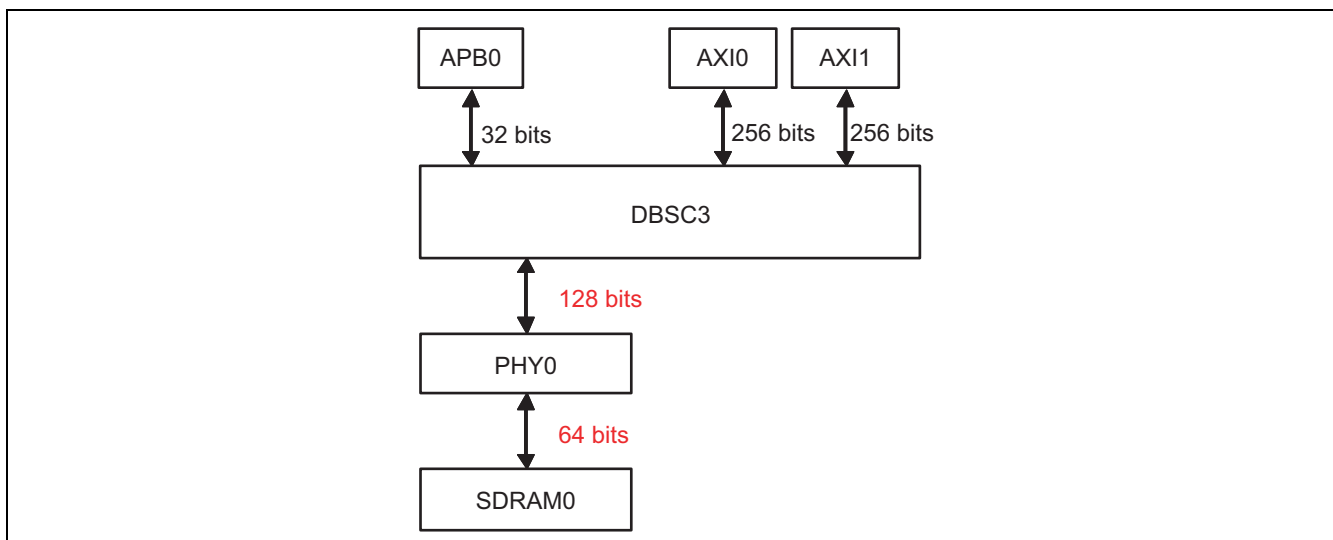

With 2-channel mode selected, PHY 2-channel mode is set to allow the configuration of two 32-bit SDRAMs and with 1-channel mode selected, PHY 1-channel mode is set to allow the configuration of one 64-bit SDRAM. For mode switching method, refer to the mode setting sections.

**15.4.9 PHY 2-Channel Mode (Two 32-Bit SDRAMs) [RZ/G1H/M]**

**Figure 15.6 PHY 2-Channel Mode**

**15.4.10 PHY 1-Channel Mode (One 64-Bit SDRAM) [RZ/G1H/M]**

**Figure 15.7 PHY 1-Channel Mode**

### 15.4.11 Setting the SDRAM Configuration Setting Register

#### (1) DDR3-SDRAM (16-Bit External Bus) [RZ/G1E]

Capacity	Memory Configuration	Rank	Bank [No. of Banks]	Row [No. of Bits]	Column [No. of Bits]	DBCONF0 Setting				
						AWRW0	AWRK0	AWBK0	AWCL0	DW0
64 Mbytes	32 M × 16 bits "512 Mbits" (1 module)	1	8	12	10	01100	0	11	1010	01
128 Mbytes	64 M × 8 bits "512 Mbits" (2 modules)	1	8	13	10	01101	0	11	1010	01
	64 M × 16 bits "1 Gbit" (1 module)	1	8	13	10	01101	0	11	1010	01
256 Mbytes	128 M × 8 bits "1 Gbit" (2 modules)	1	8	14	10	01110	0	11	1010	01
	128 M × 16 bits "2 Gbits" (1 module)	1	8	14	10	01110	0	11	1010	01
512 Mbytes	256 M × 8 bits "2 Gbits" (2 modules)	1	8	15	10	01111	0	11	1010	01
	256 M × 16 bits "4 Gbits" (1 module)	1	8	15	10	01111	0	11	1010	01
1 Gbyte	512 M × 8 bits "4 Gbits" (2 modules)	1	8	16	10	10000	0	11	1010	01
2 Gbytes	1024 M × 8 bits "8 Gbits" (4 modules)	1	8	16	11	10000	0	11	1011	01

Note: Connection between this controller and multiple memory units may or may not be possible depending on the electrical characteristics of the chip.

The above table shows the configuration of memory modules connected to a single DBSC3 channel.

## (2) DDR3-SDRAM (32-Bit External Bus)

Capacity	Memory Configuration	Rank	Bank [No. of Banks]	Row [No. of Bits]	Column [No. of Bits]	DBCONF0 Setting				
						AWRW0	AWRK0	AWBK0	AWCLO	DW0
128 Mbytes	32 M × 16 bits "512 Mbits" (2 modules)	1	8	12	10	01100	0	11	1010	10
256 Mbytes	64 M × 8 bits "512 Mbits" (4 modules)	1	8	13	10	01101	0	11	1010	10
	64 M × 16 bits "1 Gbit" (2 modules)	1	8	13	10	01101	0	11	1010	10
512 Mbytes	128 M × 8 bits "1 Gbit" (4 modules)	1	8	14	10	01110	0	11	1010	10
	128 M × 16 bits "2 Gbits" (2 modules)	1	8	14	10	01110	0	11	1010	10
1 Gbyte	256 M × 8 bits "2 Gbits" (4 modules)	1	8	15	10	01111	0	11	1010	10
	256 M × 16 bits "4 Gbits" (2 modules)	1	8	15	10	01111	0	11	1010	10
2 Gbytes	512 M × 8 bits "4 Gbits" (4 modules)	1	8	16	10	10000	0	11	1010	10
	512 M × 16 bits "8 Gbits" (2 modules)	1	8	16	10	10000	0	11	1010	10
4 Gbytes	1024 M × 8 bits "8 Gbits" (4 modules)	1	8	16	11	10000	0	11	1011	10

Note: Connection between this controller and multiple memory units may or may not be possible depending on the electrical characteristics of the chip.

The above table shows the configuration of memory modules connected to a single DBSC3 channel.

**(3) DDR3-SDRAM (64-Bit External Bus) [RZ/G1H/M]**

Capacity	Memory Configuration	Rank	Bank [No. of Banks]	Row [No. of Bits]	Column [No. of Bits]	DBCONF0 Setting				
						AWRW0	AWRK0	AWBK0	AWCL0	DW0
256 Mbytes	32 M × 16 bits "512 Mbits" (4 modules)	1	8	12	10	01100	0	11	1010	10
512 Mbytes	64 M × 8 bits "512 Mbits" (8 modules)	1	8	13	10	01101	0	11	1010	10
	64 M × 16 bits "1 Gbit" (4 modules)	1	8	13	10	01101	0	11	1010	10
1 Gbyte	128 M × 8 bits "1 Gbit" (8 modules)	1	8	14	10	01110	0	11	1010	10
	128 M × 16 bits "2 Gbits" (4 modules)	1	8	14	10	01110	0	11	1010	10
2 Gbytes	256 M × 8 bits "2 Gbits" (8 modules)	1	8	15	10	01111	0	11	1010	10
	256 M × 16 bits "4 Gbits" (4 modules)	1	8	15	10	01111	0	11	1010	10
4 Gbytes	512 M × 8 bits "4 Gbits" (8 modules)	1	8	16	10	10000	0	11	1010	10
	512 M × 16 bits "8 Gbits" (4 modules)	1	8	16	10	10000	0	11	1010	10
8 Gbytes	1024 M × 8 bits "8 Gbits" (8 modules)	1	8	16	11	10000	0	11	1011	10

Note: Connection between this controller and multiple memory units may or may not be possible depending on the electrical characteristics of the chip.

### 15.4.12 Address Multiplexing

Memory of various sizes can be connected through the settings of the SDRAM configuration setting register 0 (DBCONF0). The DW0 bits are used to set the external data bus width, and the AWRW0 and AWCL0 bits are used to set the size of the memory connected. The AWBK0 bits are used to specify the number of banks; depending on the application the possibility of page hits may be increased.

#### (1) DDR3-SDRAM (16-Bit External Bus) [RZ/G1E]

**Table 15.7 Relation between Address Pins and Logical Addresses (BKADM = B'00)**  
(When One 16-Bit-Width SDRAM Module or Two 8-Bit-Width SDRAM Modules are Connected)

Memory Type		BA2	BA1	BA0	MA15	MA14	MA13	MA12	MA11	MA10	MA9	MA8	MA7	MA6	MA5	MA4	MA3	MA2	MA1	MA0

	COL	A15	A14	A13	0	0	0	BC#	A12	AP	A11	A10	A9	A8	A7	A6	A5	A4	0	0

Notes: 1. A31 to A0 are the logical address bits in byte units. A31 represents the MSB, and A0 the LSB.  
2. AP is an abbreviation of auto precharge option.  
3. BC# is an abbreviation of burst chop option.

### 15.4.13 SDRAM Access and Timing Constraints

In this section, waveforms at the various pins during basic SDRAM access are explained first and then the relation between SDRAM access and the CAS latency (CL, CWL), tRAS, tRFC, tRCD, tRP, tRRD, tWR, tRTP, tRC, READ to WRITE minimum interval, and WRITE to READ minimum interval set using SDRAM timing registers 0 to 19 (DBTR0 to DBTR19) is explained.

#### (1) Basic SDRAM Access

In this section, waveforms at the various pins during basic SDRAM access, including reading, writing, auto-refresh, and self-refresh operations, are explained.

Figure 15.8 shows waveforms for 1-/2-/4-/8-/16-byte reading. In this case, single reading is performed in which the READ command is issued once. In this example, read access processing is executed for bank A after the ACT command is issued, but when there is a page hit, access begins with the issue of the READ command.

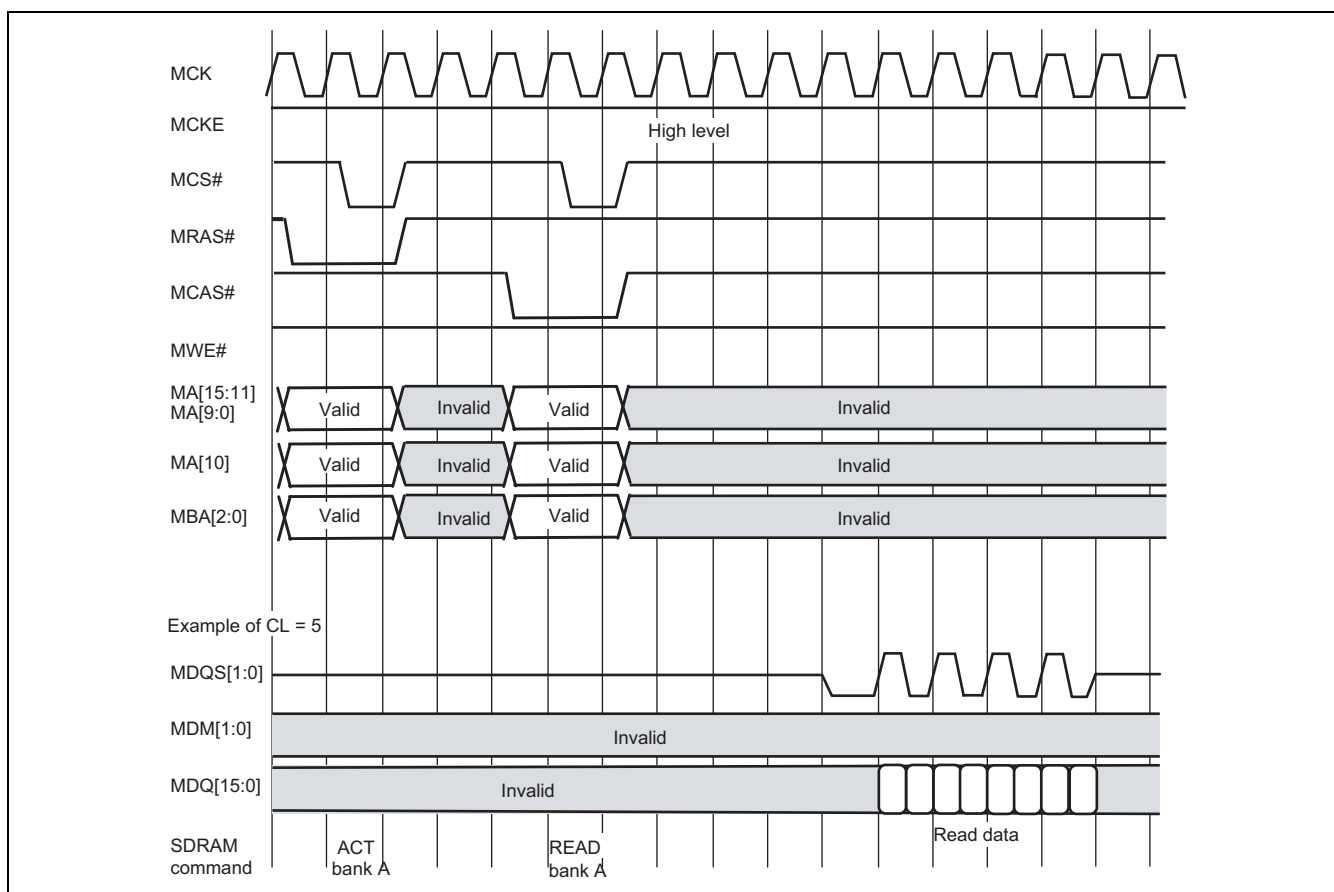

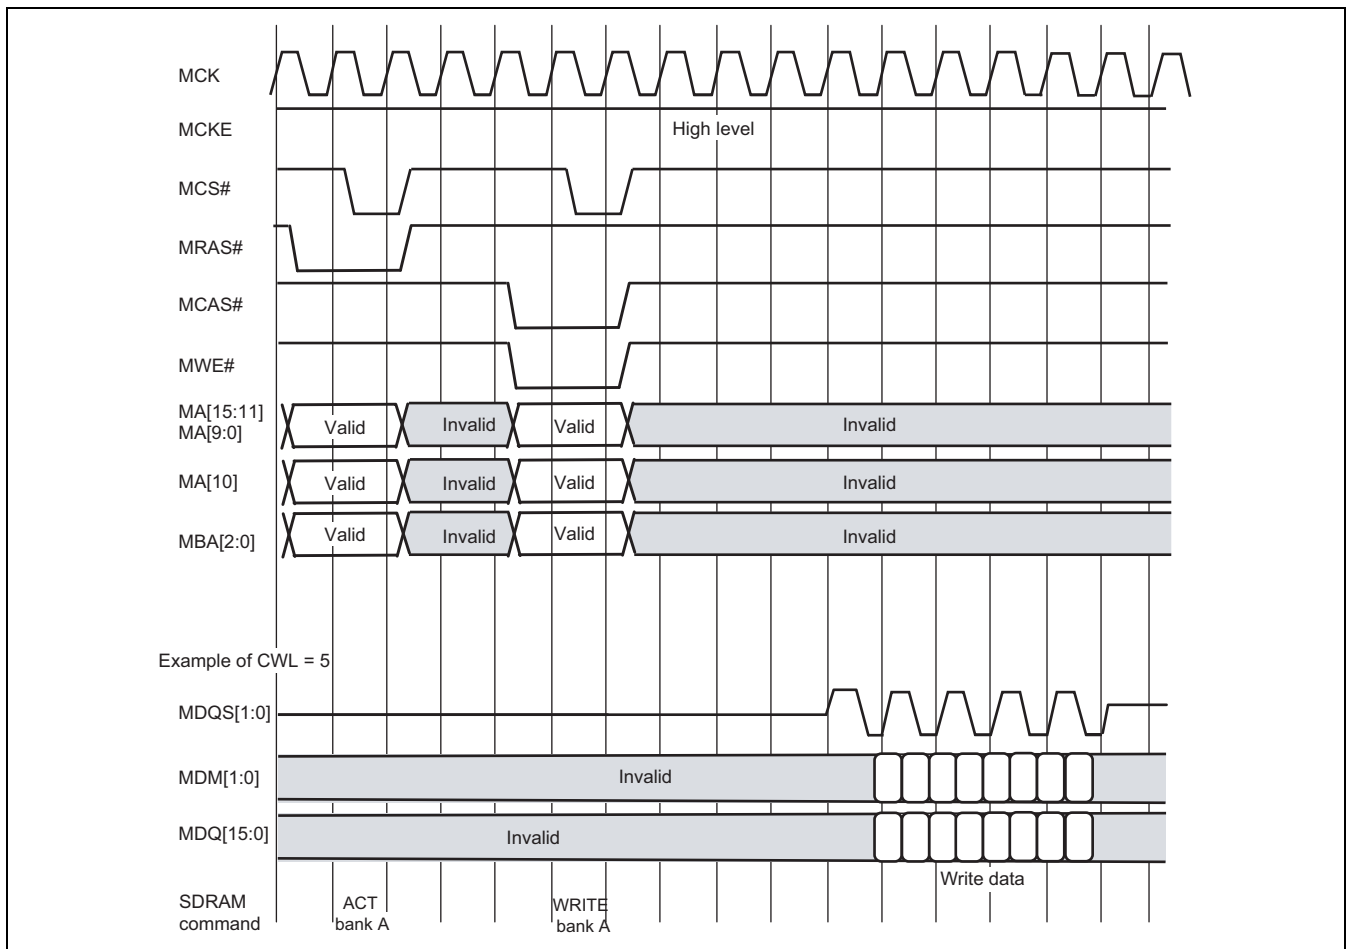

Figure 15.8 Waveforms for 1/2/4/8/16-Byte Reading

Note: In the figure, collective names are used for signals. For example, MCK and MA indicate M0CK/M1CK and M0A/M1A signals, respectively.

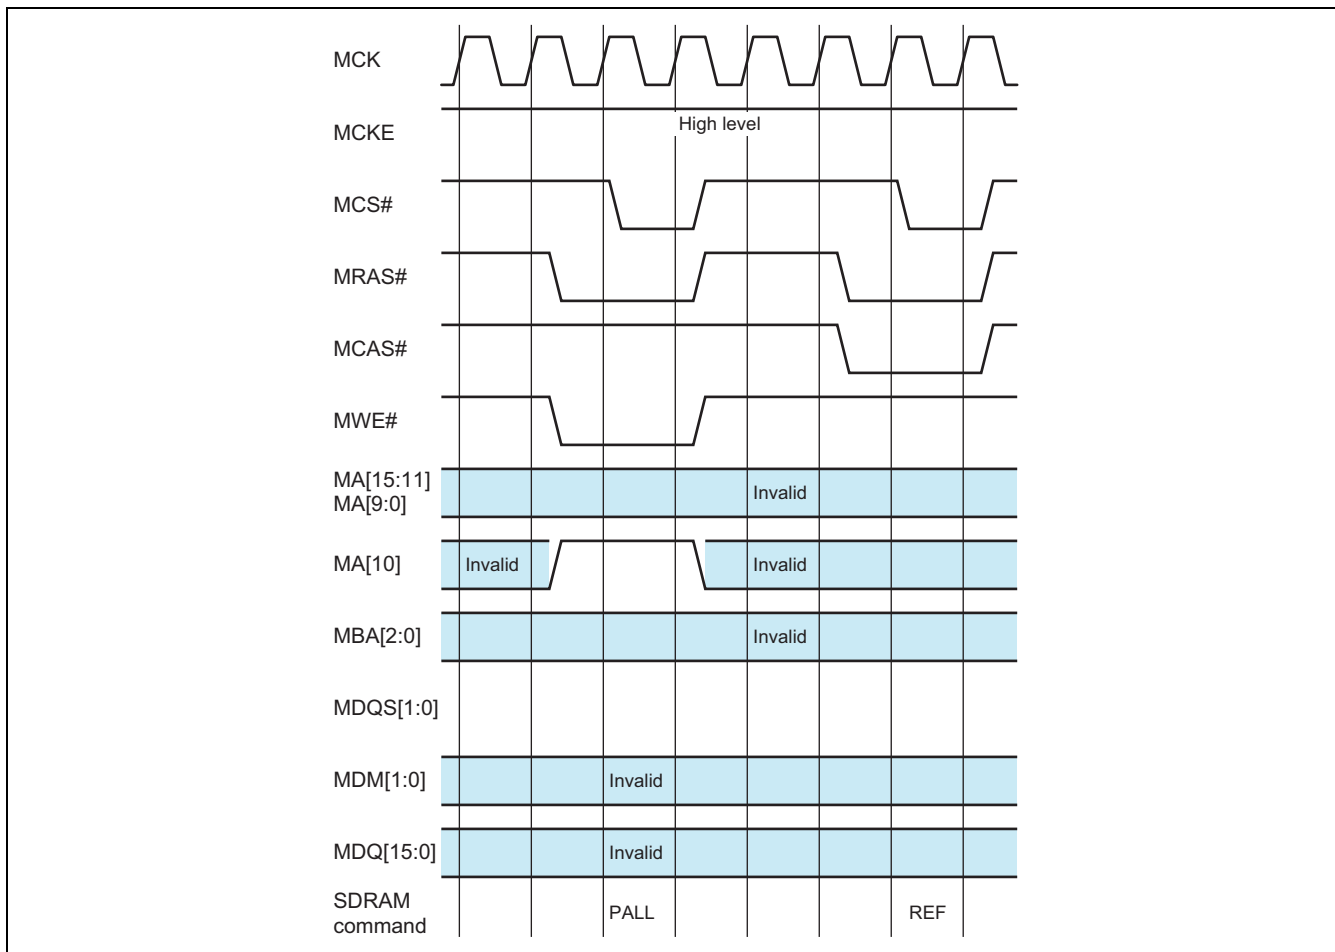

Figure 15.9 shows waveforms for 1-/2-/4-/8-/16-byte writing. In this case, single writing is performed in which the WRITE command is issued once. In this example, write access processing is executed for bank A after the ACT command is issued, but when there is a page hit, access begins with the issue of the WRITE command.

**Figure 15.9 Waveforms for 1/2/4/8/16-Byte Writing**

Note: In the figure, collective names are used for signals. For example, MCK and MA indicate M0CK/M1CK and M0A/M1A signals, respectively.

Figure 15.10 shows waveforms during auto-refresh operation resulting from settings of the refresh configuration registers 0 to 2. The DBSC3 issues a REF command automatically after the PALL command is issued when at least one SDRAM bank is activated before the REF command. Consequently, there is no need to use software to manage precharging of all the banks for the auto-refresh operation.

**Figure 15.10 Auto-Refresh Operation**

Note: In the figure, collective names are used for signals. For example, MCK and MA indicate M0CK/M1CK and M0A/M1A signals, respectively.

Figure 15.11 shows the self-refresh operation. In order to perform self-refresh operation, the specified sequence must be observed. For details, refer to section 15.4.4, Self-Refresh Operation.

When performing processing according to the sequence in section 15.4.4, Self-Refresh Operation, commands to be issued to the SDRAM are those shown in Figure 15.11. Before the transition to self-refresh, the PALL command is issued by software. Then, software is used to issue the REF command and the SRX (self-refresh entry from IDLE) command. The SDRAM is in self-refresh mode until self-refresh is released by software. After issuing the SRX (self-refresh exit) command by software, it is necessary to wait for the time ( $t_{XSNR}$ ) specified in the datasheet for the SDRAM being used until issuing a REF command. A wait example is shown in section 15.4.15, Method for Securing Time Required for Initialization, Self-Refresh Release, etc.

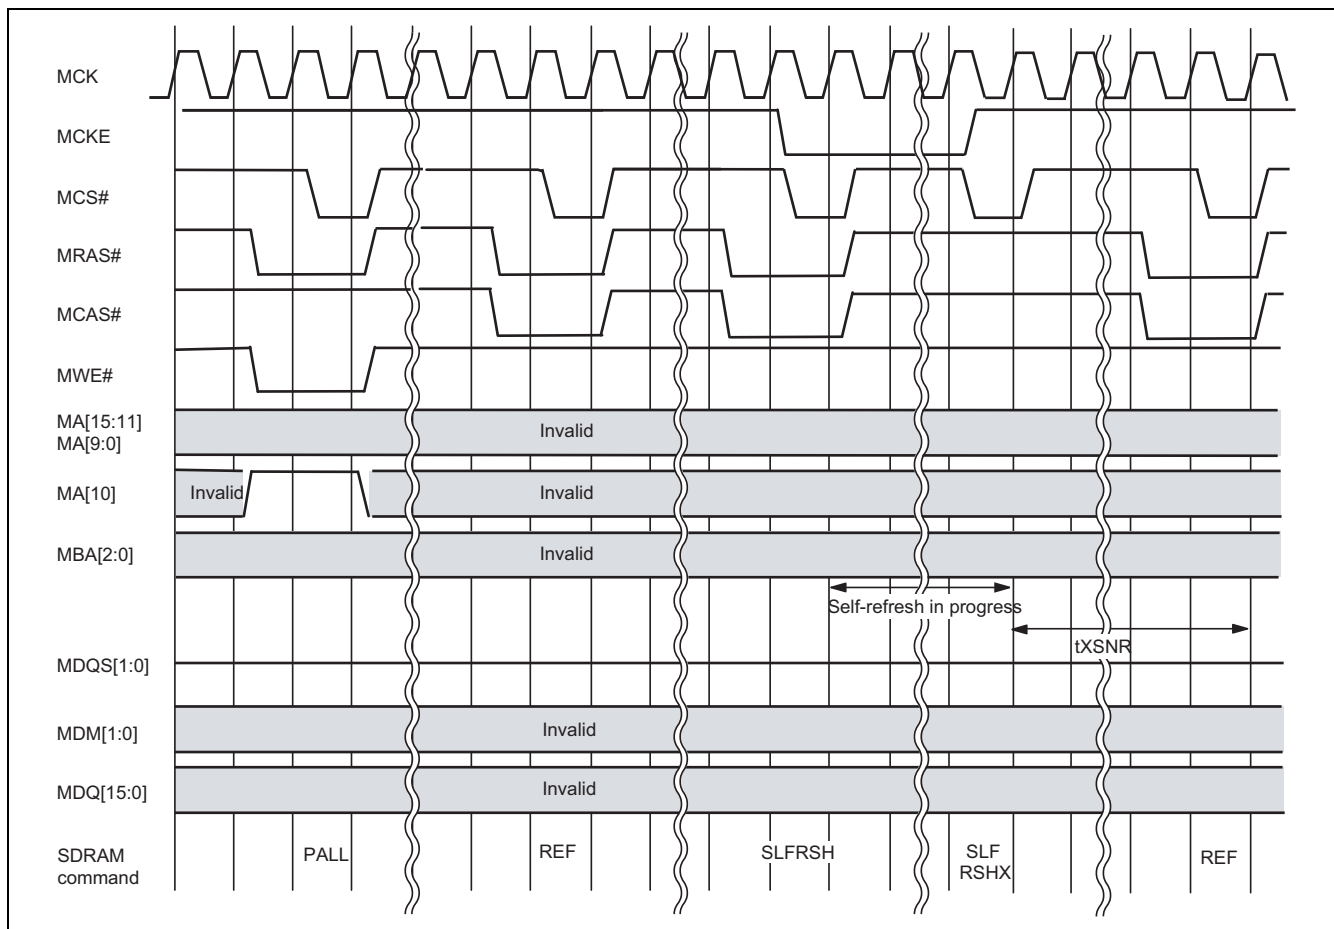

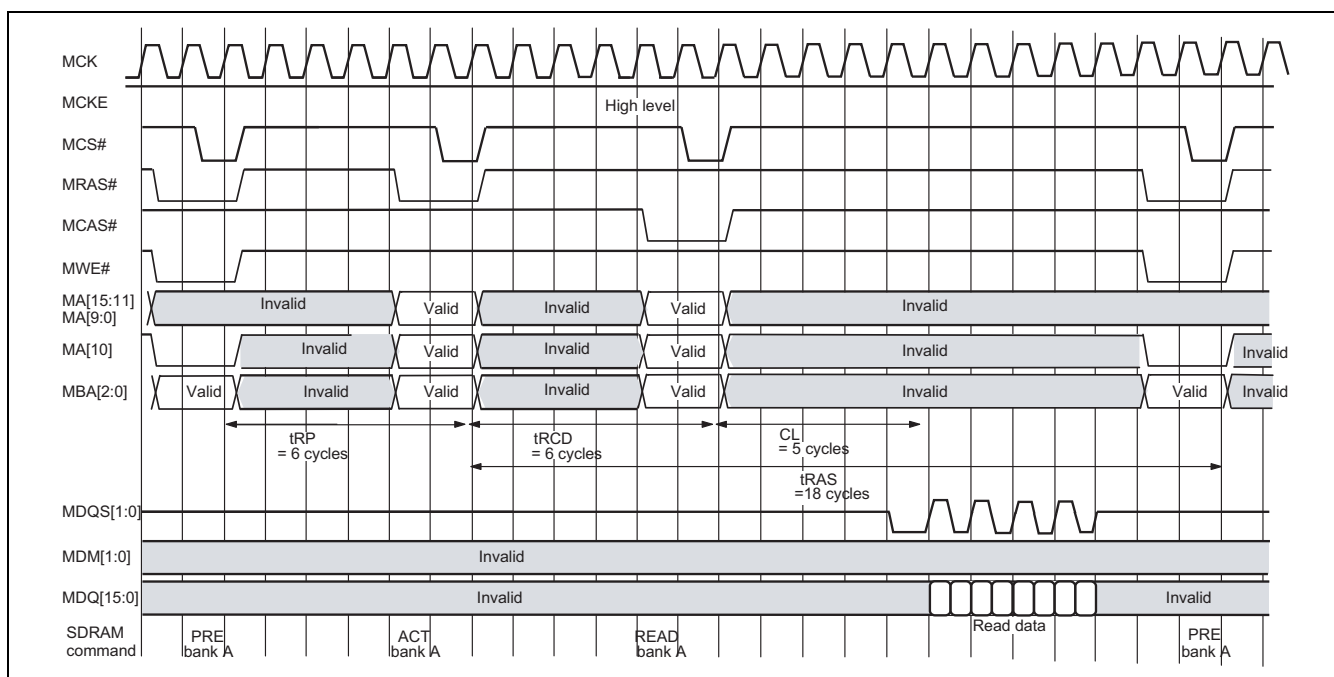

Figure 15.11 Self-Refresh Operation

Note: In the figure, collective names are used for signals. For example, MCK and MA indicate M0CK/M1CK and M0A/M1A signals, respectively.

**(2) Timing Constraints**

Figure 15.12 shows the relation between the settings of CL, tRAS, tRCD, and tRP, and the issuing of commands. Figure 15.13 shows the relation to tRRD and tRTP, Figure 15.14 shows the relation to tWR, Figure 15.15 shows the relation to tRC, Figure 15.16 shows the relation to READ-WRITE, Figure 15.17 shows the relation to WRITE-READ, and Figure 15.18 shows the relation to tRFC.

Figure 15.12 corresponds to operation in a case in which bank A is open, there is read access of bank A, and a page miss occurs. The constraint tRP between the PRE command and ACT command, the constraint tRCD between the ACT command and READ command, and the constraint tRCD between the ACT command and the PRE command are involved. The DBSC3 waits to issue commands until each of the constraints is satisfied.

**Figure 15.12 tRP, tRCD, CL, and tRAS**

Note: In the figure, collective names are used for signals. For example, MCK and MA indicate M0CK/M1CK and M0A/M1A signals, respectively.

Figure 15.13 shows a case in which the pages for both of banks A and B are closed, the page for bank C is open, and a page hit has occurred. When the  $t_{RRD}$  time constraint has been satisfied starting from issue of the ACT command for bank A, the ACT command for bank B is issued. Because time  $t_{RCD}$  has elapsed from the issue of the ACT command for bank A, a READ command can be used. The READ command has a burst length of 8, so after four cycles a READ command for bank B can be issued. A further four cycles later, a READ command for bank C can be issued. However, the next request is access for which bank C must be closed, and so after the elapse of time  $t_{RTP}$ , a PRE command is issued.

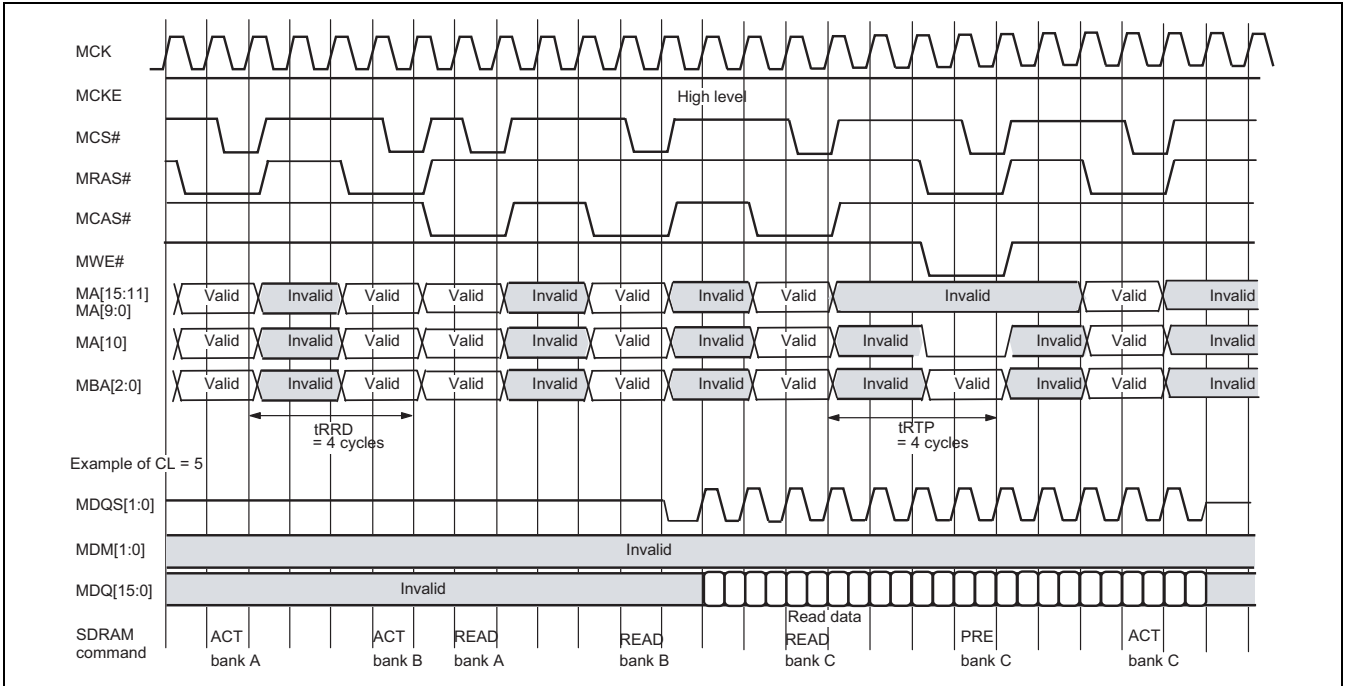

Figure 15.13  $t_{RRD}$  and  $t_{RTP}$

Note: In the figure, collective names are used for signals. For example, MCK and MA indicate M0CK/M1CK and M0A/M1A signals, respectively.

Figure 15.14 shows a case in which, after a write request, access occurs requiring that bank B be closed. After the issue of a WRITE command, it is necessary to wait for time  $t_{WR}$  or longer after output of the write data before issuing a PRE command.

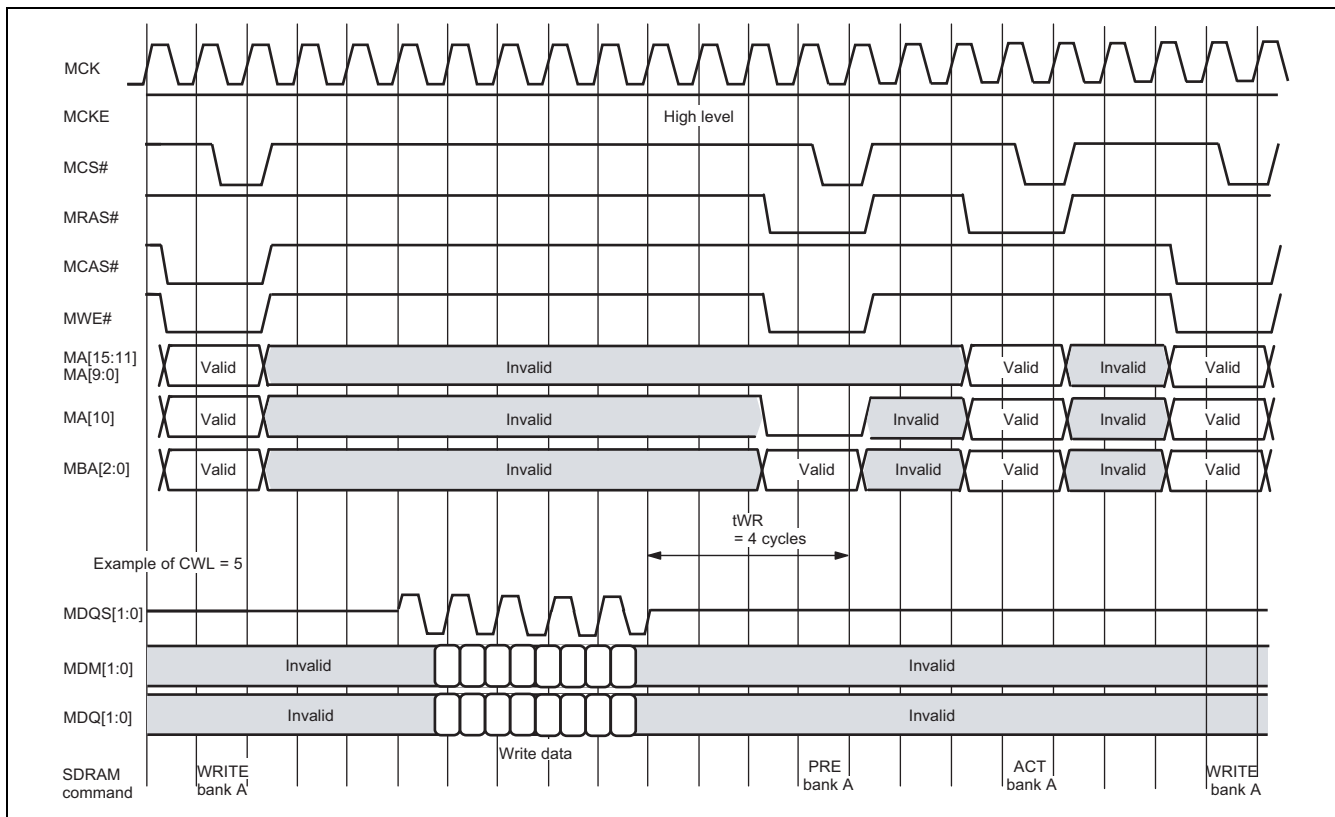

Figure 15.14  $t_{WR}$

Note: In the figure, collective names are used for signals. For example, MCK and MA indicate M0CK/M1CK and M0A/M1A signals, respectively.

Figure 15.15 shows an example of performing auto-refresh after read access of bank A, the page for which had been closed. After issuing an ACT command and READ command for bank A and performing data reading, a PALL command must be used to close all banks in order to perform auto-refresh. In order to issue the PREA command, the tRAS time constraint must be satisfied and issuing of the PREA command is delayed until this time. Then, when issuing the REF command, both of time constraints tRPA and tRC must be satisfied simultaneously. When these constraints are both satisfied, the REF command is issued and auto-refresh is performed.

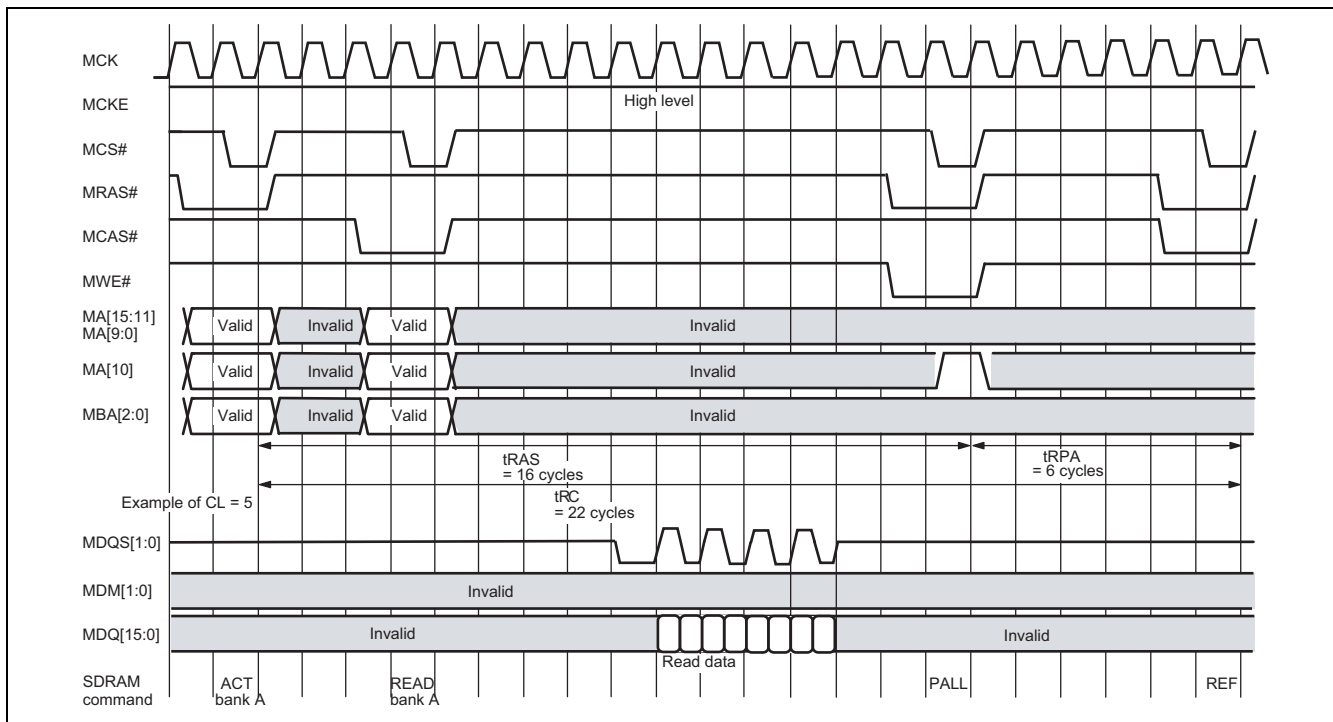

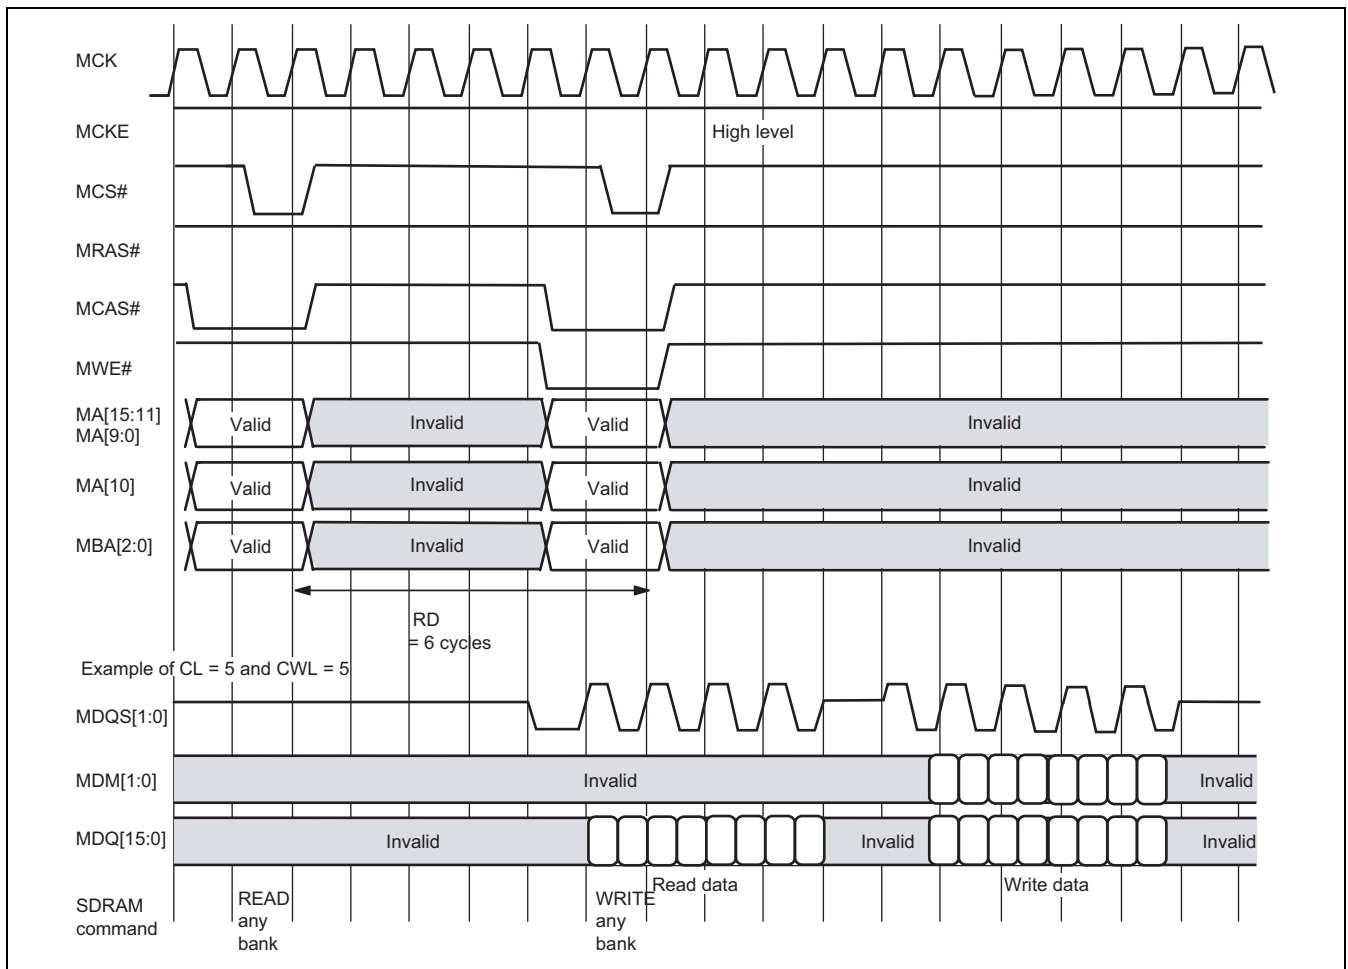

Figure 15.15 tRC

Note: In the figure, collective names are used for signals. For example, MCK and MA indicate M0CK/M1CK and M0A/M1A signals, respectively.

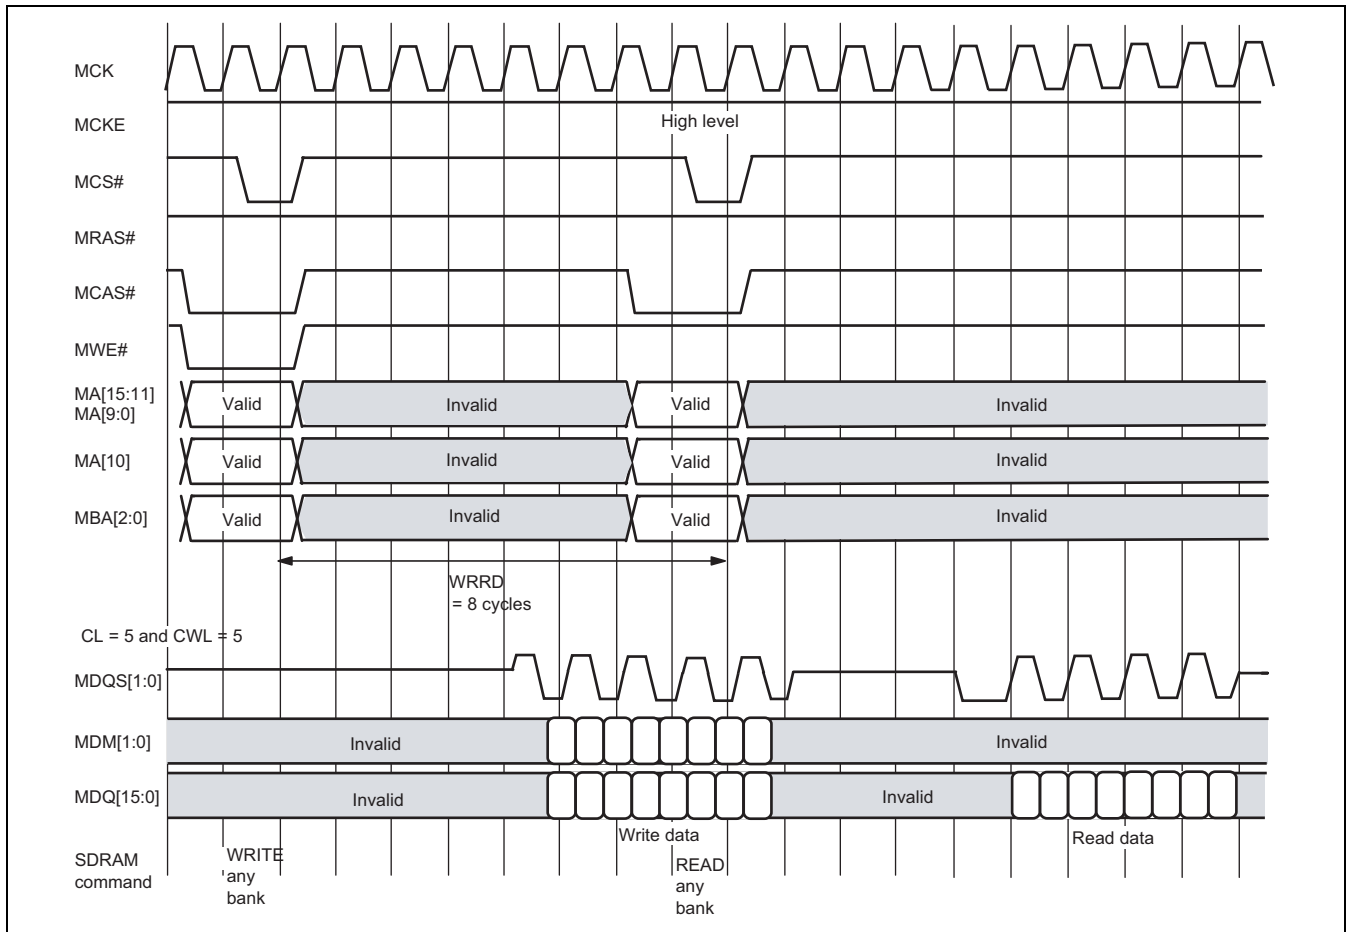

Figure 15.16 shows an example of a case in which, after issuing a READ command, a WRITE command is issued. In order to issue the WRITE command after issuing the READ command, the DBSC3 waits for a minimum time stipulated by the RDWR bits.

**Figure 15.16 READ-WRITE Minimum Time**

Note: In the figure, collective names are used for signals. For example, MCK and MA indicate M0CK/M1CK and M0A/M1A signals, respectively.

Figure 15.17 shows an example of a case in which, after issuing a WRITE command, a READ command is issued. In order to issue the READ command after issuing the WRITE command, the DBSC3 waits for a minimum time stipulated by the WRRD bits.

**Figure 15.17 WRITE-READ Minimum Time**

Note: In the figure, collective names are used for signals. For example, MCK and MA indicate M0CK/M1CK and M0A/M1A signals, respectively.

Figure 15.18 shows an example of a case in which, after issuing a REF command, a READ request is issued. In order to issue the ACT command after issuing the REF command, the DBSC3 waits for a time stipulated by tRFC.

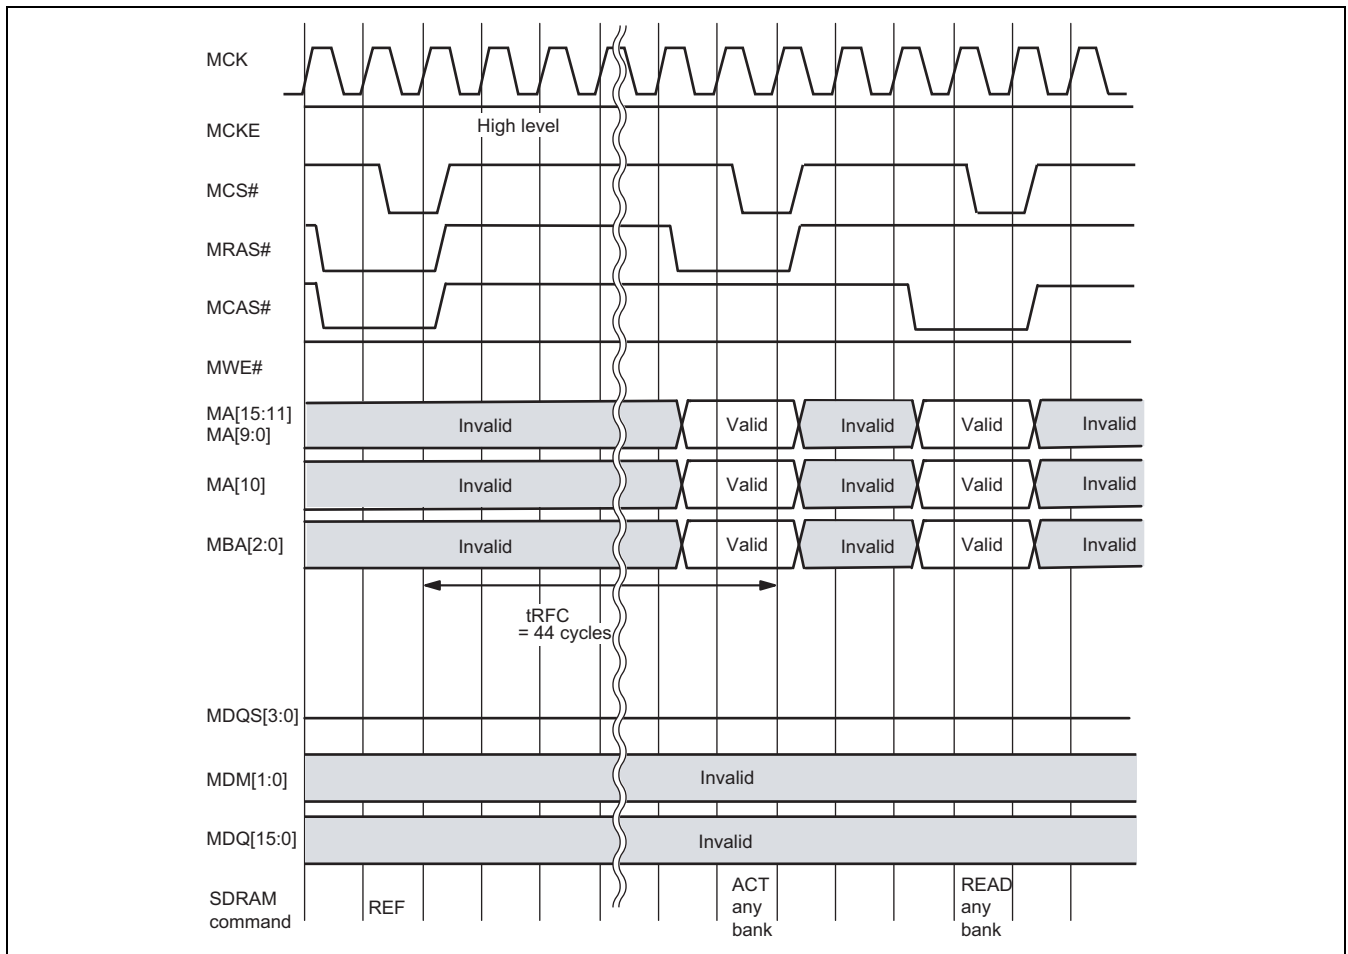

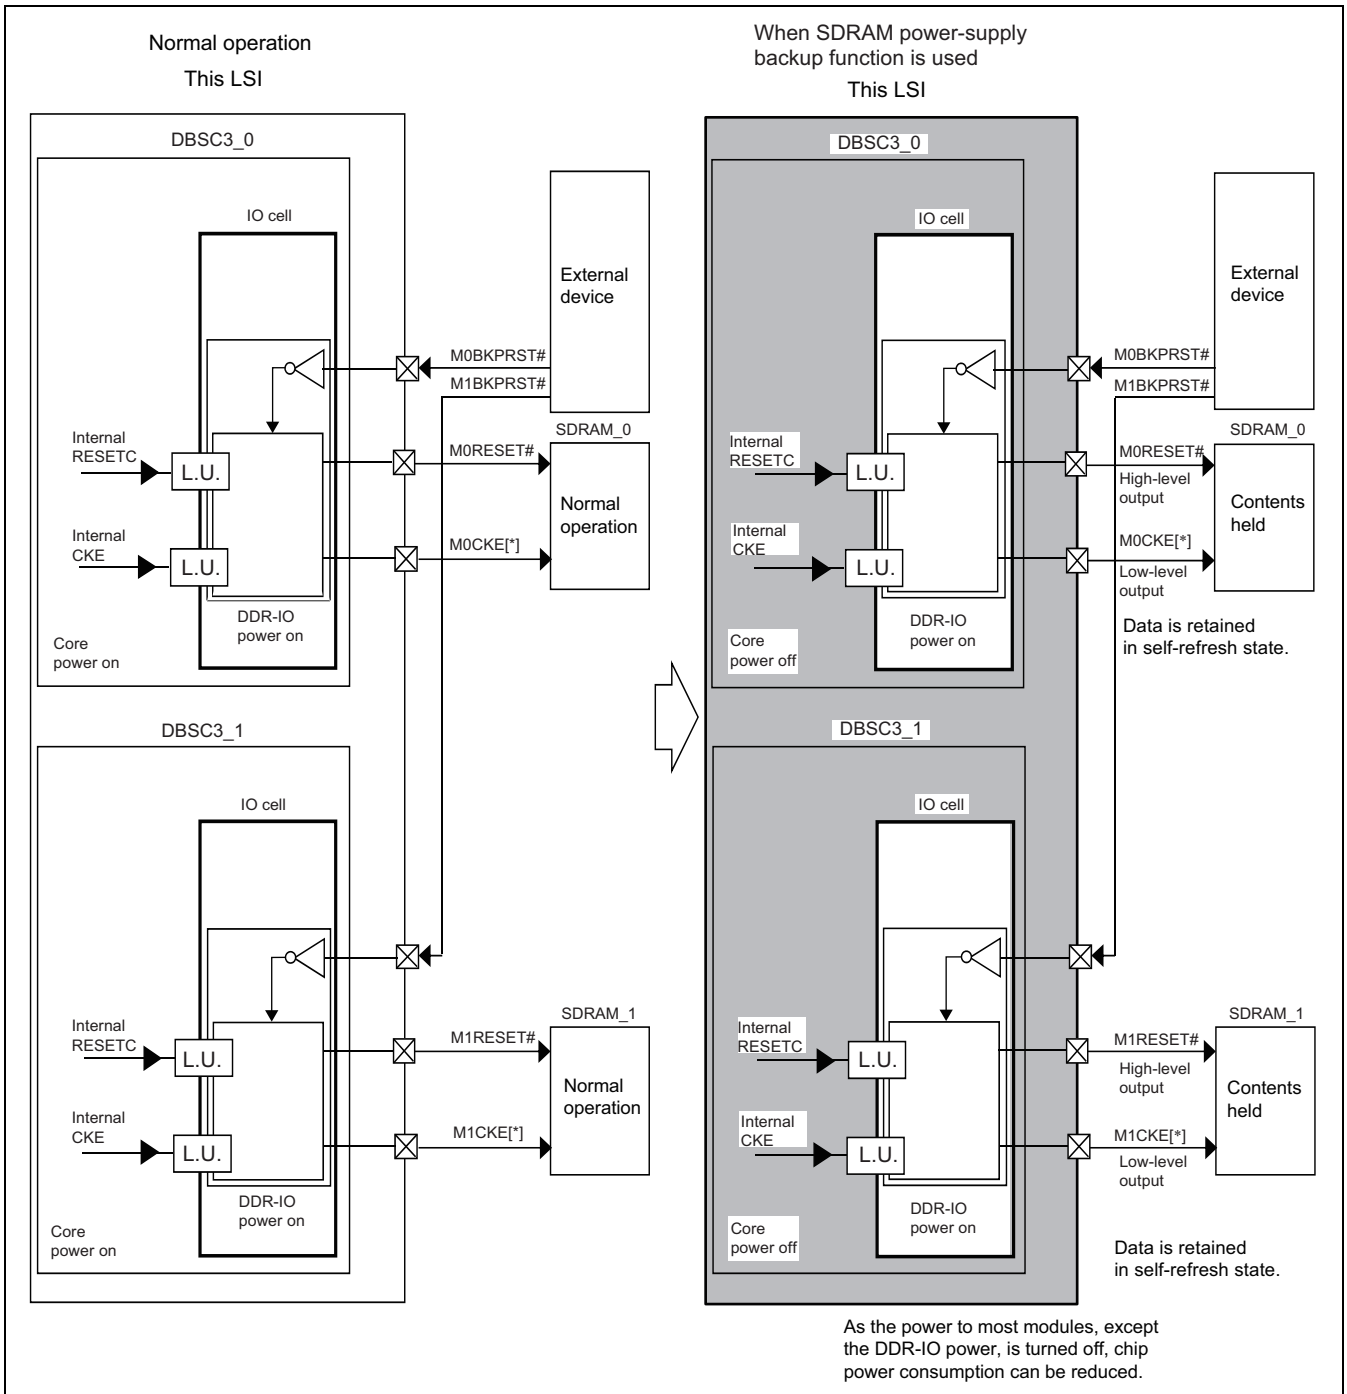

Figure 15.18 tRFC

Note: In the figure, collective names are used for signals. For example, MCK and MA indicate M0CK/M1CK and M0A/M1A signals, respectively.

**15.4.14 SDRAM Power-Supply Backup Function**

The SDRAM power-supply backup function utilizes the SDRAM self-refresh state to turn off the power supply to core power unit of the DBSC3 module, while maintaining the data in the SDRAM. By using this function, not only is it possible to cut power consumption, but the time needed to transfer data once again to the SDRAM can be eliminated, since the valid data is maintained within the SDRAM (see Figure 15.19). In order to realize this function, in addition to the LSI device containing the DBSC3, a separate external control circuit (microcomputer or similar) is needed to monitor the states of this LSI and the memory.

**Figure 15.19 SDRAM Power-Supply Backup Function**

In order to implement the power-supply backup function, a control signal M0(1)BKPRST# is necessary to hold M0(1)CKE[1:0] at low level even when power other than for the DDR-I/O is turned off. When this signal is at low level,

the M0(/1)CKE[1:0] pins can be held at low level even when the power supply within the chip is in the turned-off state. After using DBSC3\_0(/1) to put the SDRAM into the self-refresh state, by using this M0(/1)BKPRST# signal to hold the M0(/1)CKE[1:0] signals at low level, the SDRAM self-refresh state can be maintained even when the power supply in the chip is turned off.

To release the power-supply backup state, perform a power-on reset. As a result, the DBSC3\_0(/1) registers are initialized, and so the self-refresh control circuit is also initialized. In order to put the SDRAM into the self-refresh state before power-on reset and also during power-on reset, when the internal CKE signal is indefinite, the M0(/1)BKPRST# signal must be held at low level. Power-on reset causes the DBSC3\_0(/1) to fix the internal CKE signal at low level, so that after power-on reset is released the M0(/1)BKPRST# signal is raised to high level. (If not in the power-supply backup state, M0(/1)BKPRST# is always at high level and there is no problem).

Thus the power-supply backup state is released through power-on reset, and so the software must decide whether the normal SDRAM initialization sequence is necessary, or whether the LSI was in the power-supply backup state. In order to perform this decision, after power-on reset, the software monitors the external device, and judges whether the state should be the power-supply backup state or whether SDRAM initialization is necessary. Before using register settings to send M0(/1)CKE[1:0] to high level, it is necessary to signify a state other than the power-supply backup state. (After driving the M0(/1)CKE[1:0] pins to high level, upon power-on reset the data within the SDRAM is destroyed. Hence if a state other than power-supply backup state is not set in advance, there is the danger that the destroyed data may be treated as the correct data).

Table 15.19 shows the memory areas in which data cannot be retained in SDRAM power-supply backup mode.

**Table 15.19 Memory Areas in Which Data Cannot Be Retained in SDRAM Power-Supply Backup Mode**

Channel Mode	Memory Area (40-Bit Mode)
64 bits × one channel	H'01_0000_0000 to H'01_0000_00FF
32 bits × two channels	H'01_0000_0000 to H'01_0000_007F H'02_0000_0000 to H'02_0000_007F

In this way, procedures are used to make a transition to and release from the SDRAM power-supply backup mode; if these procedures are not followed, the data in the SDRAM may be destroyed.

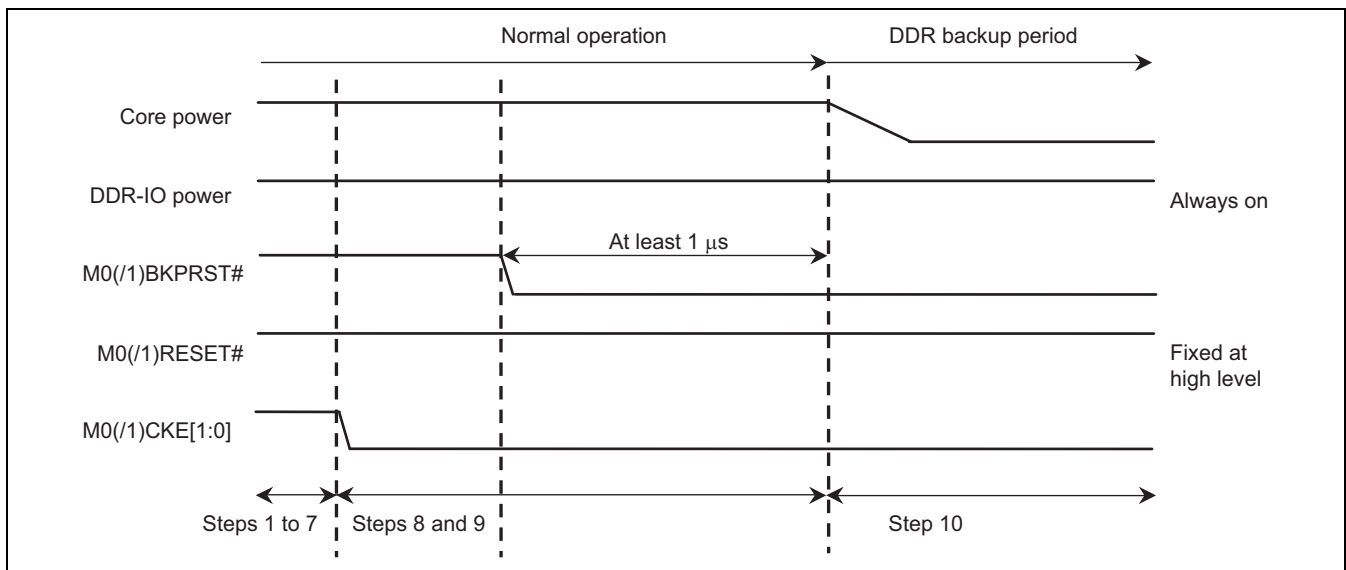

These procedures are explained below.

#### (1) Transition to SDRAM Power-Supply Backup Mode

The following method is used.

1. Confirm that the controller is not being accessed. The time required for transition must not exceed the auto-refresh interval requested by the SDRAM by interrupts or some other causes.
2. Set the ACCEN bit in the SDRAM Access enable register (DBACEN) to 0 (access disabled).
3. Use the manual command-issuing register (DBCMD) to issue a PREA (precharge all banks) command. The value written to this register should be OPC = PreA, ARG = 0.
4. Use the manual command-issuing register (DBCMD) to issue a Self-Refresh Entry command. The value written to this register should be OPC = SREn, ARG = 0.
5. Set the ARFEN bit in the auto-refresh enable register (DBRFEN) to 0.
6. Use the manual command-issuing register (DBCMD) to insert a time to wait for the clock to stop. The value written to this register should be OPC = Wait, ARG = tCKSRE (normally, max {5, 10 ns}).
7. Read the operation completion waiting register (DBWAIT) and wait for the response.
8. Write H'0000A55A to the PHY unit lock register (DBPDLCK).
9. Write H'0000000E to the PHY unit address register (DBPDRGA).
10. Write H'33C03813 to the PHY unit access register (DBPDRGD).

11. Set the M0(/1)BKPRST# signal to low level, wait for at least 1  $\mu$ s, and then turn off the unnecessary power, other than the DBSC3\_0(/1) DDR-IO power.

**Figure 15.20 Transition to SDRAM Power-Supply Backup Mode**

## (2) Recovery from SDRAM Power-Supply Backup Mode

Recover form SDRAM Power-Supply Backup Mode can be executed by similar way for the sequence for "starting the system" explained in the section 15.4.3.1, Starting the System. The following shows difference between them.

Depending on the negate timing M0/1BKPRST#, there are two methods to do this;

### Example:

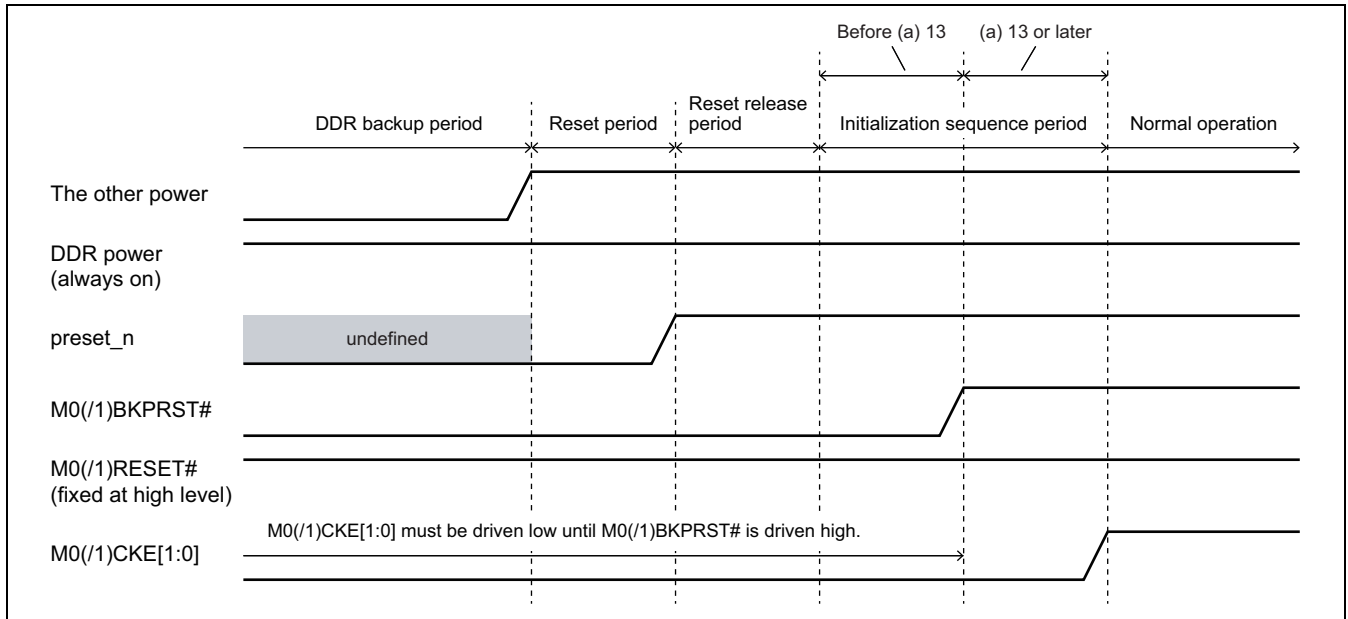

- M0/1BKPRST# is driven high during the initialization sequence.
- There is no timing constraint in this case, however, drive M0/1BKPRST# high after the setting for the M0/1RESET# signals, and before "(a) 13" in "(1) 64 Bits  $\times$  1-ch Mode" in section 15.4.3.1, Starting the System..

In the example above, No.26 in "(a) 13" in "(1) 64 Bits  $\times$  1-ch Mode" in section 15.4.3.1, Starting the System, is modified as follows.

26. Write H'00000101 to the PHY unit access register (DBPDRGD).

In the example above, the following PHY settings are added before "(a) 13" in "(1) 64 Bits  $\times$  1-ch Mode" in section 15.4.3.1, Starting the System.

1. Write H'00000060 to the PHY unit address register (DBPDRGA).
2. Write H'1244DCBD to the PHY unit access register (DBPDRGD). (For DDR3)  
Write H'12651DC1 to the PHY unit access register (DBPDRGD). (For DDR3L)
3. Write H'40000000 to the PHY unit access register (DBPDRGD).
4. Drive M0(/1)BKPRST# high

**Figure 15.21 Recovery from SDRAM Power Supply Backup Mode (Example)**

**(3) A method to stop the return from a power backup state, and to return to a power backup state.**

It can just shift to a power backup state before changing M0(/1)BKPRST# to 'high level' from 'low'.

When M0(/1)BKPRST# signal change to 'high level' from 'low'.

**(a) When processing does not arrive at the section 15.4.3.1 (1)-(c) 27.**

1. Write H'00000004 to the PHY unit address register (DBPDRGA).
2. Read the PHY unit access register (DBPDRGD) and wait until 1 is read from bit 0.
3. Write H'0000000E to the PHY unit address register (DBPDRGA).
4. Write H'33C03813 to the PHY unit access register (DBPDRGD).
5. Set the M0(/1)BKPRST# signal to low level.
6. Return to a power supply backup state.

**(b) When processing goes to section 15.4.3.1 (1)-(c) 27.**

It cannot stop.

**(c) When there is initialization processing from section 15.4.3.1 (1)-(c) 27 to 15.4.3.1 (1)-(c) 30.**

1. Write H'00000001 to the PHY unit address register (DBPDRGA).
2. Write H'80000000 to the PHY unit access register (DBPDRGD).
3. Write H'00000004 to the PHY unit address register (DBPDRGA).
4. Read the PHY unit access register (DBPDRGD) and wait until 1 is read from bit 0.
5. Set DBTR4, DBTR14, and DBTR15 (If do not yet set it).
6. Set the ACCEN bit in the SDRAM Access Enable Register (DBACEN) to 0 (access disabled).
7. Use the manual command-issuing register (DBCMD) to issue a PREA (precharge all banks) command.  
The value written to this register should be OPC = PreA and ARG = 0.
8. Use the manual command-issuing register (DBCMD) to issue a Self-Refresh Entry command.  
The value written to this register should be OPC = SREn and ARG = 0.
9. Set the ARFEN bit in the auto-refresh enable register (DBRFEN) to 0.
10. Write H'0000000E to the PHY unit address register (DBPDRGA).
11. Write H'33C03813 to the PHY unit access register (DBPDRGD).
12. Set the M0(/1)BKPRST# signal to low level.
13. Return to a power supply backup state.

**15.4.15 Method for Securing Time Required for Initialization, Self-Refresh Release, etc.**

When using DBSC3 register settings to set initialization or release the self-refresh state, there is a need to wait for the time defined in the SDRAM specifications. To reserve this waiting time, read from the DBSC3 status register 1 (DBSTATE1). When this is done, at least seven memory clock cycles elapse. For 266-MHz operation, about 26.25 ns elapse upon one DBSTATE1 read. This can be utilized to secure the required time, by repeating read access the necessary number of times.

## 15.5 Notes on Board Design

RZ/G1H

RZ/G1N

RZ/G1M

RZ/G1E

### 15.5.1 Connection of M0ZQ or M1ZQ Pin

A resistor having the following value should be connected to the M0ZQ or M1ZQ pin outside this LSI.

DDR3-SDRAM: 240  $\Omega$  ( $\pm$  1%)

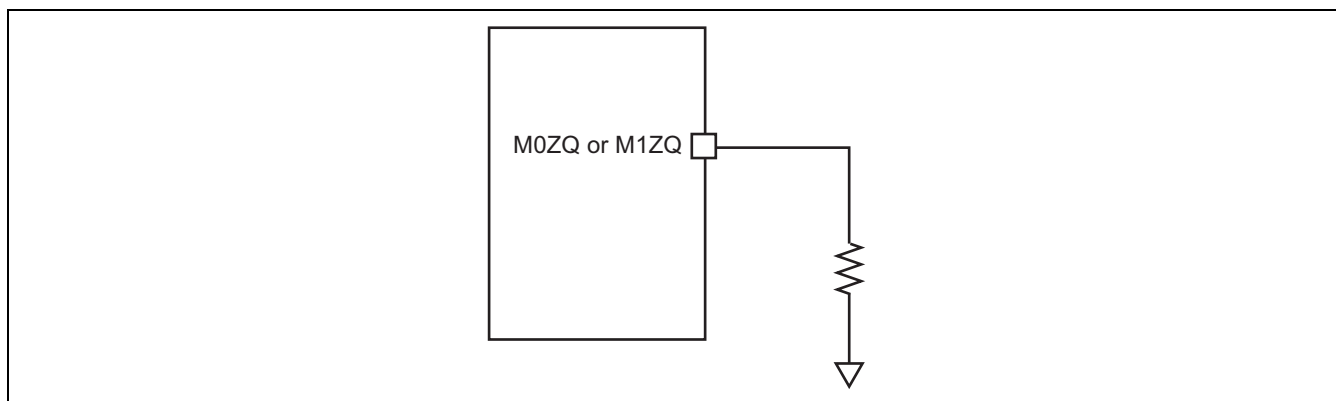

Figure 15.22 Connection of M0ZQ or M1ZQ Pin

### 15.5.2 Connection of PLL Power Supply and GND Pins

A resistor and a capacitor having the following values should be externally connected to the PLL power supply and GND pins as a noise filter.

Resistance: 1  $\Omega$

Capacitance: 2.2  $\mu$ F

PLL power supply pins: VDDQ\_M0(/1)APLL, VDDQ\_M1MPLL, VDDQ\_M(0/1)DPLL0 to VDDQ\_M(0/1)DPLL3

PLL GND pins: VSSQ\_M0(/1)APLL, VSSQ\_M1MPLL, VSSQ\_M(0/1)DPLL0 to VSSQ\_M(0/1)DPLL3

Figure 15.23 Connection of PLL Power Supply and GND Pins

## 15.6 Notes on 16 bit Mode Usage for Initial Settings

### (1) 16 Bits × 1-ch Mode

The initialization sequence for 16 bits × 1-ch mode can be executed by similar way for 64 bits × 1-ch mode. Differences between them are as follows.

The following sequence should be added below the line No.31 of subsection "(c) PHY Setting 1" in In the section "(1) 64 Bits × 1-ch Mode" to stop the DBSC3\_1 side macro and byte lane 2 and 3 of DDR-PHY;

32. Write H'000000B0 to the PHY unit address register (DBPDRGA).
33. Write H'7C020EB0 to the PHY unit access register (DBPDRGD).
34. Write H'000000C0 to the PHY unit address register (DBPDRGA).
35. Write H'7C020EB0 to the PHY unit access register (DBPDRGD).
36. Write H'000000D0 to the PHY unit address register (DBPDRGA).
37. Write H'7C020EB0 to the PHY unit access register (DBPDRGD).
38. Write H'000000E0 to the PHY unit address register (DBPDRGA).
39. Write H'7C020E80 to the PHY unit access register (DBPDRGD).
40. Write H'00000090 to the PHY unit address register (DBPDRGA).
41. Write H'7C020EB0 to the PHY unit access register (DBPDRGD).
42. Write H'000000A0 to the PHY unit address register (DBPDRGA).
43. Write H'7C020EB0 to the PHY unit access register (DBPDRGD).

## 15.7 Notes on Address MAP

### 15.7.1 Address Map (Over view)

#### (1) Legacy 2-Gbyte DRAM space

Legacy 2-Gbyte DRAM space (from H'00\_4000\_0000 to H'00\_BFFF\_FFFF) is assigned to the DBSC3\_0 space (from H'01\_0000\_0000) to H'01\_7FFF\_FFFF). If you want to access to other space, access in 40 bits address space.

## 15A. S3 Cache Controller (S3CTRL)

RZ/G1H

RZ/G1N

RZ/G1M

RZ/G1E

### 15A.1 Overview

The S3 cache controller (S3CTRL) includes a local interconnect and L3 system shared cache (s3\$) controller\* placed between AXI-bus interconnects and DBSC memory controller. The S3CTRL improves SDRAM access efficiency with data prefetching and caching. The S3CTRL includes a 2,048-Kbyte RAM which can be used as both cache memory and direct access memory (on-chip RAM)\*.

Note: \* Applicable to the RZ/G1H

#### 15A.1.1 Features

The S3CTRL include the following features.

- Includes the 2,048-Kbyte on-chip RAM shared with cache memory and direct access memory\*<sup>1</sup>
- Cache function\*<sup>1</sup>
  - Physically indexed and physically tagged, 4-bank 8-way set associative 256 line (256 bytes per line)
  - The number of cache way is configurable. The non-used ways can be configured as direct access memory (on-chip RAM)
- Provide flexible SDRAM address mapping. Linear mapping allocates a continuous address space to every single memory controller. Split mapping provides an interleaved address space to two memory controllers at 4 Kbytes granularity.\*<sup>2</sup>
- XY command decoder (media domain only)
- Support 8 entries of system CPU's exclusive access command.
- Interrupt request at the end of cache initialization (all or each banks) is supported\*<sup>1</sup>

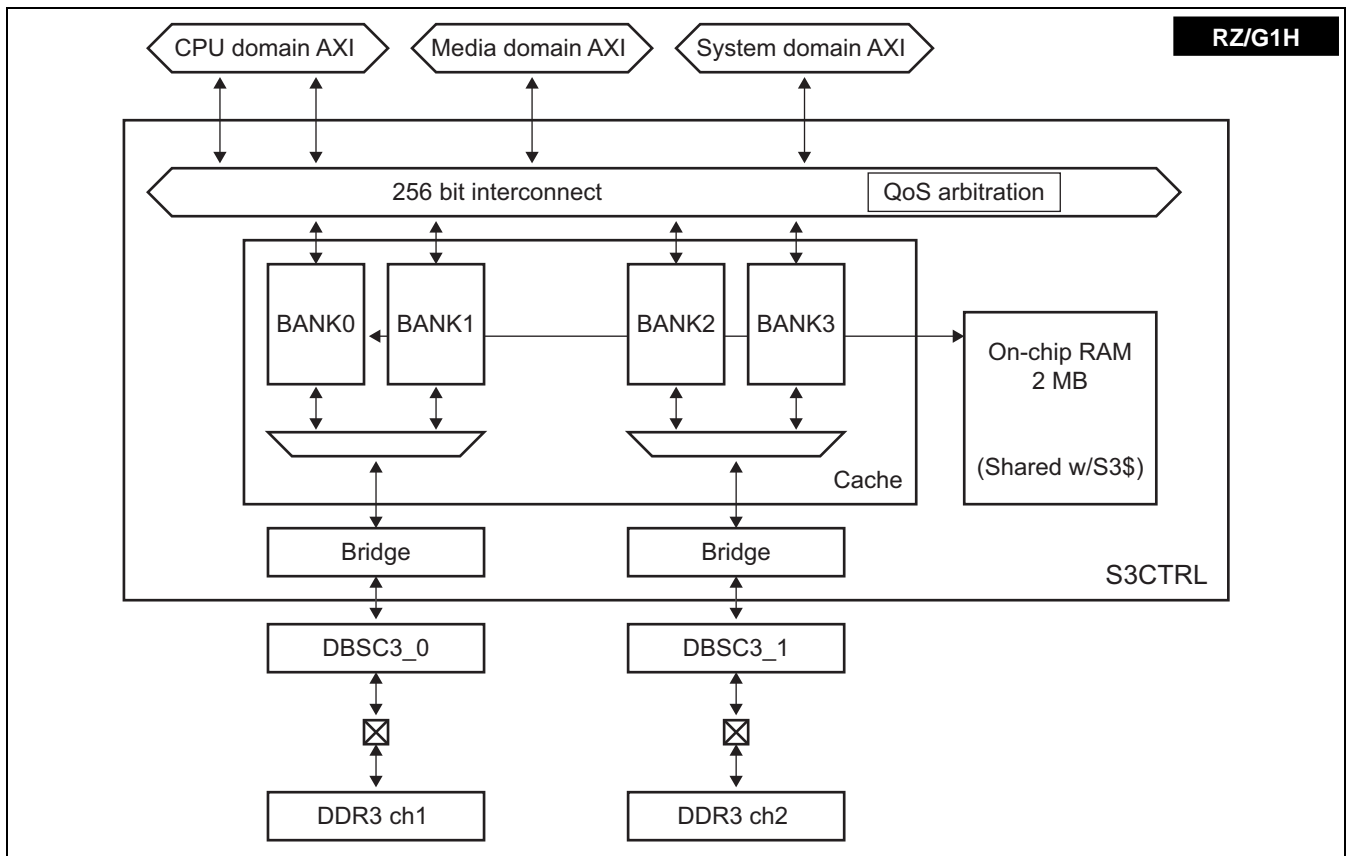

Notes: 1. Applicable to the RZ/G1H

2. Applicable to the RZ/G1H and RZ/G1M

**15A.1.2 Block Diagram**

Figure 15A.1 is a block diagram of the S3CTRL.

**Figure 15A.1a Block Diagram of S3CTRL [RZ/G1H]**

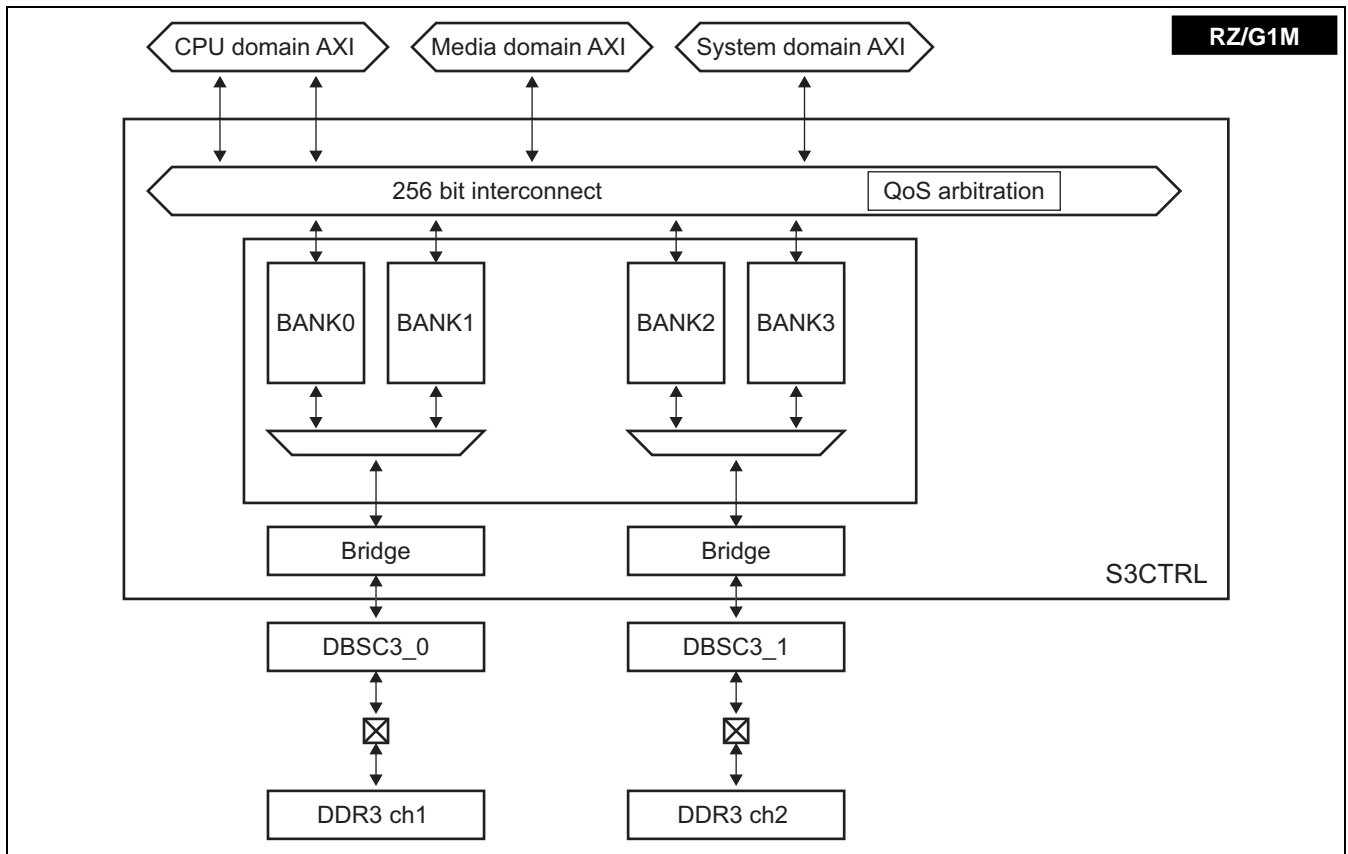

Figure 15A.1b Block Diagram of S3CTRL [RZ/G1M]

Notes: 1. Some restrictions apply.  
2. The operation is not guaranteed when this register is set up.

## 15A.2 Register Description

### Legend for Register Description

Initial value: Register value after a reset. H'xxxx represents a hexadecimal number. Others are represented in binary numbers.

—: Undefined value

R/W: Readable/writable. The written value can be read.

R: Read-only. The write value should always be 0.

R/WC0: Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.

R/WC1: Readable/writable. Writing 1 initializes the bit. Writing 0 is ignored.

W: Write-only. Reading this bit is prohibited. When the bit is reserved, the write value should always be 0.

—/W: Write-only. The read value is undefined.

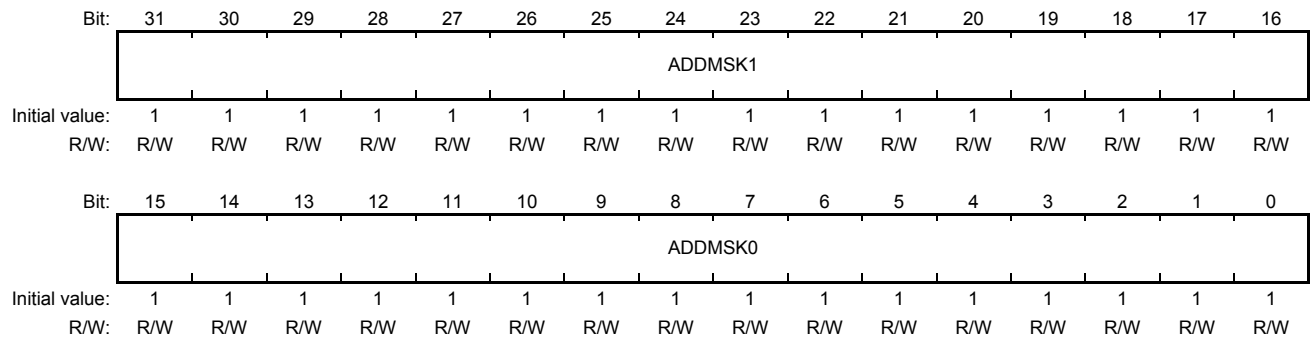

All access to registers is made in longword units.

**15A.2.1 Exclusive Address Mask Register (S3CEXCLADDMSK)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√*	√*

Note: \* Some restrictions apply.

Function: Address bit mask of exclusive access. Lower 16-bit address can be masked.

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	ADDMSK1	H'FFFF	R/W	[RZ/G1H, M] Exclusive address mask (Lower 16 bits) enable bit for DBSC channel 1 0: Disable bit 1: Enable bit
				[RZ/G1N, E] Reserved These bits are always read as H'FFFF. The write value should always be H'FFFF.
15 to 0	ADDMSK0	H'FFFF	R/W	Exclusive address mask (Lower 16 bits) enable bit for DBSC channel 0 0: Disable bit 1: Enable bit

**15A.2.2 Exclusive ID Mask Register (S3CEXCLIDMSK)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√*	√*

Note: \* Some restrictions apply.

Function: ID bit mask of exclusive access

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	IDMSK1	H'FFFF	R/W	[RZ/G1H, M] Exclusive ID mask (Lower 16 bits) enable bit for DBSC channel 1 0: Disable bit 1: Enable bit
				[RZ/G1N, E] Reserved These bits are always read as H'FFFF. The write value should always be H'FFFF.
15 to 0	IDMSK0	H'FFFF	R/W	Exclusive ID mask (Lower 16 bits) enable bit for DBSC channel 0 0: Disable bit 1: Enable bit

### 15A.2.3 S3C Address Split Control Register (S3CADSPLCR)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	—*	—*

Note: \* The operation is not guaranteed when this register is set up.

Function: This register sets about SDRAM linear/split address mapping.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SWPO E	SWP2SEL			SWP2	—	—	—	SPLITSEL							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	AREA				—	—	—	SWP					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	SWPOE	0	R/W	Select output address to DBSC. 0: Output address after SWP translation for 2 channels SDRAM mode (32-bit bus mode) 1: Output address before SWP translation for 1 channels SDRAM mode (64-bit bus mode)
30 to 28	SWP2SEL	000	R/W	Specify the address bit replaced with the address bit of SWP. 000: bit 17 001: bit 18 others: Reserved
27	SWP2	0	R/W	0: Disable SWP2SEL translation. 1: Enable SWP2SEL translation.
26 to 24	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	SPLITSEL	H'00	R/W	Specify the areas translated through SWP. Each bit of SPLITSEL represents the number of area (0 to 7).
15 to 13	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
12 to 8	AREA	H'00	R/W	Indicate the address bit which divides a DBSC address space into 8 areas. H'18 and more must be set. Example: H'1D: 8 Gbytes DRAM H'1C: 4 Gbytes DRAM H'1B: 2 Gbytes DRAM
7 to 5	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
4 to 0	SWP	H'00	R/W	Indicate the address bit to interleave two DBSCs. H'C and more must be set.

**15A.2.4 Reserved Register (S3CMAAR)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√*	√*	√*	√*

Note: \* Some restrictions apply.

Function: This register is reserved. The operation is not guaranteed when setting up other than an initial value.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	1	0	0	0	0	0	0	1	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
26	—	1	R/W	Reserved This bit is always read as 1. The write value should always be 1.
25 to 20	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
19	—	1	R/W	Reserved This bit is always read as 1. The write value should always be 1.
18 to 0	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.

### 15A.2.5 S3C Read Outstanding Regulation Register (S3CRORR)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: S3CTRL can control the number of read transaction at every QoS level to prevent DBSC's queue with low priority transactions. Transaction number is set by QOSTHn + 1. When QOSTHn = H'1F, its transaction number is not limited.

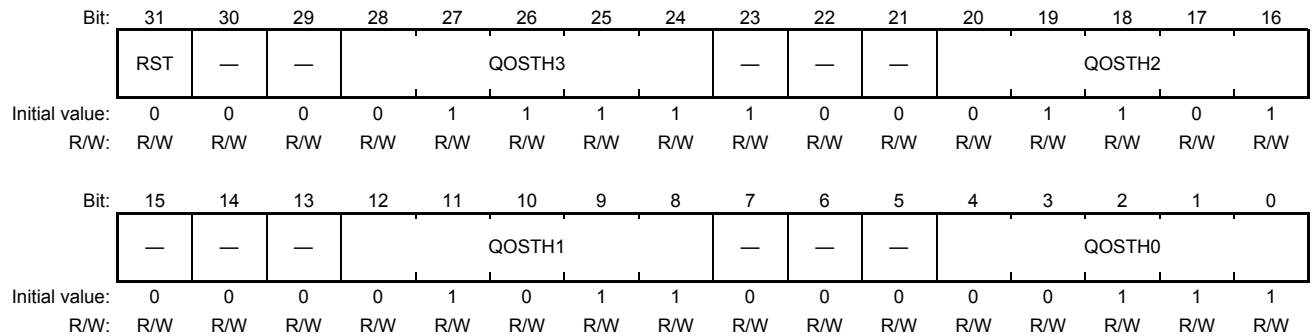

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RST	—	—	QOSTH3					—	—	—	QOSTH2				
Initial value:	0	0	0	0	1	1	1	1	1	0	0	0	1	1	0	1
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	QOSTH1				—	—	—	QOSTH0					
Initial value:	0	0	0	0	1	0	1	1	0	0	0	0	0	1	1	1
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	RST	0	R/W	Reset the read transaction counter.
30, 29	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
28 to 24	QOSTH3	H'0F	R/W	The threshold queue length which the read transactions of QOS-Level3 can fill.
23 to 21	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
20 to 16	QOSTH2	H'0D	R/W	The threshold queue length which the read transactions of QOS-Level2 can fill.
15 to 13	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
12 to 8	QOSTH1	H'0B	R/W	The threshold queue length which the read transactions of QOS-Level1 can fill.
7 to 5	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
4 to 0	QOSTH0	H'07	R/W	The threshold queue length which the read transactions of QOS-Level0 can fill.

**15A.2.6 S3C Write Outstanding Regulation Register (S3CWORR)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: S3CTRL can control the number of write transaction at every QoS level to prevent DBSC’s queue with low priority transactions. Transaction number is set by QOSTHn + 1. When QOSTHn = H'1F, its transaction number is not limited.

Bit	Bit Name	Initial Value	R/W	Description
31	RST	0	R/W	Reset the write transaction counter.
30, 29	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
28 to 24	QOSTH3	H'0F	R/W	The threshold queue length which the write transactions of QOS-Level3 can fill.
23 to 21	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
20 to 16	QOSTH2	H'0D	R/W	The threshold queue length which the write transactions of QOS-Level2 can fill.
15 to 13	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
12 to 8	QOSTH1	H'0B	R/W	The threshold queue length which the write transactions of QOS-Level1 can fill.
7 to 5	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
4 to 0	QOSTH0	H'07	R/W	The threshold queue length which the write transactions of QOS-Level0 can fill.

**15A.2.7 S3C Cache Master Control Register (S3CMCTR)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	—	—	—

Function: This register sets about cache functions.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

31 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11	XRCM	0	R/W	X Read Convert Mode. Convert $16 \times 1$ to $16 \times 2$ . 0: Disable 1: Enable
10	XWCM	0	R/W	X Write Convert Mode. Convert $16 \times 1$ to $16 \times 2$ . 0: Disable 1: Enable
9	YRCM	0	R/W	Y Read Convert Mode. Convert $16 \times 1$ to $16 \times 2$ . 0: Disable 1: Enable
8	YWCM	0	R/W	Y Write Convert Mode. Convert $16 \times 1$ to $16 \times 2$ . 0: Disable 1: Enable
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	LM	0	R/W	Line Mode 0: $16 \times 1$ mode 1: $16 \times 2$ mode
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	TT	0	R/W	Tile Type 0: $128 \text{ pix} \times 32 \text{ line}$ 1: $256 \text{ pix} \times 32 \text{ line}$

<b>RZ/G1H</b>	<b>RZ/G1N</b>
<b>RZ/G1M</b>	<b>RZ/G1E</b>

### 15A.3 Operation

#### 15A.3.1 SDRAM Address Space

The S3CTRL supports two\* independent SDRAM memory controllers (DBSC) and 4 Gbytes address space on each controller. The SDRAM address mapping is managed on 40-bit physical address. Legacy address space is mapped to H'01\_00000000 to H'01\_7FFFFFFF.

Note: \* Applicable to the RZ/G1H and RZ/G1M

Figure 15A.2 is shown SDRAM address map related to S3CTRL.

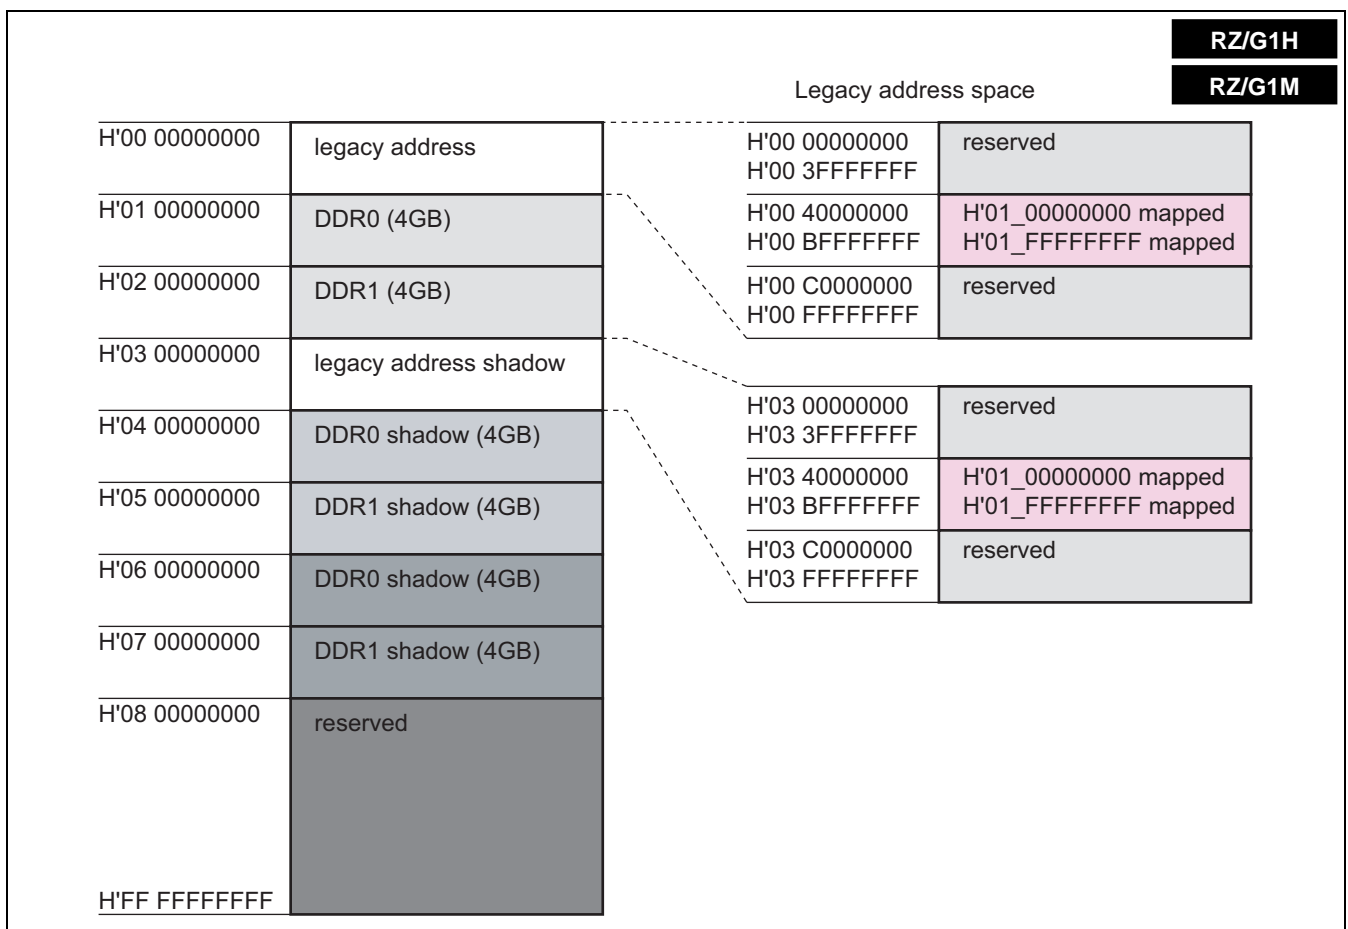

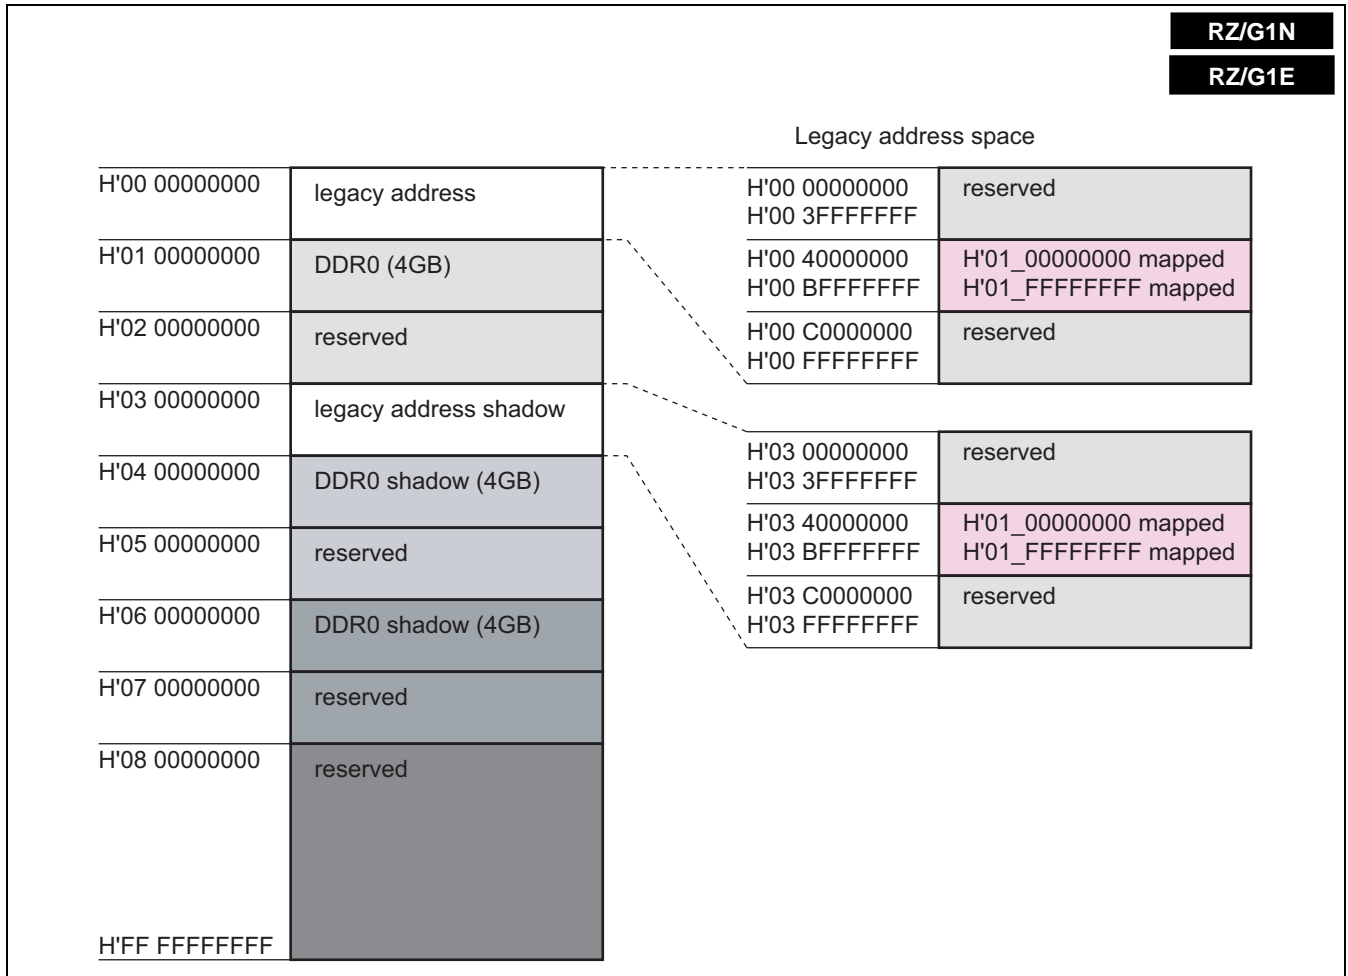

Figure 15A.2a SDRAM Address Map (Concerned with S3CTRL) [RZ/G1H and RZ/G1M]

**Figure 15A.2b SDRAM Address Map (Concerned with S3CTRL)**  
**[RZ/G1N, RZ/G1E]**

### 15A.3.2 SDRAM Split/Linear Address Mapping for RZ/G1H and RZ/G1M

The S3CTRL provides the mixed address space of interleaved address mapping (split mapping) and no-interleaved address mapping (linear mapping) on two memory controllers through S3CADSP\_LCR register. The split mapping mode enhances SDRAM access efficiency and bandwidth via parallel access to two memory controllers. In this mode, the even block is allocated to DBSC0 and the odd block is to DBSC1 at the specified granularity that set by S3CADSP\_LCR.SWP bit. The linear mapping mode allocates a continuous address space to each memory controller. It can be divided into 8 areas through S3CADSP\_LCR.AREA. And also, linear or split mapping can be chosen in each area through S3CADSP\_LCR.SPLITSEL.

Figure 15A.3 is shown split/linear address mapping, and Figure 15A.4 is shown example of split/linear address mapping with 32 bit × 2 ch DRAM mode (ch1: 1 Gbyte/ch2: 1 Gbyte). Figure 15A.5 is shown example of split address mapping with S3CADSP\_LCR.SPLITSEL = H'CF setting.

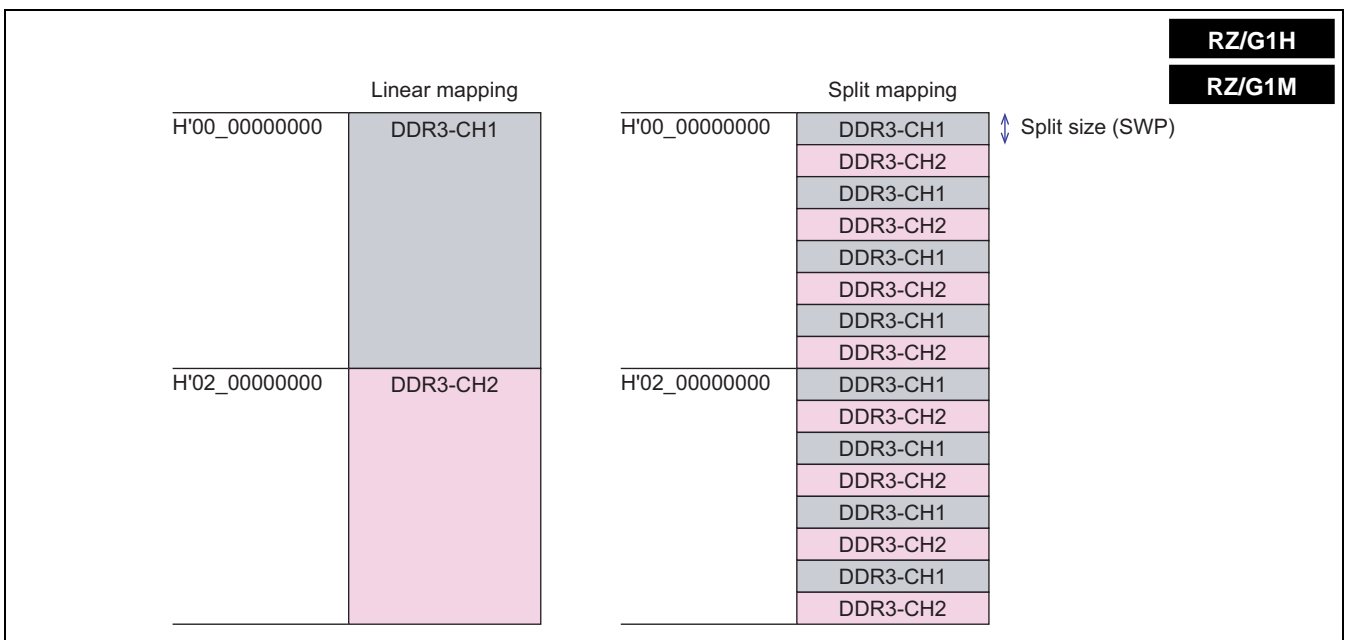

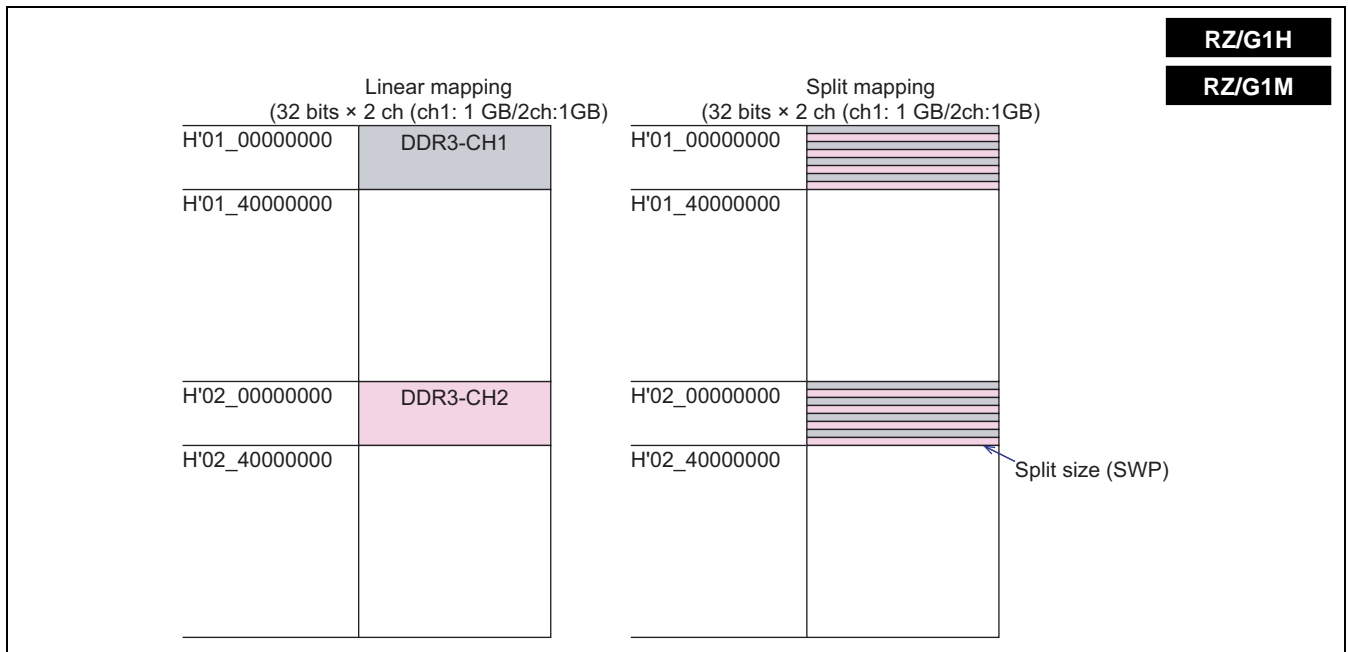

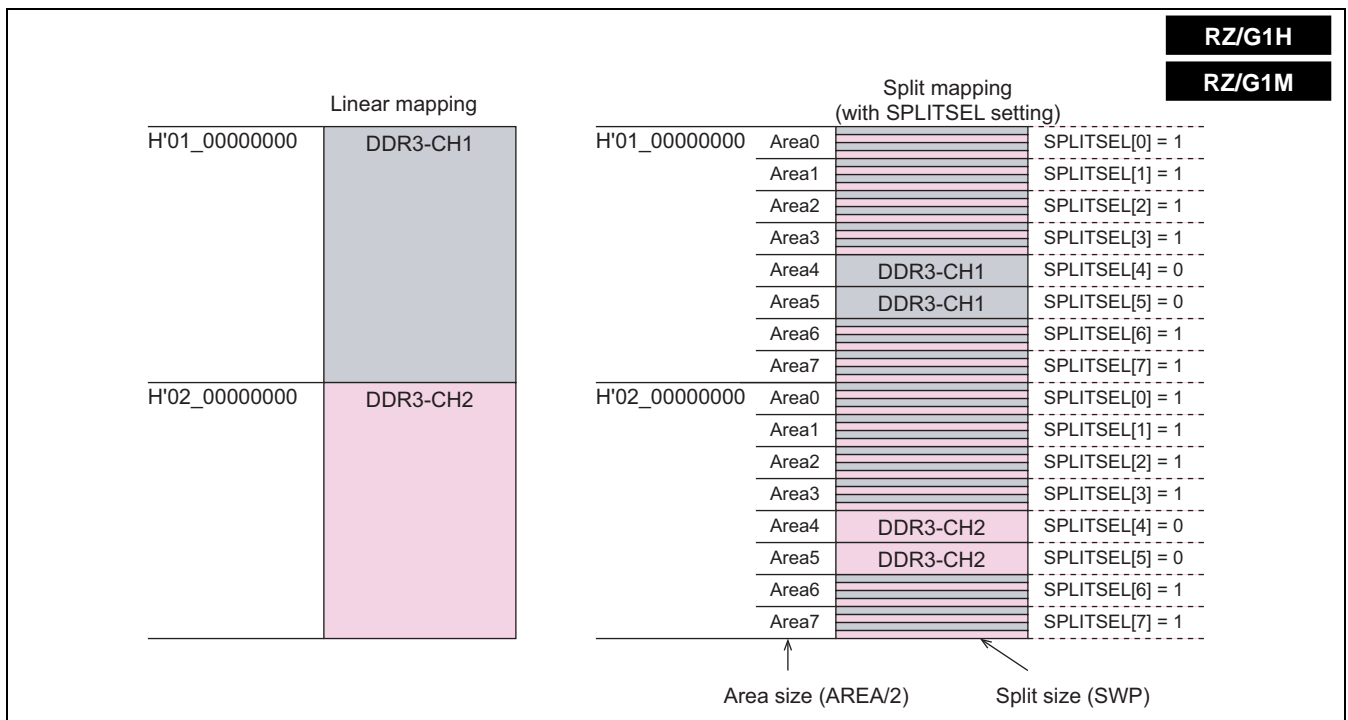

Figure 15A.3 Split/Linear Address Mapping [RZ/G1H and RZ/G1M]

**Figure 15A.4 Example of Split/Linear Address Mapping with 32bit × 2ch DRAM Mode (ch1: 1 Gbyte/ch2: 1 Gbyte) [RZ/G1H and RZ/G1M]**

**Figure 15A.5 Example of Split Address Mapping with S3CADSPLCR.SPLITSEL = H'CF Setting [RZ/G1H and RZ/G1M]**

### 15A.3.3 On-Chip RAM Address Space for RZ/G1H

The on-chip RAM is 2,048-Kbyte RAM shared between S3CTRL, Audio domain and S3\$. Unallocated ways in the S3CTRL can be used as direct access memory.

Figure 15A.6 shows on-chip RAM address space.

S3CTRL	Audio domain	S3\$		<b>RZ/G1H</b>
H'E8080000	H'ED000000	Way 0	256 KB	
H'E80BFFFF	H'ED03FFFF	(Bank0, 1, 2, 3)		
H'E80C0000	H'ED040000	Way 1		
H'E8100000	H'ED080000	Way 2		
H'E8140000	H'ED0C0000	Way 3		
H'E8180000	H'ED100000	Way 4		
H'E81C0000	H'ED140000	Way 5		
H'E8200000	H'ED180000	Way 6		
H'E8240000	H'ED1C0000	Way 7		
H'E827FFFF	H'ED1FFFFF			

**Figure 15A.6 On-Chip RAM Address Space [RZ/G1H]**

### 15A.3.4 XY Command Address Area

S3CTRL supports XY operation from Media domain. The address area accessed by XY operation is defined as Tile-Linear translated area. This area can be defined up to 8 areas. This Tile-Linear translated area also can be accessed by normal (linear) transaction from Media domain.

### 15A.3.5 Cache Operation for RZ/G1H

S3CTRL supports cache function by using on-chip RAM as cache memory. This cache function can be validated in units of 4-bank and 8-way. The validation or invalidation of cache function is set by register. S3CTRL supports interrupt request at the end of each or all cache validation.

### 15A.3.6 QoS Arbitration

Every AXI domain has their own QoS level generator which can change a priority value of transactions dynamically based on its mode. The value is used when choosing the highest priority transaction at arbitration points. Read/Write transaction queues before a memory controller can limit the maximum number of transaction that can be enqueued at every QoS level through S3CRORR/S3CWORR register. That allows low QoS transactions not to fill the queues and reserves space for higher QoS transactions.

### 15A.3.7 About Exclusive Instruction Monitor

The S3CTRL provides 8 exclusive access monitors for each memory controller. In the AXI specification, the AXI IDs and the addresses of the exclusive read and the exclusive write must be identical. However, the S3CTRL can specify the valid range of the IDs and the address through S3CEXCLADMSK and S3CEXCLIDMSK registers.

## 16. Direct Memory Access Controller for System (SYS-DMAC)

RZ/G1H

RZ/G1N

RZ/G1M

RZ/G1E

This LSI includes a direct memory access controller for system (SYS-DMAC). The SYS-DMAC can be used in place of the CPU to handle high-speed data transfer to and from an external memory, the on-chip memory, memory-mapped external devices, or on-chip peripheral modules.

### 16.1 Features

- Up to 30 channels are available (in the RZ/G1H, M, N, and E).
- 4-Gbyte physical address space
- Transfer data length: Byte, word (2 bytes), longword (4 bytes), 8 bytes, 16 bytes, 32 bytes, and 64 bytes
- Maximum number of transfer times: 16,777,216
- Address mode: Dual address mode
- Transfer requests:
 

Requests from on-chip peripheral modules or auto requests can be selected. The following modules can issue on-chip peripheral module requests.

TPU0, MMCIF0/1, IIC0/1/2/3, MSIOF0/1/2/3, HSCIF0/1/2, SCIF0/1/2/3/4/5, SCIFA0/1/2/3/4/5, SCIFB0/1/2, SDHI0/1/2/3, QSPI

Note: The availability of these modules and channels depends on the product. Refer to Table 16.5 for available modules in each product.
- Selectable bus modes:
 

Normal speed mode or slow mode can be selected for each channel.
- Either fixed priority or round-robin arbitration can be selected for use in arbitration among the transfer channels.
- Interrupt request:
 

The SYS-DMAC can be set up to generate an interrupt request for the CPU upon completion of transfer under the control of one stage of the descriptor memory, at the end of the data transfer, in response to an MMU error, and in response to an address error.
- Descriptor memory function:
 

Up to 128 sets of the settings for the source address register, destination address register, and transfer count register are available (if use of the descriptor memory is only enabled for one channel) for use in setting up consecutive DMA transfers (the memory can hold register values for up to 256 stages of transfer when the external memory is selected). An infinite repeat mode is also available.

Figure 16.1 shows the block diagram of the SYS-DMAC.

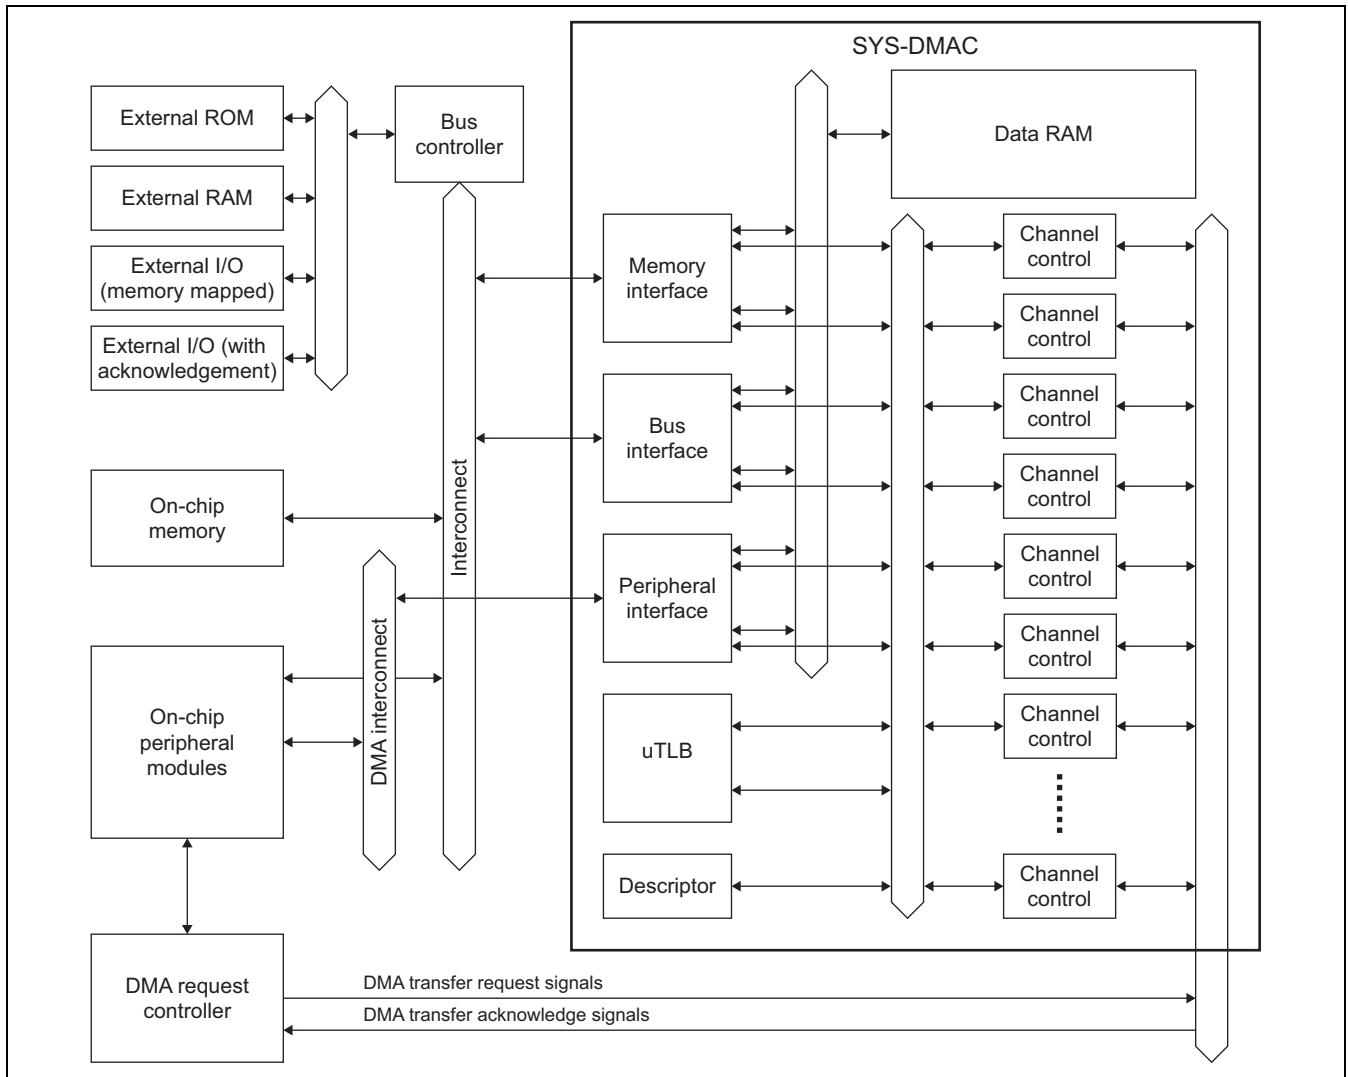

Figure 16.1 Block Diagram of the SYS-DMAC

## 16.2 Input/Output Pins

There are no external pins relevant to the SYS-DMAC.

## 16.3 Register Descriptions

Table 16.1 lists the registers of the SYS-DMAC. Table 16.2 shows the register states of the SYS-DMAC in each operating mode.

Each product of the RZ/G series has the same configuration of registers for the SYS-DMAC.

**Table 16.1 Register Configuration of the SYS-DMAC**

Name	Abbreviation	R/W	Address	Access Size	RZ/G Series Products

### 16.3.3 DMA Secure Control Register for Lower-Numbered Channels (DMASEC\_L)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

DMASEC\_L is a 32-bit readable/writeable register that controls the security attribute of each of the lower-numbered channels. Only the initiator in the secure mode can change the setting of this register.

Only secure access is allowed to registers of channels with the secure mode setting. The following registers are protected by the secure mode.

DMASAR, DMADAR, DMATCR, DMATSR, DMACHCR, DMATCRB, DMATSRB, DMACHCRB, DMARS, DMABUFCR, DMADPBASE, DMADPCR, DMAFIXSAR, DMAFIXDAR, and DMAFIXDPBASE

### 16.3.5 DMA Operation Register for Lower-Numbered Channels (DMAOR\_L)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

DMAOR\_L is a 16-bit readable/writable register that enables DMA transfer on all lower-numbered channels and specifies the method used to determine the priority levels for all lower-numbered DMA channels. This register also indicates address errors.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	PR[1:0]	—	—	—	—	—	—	AE	—	DME
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R/(W)*	R	R/W

Bit	Bit Name	Initial Value	R/W	Descriptions
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9, 8	PR[1:0]	00	R/W	Priority Mode Select the method for setting the order of priority of channels when transfer requests for multiple channels arrive simultaneously. 00: Fixed CH0 > CH1 > ... > CH13 > CH14 11: Round-robin priority Other than above: Setting prohibited
7 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2	AE	0	R/(W)*	Address Error Flag Indicates that an address error interrupt occurred during DMA transfer. This bit is set under the following conditions: The value set in DMASAR or DMADAR does not fall on a boundary corresponding to the transfer size. The source or destination for transfer is in an invalid space. The source or destination for transfer is in module stop mode. If this bit is set, DMA transfer through the channel is not possible even if the DE bit is set to 1. To clear the AE bit, write 0 to the AE bit after reading 1 from it or clear the CAE bit for each channel for which it is set. Clearing the AE bit clears the channel address error bits for all channels. 0: A SYS-DMAC address error interrupt is not present. [Clearing condition] Writing CAE = 0 after reading CAE = 1 1: A SYS-DMAC address error interrupt being generated during DMA transfer.
1	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

---

Bit	Bit Name	Initial Value	R/W	Descriptions
0	DME	0	R/W	<p>DMA Master Enable</p> <p>Enables or disables DMA transfer on all channels. If the DME bit and the DE bit in DMACHCR are both set to 1, DMA transfer is enabled. At this time all AE bits in DMAOR_L must have the value 0. For DMA transfer on a channel to then proceed, the TE bit in DMACHCR for the channel must also have the value 0. Clearing this bit during transfer aborts transfer on all channels.</p> <p>0: Disables DMA transfers on all channels</p> <p>1: Enables DMA transfers on all channels</p>

---

### 16.3.6 DMA Operation Register for Higher-Numbered Channels (DMAOR\_U)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

DMAOR\_U is a 16-bit readable/writable register that enables DMA transfer on all higher-numbered channels and specifies the method used to determine the priority levels for all higher-numbered DMA channels. This register also indicates address errors.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	PR[1:0]	—	—	—	—	—	—	AE	—	DME

### 16.3.7 DMA Channel Clear Register for Lower-Numbered Channels (DMACHCLR\_L)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

DMACHCLR\_L is a 32-bit writable register that initializes each of the lower-numbered channels.

When a bit of this register is set, the state of the corresponding channel is completely initialized.

This includes initialization of the following registers.

DMASAR, DMADAR, DMATCR, DMATSR, DMACHCR, DMATCRB, DMATSRB, DMACHCRB, DMARS, DMABUFCR, DMADPBASE, DMADPCR, DMAFIXSAR, DMAFIXDAR, and DMAFIXDPBASE

Bit	Bit Name	Initial Value	R/W	Description
31 to 15	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
14 to 0	CLR[14:0]	All 0	W	Writing to a bit leads to clearing of all registers for the corresponding channel. CLR[0] 0: Ignored 1: All registers for channel 0 are cleared. CLR[1] 0: Ignored 1: All registers for channel 1 are cleared. CLR[2] 0: Ignored 1: All registers for channel 2 are cleared. ... CLR[14] 0: Ignored 1: All registers for channel 14 are cleared. When writing to this register, confirm that the DE bit is set to 0.

### 16.3.8 DMA Channel Clear Register for Higher-Numbered Channels (DMACHCLR\_U)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

DMACHCLR\_U is a 32-bit writable register that initializes each of the higher-numbered channels.

When a bit of this register is set, the state of the corresponding channel is completely initialized.

This includes initialization of the following registers.

DMASAR, DMADAR, DMATCR, DMATSR, DMACHCR, DMATCRB, DMATSRB, DMACHCRB, DMARS, DMABUFGR, DMADPBASE, DMADPCR, DMAFIXSAR, DMAFIXDAR, and DMAFIXDPBASE

Bit	Bit Name	Initial Value	R/W	Description
31 to 15	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
14 to 0	CLR[29:15]	All 0	W	Writing to a bit leads to clearing of all registers for the corresponding channel. CLR[15] 0: Ignored 1: All registers for channel 15 are cleared. CLR[16] 0: Ignored 1: All registers for channel 16 are cleared. ... CLR[29] 0: Ignored 1: All registers for channel 29 are cleared. When writing to this register, confirm that the DE bit is set to 0.

### 16.3.9 DPRAM Secure Control Register for Lower-Numbered Channels (DMADPSEC\_L)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

DMADPSEC\_L is a 32-bit readable/writable register that controls the security attribute of the descriptor memory. Only the initiator in the secure mode can change the setting of this register.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16			
	SEC	—	—	—	—	—	—	SA[8:0]

R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W			

Bit	Bit Name	Initial Value	R/W	Description
31	SEC	0	R/W	Security Attribute Setting for Descriptor Memory Specifies the security attribute of the address space used for the descriptor memory. 0: Non-secure 1: Secure
30 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24 to 16	SA[8:0]	H'000	R/W	Security Attribute Setting for Base Address of Descriptor Memory Specify the base address of the descriptor memory to be assigned the security attribute. H'000: H'A000 H'001: H'A004 ... H'1FF: H'A7FC
15 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8 to 0	SM[8:0]	H'000	R/W	Security Attribute Setting for Base Address Mask of Descriptor Memory Specify the security attribute base address mask of the descriptor memory. The range of memory to be assigned the security attribute is specified by this register. See Figure 16.4.

### 16.3.10 DPRAM Secure Control Register for Higher-Numbered Channels (DMADPSEC\_U)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

DMADPSEC\_U is a 32-bit readable/writeable register that controls the security attribute of the descriptor memory. Only the initiator in the secure mode can change the setting of this register.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16			
	SEC	—	—	—	—	—	—	SA[8:0]											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0			
R/W:	R/W	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W			
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0			
	—	—	—	—	—	—	—	SM[8:0]											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0			
R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W			

Bit	Bit Name	Initial Value	R/W	Description
31	SEC	0	R/W	Security Attribute Setting for Descriptor Memory Specifies the security attribute of the address space used for the descriptor memory. 0: Non-secure 1: Secure
30 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24 to 16	SA[8:0]	H'000	R/W	Security Attribute Setting for Base Address of Descriptor Memory Specify the base address of the descriptor memory to be assigned the security attribute. H'000: H'A000 H'001: H'A004 ... H'1FF: H'A7FC
15 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8 to 0	SM[8:0]	H'000	R/W	Security Attribute Setting for Base Address Mask of Descriptor Memory Specify the security attribute base address mask of the descriptor memory. The range of memory to be assigned the security attribute is specified by this register. See Figure 16.4.

**16.3.11 DMA Source Address Registers 0 to 29 (DMASAR\_0 to DMASAR\_29)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

DMASAR is a 32-bit readable/writable register that specifies the source address of a DMA transfer. While a DMA transfer is in progress, this register indicates the next source address.

When the address mode is incrementation, sources in memory only have byte boundaries. For details, refer to Table 16.3.

**16.3.12 DMA Destination Address Registers 0 to 29 (DMADAR\_0 to DMADAR\_29)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

DMADAR is 32-bit readable/writable register that specify the destination address of a DMA transfer. While a DMA transfer is in progress, this register indicates the next destination address.

When the address mode is incrementation, destinations in memory only have byte boundaries. For details, refer to Table 16.3.

**Table 16.3 SAR/DAR Address Restriction**

Resource Selection	Address Mode	Restriction
Auto request	Incrementation	No restriction (byte boundaries)
	Others	Boundary corresponding to the DMA transfer size
On-chip peripheral module request Transmission/DAR, Reception/SAR	All	Boundary corresponding to the DMA transfer size
On-chip peripheral module request Transmission/SAR, Reception/DAR	Incrementation	No restriction (byte boundaries)
	Others	Boundary corresponding to the DMA transfer size

**16.3.13 DMA Transfer Count Registers 0 to 29 (DMATCR\_0 to DMATCR\_29)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

DMATCR is a 32-bit readable/writable register that specifies the number of rounds of DMA transfer. The number of rounds of DMA transfer is 1 when the setting is H'00000001, 16,777,215 when the setting is H'00FFFFFF, and 16,777,216 (the maximum) when the setting is H'00000000. During a DMA transfer, this register indicates the remaining number of rounds of transfer.

The SYS-DMAC includes independent data buffers for reading and writing. Therefore, the read transfer counter and write transfer counter have different values. This register indicates the counter value used in reading.

The eight higher-order bits of DMATCR are always read as 0, and the write value should always be 0.

### 16.3.14 DMA Transfer Count Registers B\_0 to 29 (DMATCRB\_0 to DMATCRB\_29)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

DMATCRB is a 32-bit readable/writable register that specifies the number of rounds of DMA transfer. The number of rounds of DMA transfer is 1 when the setting is H'00000001, 16,777,215 when the setting is H'00FFFFFF, and 16,777,216 (the maximum) when the setting is H'00000000. During a DMA transfer, this register indicates the remaining number of rounds of transfer.

The SYS-DMAC includes independent data buffers for reading and writing. Therefore, the read transfer counter and write transfer counter have different values. This register indicates the counter value used in writing.

The eight higher-order bits of DMATCRB are always read as 0, and the write value should always be 0.

### 16.3.15 DMA Transfer Size Registers 0 to 29 (DMATSR\_0 to DMATSR\_29)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

DMATSR is a 32-bit readable/writable register that specifies a total amount of memory to be transferred. The total size of DMA transfer is 1 byte when the setting is H'00000001, 4,294,967,295 bytes when the setting is H'FFFFFFF, and 4,294,967,296 bytes (the maximum) when the setting is H'00000000. During a DMA transfer, this register indicates the remaining amount of memory to be transferred. This register is used in total size transmission.

The SYS-DMAC includes independent data buffers for reading and writing. Therefore, reading and writing will have different transfer sizes. This register indicates the value of the read transfer size.

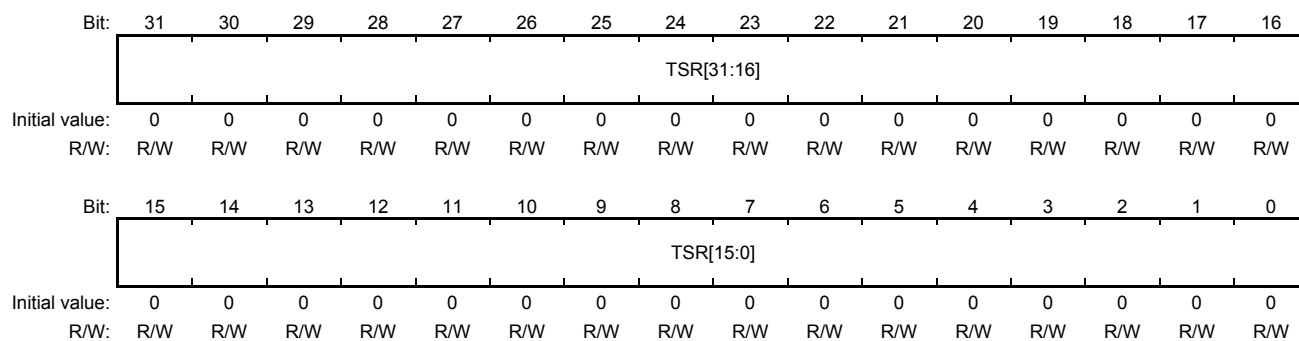

**16.3.16 DMA Transfer Size Registers B\_0 to 29 (DMATSRB\_0 to DMATSRB\_29)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

DMATSRB is a 32-bit readable/writable register that specifies a total amount of memory to be transferred. The total size of DMA transfer is 1 byte when the setting is H'00000001, 4,294,967,295 bytes when the setting is H'FFFFFFFF, and 4,294,967,296 bytes (the maximum) when the setting is H'00000000. During a DMA transfer, this register indicates the remaining amount of memory to be transferred. This register is used in total size transmission.

The SYS-DMAC includes independent data buffers for reading and writing. Therefore, reading and writing will have different transfer sizes. This register indicates the value of the write transfer size.

### 16.3.17 DMA Channel Control Registers 0 to 29 (DMACHCR\_0 to DMACHCR\_29)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

DMACHCR is a 32-bit readable/writable register that controls the DMA transfer mode.

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	W	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Descriptions
31 to 24	DCNT[7:0]	H'00	R/W	Number of Stages of Descriptor Memory Specify the number of stages of the descriptor memory as DCNT + 1. When the descriptor memory is enabled, a transfer end (TE) interrupt is only generated for the CPU on completion of transfer under control of the specified number of stages.
23 to 16	DPTR[7:0]	H'00	R	Descriptor Pointer This bit indicates the pointer to the next descriptor to be read. It is cleared to 0 when the last descriptor of the number of stages specified by DCNT[7:0] is read. It is also cleared to 0 when 1 is written to DRST.
15	DRST	0	W	Descriptor Reset Resets the descriptor pointer. Before the descriptor memory is used, the pointer must be reset by writing 1 to this bit. This bit is always read as 0.
14 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	DTS	0	R/W	Total Size Transmission under Descriptor Control This bit is only effective when total size transmission is selected. 0: The TCR fields of the descriptors are used as transfer count settings. 1: The TCR fields of the descriptors are used as total size settings.

Bit	Bit Name	Initial Value	R/W	Descriptions
7 to 4	SLM[3:0]	0000	R/W	<p>DMA Transfer Low-Speed Mode</p> <p>Specify the number of cycles of the clock (ZS) for the DMA transfer. One round of DMA transfer is executed in the number of cycles of the clock specified by this bit.</p> <p>0000: Normal mode</p> <p>1000: On round in 256 cycles of the clock.</p> <p>1001: On round in 512 cycles of the clock.</p> <p>1010: On round in 1024 cycles of the clock.</p> <p>:</p> <p>1111: On round in 32768 cycles of the clock.</p> <p>Other than above: Setting prohibited</p>
3 to 0	PRI[3:0]	0000	R/W	<p>Channel Request Priority Setting</p> <p>These bits set the priority of requests for transfer on the given channel.</p> <p>1111: Highest priority</p> <p>:</p> <p>0111 to 0000: Lowest priority</p>

**16.3.19 DMA Buffer Control Registers 0 to 29 (DMABUFCR\_0 to DMABUFCR\_29)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

DMABUFCR is a 32-bit readable/writable register that controls the upper limit on buffer size in and burst unit for the SDRAM.

Use this register when the upper limit on buffering requires control.

Bit	Bit Name	Initial Value	R/W	Descriptions
31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24 to 16	MBU[8:0]	H'080	R/W	Maximum Burst Unit for SDRAM This register is only effective for SDRAM access, and everything other than that is under control of the transfer size (unit). Settings bigger than UBL are prohibited. Power-of-two settings are recommended. Maximum value is 256 (bytes).
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	ULB[9:0]	H'100	R/W	Upper Limit on Buffer Size This register controls the upper limit value for buffering. Power-of-two settings are recommended. Maximum value is 512 (bytes).

**16.3.20 DMA Extended Resource Selectors 0 to 29 (DMARS\_0 to DMARS\_29)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

DMARS is a 16-bit readable/writable register that specifies the on-chip peripheral module to be the source of the DMA transfer request for the given channel. DMARS\_0 specifies the source for channel 0, DMARS\_1 specifies the source for channel 1 and so on.

When bits MID and RID are set to a value other than the values listed in Table 16.4, the operation of this LSI is not guaranteed. Transfer requests from the source selected in DMARS are only valid when the resource selection bits (RS[3:0]) in DMACHCR have been set to B'1000. Otherwise, even if DMARS has been set, requests from the corresponding transfer request source are not accepted.

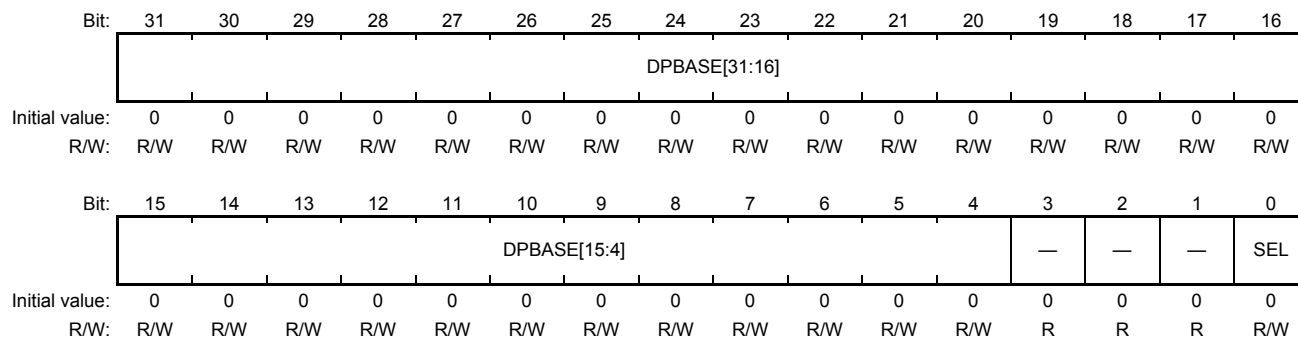

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	MID[5:0]						RID[1:0]	
Initial value:	—	—	—	—	—	—	—	—	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Descriptions
15 to 8	—	—	R	Reserved These bits are always read as an undefined value. The write value should always be 0.
7 to 2	MID[5:0]	000000	R/W	DMA Request Source Adoption ID5 to ID0 (MID) See Table 16.4.
1, 0	RID[1:0]	00	R/W	DMA Request Source Adoption ID1 and ID0 (RID) See Table 16.4.

**16.3.21 DMA Descriptor Base Address Registers 0 to 29 (DMADPBASE\_0 to DMADPBASE\_29)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

DMADPBASE specifies the base address of the descriptor memory. The address range of the descriptor memory is specified by setting this register.

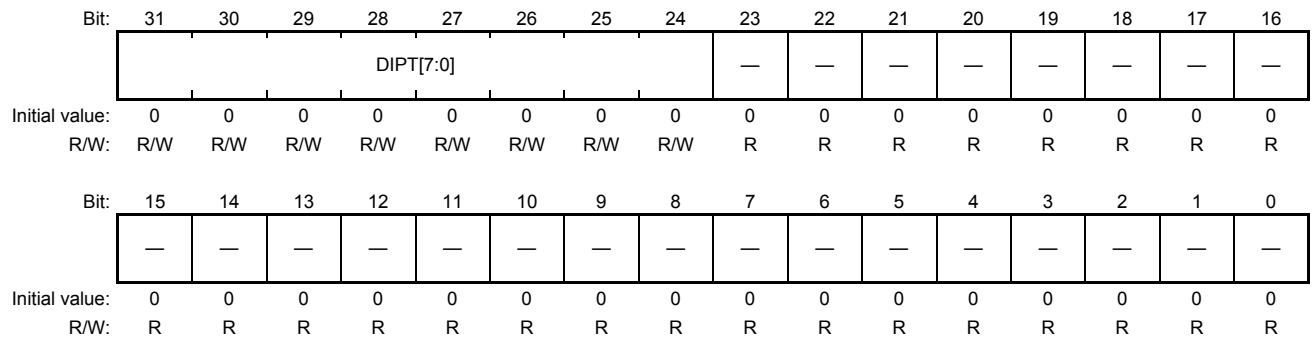

Bit	Bit Name	Initial Value	R/W	Descriptions
31 to 4	DPBASE[31:4]	All 0	R/W	Base Address of Descriptor Memory Place each stage of the descriptor memory on a 16-byte boundary. Setting example When Built-in memory is used, [SYS-DMAC Lower]: H'E670 A000 to H'E670 A7FC [SYS-DMAC Higher]: H'E672 A000 to H'E672 A7FC When External memory is used, Other memory area on a 16-byte boundary
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SEL	0	R/W	Descriptor Memory Selection Select the memory to be used as descriptor memory. 0: Setting Prohibited 1: Built-in memory or External memory is used.

**16.3.22 DMA Descriptor Control Registers 0 to 29 (DMADPCR\_0 to DMADPCR\_29)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

DMADPCR is a 32-bit readable/writable register that controls the timing with which interrupts are output in read-out interrupt mode (descriptor mode 3).

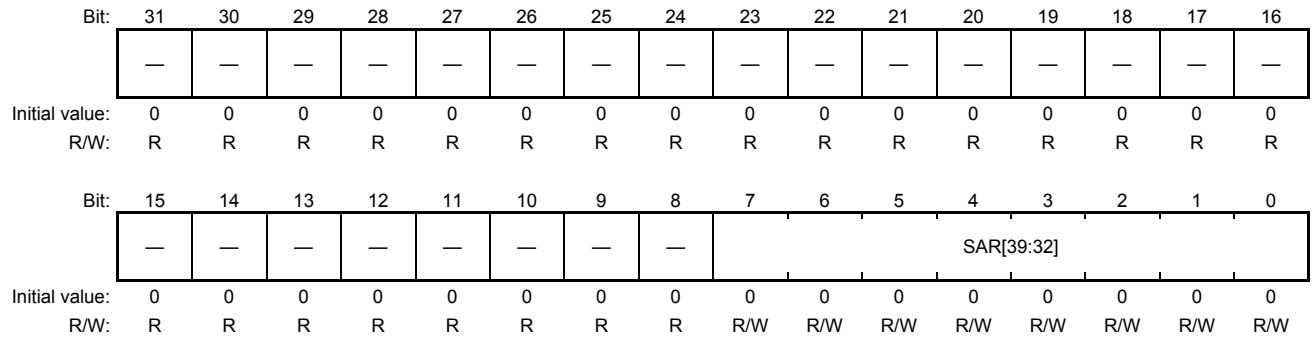

Bit	Bit Name	Initial Value	R/W	Descriptions
31 to 24	DIPT[7:0]	All 0	R/W	Descriptor Read-out Interrupt Pointer The number of stages for which descriptor read-out interrupts are generated in descriptor mode 3. DIPT + 1 specifies the number of descriptor stages.
23 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

**16.3.23 DMA Fixed Source Address Registers 0 to 29 (DMAFIXSAR\_0 to DMAFIXSAR\_29)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

DMAFIXSAR is a 32-bit readable/writable register that specifies the most significant 8 bits of the 40-bit source address for a DMA transfer.

This register is not incremented by carrying when DMASAR overflows.

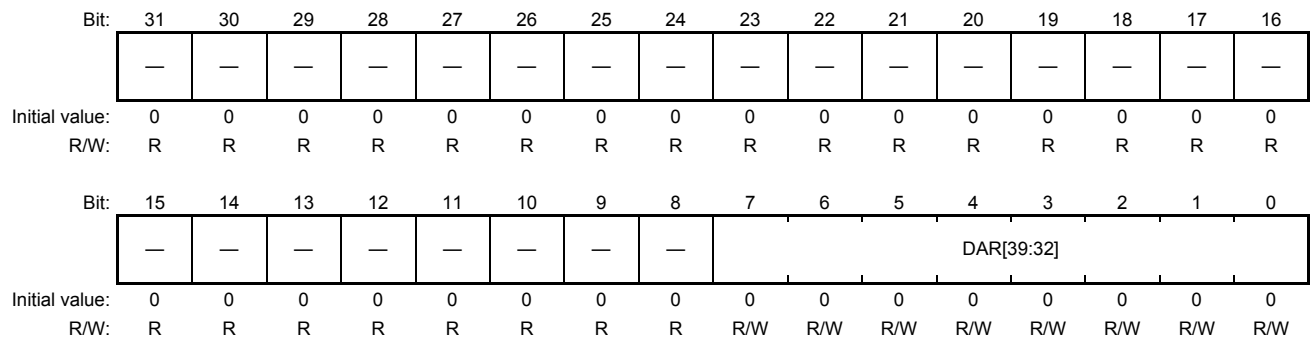

**16.3.24 DMA Fixed Destination Address Registers 0 to 29 (DMAFIXDAR\_0 to DMAFIXDAR\_29)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

DMAFIXDAR is a 32-bit readable/writable register that specifies the most significant 8 bits of the 40-bit destination address for a DMA transfer.

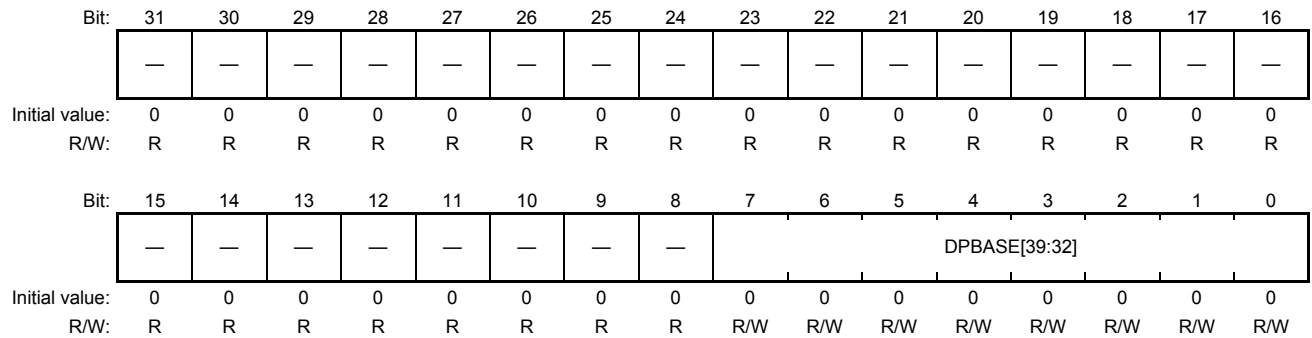

This register is not incremented by carrying when DMASAR overflows.

**16.3.25 DMA Fixed Descriptor Base Address Registers 0 to 29 (DMAFIXDPBASE\_0 to DMAFIXDPBASE\_29)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

DMAFIXDPBASE is a 32-bit readable/writable register that specifies the most significant 8 bits of the 40-bit descriptor base address for a DMA transfer.

**16.3.26 Descriptor Memory (DescriptorMEM)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

See section 16.4.4, Descriptor Memory.

## 16.4 Operation

RZ/G1H

RZ/G1N

RZ/G1M

RZ/G1E

When there is a DMA transfer request, the DMAC starts the transfer according to the predetermined channel priority; when the transfer end conditions are satisfied, it ends the transfer. Transfers can be requested in two modes: auto request and on-chip peripheral module request. The bus mode can be selected from normal speed mode and slow speed mode).

### 16.4.1 DMA Transfer Requests

Most commonly, DMA transfer requests are generated by either the source or destination for transfer, but they can also be generated by on-chip peripheral modules that are neither the source nor the destination. Transfers can be requested in two modes: auto request, and on-chip peripheral module request. The request mode is selected for each channel by DMARS.

#### (1) Auto-Request Mode

When there is no transfer request signal from an external source, as in a memory-to-memory transfer or a transfer between memory and an on-chip peripheral module unable to request a transfer, auto-request mode allows the SYS-DMAC to automatically generate a transfer request signal internally. When the DE bit in DMACHCR and the DME bit in DMAOR are set to 1 for the target channel, the transfer begins so long as the CAE bit in DMACHCR is 0.

#### (2) On-Chip Peripheral Module Request Mode

In this mode, a transfer is performed at the transfer request signal of an on-chip peripheral module. The source (on-chip peripheral module) of the DMA transfer request is specified by DMARS.

When this mode is selected, if the DMA transfer is enabled (DE = 1, DME = 1, TE = 0, CAE = 0), a transfer is performed upon the input of a transfer request signal.

When a transmit data empty transfer request of the SCIF is set as the transfer request, the transfer destination must be the SCIF's transmit data register. Likewise, when receive data full transfer request of the SCIF is set as the transfer request, the transfer source must be the SCIF's receive data register. These conditions also apply to the other on-chip peripheral modules.

The number of the receive FIFO triggers can be set as a transfer request depending on an on-chip peripheral module. Data needs to be read after the DMA transfer is ended, because data may be left in the receive FIFO when the receive FIFO trigger condition is not satisfied.

Table 16.4 Selecting On-Chip Peripheral Module Request Modes

DMARS MID + RID	DMA Transfer Request Source	DMA Transfer Request Signal	Source	Destination	RZ/G Series Products

MMCIF0/1			√				√	√	√	√
AXSTM			√				√	√	√	—

Note: \* For the availability of module channels of each product, refer to Table 16.4.

### 16.4.2 Channel Priority

When the SYS-DMAC receives simultaneous transfer requests on two or more channels, it transfers data according to a predetermined priority. Two modes (fixed mode and round-robin mode) are selected by the PR[1:0] bits in DMAOR.

#### (a) Fixed Mode

In this mode, the priority levels among the channels remain fixed.

CH0 > CH1 > ... > CH13 > CH14, CH15 > CH16 > ... > CH28 > CH29

#### (b) Round-Robin Mode

In round-robin mode, each time data of one transfer unit (byte, word, longword, 8-byte, or 16-byte units) is transferred on one channel, the priority is rotated. The channel on which the transfer was just finished rotates to the bottom of the priority. The priority of round-robin mode is CH0 > CH1 > ... > CH13 > CH14 and CH15 > CH16 > ... > CH28 > CH29 immediately after reset.

### 16.4.3 Slow Speed Mode

In the low-speed mode, a single round of DMA transfer is performed every time the number of clock cycles specified by the SLM bits in DMACHCRB elapse. This mode can be selected per DMA channel. Transfer on other channels can proceed after each round of transfer for a channel in the low-speed mode is completed.

Figure 16.2 Slow Speed Mode

### 16.4.4 Descriptor Memory

The descriptor memory function is selected by setting the DPM[1:0] bits in DMACHCR to B'01, B'10, or B'11. When DMATCR is set to 0 and the DMA transfer is completed, the next set of settings is read, and if only a single channel is enabled, the contents defined by up to 128 stages of descriptor memory can be consecutively transferred when the built-in descriptor memory is used. External memory can also be used as the descriptor memory. In that case, the contents defined by up to 256 stages of descriptor memory can be transferred.

The following initial settings are required to use the descriptor memory.

- Set the base address of the descriptor memory for the DMA transfer in DMADPBASE.
- Set the DRST bit in DMACHCRB to reset the descriptor memory.
- Set the number of stages of the descriptor memory in the DCNT bits of DMACHCRB.

The descriptor memory is shared between all channels. Ensure that the areas of descriptor memory for use by each of the channels do not overlap. It is necessary to arrange each stage of the descriptor memory on a 16-byte boundary.

There are two methods to activate the descriptor memory as follows.

- Specify the first DMA transfer settings in DMASAR, DMADAR, and DMATCR, and specify the subsequent settings in the descriptor memory. Then, set the DPB bit in DMACHCR to 0 to activate the descriptor memory. In this case, after completion of the transfer specified in DMASAR, DMADAR, and DMATCR, transfer continues after new settings are read from the descriptor memory. Note, however, that when the operating mode of the descriptor memory is set to the repeat mode, the values specified in DMASAR, DMADAR, and DMATCR are not read, and the transfer starts and is repeated from the head of the descriptor memory.
- Write the DMA transfer settings to the descriptor memory, and write 1 to the DPB bit in DMACHCR to activate the descriptor memory. In this case, the DMA transfer starts from the first settings in the descriptor memory.

There are three operating modes of the descriptor memory, which can be selected by setting the DPM bits in DMACHCR.

For details on these operating modes, see the descriptions of each operating mode in this section.

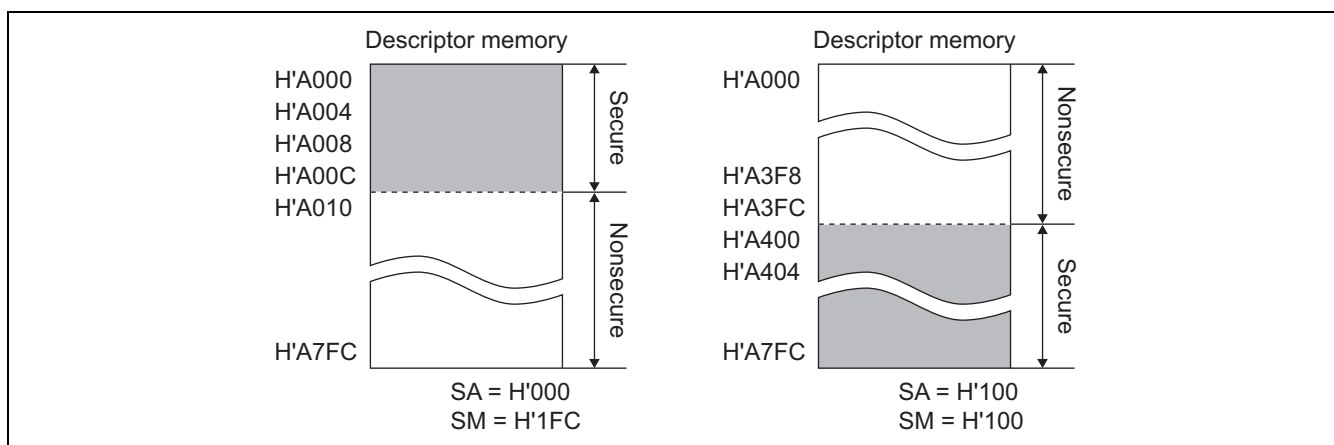

**(1) Configuration of Descriptor Memory**

Figure 16.3 shows the configuration of the built-in descriptor memory.

The capacity of the built-in descriptor memory is 16 bytes per stage × 128 stages.

**Figure 16.3 Configuration of Built-in Descriptor Memory**

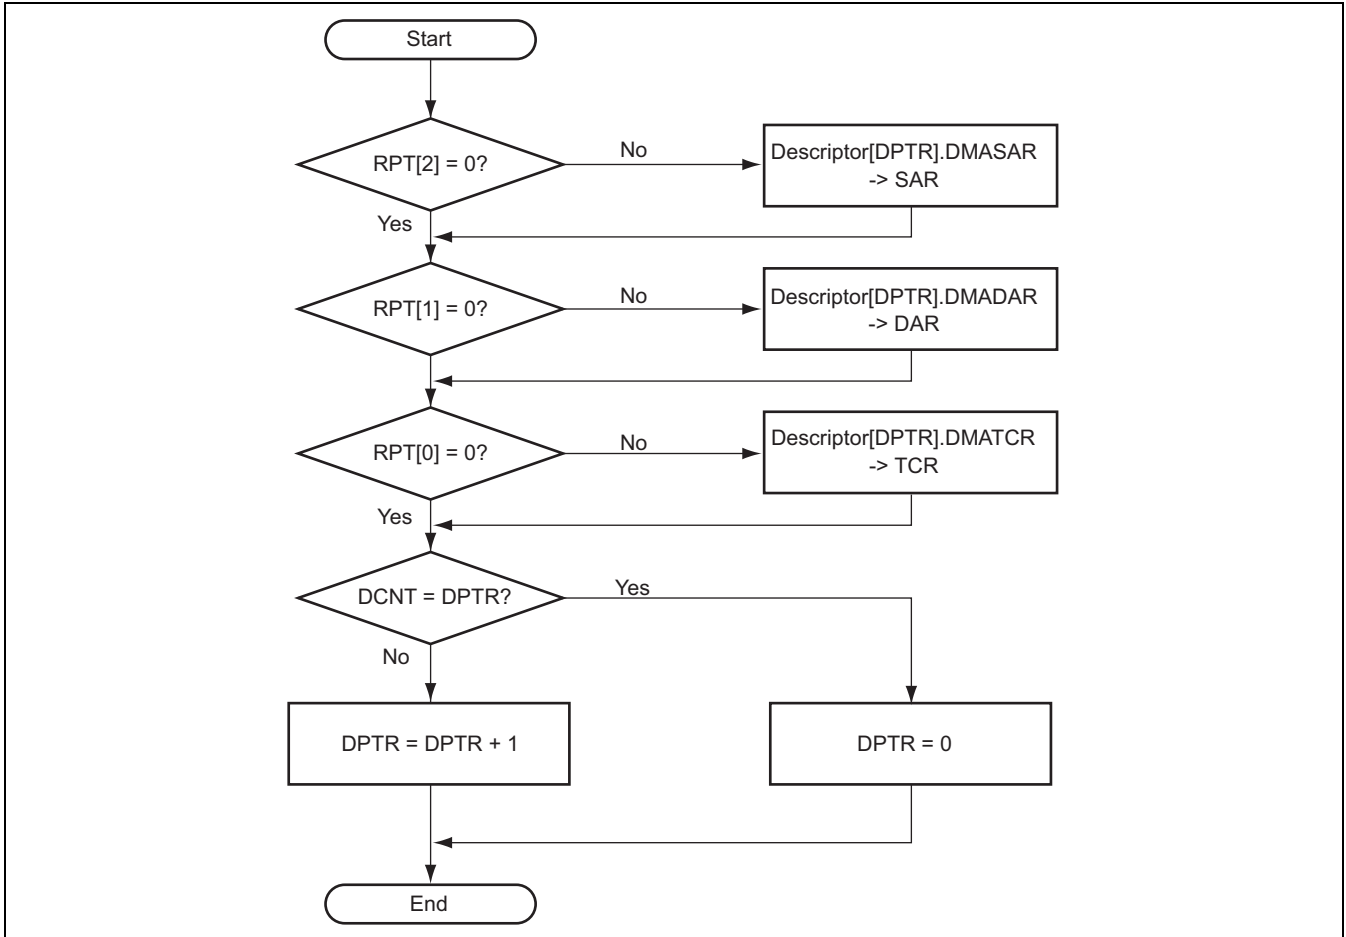

**Figure 16.4 Example of DMADPSEC Setting**

**(2) Flow of Updating from Descriptor Memory**

The RPT bits in DMACHCR can be used to specify which registers are to be updated from the descriptor memory.

The DPTR bits in DMACHCRB are incremented when updating from the descriptor memory is completed. If the DPTR value matches the DCNT value, the DPTR value is reset to 0.

This flow is automatically processed by hardware.

**Figure 16.5 Flow of Updating from Descriptor Memory**

**(3) Operating Mode 1 of Descriptor Memory**

Set the DPM bits in DMACHCR to B'01 to select operating mode 1 (normal mode). This mode allows consecutive transfer under control of the descriptor memory.

In this mode, the DMA transfer is complete when the TE bit in DMACHCR is set to 1 after transfer under control of the number of stages of the descriptor memory specified in the DCNT bits in DMACHCRB.

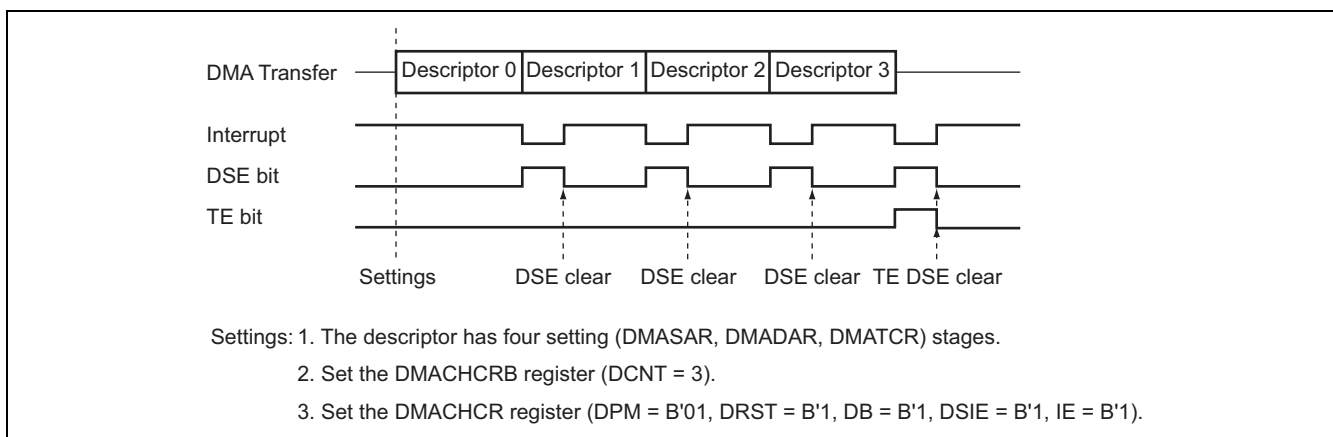

When the DSIE bit in DMACHCR is set to 1, a DSE interrupt is generated every time transfer under the control of one stage of descriptor memory is complete. If a first DSE interrupt has not been processed when a further DSE interrupt is generated, the contents of the next stage of the descriptor memory are not read and the DMA transfer is aborted. Clearing the DSE bit only causes clearing of the first interrupt and reading of the next stage of the descriptor memory.

Figure 16.6 is an example of transfer when operating mode 1 is selected and the TE and DSE bits are set to 1.

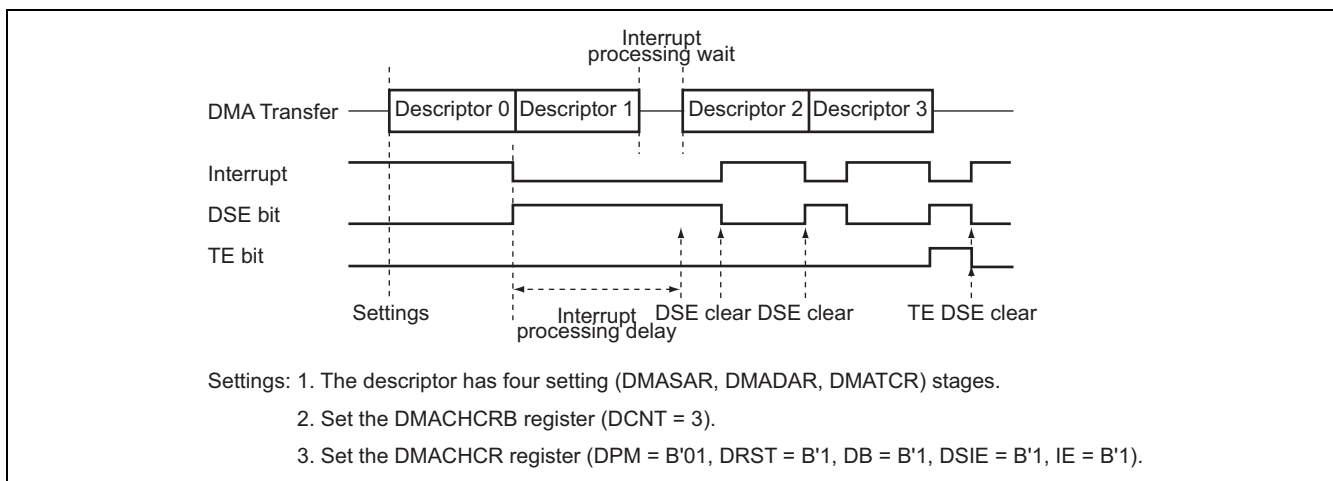

Figure 16.7 is an example of transfer when there is a delay in processing of the DSE interrupt when operating mode 1 is selected and the TE and DSE bits are set to 1.

Figure 16.8 is an example of transfer when operating mode 1 is selected and the TE bit is set to 1.

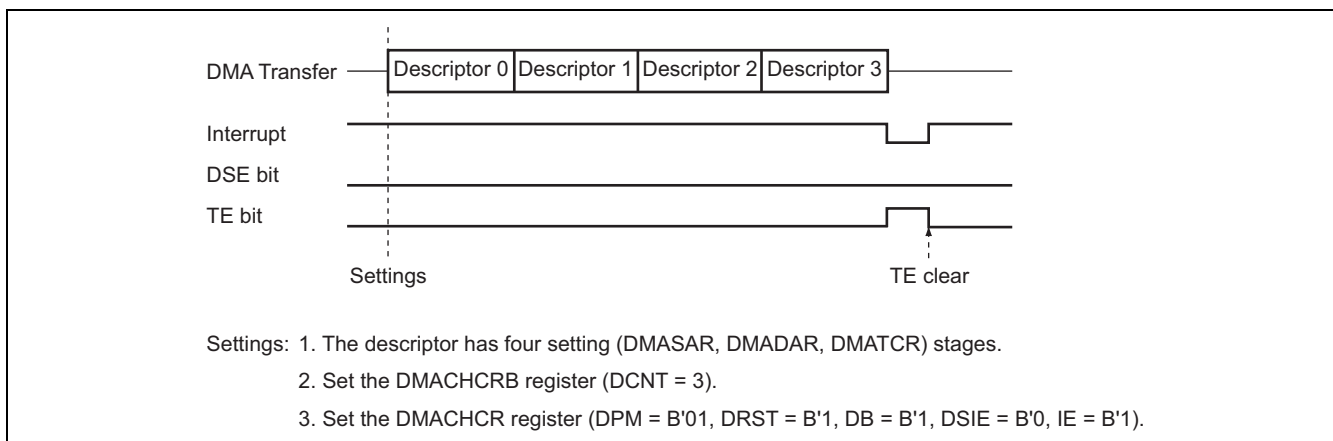

In each example, there are four descriptor stages.

**Figure 16.6 Operating Mode 1 (Example 1)**

**Figure 16.7 Operating Mode 1 (Example 2)**

**Figure 16.8 Operating Mode 1 (Example 3)**

#### (4) Operating Mode 2 of Descriptor Memory

Set the DPM bits in DMACHCR to B'10 to select operating mode 2 (repeat mode). This mode allows consecutive transfer under control of the descriptor memory.

In this mode, after transfer under control of the number of stages of descriptor memory specified in the DCNT bits in DMACHCRB, the TE bit in DMACHCR is set to 1. This operation is then repeated from the head of the descriptor memory.

When the DSIE bit in DMACHCR is set to 1, a DSE interrupt is generated every time transfer under the control of one stage of descriptor memory is complete. If a first DSE interrupt has not been processed when a further DSE interrupt is generated, the contents of the next stage of the descriptor memory are not read and the DMA transfer is aborted. Clearing the DSE bit only causes clearing of the first interrupt and reading of the next stage of the descriptor memory.

When the DSIE bit in DMACHCR is set to 0, after transfer under control of all stages of the descriptor memory is complete, the TE bit in DMACHCR is set to 1 and a TE interrupt is generated. If a TE interrupt has not been processed when a further DSE interrupt is generated, the contents of the next stage of the descriptor memory are not read and the DMA transfer is aborted. Clearing the TE bit only causes clearing of the first interrupt and reading of the next stage of the descriptor memory.

To end operation in mode 2, change the mode to mode 1 by using the TE interrupt processing. When the mode is changed to mode 1, the DMA transfer is completed when the next TE interrupt is generated.

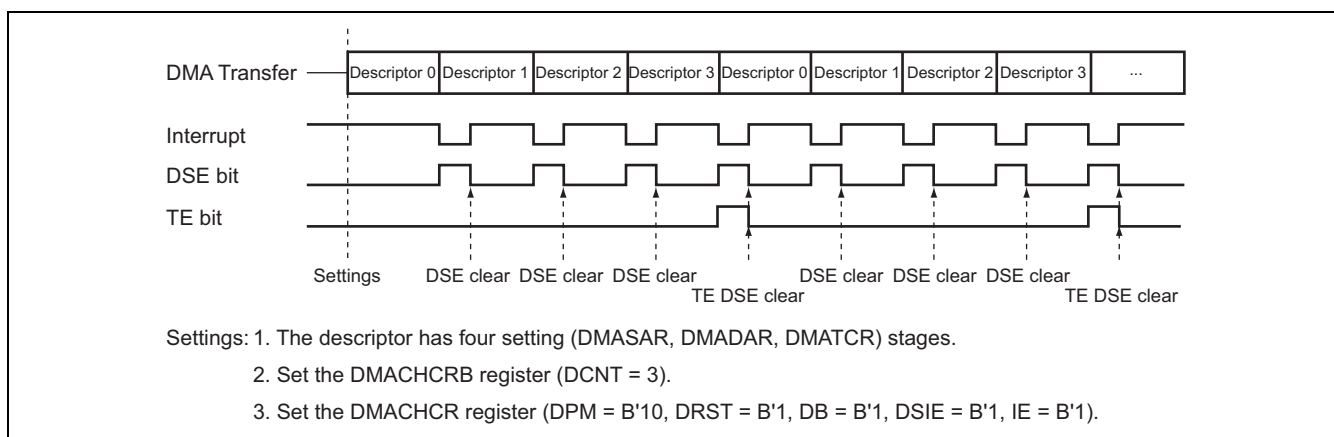

Figure 16.9 is an example of transfer when operating mode 2 is selected and the TE and DSE bits are set to 1.

Figure 16.10 is an example of transfer when there is a delay in processing of the DSE interrupt when operating mode 2 is selected and the TE and DSE bits are set to 1.

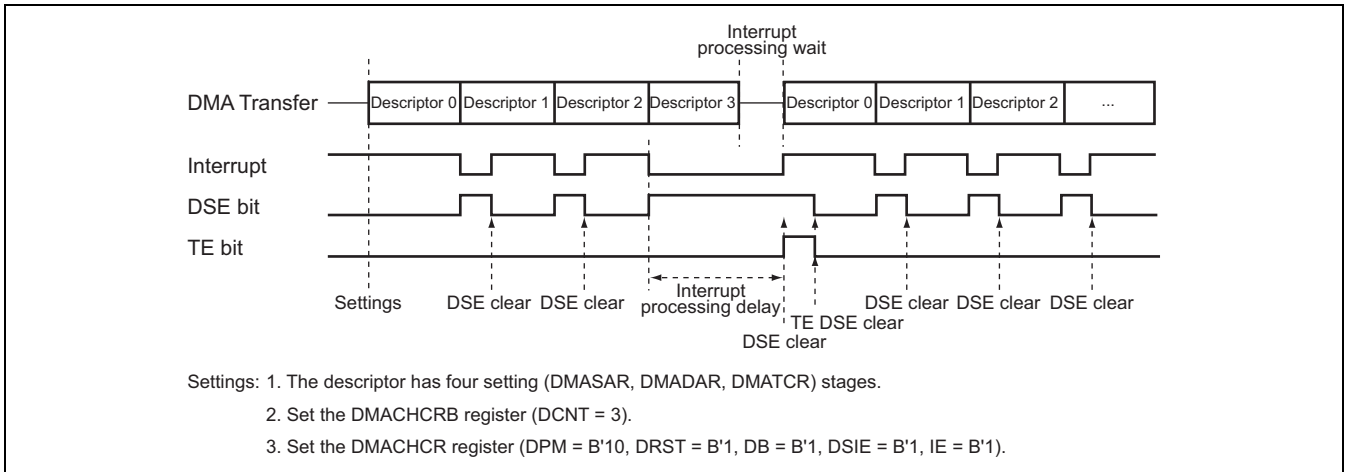

Figure 16.11 is an example of transfer when operating mode 2 is selected and the TE bit is set to 1.

Figure 16.12 is an example of transfer when there is a delay in processing of the DSE interrupt when operating mode 2 is selected and the TE is set to 1.

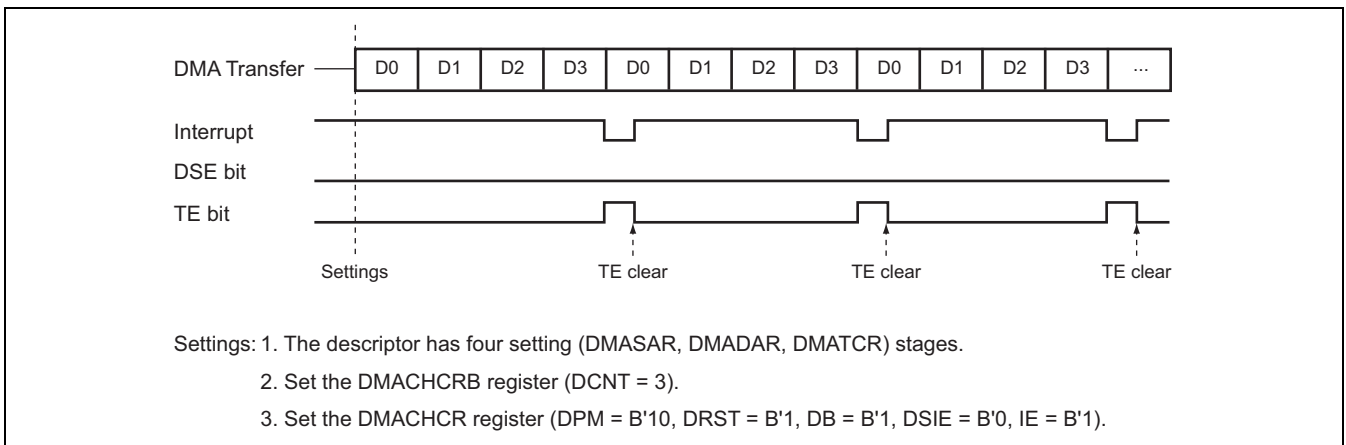

In each example, there are four descriptor stages.

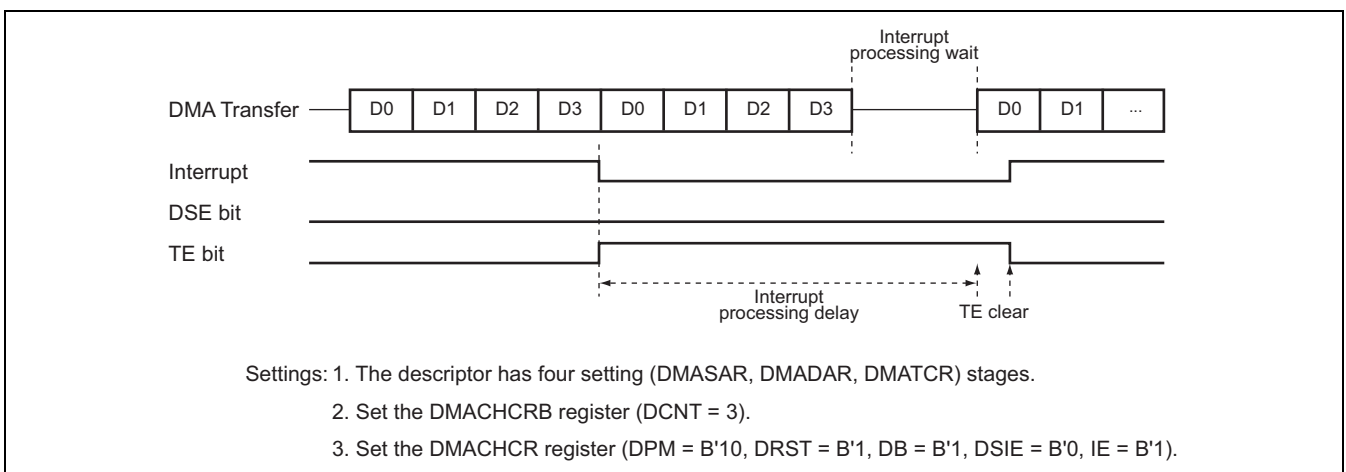

**Figure 16.9 Operating Mode 2 (Example 1)**

**Figure 16.10 Operating Mode 2 (Example 2)**

**Figure 16.11 Operating Mode 2 (Example 3)**

**Figure 16.12 Operating Mode 2 (Example 4)**

### (5) Operating Mode 3 of Descriptor Memory

Set the DPM bits in DMACHCR to B'11 to select operating mode 3 (infinite repeat mode). This mode allows consecutive transfer under control of the descriptor memory.

In this mode, after transfer under control of the number of stages of descriptor memory specified in the DCNT bits in DMACHCRB, the TE bit in DMACHCR is set to 1. This operation is then repeated from the head of the descriptor memory.

When the DSIE bit in DMACHCR is set to 1, a DSE interrupt is generated every time transfer under the control of one stage of descriptor memory is complete. Even if a first DSE interrupt has not been processed when a further DSE interrupt is generated, the DMA transfer is not aborted. Regardless of the number of DSE interrupts that have been generated, the TE bit can be cleared by writing to it once. Similarly, even if a first TE interrupt has not been processed when a further TE interrupt is generated, the DMA transfer is not aborted. Regardless of the number of TE interrupts that have been generated, the TE bit can be cleared by writing to it once.

Figure 16.13 is an example of transfer when infinite repeat mode is selected.

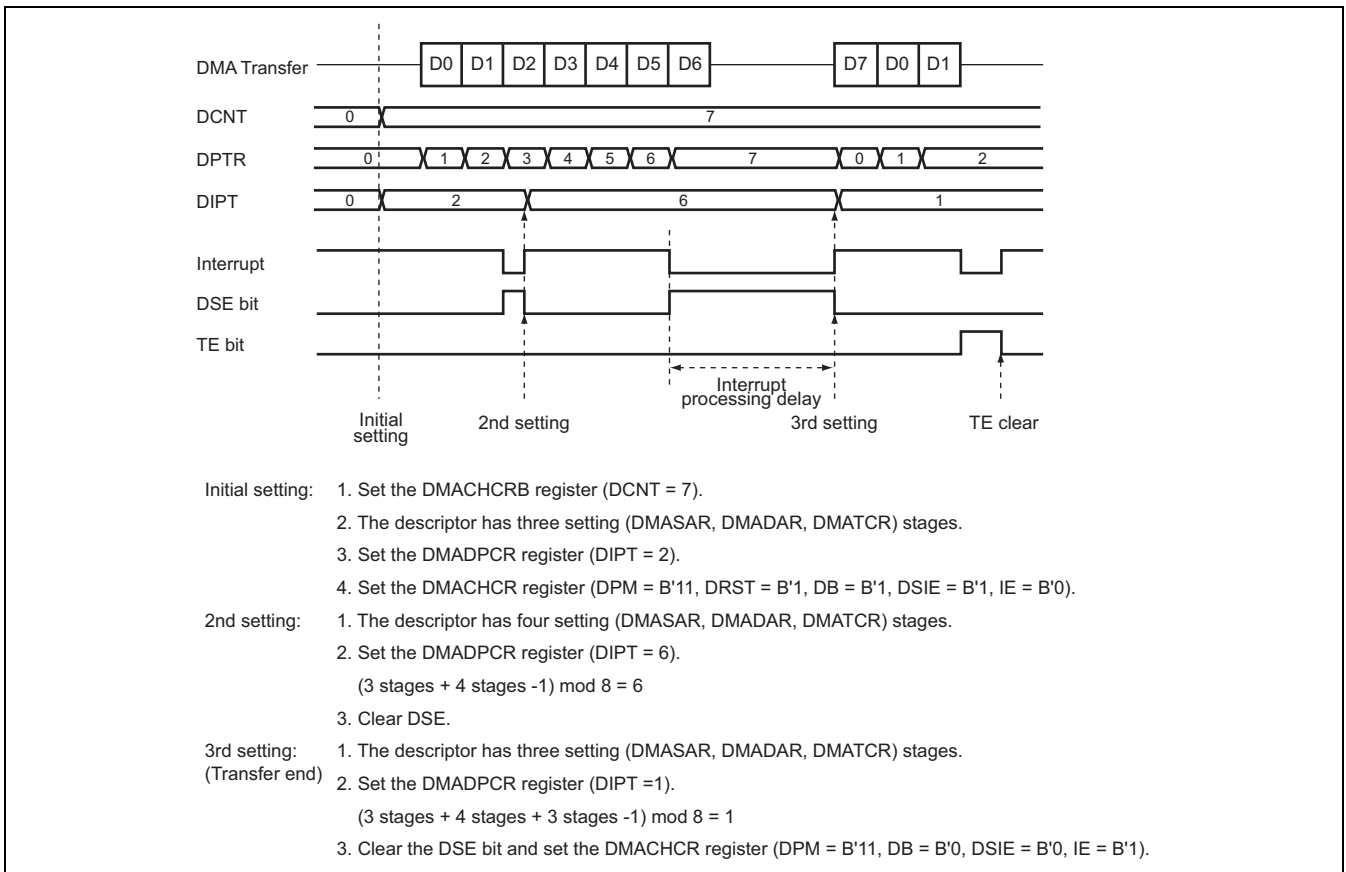

Figure 16.14 is an example of transfer when read-out interrupt mode is selected.

In each example, there are four descriptor stages.

**Figure 16.13 Operating Mode 3 (Infinite Repeat Mode)**

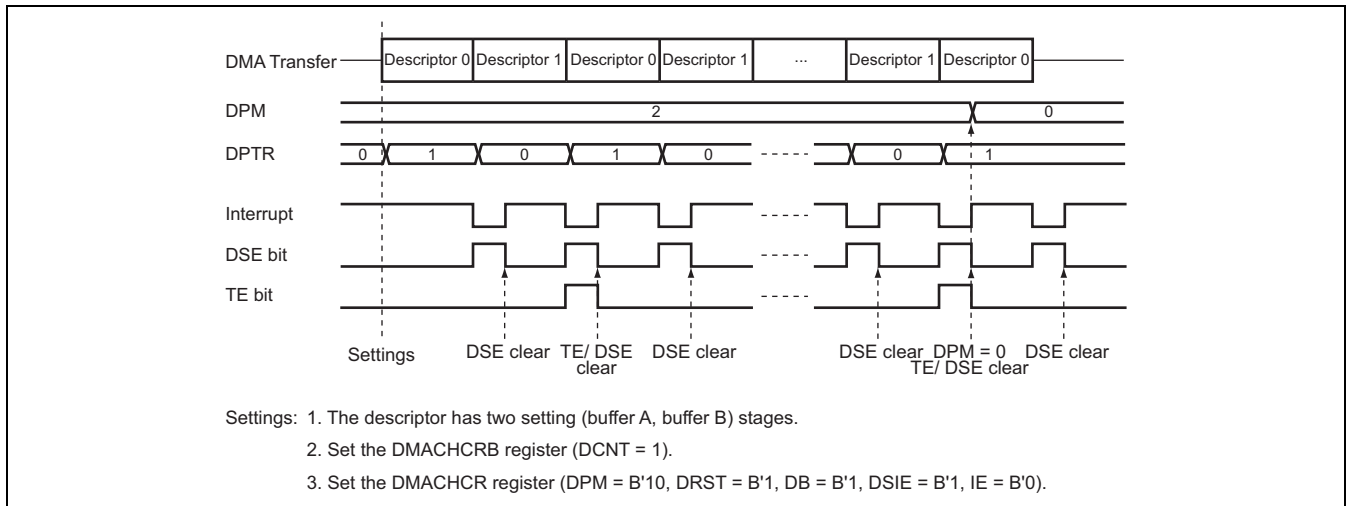

**Figure 16.14 Operating Mode 3 (Read-Out Interrupt Mode)**

### (6) Using the Descriptor Memory for Double Buffering

To use the descriptor memory for double buffering, set the number of stages of descriptor memory to 2, set the buffer configuration to the descriptor memory, and activate the memory in operating mode 2. The DSE interrupt is used in double buffering. To end the use of double buffering, disable the descriptor operating mode, which stops the transfer on completion of the transfer currently in progress.

**Figure 16.15 Using the Descriptor Memory for Double Buffering**

#### 16.4.5 Transmission Flow

Set the transfer conditions as required in the following registers:

DMA source address register (DMASAR), DMA destination address register (DMADAR), DMA transfer count register (DMATCR), DMA Channel control register (DMACHCR), DMA operation register (DMAOR) and DMA extended resource selector (DMARS)

The DMAC then transmits data in the following order.

- A transfer request is generated and the controller checks whether the transfer is allowed (DE = 1, DME = 1, TE = 0, DSE = 0, CAE = 0). When a channel is in the auto request mode, the transfer starts automatically.
- The controller checks whether updating from the descriptor memory is required.  
 Updating from the descriptor memory proceeds when the DPB bit in DMACHCR is set to 1 or the descriptor memory is enabled, if DMATCR is set to 0.  
 For updating by using the descriptor memory, see section 16.4.4, Descriptor Memory.
- Check whether address translation by the IPMMU is required.  
 Address translation by the IPMMU proceeds if the address exceeds the effective size for address translation when the DE bit in DMACHCR is enabled and updating of transfer settings from the descriptor memory is executed.
- Each time a transfer request is generated, the amount of data for a single round of transfer (specified by the TS[3:0] bits) is transmitted. The value in DMATCR is decremented by 1 every time the DMA transfer is completed.
- When the specified number of rounds of transfer are completed (the value in DMATCR is set to 0), the transfer ends normally. A TE interrupt is generated for the CPU upon the end of the transfer if the IE bit in DMACHCR is set to 1. If the descriptor memory is enabled, the processing differs with the mode of the descriptor memory. For more details, see section 16.4.4, Descriptor Memory.
- Transfer is aborted when the DMAC encounters an address error. Transfer is also aborted when the DE bit in DMACHCR or the DME bit in DMAOR is set to 0.

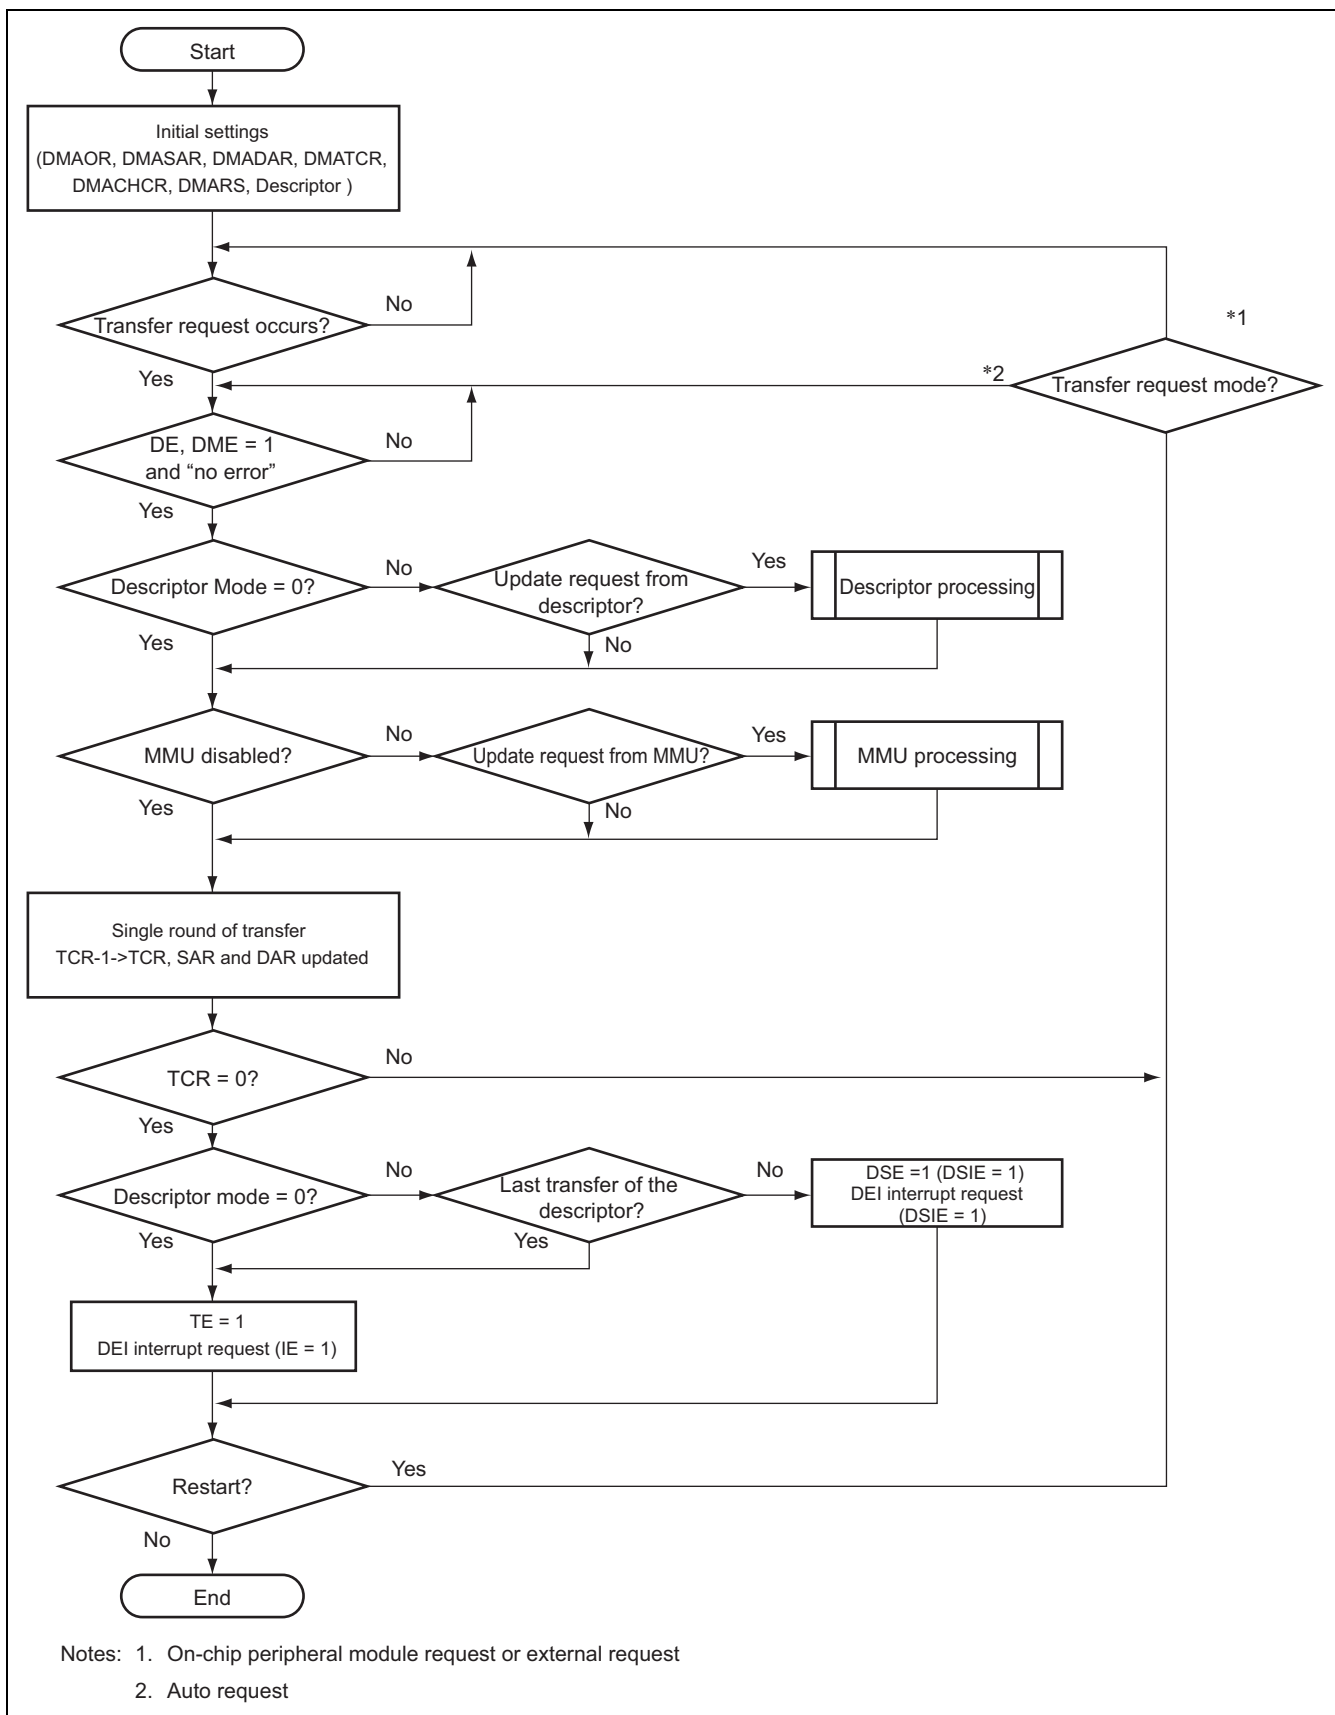

Figure 16.16 Transmission Flow

#### 16.4.6 Total Size Transmission

The amount of data for total size transmission can be set in DMATSR (in bytes), and this setting is effective regardless of the size specified in the TS bits in DMACHCR. Thereby, the desired size can be transmitted in a single round of DMA transfer.

To use this function, make the settings for total size transmission in DMASAR, DMADAR, DMATSR, DMATSRB and DMACHCR.

Total size is set in the TCR (TSR) field of descriptors and 1 is set in DMACHCRB.DTS when total size transmission and descriptors are in use.

## 16.5 Usage Notes

RZ/G1H

RZ/G1N

RZ/G1M

RZ/G1E

Pay attention to the following notes when using the SYS-DMAC.

### (1) DMA Transfer for Peripheral Modules

When executing DMA transfer for an on-chip peripheral module, set addresses on the appropriate boundary (in terms of the amount of data for each round of transfer) for the transfer source and destination addresses. Otherwise, an address error may occur.

### (2) Module Stop

While the SYS-DMAC is operating, the module stop register (MSTPCR2) should not be set to stop the SYS-DMAC. If the SYS-DMAC is stopped in this way, results of the transfer that was in progress cannot be guaranteed.

### (3) Address Error

When a DMA address error is generated, reset the registers of the channel on which the error has occurred and then start transfer anew.

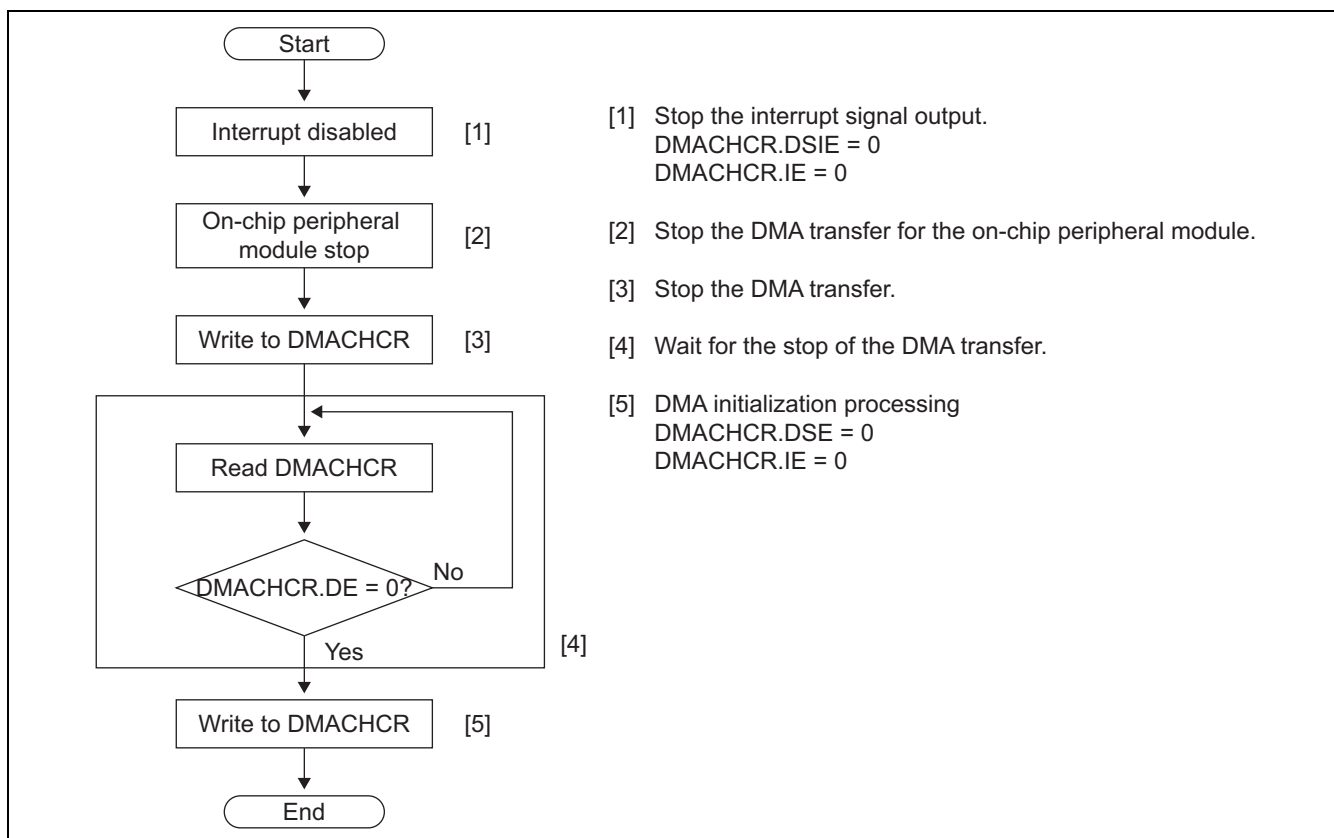

### (4) Aborting DMA Transfer

To abort a DMA transfer, disable the interrupt signal and set the DE bit in the DMA channel control register (DMACHCR) to 0 to disable the DMA transfer. If the TE and DSE bits are set when DMA transfer is aborted, these bits should be initialized. There is a possibility that TE and DSE will not be set with synchronized timing after transmission, so it's necessary to recognize the following three possibilities and take measures accordingly.

1. The DSE and TE bits are set to 1 before initialization of DMACHCR, but after the interrupt was disabled.  
The TE and DSE bits are initialized within the DMA transfer initialization sequence.
2. The DSE and TE bits are set to 1 and the controller fails to abort the transfer, after the interrupt was disabled.  
When the DE bit has become 0 after DMA transfer initialization, check the TE and DSE bits. If the TE or DSE bit is 1, go through the DMA transfer initialization process.
3. The TE and DSE bits are not cleared to 0 but the transfer is aborted, after the interrupt is disabled.  
The TE or DSE bits are not set because data for transfer still remain after transfer is aborted.

Note: Initialization of DMA transfer during execution of the last transfer leads to a delay in setting of the TE and DSE bits, so include a dummy read.

Figure 16.17 shows an example of processing to abort DMA transfer.

**Figure 16.17 Example of Processing to Abort DMA Transfer**

### (5) Descriptor Transfer

When using the descriptor transfer in cases where both conditions 1) and 2) apply, an incorrect DMA transfer proceeds before the correct transfer starts.

- Conditions

- 1) The timing of the start of transfer is specified as being after the descriptor information is loaded, i.e. DPB = 1.  
SYS-DMAC: DMACHCR\_n.DPB = 1 (refer to the description of bit 22 in section 16.3.17)
- 2) Address translation by the uTLB is enabled.

- Problem

When both conditions 1) and 2) apply, an incorrect DMA read transfer to the address formerly stored in DAR proceeds after DMA is enabled (DE = 1). Furthermore, if the address is undefined in the IPMMU, the DMA transfer may stop and operation of the DMAC may hang up without any indication of the error.

[Workarounds]

1. Use the descriptor transfer with DPB = 0.
2. Use the descriptor transfer with DPB = 1 and address translation by the uTLB disabled.
3. When using the descriptor transfer with DBP = 1 and address translation by the uTLB enabled, write the same destination address as the first address in the descriptor to the corresponding DAR before enabling DMA (DE = 1). While the incorrect DMA read transfer still proceeds, the descriptor transfer is executed correctly as long as the address written to the corresponding DAR is a defined address.

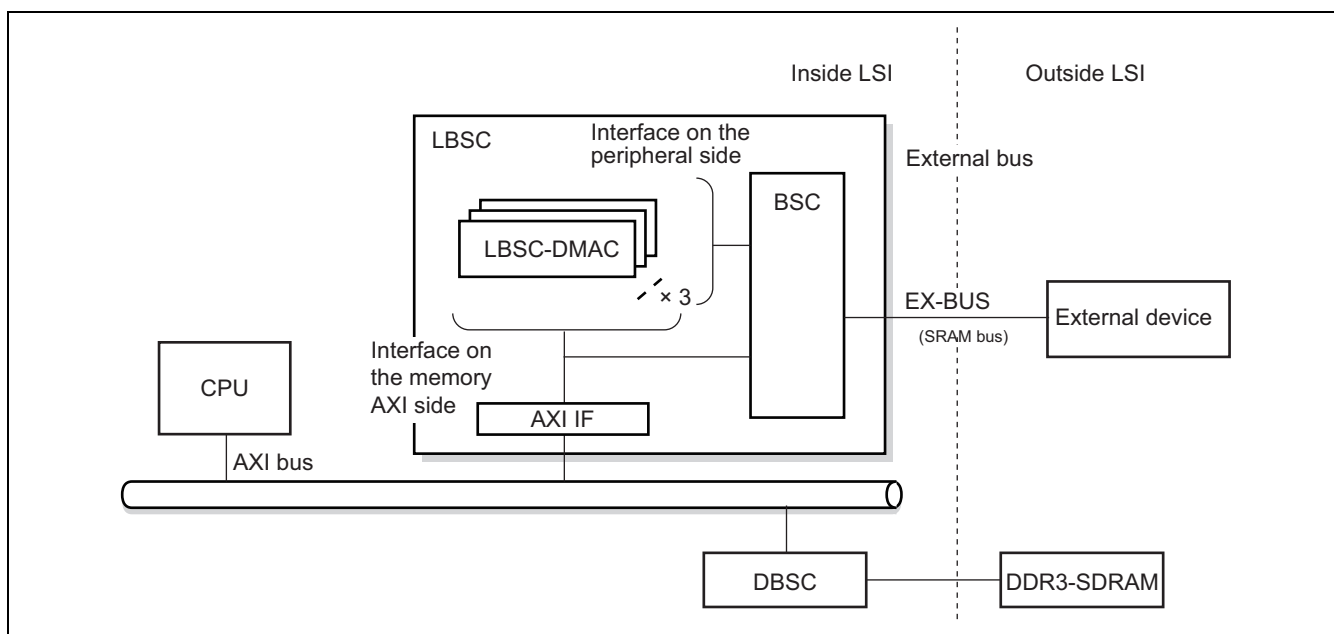

# 17. LBSC-DMAC

RZ/G1H	RZ/G1N
RZ/G1M	RZ/G1E

## 17.1 Overview

The LBSC-DMAC performs DMA transfer between the external bus (EX-BUS) and DDR3-SDRAM. The LBSC-DMAC is assigned channel numbers 0 to 2. These DMA channels are capable of independent parallel operation and a different transfer destination can be selected for each.

Different data transfer modes are selectable for each channel. In this section, the character "n" refers to one of the 43 DMA channels of the DMACs.

**Figure 17.1 Context of LBSC-DMAC**

Figure 17.1 shows the context of the LBSC-DMAC. The DMACs are connected to DDR3-SDRAM outside the chip via the DBSC, connected via a memory-side (AXI-bus) interface, and to peripherals connected to the external bus via the peripheral-side interface. Register settings within each of the DMACs select the connected (source and destination) peripheral module or memory. Of these, the LBSC-DMAC supports DMA transfers with general-purpose external devices on the EX-BUS (SRAM bus), and transfer can be performed under handshaking control by the DMA request and DMA acknowledge signals (these channels also support an auto-request mode with no handshaking).

## 17.2 Features

RZ/G1H

RZ/G1N

RZ/G1M

RZ/G1E

The LBSC-DMAC has the following features.

- Number of channels: Three channels (channels 0 to 2)
- Address space: Physical address space
- Transfer direction: Capable of transfer from a peripheral module to a memory (AXI bus), or from a memory (AXI bus) to a peripheral module
- Transfer data length:
  - For peripherals: Selectable from 1, 2, or 4 bytes.
  - For memory (AXI bus):
    - When the SWMD bit in the DCR register is cleared to 0: Access size specified for a memory (AXI bus) (For details on each channel access size, see section 17.4.8, DMA Control Register (DCR).)
    - When the SWMD bit in the DCR register is set to 1: Selectable from 1, 2, or 4 bytes
    - When final packing processing is performed while the PKMD bit in the DCR register is set to 1: 1 byte or the access size specified for a memory (AXI bus)
- Transfer burst length: 1 or 8 (Transfer with a burst length of 8 is supported only for channels 0 and 1.)
- Transfer count:
  - Maximum: 16 M (16,777,216) or 64 M (67,108,864) times (64 M is supported only for channel 0 of LBSC-DMAC.)
  - Minimum: One time
- Address mode: Dual address mode
  - Dual address mode
    - Both the transfer source and transfer destination are accessed by using addresses.
    - Values set in the DMAC's internal registers indicate the addresses for both the transfer source and the transfer destination. (Registers: DMA source address register (DSAR0 or DSAR1), DMA destination address register (DDAR0 or DDAR1), and DMA control register (DCR; bits SPDAM and DPDAM))
- Transfer requests: The external requests, peripheral requests, auto-requests, and timer requests are supported.
  - External requests (LBSC-DMAC channel 2)
    - Requests from three external DREQ pins. Low or high level detection or edge detection can be specified for the request signals (DREQ) in the LBSC register. Either the active high or active low logic can be specified by LBSC for the request acknowledge level signal (DRACK) and the acknowledge level signal (DACK). (DRACK is supported for only channel 0 of the LBSC-DMAC.)
  - Peripheral request
    - Transfer requests from on-chip peripheral modules.
  - Auto-request
    - Initiates DMA transfer according to the DMAC internal timing.
  - Timer request
    - A transfer request is generated at an interval specified by a timer in the DMAC.
- Transfer modes: Single transfer and continuous transfer modes are supported.
  - Single transfer mode
    - DMA transfer ends when transfer is completed for the transfer count specified by the DMA transfer count register.

— Continuous transfer mode

Available in all channels. If there is a next DMA transfer request (DNXT) when transfer is completed for the transfer count specified by the DMA transfer count register, the next DMA transfer information is fetched and the next DMA transfer is continued. If no next DMA transfer request (DNXT) is found, the DMAC waits until a next DMA transfer request is specified. The continuous transfer mode is terminated by the DQEND bit in the DMA command register (DCMDR).

- DMA information can be specified in two modes: one mode uses one of two sets of DMA information registers (registers in which the offset of the address is in the range from H'0000\_0000 to H'0000\_0014) repeatedly, and the other uses the two sets alternately.
- The DMAC also provides the automatic continuous transfer mode. The automatic continuous transfer mode is enabled by setting the ACMD bit in the DMA control register (DCR) to 1 while the continuous transfer mode is enabled (the CT bit in DCR is set to 1). In this mode, when transfer is completed for the transfer count specified by the DMA transfer count register, the DMAC fetches the next DMA transfer information and continues DMA transfer regardless of whether there is a next DMA transfer request (DNXT). This mode is terminated by the DQEND bit in the DMA command register (DCMDR).
- Transfer end interrupt: An interrupt request can be sent to the CPU on completion of the number of transfers specified for each DMA information unit.
- Supports DMA operation for Ultra ATA (LBSC-DMAC channels 0 and 1 only)
  - Timer monitoring function for temporarily queued requests, write-data setup/hold setting function, and CRC indicating function in DMA operations for Ultra ATA.

### 17.3 DMA Transfer Method in LBSC-DMAC

RZ/G1H

RZ/G1N

RZ/G1M

RZ/G1E

The relation of each DMA channel to peripherals is shown below. Transfers can be performed with between various functional blocks over different channels, but if destination is on the memory (AXI) side, DDR3-SDRAM via the DBSC and so on becomes the destination for transfer according to the address setting.

Channel	Application	Communication Type	Selection of Transfer Destination (On-Chip Peripheral Function)
LBSC-DMA00	Communication with general-purpose device via EX-BUS	Dual address transfer, single transfer or 8-burst transfer,	DREQ/DACK number and DMA channel number correspond.
LBSC-DMA01		DREQ/DACK handshake (Channel 0 can select DRACK) Channels 0 and 1 can select Ultra ATA DMA function. (Only RZ/G1H, M, N, and E)	External bus spaces allocated to each DMAC are specified in the LBSC internal register.
LBSC-DMA02		Dual address transfer single transfer, DREQ/DACK handshake (Only RZ/G1H, M, N, and E)	

## 17.4 Register Descriptions

Registers shown below can be accessed from ARM CPU. The DMAC has forty-three channels; some registers are prepared for each individual channel and some are used by all channels in common.

### 17.4.1 LBSC-DMAC Register Map

**Table 17.1 List of LBSC-DMAC Registers**

Register Name		Abbr.	Access Type	Address	Access Size	RZ/G Series Products			
						RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
DMA source address register 0	DMA information register set 0	DSAR0	R/W	H'FEC0 1000 + H'40 × [n]	32	√	√	√	√
DMA destination address register 0		DDAR0	R/W	H'FEC0 1004 + H'40 × [n]	32	√	√	√	√
DMA transfer count register 0		DTCR0	R/W	H'FEC0 1008 + H'40 × [n]	32	√	√	√	√
DMA source address register 1	DMA information register set 1	DSAR1	R/W	H'FEC0 100C + H'40 × [n]	32	√	√	√	√
DMA destination address register 1		DDAR1	R/W	H'FEC0 1010 + H'40 × [n]	32	√	√	√	√
DMA transfer count register 1		DTCR1	R/W	H'FEC0 1014 + H'40 × [n]	32	√	√	√	√
DMA source address status register		DSASR	R	H'FEC0 1018 + H'40 × [n]	32	√	√	√	√
DMA destination address status register		DDASR	R	H'FEC0 101C + H'40 × [n]	32	√	√	√	√
DMA transfer count status register		DTCSR	R	H'FEC0 1020 + H'40 × [n]	32	√	√	√	√
DMA control register		DCR	R/W	H'FEC0 1028 + H'40 × [n]	32	√	√	√	√

Ultra ATA error indication register	UATTER	R/W	H'FEC0 14CC	32	√	√	√	√
Ultra ATA error interrupt enable register	UATIER	R/W	H'FEC0 14D0	32	√	√	√	√
Ultra ATA CRC code indication register	UATCRCR	R	H'FEC0 14D4	32	√	√	√	√
Ultra ATA transfer mode register	UATTMR	R/W	H'FEC0 0030	32	√	√	√	√

Notes: 1. n: LBSC-DMAC channel number

2. The CPU should access the above register in longword units (32 bits). The CPU should not access the above register in byte or word units.
3. Do not write to any addresses other than listed above. Operations cannot be guaranteed if writing is attempted. Values read from addresses other than listed above are undefined.

#### [Legend]

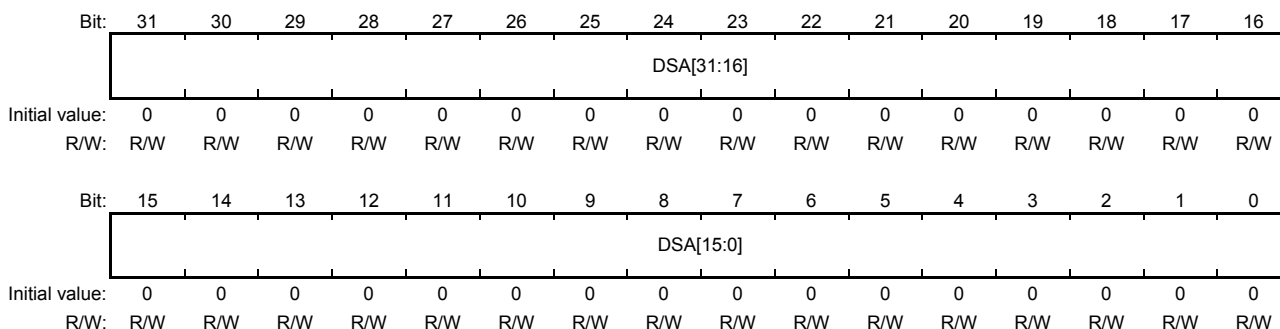

Initial value:	Register value after a reset
—:	Undefined value
R/W:	Readable/writable. The written value can be read.
R/WC1:	Readable/writable. Writing 1 initializes the bit. Writing 0 is ignored.
R:	Read-only. The write value should always be 0.
—/W:	Write-only. The read value is undefined.

All signals for the control registers and status registers are active-high.

### 17.4.2 DMA Source Address Registers 0, 1 (DSAR0, DSAR1)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

**Function:** Each register specifies the DMA start address of the transfer source.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DSA	All 0	R/W	<p>DMA Transfer Source Start Address</p> <p>The transfer source start address indicates a memory address, a peripheral module address, or an external module address according to the SMDL bit value in the DMA control register (DCR).</p> <p>When SMDL = 0: Transfer source address = Memory (AXI bus) address</p> <p>When SMDL = 1: Transfer source address = Peripheral address or external module address</p>

Notes: 1. When the address setting is a memory address, the following address boundary should be used.

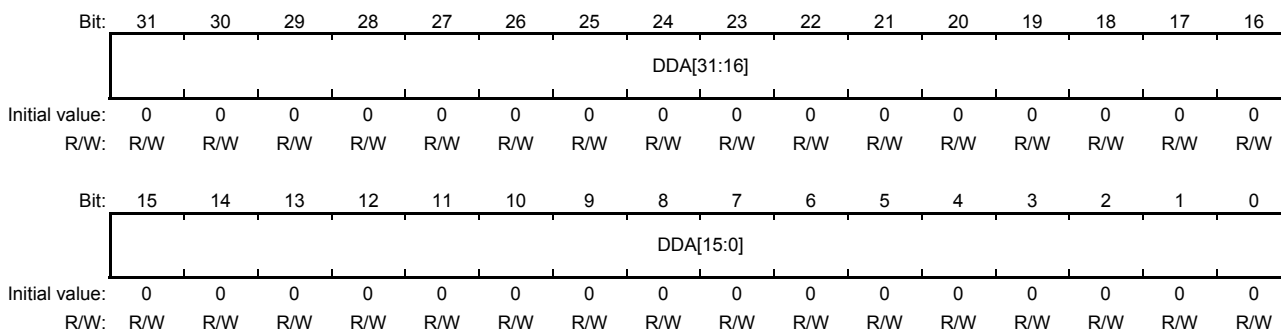

SWMD Bit in the DCR Register	LBSC-DMAC Channel Number	
	Channels 0 and 1	Channel 2
0	32-byte boundary	16-byte boundary
1	4-byte boundary	

- When the address set is an external module address, and in addition the SPDS or DPDS bit in DCR selects an 8-bit access size, up to an 8-bit boundary can be set.
- In the case of note 2, when the DMAC external module data access size is smaller than the external bus width setting in LBSC, the DMALGR register in the DMAC can be used to specify whether there is a change in data alignment (data access byte lane according to the address value). See section 17.4.22, External DMA Data Alignment Control Register (DMALGR) and specifications of section 14, LBSC within Bus Bridge.
- When an address setting is an external module address, the upper address bits 31 to 26 are not connected to the external bus. These are provided for ease in understanding the contents of software settings. Also, CS1 and EX\_CS0 to EX\_CS5 space identification using these upper bits is not performed. DMAC access destination space is identified through the LBSC external DMAC channel area allocation register.
- When an address setting is for a peripheral device, the upper address is provided for ease of understanding of the contents of software settings, and is not used for identification of access destination space specific to the peripheral.

### 17.4.3 DMA Destination Address Registers 0, 1 (DDAR0, DDAR1)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

**Function:** Each register specifies the DMA start address of the transfer destination.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DDA	All 0	R/W	<p>DMA Transfer Destination Start Address</p> <p>The transfer destination start address indicates a memory address, a peripheral module address, or an external module address according to the DMDL bit value in the DMA control register (DCR).</p> <p>When DMDL = 0: Transfer destination address = Memory (AXI bus) address</p> <p>When DMDL = 1: Transfer destination address = Peripheral module or external module address</p>

**Note:** See the notes 1 to 5 in section 17.4.2, DMA Source Address Registers 0, 1 (DSAR0, DSAR1). Those notes also apply to this register.

### 17.4.4 DMA Transfer Count Registers 0, 1 (DTCR0, DTCR1)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

**Function:** Each register specifies the DMA transfer count.

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
25 to 0	DTC	All 0	R/W	DMA Transfer Count These bits specify the DMA transfer count (number of bytes, words, or longwords). LBSC-DMAC channel 0: The maximum count is DTC = H'0, which indicates 64 M (67,108,864) times. Other than LBSC-DMAC channel 0: The maximum count is DTC = H'0, which indicates 16 M (16,777,216) times.

**Note:** This register specifies the transfer count on the peripheral side for transfer from a peripheral to a memory (AXI bus) or from a memory (AXI bus) to a peripheral. For 8-burst DMA operation, one count for each 8-burst operation.

### 17.4.5 DMA Source Address Status Register (DSASR)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

**Function:** DSASR indicates the transfer source address.

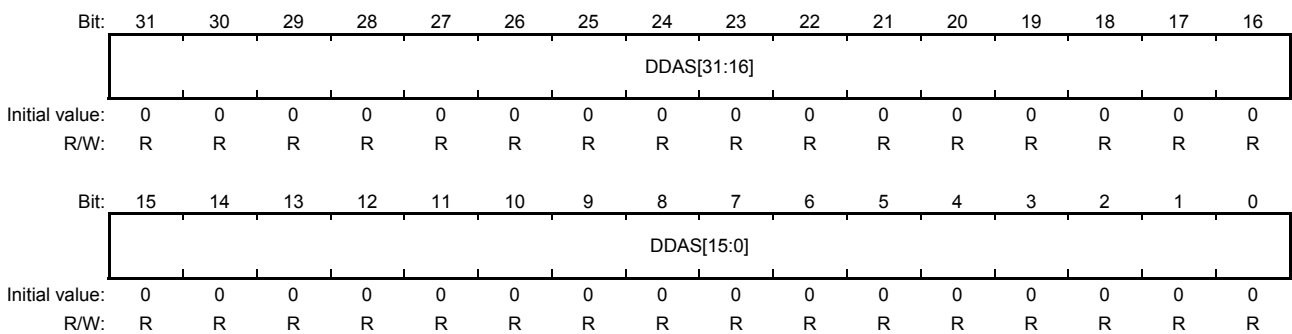

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DSAS	All 0	R	These bits indicate the latest source address for which DMA transfer has been completed.

### 17.4.6 DMA Destination Address Status Register (DDASR)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

**Function:** DDASR indicates the transfer destination address.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DDAS	All 0	R	These bits indicate the latest destination address for which DMA transfer has been completed.

### 17.4.7 DMA Transfer Count Status Register (DTCSR)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

**Function:** DTCSR indicates the remaining count of the current transfer.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16		
	—	—	—	—	—	—	DTCS[25:16]											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0		
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R		
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		
	DTCS[15:0]																	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0		
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R		

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
25 to 0	DTCS	All 0	R	Remaining DMA Transfer Count These bits indicate the remaining count of the current DMA transfer (number of bytes, words, or longwords). Note that bits 25 to 0 are used only for the LBSC-DMAC channel 0 and bits 23 to 0 are used for the other channels. The number of transferred bytes depends on the peripheral's data bus width.

**Note:** This register indicates the remaining transfer count on the peripheral side for transfer from a peripheral to a memory (AXI bus) or from a memory (AXI bus) to a peripheral.

### 17.4.8 DMA Control Register (DCR)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

**Function:** DCR specifies the transfer mode.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	DTAMD	DTAC	DTAU	DTAU1	SWMD	BTMD	PKMD	—	CT	ACMD	DIP
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	SMDL	SPDAM	SDRMD	SPDS	—	—	DMDL	DPDAM	DDRMD	DPDS	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26	DTAMD	0	R/W	Specifies the data alignment conversion mode when a memory is accessed in DMA transfer (see section 17.5.7, Data Alignment in AXI Bus Interface). 0: Conversion according to the combination of the input pin (little: endian mode) and the AXI width. 1: Conversion according to the combination of DTAC (DMA data alignment conversion), DTAU (DMA data alignment unit), and DTAU1 (8-byte conversion in 4-byte units).
25	DTAC	0	R/W	Enables or disables data alignment conversion when a memory is accessed in DMA transfer (see section 17.5.7, Data Alignment in AXI Bus Interface). This setting is valid when DTAMD = 1. 0: Disables data alignment conversion. 1: Enables data alignment conversion.
24	DTAU	0	R/W	Specifies the unit for data alignment conversion (see section 17.5.7, Data Alignment in AXI Bus Interface). This setting is valid when DTAMD = 1. 0: Byte units 1: Word units
23	DTAU1	0	R/W	Specifies whether 8-byte data alignment is performed in 4 bytes unit (see section 17.5.7, Data Alignment in AXI Bus Interface). The setting value is valid when DTAMD = 1. 0: Not performed. 1: Performed.
22	SWMD	0	R/W	Specifies memory (AXI bus) access size. 0: * (Clearing this bit to 0 is recommended when DDR3-SDRAM is specified.) 1: 4 bytes

Bit	Bit Name	Initial Value	R/W	Description
21	BTMD	0	R/W	Specifies the burst DMA transfer (only for LBSC-DMAC channels 0 and 1). Burst DMA transfer is performed for peripherals. 0: Does not transfer in burst mode. 1: Transfers in burst mode (burst length is fixed to eight).
20	PKMD	0	R/W	Enables or disables packing of data read from a peripheral for DMA transfer from the peripheral to the AXI bus. 0: Disables packing. 1: Enables packing.
19	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
18	CT	0	R/W	Specifies continuous DMA transfer. 0: Does not transfer in continuous mode. 1: Transfers in continuous mode.
17	ACMD	0	R/W	Specifies automatic continuous DMA transfer (valid only when CT = 1). 0: Does not transfer in automatic continuous mode (checks DNXT = 1 in DCMDR). 1: Transfers in automatic continuous mode (regardless of the DNXT bit in DCMDR).
16	DIP	0	R/W	Specifies the valid DMA information set(s). 0: Uses one DMA information set repeatedly. 1: Uses two DMA information sets alternately.
15, 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13	SMDL	0	R/W	Selects the transfer source module. 0: Memory (AXI bus) 1: Peripheral
12	SPDAM	0	R/W	Specifies whether to fix or increment the transfer source peripheral address. 0: Fixes the peripheral address at the value specified in DSAR0 or DSAR1. 1: Increments the peripheral address (increments by one for 8-bit transfer, by two for 16-bit transfer, or by 4 for 32-bit transfer). When SMDL = 0, the address for memory access (via the AXI bus) is incremented regardless of the setting of this bit.
11, 10	SDRMD	00	R/W	These bits specify the DMA request mode for the transfer source. 00: Module request (external request or peripheral module request) 01: Auto-request 10: Timer request 11: Setting prohibited When SMDL = 0, clear the SDRMD bits to B'00 or set them to the same value as that of the DDRMD bits.
9, 8	SPDS	00	R/W	These bits specify the data bus width for the transfer source peripheral. 00: 8 bits 01: 16 bits 10: 32 bits 11: Setting prohibited When SMDL = 0, clear the SPDS bits to B'00 or set them to the same value as that of the DPDS bits.

Bit	Bit Name	Initial Value	R/W	Description
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5	DMDL	0	R/W	Selects the transfer destination module. 0: Memory (AXI bus) 1: Peripheral
4	DPDAM	0	R/W	Specifies whether to fix or increment the transfer destination peripheral address. 0: Fixes the peripheral address at the value specified in DDAR0 or DDAR1. 1: Increments the peripheral address (increments by one for 8-bit transfer, by two for 16-bit transfer, or by 4 for 32-bit transfer). When DMDL = 0, the address for memory access (via the AXI bus) is incremented regardless of the setting of this bit.
3, 2	DDRMD	00	R/W	These bits specify the DMA request mode for the transfer destination. 00: Module request (external request or peripheral module request) 01: Auto-request 10: Timer request 11: Setting prohibited When DMDL = 0, clear the DDRMD bits to B'00 or set them to the same value as that of the SDRMD bits.
1, 0	DPDS	00	R/W	These bits specify the data bus width for the transfer destination peripheral. 00: 8 bits 01: 16 bits 10: 32 bits 11: Setting prohibited When DMDL = 0, clear the DPDS bits to B'00 or set them to the same value as that of the SPDS bits.

- Notes:
- When SMDL and DMDL = 1 and 0, data is transferred from a peripheral to a memory.  
When SMDL and DMDL = 0 and 1, data is transferred from a memory to a peripheral.  
Setting SMDL and DMDL = "1 and 1" or "0 and 0" is prohibited.
  - Not all DMAC functions can be applied to every peripheral. DMAC functions must be specified appropriately according to the functions and restrictions of each peripheral.
  - Since the width of the EX-BUS is 16 bits, setting of the SPDS or DPDS bits for the LBSC-DMAC to B'10 (selecting a transfer source or destination width of 32 bits, respectively) is prohibited.
- \* The following table summarizes the memory (AXI) access size in each DMAC channel when SWMD bit is cleared to 0.

SWMD Bit in DCR Register	LBSC-DMAC Channel Number	
	Channels 0 and 1	Channel 2
0	32 bytes	16 bytes

### 17.4.9 DMA Command Register (DCMDR)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

**Function:** DCMDR activates or stops DMA transfer.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	BDOUT	DQSPD	DQSPC	DMSPD	DMSP C	DQEND	DNXT	DMEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7	BDOUT	0	—/W	1: Forcibly writes the data read from a peripheral to the AXI bus side (Transfer direction: from a peripheral to the AXI bus). Writing 1 to this bit forcibly writes to the AXI bus side, and then terminates DMA transfer.
6	DQSPD	0	—/W	1: Temporarily stops transfer in DMA information units.
5	DQSPC	0	—/W	1: Cancels temporary transfer stop in DMA information units.
4	DMSPD	0	—/W	1: Temporarily stops transfer in bus cycle units.
3	DMSPC	0	—/W	1: Cancels temporary transfer stop in bus cycle units.
2	DQEND	0	—/W	1: Terminates continuous DMA transfer mode. Only the DMA information specified before is transferred, and then continuous transfer mode is terminated.
1	DNXT	0	—/W	1: Requests the next DMA transfer. In continuous transfer mode, after the current DMA information is transferred, the next DMA information is transferred.
0	DMEN	0	—/W	1: Activates DMA transfer.

**Note:** For use of BDOUT, see sections 17.5.3, Packing Data Read from Peripheral or External Module and 17.5.4, Limitations on Packing of Data Read from Peripheral or External Module.

**17.4.10 DMA Forced Stop Register (DSTPR)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

**Function:** DSTPR forcibly terminates DMA transfer.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DMSTP
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	—/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	DMSTP	0	—/W	1: Forcibly terminates DMA transfer. After the current bus cycle is completed, DMA transfer is terminated. (Values set for the DMA transfer status registers (DSASR, DDASR, and DTCSR) are retained.)

### 17.4.11 DMA Status Register (DSTSR)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

**Function:** DSTSR indicates the DMA transfer status.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	NDP1	NDP0	DQSPS	DMSPS	DQSTS	DRSTS	DMSTS
Initial value:	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 7	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
6	NDP1	0	R	Next DMA Transfer Information Register Status 1 0: Does not transfer DMA information in DMA information register set 1 in the next DMA information transfer. 1: Transfers DMA information in DMA information register set 1 in the next DMA information transfer.
5	NDP0	1	R	Next DMA Transfer Information Register Status 0 0: Does not transfer DMA information in DMA information register set 0 in the next DMA information transfer. 1: Transfers DMA information in DMA information register set 0 in the next DMA information transfer.
4	DQSPS	0	R	Temporary Stop Status of DMA Information Updating 0: Normal operation 1: DMA information updating is temporarily stopped.
3	DMSPS	0	R	Temporary Stop Status of DMA Transfer 0: Normal operation 1: DMA transfer is temporarily stopped.
2	DQSTS	0	R	DMA Acceptance End Status 0: DMA information can be accepted. 1: DMA information acceptance is stopped.
1	DRSTS	0	R	DMA Transfer Request Status 0: Next DMA transfer has not been requested. 1: Next DMA transfer has been requested.
0	DMSTS	0	R	DMA Status 0: DMA transfer has been completed. 1: DMA transfer is active.

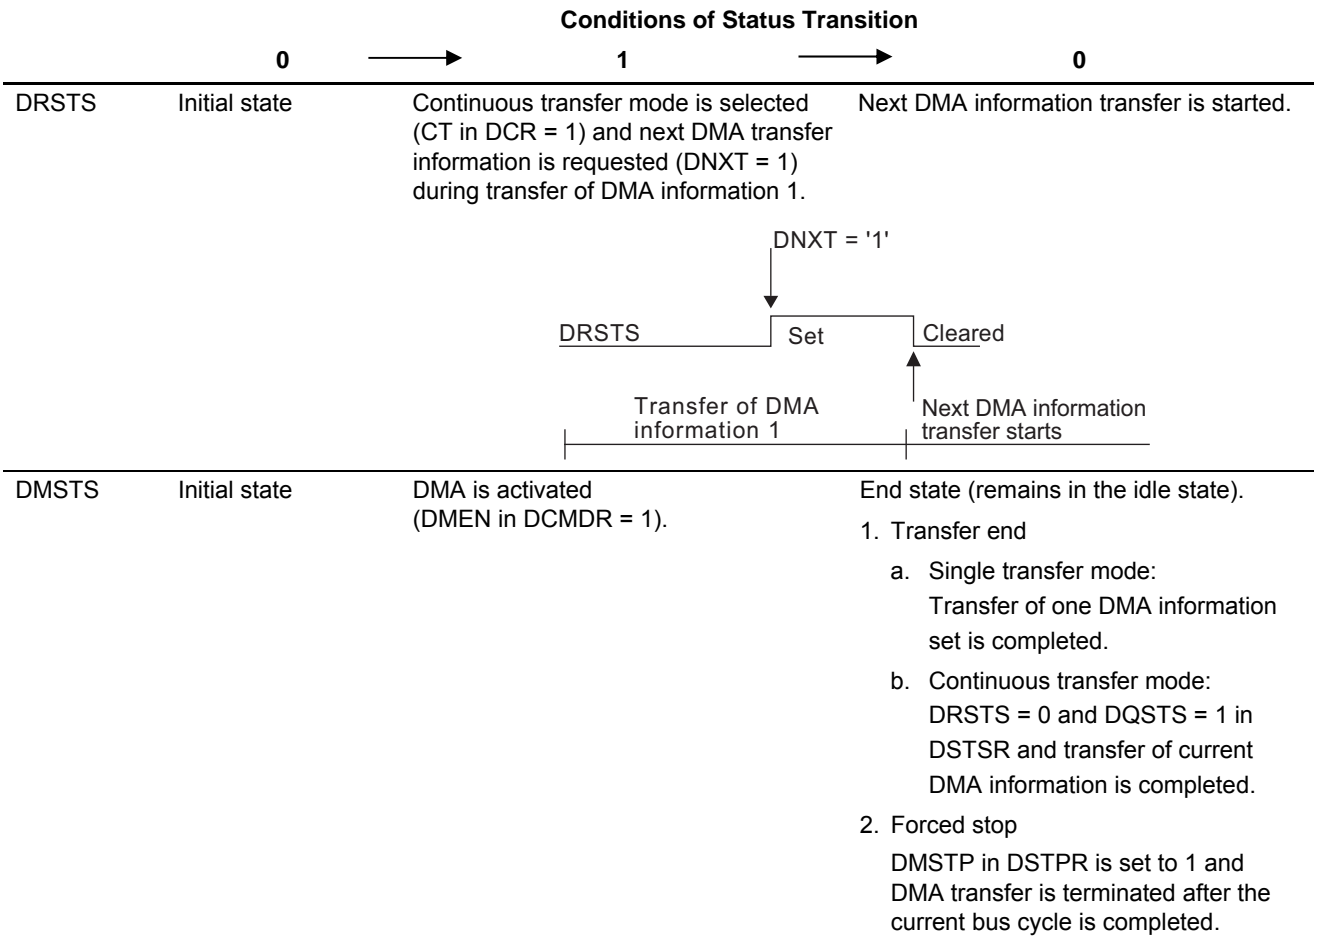

Note: Either NDP0 or NDP1 (next DMA transfer information register status 0 or 1) is always set to 1.

The following shows the transition of each bit status in DSTSR.

		<b>Conditions of Status Transition</b>	
		0	1
		→	→
		0	0
NDP1	Initial state	Continuous transfer mode is selected and information register sets 0 and 1 are used alternately (DIP in DCR = 1): DMA transfer for information register set 0 is in progress.	Continuous transfer mode is selected and information register sets 0 and 1 are used alternately (DIP in DCR = 1): DMA transfer for information register set 1 is in progress.
NDP0	—	1. Initial state 2. Single transfer mode: Always 3. Continuous transfer mode is selected and information register set 0 is used repeatedly (DIP in DCR = 0): Always 4. Continuous transfer mode is selected and information register sets 0 and 1 are used alternately (DIP in DCR = 1): DMA transfer for information register set 1 is in progress.	Continuous transfer mode is selected and information register sets 0 and 1 are used alternately (DIP in DCR = 1): DMA transfer for information register set 0 is in progress.
DQSPS	Initial state	DMA transfer is temporarily stopped in DMA information units (DQSPD in DCMDR = 1) and the current information transfer is completed.	Temporary stop of DMA transfer in DMA information units is canceled (DQSPC in DCMDR = 1).
DMSPS	Initial state	DMA transfer is temporarily stopped in bus cycle units (DMSPD in DCMDR = 1) and the current bus cycle is completed.	Temporary stop of DMA transfer in bus cycle units is canceled (DMSPC in DCMDR = 1).
DQSTS	Initial state	Continuous transfer mode is selected (CT in DCR = 1) and DMA continuous transfer is terminated (DQEND = 1) during transfer of DMA information 1.	Transfer of DMA transfer information ends.

### 17.4.12 DMA Channel Debugging Register (DDBGR)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

**Function:** DDBGR is used for debugging.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DBG02	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	DBG01		—	DBG00			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	DBG02	0	R/W	Test Bit This bit is a test bit and cannot be written to. If this bit is written to, correct operation cannot be guaranteed.
30 to 7	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
6 to 4	DBG01	All 0	R	Test Bits
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	DBG00	All 0	R	Test Bits

### 17.4.13 DMA Channel Debugging Register 2 (DDBGR2)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

**Function:** DDBGR2 is used to for debugging.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	DBG12	DBG11		—	—	DBG10									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DBG10															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
30	DBG12	0	R/W	Test Bit This bit is a test bit and cannot be written to. If this bit is written to, correct operation cannot be guaranteed.
29, 28	DBG11	All 0	R/W	Test Bits These bits are test bits and cannot be written to. If these bits are written to, correct operation cannot be guaranteed.
27, 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
25 to 0	DBG10	All 0	R	Test Bits

**17.4.14 DMA Timer Control Register (DTIMR)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: DTIMR specifies the timer cycle in the DMAC.

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	DTIM	All 0	R/W	DMAC Internal Timer Cycle Set Request mode: Specify the DMA request interval in timer request mode. Request interval: DTIM × peripheral-side bus clock cycle (ns) Peripheral-side bus clock cycle (ns) for LBSC-DMAC: Approximately 15 ns (EX-BUS frequency 65.00 MHz) Approximately 23 ns (EX-BUS frequency 43.33 MHz) Note: Even in timer request mode, operation is the same as that in auto-request mode when the value of DTIM is 0.

### 17.4.15 DMA Request Mask Control Register (DRMSKR)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

**Function:** DRMSKR0 specifies the timing for detecting DMA requests in the external-bus DMAC.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	DRMSK2[3:0]			DRMSK1[3:0]			DRMSK0[3:0]			—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 8	DRMSK2	All 0	R/W	These bits specify the number of clock cycles from the completion of a DMA transfer (at the time of CS# signal negation) until the next DMA request is detected, for each DMAC channel corresponding to each field. Request detection cycle: DRMSK × external bus clock cycle (ns)
7 to 4	DRMSK1	All 0	R/W	
3 to 0	DRMSK0	All 0	R/W	

**Note:** Settings for DRMSK2 to DRMSK0 are only valid when level-detection is specified for the external DREQ signal (specified by EXDMCRy in the LBSC) for the channel. In edge-detection mode, set the bits to 0.

### 17.4.16 DMA Memory Access Priority Level Control Register (DMLVLR)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

**Function:** DMLVLR specifies the access priority level (1 or 2).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	DMLV2	DMLV1	DMLV0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2	DMLV2	0	R/W	These bits specify the external bus arbitration priority group for each DMAC channel which corresponds to each bit. 0: Level 2 (Low: Group 2) 1: Level 1 (High: Group 1)
1	DMLV1	0	R/W	
0	DMLV0	0	R/W	

### 17.4.17 DMA Transfer End Interrupt Status Register (DINTSR)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

**Function:** DINTSR indicates the DMA transfer end interrupt status.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	DTE2	DTE1	DTE0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2	DTE2	0	R	DMA Transfer End Interrupt Status
1	DTE1	0	R	Each bit indicates the DMA transfer status (n: DMA channel number).
0	DTE0	0	R	0: Initial state or data is being transferred before the count specified by DTCR is reached. 1: Transfer has been completed for the count specified by DTCR.

### 17.4.18 DMA Transfer End Interrupt Status Clear Register (DINTCR)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

**Function:** DINTCR clears the DMA transfer end interrupt status.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	DTEC2	DTEC1	DTEC0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	—/W	—/W	—/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2	DTEC2	0	—/W	DMA Transfer End Interrupt Status Clear
1	DTEC1	0	—/W	Writing 1 to each bit clears the corresponding DMA transfer end interrupt status (n: DMAC channel number)
0	DTEC0	0	—/W	Writing 0 to these bits is ignored. Each bit is always read as 0.

**17.4.19 DMA Transfer End Interrupt Enable Register (DINTMR)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

**Function:** DINTMR controls output of DMA transfer end interrupts.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	DTEM2	DTEM1	DTEM0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2	DTEM2	0	R/W	DMA Transfer End Interrupt Output Control
1	DTEM1	0	R/W	An interrupt signal is output as a level signal (n: DMA channel number).
0	DTEM0	0	R/W	0: Does not output an interrupt on completion of a DMA transfer. 1: Outputs an interrupt on completion of a DMA transfer.

### 17.4.20 DMA Activation Status Register (DACTSR)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

**Function:** DACTSR indicates the activation status of each channel.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	DS2	DS1	DS0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2	DS2	0	R	DMA Channel n Status (n: DMA channel number)
1	DS1	0	R	0: Idle state
0	DS0	0	R	1: Active state

### 17.4.21 Software-Reset Registers (LSRSTR0 to LSRSTR2)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

**Function:** Each register resets DMA channel n.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SRST
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SRST	0	R/WC1	Software Reset Resets DMA channel n. 0: Writing 0 is ignored. 1: Resets DMA channel n. This register is always read as 0.

**Note:** Writing 1 resets the DMAC regardless of the DMA transfer status. The same registers are reset as when a power-on reset is performed. Accordingly, a software reset should be used only while DMA transfer is not in progress (e.g., during system debugging). To stop operation, forced termination or temporary stop should be specified instead of software reset. In the registers used by all channels in common (DMA transfer end interrupt status register (DINTSR) and DMA transfer end interrupt enable register (DINTMR)), only the bits corresponding to the software-reset channel are initialized.

### 17.4.22 External DMA Data Alignment Control Register (DMALGR)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

**Function:** DMALGR specifies whether there is a data alignment conversion in external bus access by the external bus DMAC.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	DMLG2			DMLG1			DMLG0					
					exbwe	exac	exbw	exbwe	exac	exbw	exbwe	exac	exbw			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 0	DMLGn exbwe	0	R/W	Specifies whether there is an EX-BUS data alignment conversion for each DMAC channel (n: DMAC channel number). When the DMAC/DCR setting DMA access bus width is smaller than the external bus width for the relevant DMA area set in LBSC. 0: Access byte lanes fixed 1: Access byte lanes variable
	DMLGn exac	0	R/W	Specifies endian setting when there is alignment conversion with the exbwe bit set to 1 (n: DMAC channel number). 0: Big endian 1: Little endian
	DMLGn exbw	00	R/W	Specifies the unit for data alignment conversion with the exbwe bit set to 1 (n: DMAC channel number). 00: 8 bits 01: 16 bits 10: Setting prohibited 11: Invalid

**Note:** Does not need to be set when the bus width set in LBSC and the DMA access size set in DMAC/DCR are the same. For details, see section 14.6.3 (1), Data Alignment during LBSC-DMAC Access in specifications for LBSC within Bus Bridge.

### 17.4.23 LBSC-DMA AXI Priority Control Register (LBSC-DMASPR)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

**Function:** LBSC-DMASPR specifies the AXI bus access priority level for external DMAC.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	SPRR2				SPRR1				SPRR0			
Initial value:	0	0	0	0	1	0	0	0	1	0	0	0	1	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 0	SPRRn	H'8	R/W	Specify the AXI bus access priority level for each DMAC channel (n: DMAC channel number). Priority: H'0 (lowest) to H'F (highest)

**Note:** Since AXI bus access priority level settings relate to priority control for the AXI bus overall, priority levels with other access modules must be confirmed when making settings.

### 17.4.24 Ultra ATA DMA Mode Register (UATMR)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

**Function:** UATMR enables the Ultra ATA mode and specifies data alignment in Ultra ATA mode.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	UTDR1		—	—	UTWE1	UTRE1	—	UTSL1		UATM1
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R	R	R/W	R/W	R	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	UTDR0		—	—	UTWE0	UTRE0	—	UTSL0		UATM0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R	R	R/W	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
25, 24	UTDR1	00	R/W	[For Ultra ATA port 1] These bits select the external pin for the DREQ signal in the Ultra ATA interface. 00: No external pin is used. 01: The DREQ0 pin in the EX-BUS is used as the DREQ (DMARQ) pin. 10: The DREQ1 pin in the EX-BUS is used as the DREQ (DMARQ) pin. 11: No external pin is used.
23, 22	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
21	UTWE1	0	R/W	[For Ultra ATA port 1] Enables or disables data alignment conversion for write operation in Ultra ATA mode. 0: Disables data alignment conversion for DMA write operation. 1: Enables data alignment conversion for DMA write operation. (Data alignment is in 2-byte units for every 4 bytes of data.)
20	UTRE1	0	R/W	[For Ultra ATA port 1] Enables or disables data alignment conversion for read operation in Ultra ATA mode. 0: Disables data alignment conversion for DMA read operation. 1: Enables data alignment conversion for DMA read operation. (Data alignment is in 2-byte units for every 4 bytes of data.)
19	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
18, 17	UTSL1	00	R/W	[For Ultra ATA port 1] These bits select the external pin for the IORDY (DDMARDY#/DSTROBE) signal in the Ultra ATA interface. 00: No external pin is used. 01: The EX_WAIT0 pin in the EX-BUS is used as the IORDY (DDMARDY#/DSTROBE) pin. 10: The EX_WAIT1 pin in the EX-BUS is used as the IORDY (DDMARDY#/DSTROBE) pin. 11: The EX_WAIT2 pin in the EX-BUS is used as the IORDY (DDMARDY#/DSTROBE) pin.
16	UATM1	0	R/W	[For Ultra ATA port 1] Specifies the Ultra ATA operating mode. 0: Normal DMA mode 1: Ultra ATA DMA mode
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9, 8	UTDR0	00	R/W	[For Ultra ATA port 0] These bits select the external pin for the DREQ signal in the Ultra ATA interface. 00: No external pin is used. 01: The DREQ0 pin in the EX-BUS is used as the DREQ (DMARQ) pin. 10: The DREQ1 pin in the EX-BUS is used as the DREQ (DMARQ) pin. 11: No external pin is used.
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5	UTWE0	0	R/W	[For Ultra ATA port 0] Enables or disables data alignment conversion for write operation in Ultra ATA mode. 0: Disables data alignment conversion for DMA write operation. 1: Enables data alignment conversion for DMA write operation. (Data alignment is in 2-byte units for every 4 bytes of data.)
4	UTRE0	0	R/W	[For Ultra ATA port 0] Enables or disables data alignment conversion for read operation in Ultra ATA mode. 0: Disables data alignment conversion for DMA read operation. 1: Enables data alignment conversion for DMA read operation. (Data alignment is in 2-byte units for every 4 bytes of data.)
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
2, 1	UTSL0	00	R/W	<p>[For Ultra ATA port 0]</p> <p>These bits select the external pin for the IORDY (DDMARDY#/DSTROBE) signal in the Ultra ATA interface.</p> <p>00: No external pin is used.</p> <p>01: The EX_WAIT0 pin in the EX-BUS is used as the IORDY (DDMARDY#/DSTROBE) pin.</p> <p>10: The EX_WAIT1 pin in the EX-BUS is used as the IORDY (DDMARDY#/DSTROBE) pin.</p> <p>11: The EX_WAIT2 pin in the EX-BUS is used as the IORDY (DDMARDY#/DSTROBE) pin.</p>
0	UATM0	0	R/W	<p>[For Ultra ATA port 0]</p> <p>Specifies the Ultra ATA operating mode.</p> <p>0: Normal DMA mode</p> <p>1: Ultra ATA DMA mode</p>

- Notes:
1. For the Ultra ATA DMA operation, refer to section 14, LBSC within Bus Bridge.
  2. When the UTSL bits (external pin selection for the IORDY (DDMARDY#/DSTROBE) signal in the Ultra ATA interface) are set to B'00 (initial value: no external pin is used), the IORDY (DDMARDY#/DSTROBE) signal in the Ultra ATA interface is set to an internally-fixed value and does not work correctly; be sure to select one of EX\_WAIT0 to EX\_WAIT2 in the EX-BUS.
  3. When the UTDR bits (external pin selection for the DREQ signal in the Ultra ATA interface) are set to B'00 or B'11 (no external pin is used), the DREQ signal in the Ultra ATA interface is set to an internally-fixed value and does not work correctly; be sure to select DREQ0 or DREQ1 in the EX-BUS.

**17.4.25 Ultra ATA Write Cycle Setting Register (UATWCR)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

**Function:** UARWCR (a dedicated register of the LBSC-DMAC) specifies the setup and hold clock cycles of the write data relative to the HSTROBE signal in Ultra ATA DMA operation.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	UATWCYC1		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	UATWCYC0		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

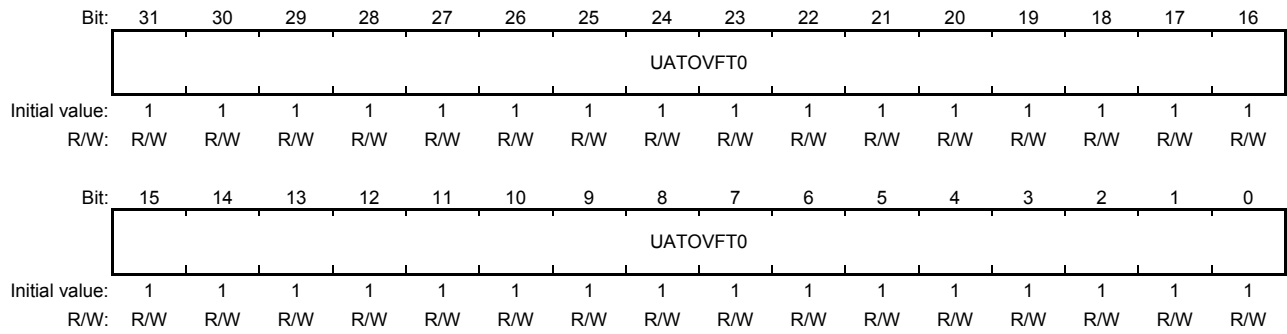

Bit	Bit Name	Initial Value	R/W	Description
31 to 19	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
18 to 16	UATWCYC1	H'0	R/W	[For Ultra ATA port 1] These bits specify the setup and hold clock cycles of the write data relative to the HSTROBE (DIOR#) signal in Ultra ATA DMA operation. H'0: Setup = 1 bus clock cycle, Hold = 1 bus clock cycle H'1: Setup = 2 bus clock cycles, Hold = 1 bus clock cycle H'2: Setup = 2 bus clock cycles, Hold = 2 bus clock cycles H'3: Setup = 3 bus clock cycles, Hold = 2 bus clock cycles H'4: Setup = 3 bus clock cycles, Hold = 3 bus clock cycles H'5: Setup = 4 bus clock cycles, Hold = 3 bus clock cycles H'6: Setup = 4 bus clock cycles, Hold = 4 bus clock cycles H'7: Setup = 5 bus clock cycles, Hold = 4 bus clock cycles
15 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2 to 0	UATWCYC0	H'0	R/W	[For Ultra ATA port 0] These bits specify the setup and hold clock cycles of the write data relative to the HSTROBE (DIOR#) signal in Ultra ATA DMA operation. H'0: Setup = 1 bus clock cycle, Hold = 1 bus clock cycle H'1: Setup = 2 bus clock cycles, Hold = 1 bus clock cycle H'2: Setup = 2 bus clock cycles, Hold = 2 bus clock cycles H'3: Setup = 3 bus clock cycles, Hold = 2 bus clock cycles H'4: Setup = 3 bus clock cycles, Hold = 3 bus clock cycles H'5: Setup = 4 bus clock cycles, Hold = 3 bus clock cycles H'6: Setup = 4 bus clock cycles, Hold = 4 bus clock cycles H'7: Setup = 5 bus clock cycles, Hold = 4 bus clock cycles

Note: For the Ultra ATA DMA operation, refer to section 14, LBSC within Bus Bridge.

**17.4.26 Ultra ATA Timeout Period Setting Register 0 (UATTSR0)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

**Function:** UATTSR0 specifies the period until timeout when communication temporarily stops in Ultra ATA DMA read operation.

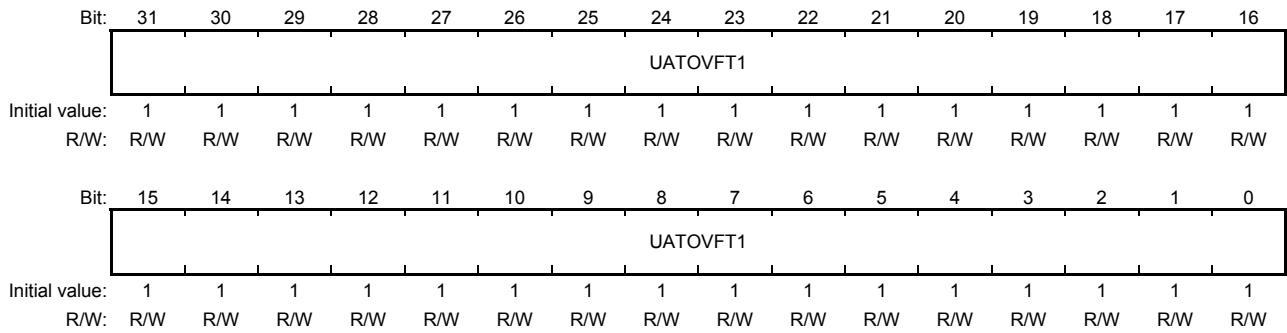

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	UATOVFT0	All 1	R/W	<p>[For Ultra ATA port 0]</p> <p>These bits specify the period until HOST timeout when communication temporarily stops (no change in DSTROBE) in Ultra ATA DMA read operation.</p> <p>Timeout period (ns) = Set value converted to decimal × EX-BUS clock period (ns).</p>

**Note:** For the Ultra ATA DMA operation, refer to section 14, LBSC within Bus Bridge.

**17.4.27 Ultra ATA Timeout Period Setting Register 1 (UATTSR1)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: UATTSR1 specifies the period until timeout when communication temporarily stops in Ultra ATA DMA read operation.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	UATOVFT1	All 1	R/W	<p>[For Ultra ATA port 1]</p> <p>These bits specify the period until HOST timeout when communication temporarily stops (no change in DSTROBE) in Ultra ATA DMA read operation.</p> <p>Timeout period (ns) = Set value converted to decimal × EX-BUS clock period (ns).</p>

Note: For the Ultra ATA DMA operation, refer to section 14, LBSC within Bus Bridge.

### 17.4.28 Ultra ATA Error Indication Register (UATTER)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

**Function:** UATTER indicates the error status in Ultra ATA DMA operation.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DER1
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	DER1	0	R/W	[For Ultra ATA port 1] Indicates whether timeout occurs due to a temporary communication stop (no change in DSTROBE) during Ultra ATA DMA read operation. The timeout period is specified through UATTSR1. (When reading) 0: No timeout error has occurred. 1: A timeout error has occurred (interrupt is generated when enabled through UATIER). (When writing) No timeout detection.
15 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	PER	0	R/W	Indicates whether PIO access is executed for the area allocated to the ATA space during Ultra ATA DMA operation. (The PIO access attempted for the area allocated to the ATA space during Ultra ATA DMA operation is ignored.) 0: No PIO access has been executed for the area allocated to the ATA space during Ultra ATA DMA operation. 1: PIO access has been executed for the area allocated to the ATA space during Ultra ATA DMA operation.
0	DER0	0	R/W	[For Ultra ATA port 0] Indicates whether timeout occurs due to a temporary communication stop (no change in DSTROBE) during Ultra ATA DMA read operation. The timeout period is specified through UATTSR0. (When reading) 0: No timeout error has occurred. 1: A timeout error has occurred (interrupt is generated when enabled through UATIER). (When writing) No timeout detection.

**Note:** For the Ultra ATA DMA operation, refer to section 14, LBSC within Bus Bridge.

### 17.4.29 Ultra ATA Error Interrupt Enable Register (UATIER)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

**Function:** UATIER enables interrupts when errors occur in Ultra ATA DMA operation.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DERE1
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PERE	DERE0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	DERE1	0	R/W	[For Ultra ATA port 1] Specifies whether to output an interrupt notification signal while the DER1 bit in UATTER is set to 1. 0: The interrupt notification signal is not output. 1: The interrupt notification signal is output.
15 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	PERE	0	R/W	Specifies whether to output the interrupt notification signal while the PER bit in UATTER is set to 1. 0: The interrupt notification signal is not output. 1: The interrupt notification signal is output.
0	DERE0	0	R/W	[For Ultra ATA port 0] Specifies whether to output an interrupt notification signal while the DER0 bit in UATTER is set to 1. 0: The interrupt notification signal is not output. 1: The interrupt notification signal is output.

**Note:** For the Ultra ATA DMA operation, refer to section 14, LBSC within Bus Bridge.

**17.4.30 Ultra ATA CRC Code Indication Register (UATCRCR)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: UATCRCR indicates the CRC code of the communication data in Ultra ATA DMA operation.

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	CRC1	All 0	R	[For Ultra ATA port 1] These bits indicate the CRC code created from the transfer data in Ultra ATA DMA operation.
15 to 0	CRC0	All 0	R	[For Ultra ATA port 0] These bits indicate the CRC code created from the transfer data in Ultra ATA DMA operation.

Note: For the Ultra ATA DMA operation, refer to section 14, LBSC within Bus Bridge.

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 10	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
9	DTCD1	0	R/W	[For Ultra ATA port 1] Controls the operating mode for continuation in case of transfer termination operations during DMA operations for Ultra ATA. This bit is used to enable or disable the transfer termination continuation mode. Some existing ATA devices handle the termination of transfer in the same way as a pause. If the DMA transfer count has not been reached, such devices should not abnormally end the transfer even if they acknowledge the termination request, but should restart the transfer upon reception of the next DREQ (DMARQ) signal from the device. This operation is called “transfer termination continuation mode”. 1: Transfer termination continuation mode is disabled. 0: Transfer termination continuation mode is enabled.
8	DTCD0	0	R/W	[For Ultra ATA port 0] Controls the operating mode for continuation in case of transfer termination operations during DMA operations for Ultra ATA. This bit is used to enable or disable the transfer termination continuation mode. Some existing ATA devices handle the termination of transfer in the same way as a pause. If the DMA transfer count has not been reached, such devices should not abnormally end the transfer even if they acknowledge the termination request, but should restart the transfer upon reception of the next DREQ (DMARQ) signal from the device. This operation is called “transfer termination continuation mode”. 1: Transfer termination continuation mode is disabled. 0: Transfer termination continuation mode is enabled.
7 to 1	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.

---

<b>Bit</b>	<b>Bit Name</b>	<b>Initial Value</b>	<b>R/W</b>	<b>Description</b>
0	DBG0	0	R/W	Test Bit

---

Writing 1 to this bit is prohibited since this is a test bit. This bit is always read as 0. The write value should always be 0.

---

Note: For the Ultra ATA DMA operation, refer to section 14, LBSC within Bus Bridge.

## 17.5 Operation

RZ/G1H

RZ/G1N

RZ/G1M

RZ/G1E

### 17.5.1 DMA Transfer Procedure

The following describes the DMA transfer procedure.

1. Making the initial setting for the DMAC
  - Specify transfer conditions in the DMA control register (DCR).
2. Specifying DMA transfer information
  - Make appropriate settings in the following registers according to the DIP bit setting (input mode: using one information set repeatedly or two information sets alternately) in DCR:
    - DMA source address register (DSAR)
    - DMA destination address register (DDAR)
    - DMA transfer count register (DTCR)
 When the DIP bit specifies that one information set is used repeatedly, make the appropriate settings in DSAR0, DDAR0, and DTCR0.
3. Activating the DMAC
  - Activate the DMAC by setting the DMEN bit in the DMA command register (DCMDR).
4. Reading the specified DMA transfer information
  - The specified DMA transfer information is read from DMA information registers 0 and 1 in that order.
5. Clearing the DMA transfer request
  - The DMA transfer request status signal is cleared.
6. Starting DMA transfer
  - When the auto-request mode is selected as the transfer request mode, transfer automatically starts at the DMAC transfer timing after the transfer information is obtained.
  - When the external request or peripheral request mode is selected, DMA transfer is performed for one bus access cycle when a transfer request is accepted.
  - When the timer request is selected, transfer automatically starts at the intervals specified in the DMAC internal timer after the transfer information is obtained.
7. Issuing an interrupt for the end of a specified number of transfers
  - In single transfer mode, DMA transfer stops when transfer is completed for the specified number of times, and the CPU is notified of the end of transfer through an interrupt.
  - In continuous transfer mode, the CPU is notified of the end of transfer in DMA transfer information units through an interrupt.
  - The interrupt signal is controlled according to the setting in the DMA transfer end interrupt enable register (DINTMR).
  - RZ/G1H and RZ/G1M have a possibility that the DMA transfer end interrupt reaches to CPU in advance of completion of the last write access if the destination address is in the DDR3 area. In order to prevent from reading the value before the last write access is completed, a dummy DMA transfer with SYS-DMAC is required.
  - The source address of the dummy SYS-DMAC transfer can be any address.
  - The destination address of the dummy SYS-DMAC transfer can be any DDR3 area address in DDR3 64-bit mode.
  - In case of DDR3 32-bit dual channel mode, the destination address of the dummy SYS-DMAC transfer must be an address in the same DDR3 channel as the destination address of last transfer of LBSC-DMAC transfer.
  - The transfer count and transfer data size of the dummy SYS-DMAC transfer can be the minimum value.
  - RZ/G1N, and RZ/G1E don't have this problem.
8. Reading the next DMA transfer information (continuous transfer mode)

If the next DMA transfer request is specified, the information of the transfer is read and data is transferred in the same way as described in step 6.

If no additional DMA transfer request is specified (DRSTS = 0), the continuous DMA transfer mode is terminated when DQSTS = 1, or the next DMA transfer request is waited for when DQSTS = 0.

9. Adding DMA transfer information (continuous transfer mode)

If new DMA transfer information should be added, specify the information in the DMA transfer information set that will be used for the next transfer (the next DMA transfer information set can be checked with the NDP1 and NDP0 bits in the DMA status register (DSTSR)).

If no DMA transfer information should be added, write 1 to the DQEND bit in the DMA command register (DCMDR) to terminate the continuous transfer mode.

Note: Actually, the source bus and destination bus operate independently.

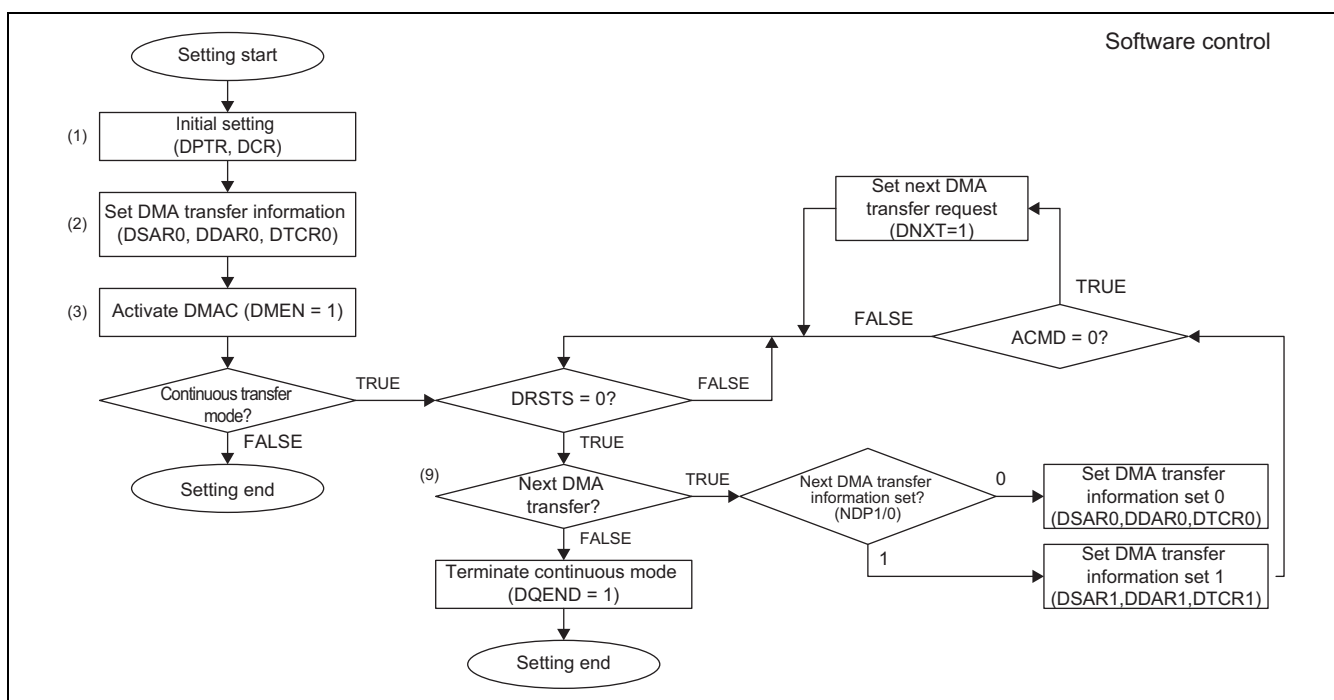

Figure 17.2 DMA Transfer Flowchart (1)

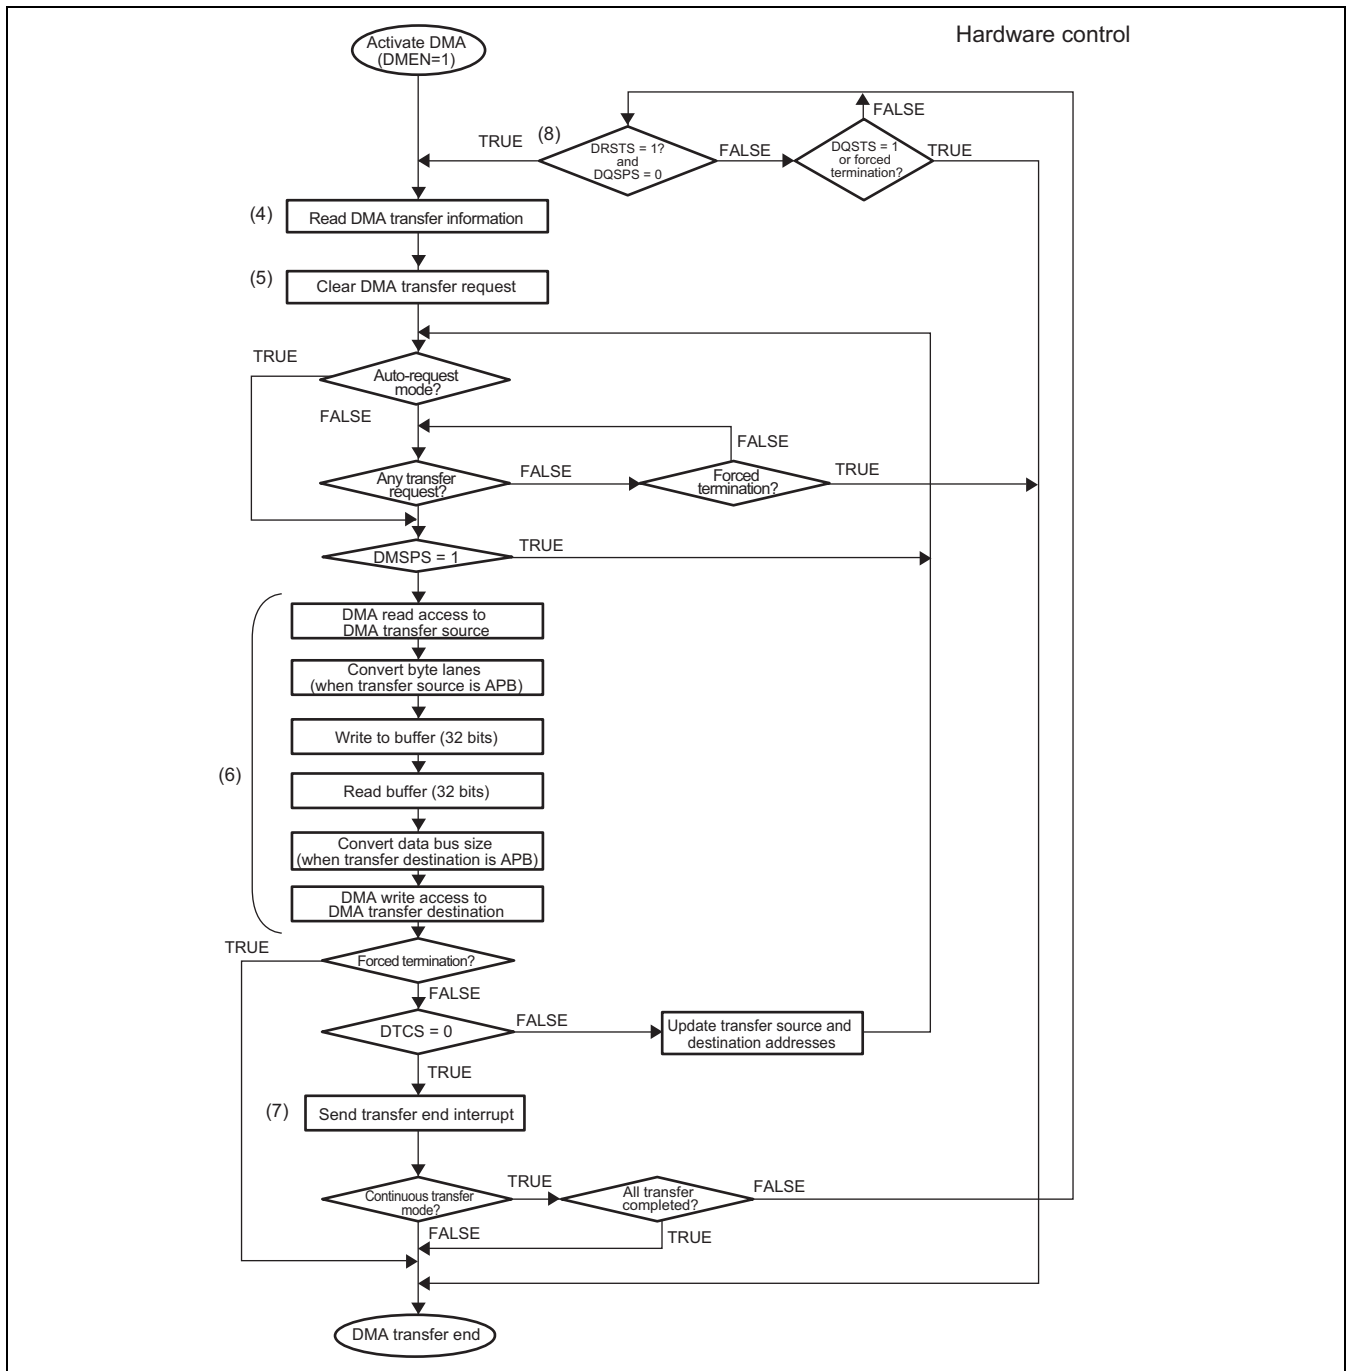

Figure 17.3 DMA Transfer Flowchart (2)

### 17.5.2 Continuous DMA Transfer Operation

The following shows the relationship between addition of DMA transfer information by software and DMA transfer information read and data transfer operation by hardware, which are described in step 9 in section 17.5.1, DMA Transfer Procedure. Figures 17.4 and 17.5 show transfer using DMA information set 0 repeatedly, and Figures 17.6 and 17.7 show transfer using DMA information sets 0 and 1 alternately.

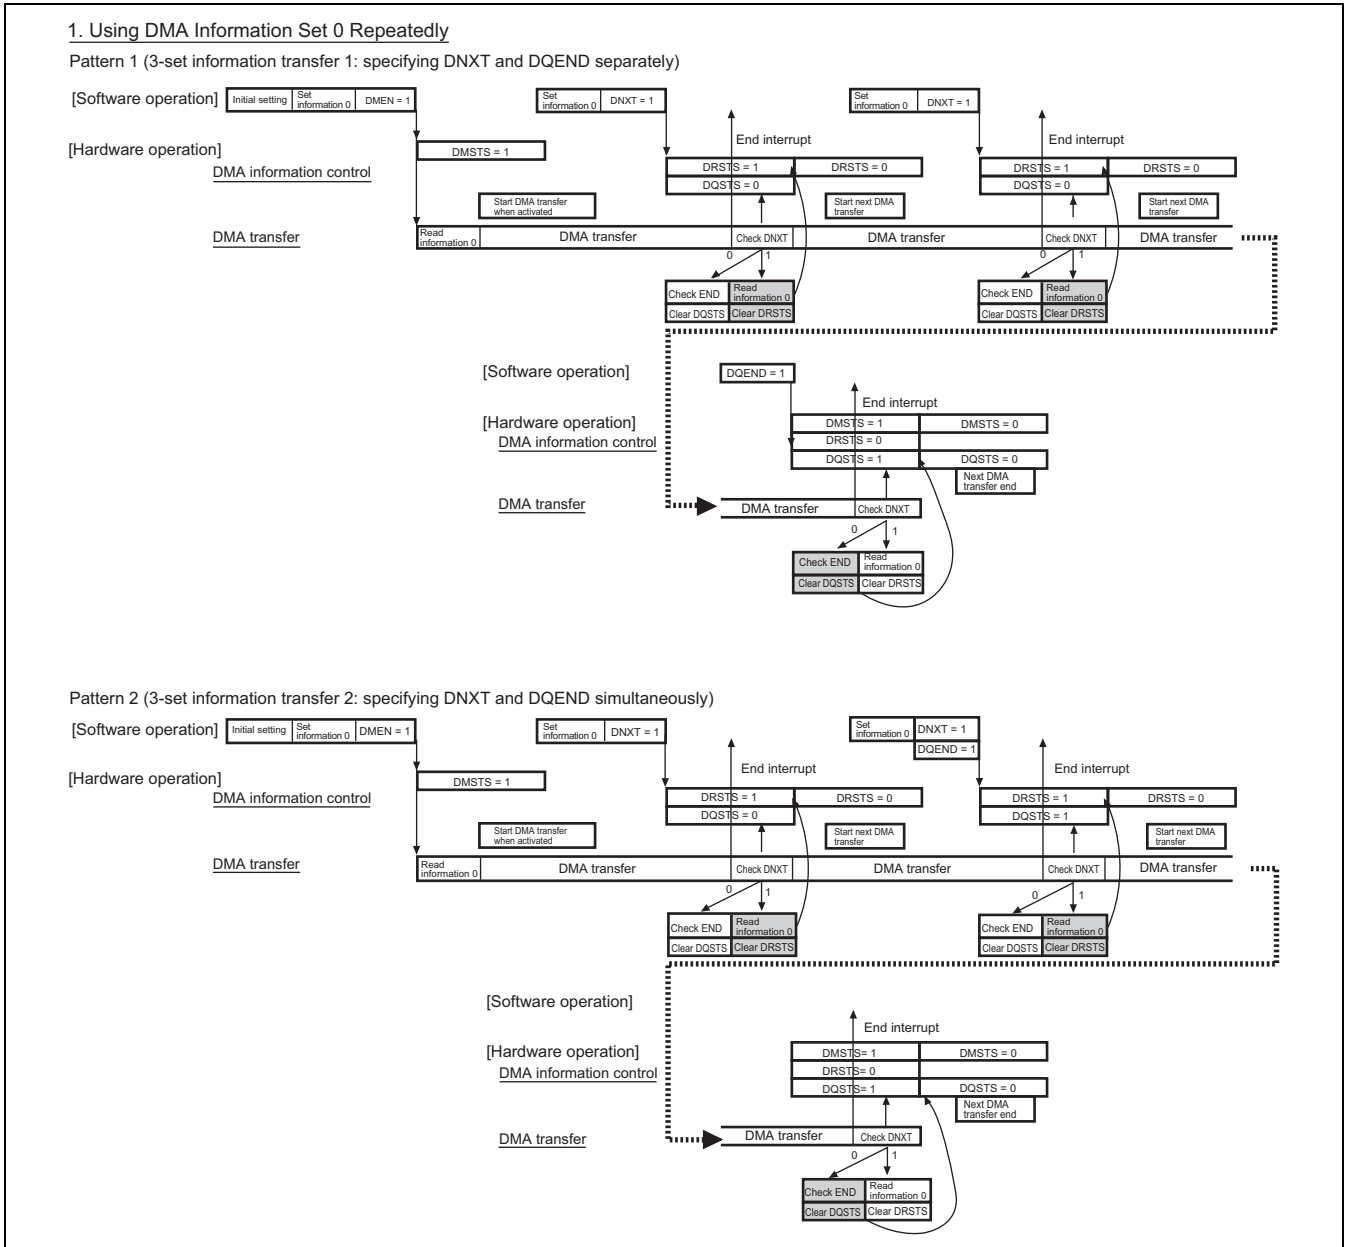

Figure 17.4 Transfer Using DMA Information Set 0 Repeatedly (1)

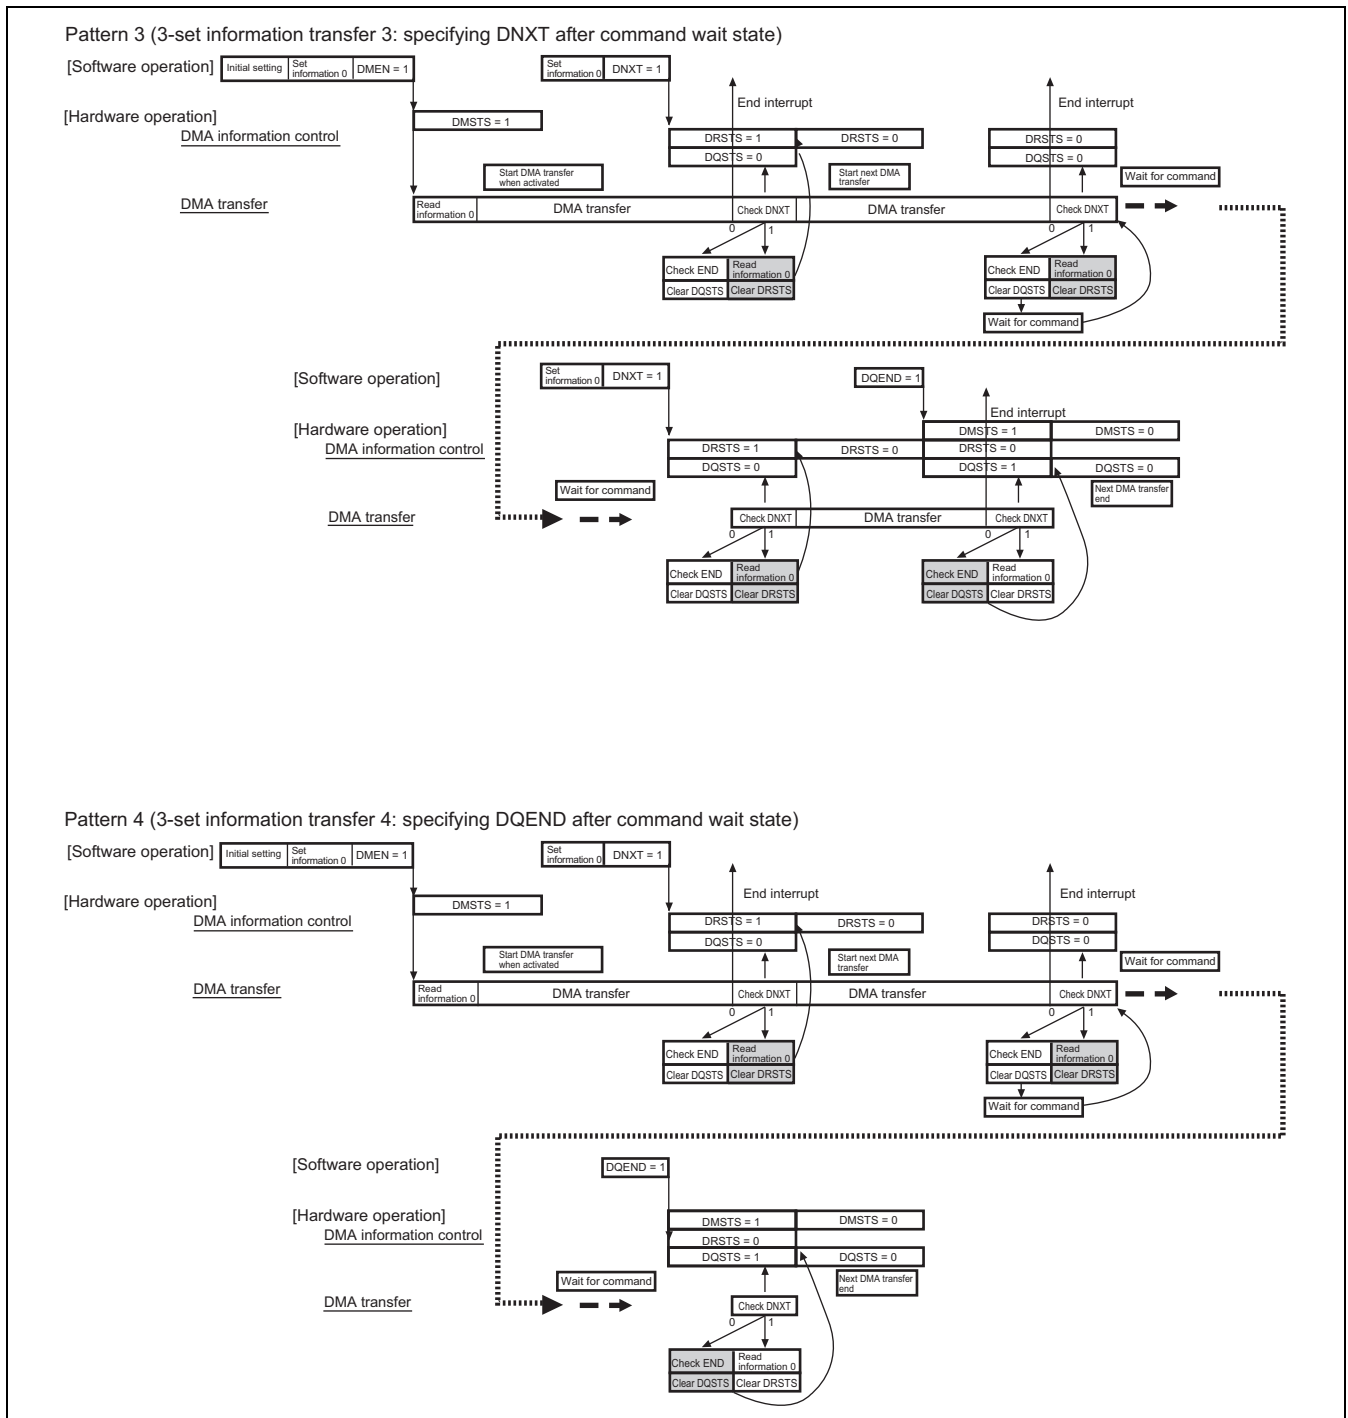

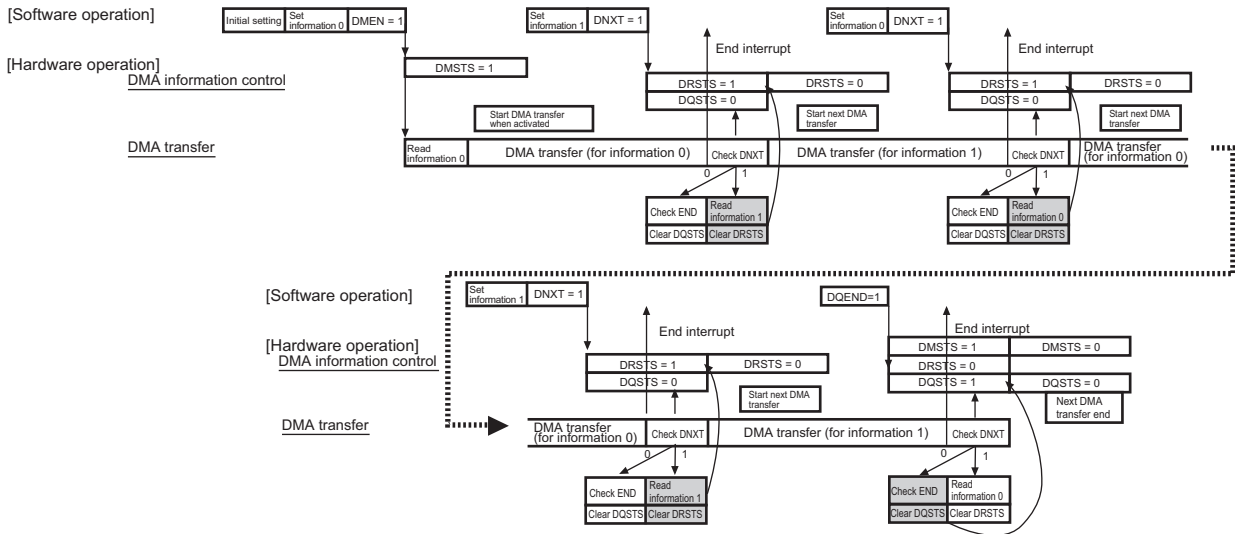

Figure 17.5 Using DMA Information Set 0 Repeatedly (2)

2. Using DMA Information Sets 0 and 1 Alternately

Pattern 1 (4-set information transfer 1: specifying DMEN, DNXT, and DQEND separately)

Pattern 2 (4-set information transfer 2: specifying DNXT and DQEND simultaneously)

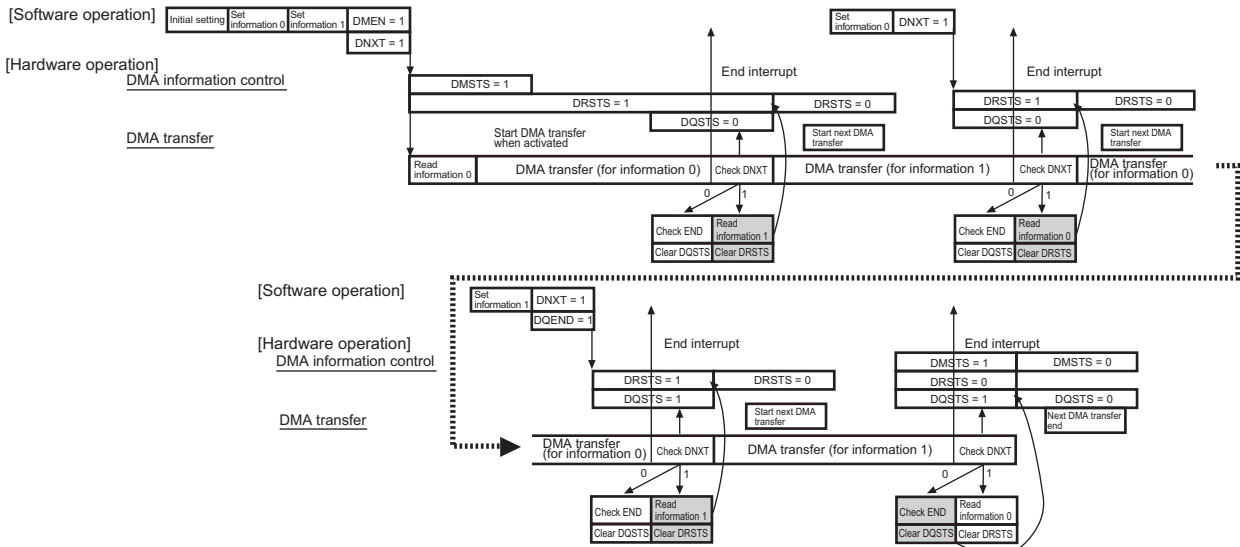

Figure 17.6 Using DMA Information Sets 0 and 1 Alternately (1)

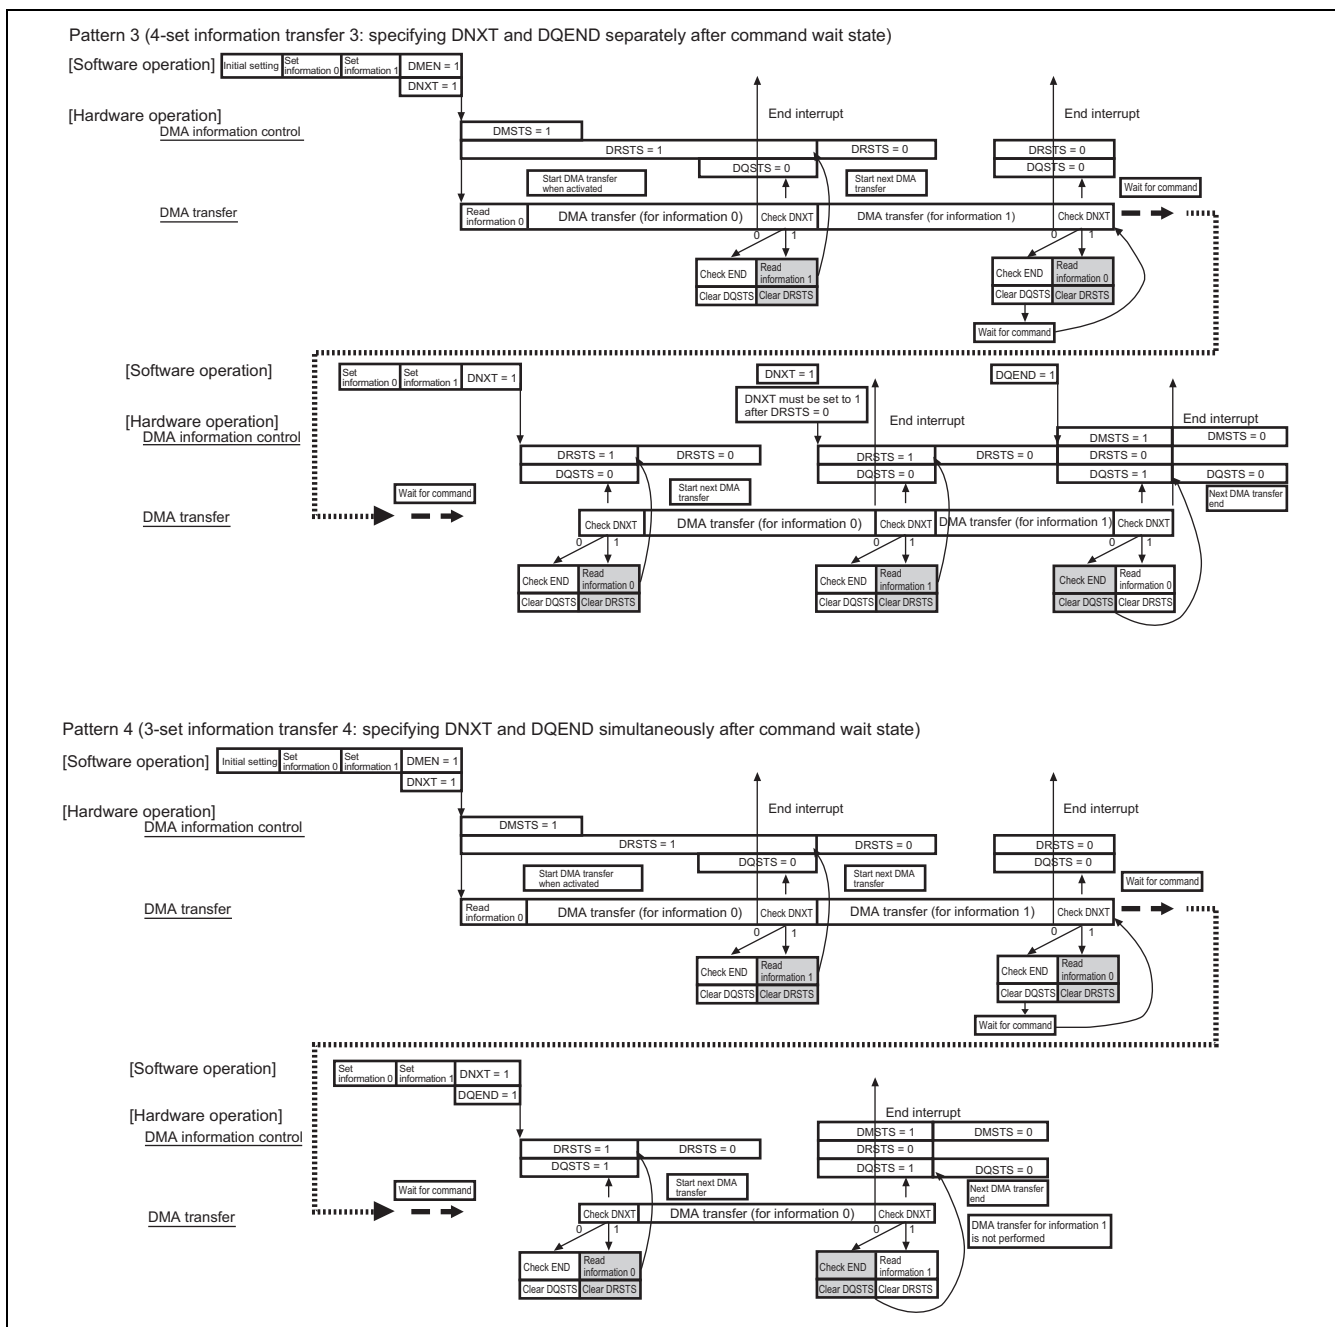

Figure 17.7 Using DMA Information Sets 0 and 1 Alternately (2)

### 17.5.3 Packing Data Read from Peripheral or External Module

Writing 1 to the PKMD bit when making necessary settings in the DMA control register (DCR) in the usual DMA activation procedure enables packing of data read from a peripheral or external module and then writing the data to memory (the AXI bus). Packing size can be specified to either 4 bytes or byte units shown in \* in the DCR register description by the SWMD bit in DCR. However, when the transfer destination on the AXI side is memory (DDR-DRAM), packing size in a byte unit shown in \* in the DCR register description is recommended in order to use memory and the AXI efficiently. The data packing of an access size when SWMD in DCR = 0 cannot be specified for the LBSC-DMAC (for details on access size in each channel, see \* in the DCR register description), because size of data written from peripheral modules connected to the APB to registers is equal to or less than 4 bytes when the transfer destination on the AXI side is one of the units connected to the APB.

During the packing operation, even if the DMAC holds data less than the specified packing size when the DMAC completes the specified count of transfer, the DMAC writes fetched data to memory and indicates the end of DMA transfer by setting the DTEn bit in the DMA transfer end interrupt status register (DINTSR). If the peripheral or external module completes a DMA request before the specified transfer count is reached, DMA transfer can be terminated by writing 1 to the BDOUT bit in the DMA command register (DCMDR). In this case, if data which is being packed remains in the DMAC, the DMAC writes the data to memory (AXI). The DTE[n] bit in the DMA transfer end interrupt status register (DINTSR) is set and a transfer end interrupt is generated. Note that zero padding does not occur during write to memory. If no data remains in the DMAC, the DMAC terminates DMA transfer without accessing memory and generates a transfer end interrupt in the same way as when data remains in the DMAC.

When transfer is terminated by the BDOUT bit setting in continuous transfer mode, the DMAC transfers the next DMA information if the next DMA information transfer is requested through the DNXT bit in DCMDR, and then terminates DMA transfer in the continuous transfer mode termination procedure. In this mode, DMA requests (DREQ) from peripheral or external modules are masked (not accepted) before a transfer end interrupt occurs after the BDOUT bit is set to 1.

### 17.5.4 Limitations on Packing of Data Read from Peripheral or External Module

The transfer count is specified in DMA transfer count registers 0 and 1 (DTCR0 and DTCR1) in the DMAC.

If DMA transfer from a peripheral or external module is completed before the specified transfer count is reached, the DMAC cannot distinguish whether data is being transferred or the transfer has been completed, and data of less than packing size may remain in the DMAC internal buffer. When the size of remaining data is the same as the specified packing size, the data is transferred to memory.

Data remaining in the DMAC internal buffer is written to memory through a forced write executed by setting the BDOUT bit in the DMA command register (DCMDR). (Zero padding does not occur because the transfer destination is memory. For example, if 3-byte data remains in the DMAC un-transferred to memory, the 3-byte data is written to the memory as is.)

A forced write can be triggered by a communication completion interrupt from a peripheral or external module. Note that whether DMA transfer from the peripheral or external module is completed when the communication end interrupt occurs depends on the specifications of the peripheral or external module. Accordingly, check the specifications of the module before executing a forced write.

### 17.5.5 Notification of the End of DMA Transfer

The DMAC notifies the CPU of the end of transfer by outputting transfer end interrupt signal (a level signal) through INTC (SYS) when transfer is completed for the transfer count specified in DMA transfer information in single transfer mode. In continuous transfer mode, the DMAC outputs transfer end interrupt signal every time transfer is completed for the transfer count specified in one DMA transfer information set.

The transfer end interrupt signal is controlled according to the setting in the DMA transfer end interrupt enable register (DINTMR). Writing 1 to the DMA transfer end interrupt status clear register (DINTCR) clears the transfer end interrupt signal.

### 17.5.6 DMA Transfer Stop, and Resume Procedures

This section describes the procedures for stopping, and resuming DMA transfer.

- To stop (cancel) DMA transfer during operation

Step	Overview	Register Operation	Operation after Register Write
1 ↓	Specify forced termination for DMAC.	Write 1 to DMSTP of DSTPR in DMAC.	The DMAC stops DMA transfer as soon as the current DMA bus cycle is completed, and then enters the idle state. Unfinished transfer data remaining in the buffer is discarded. The registers retain the values. No end interrupt is issued.
2 ↓	Check that the DMAC has entered the idle state.	If DMSTS of DSTSR in DMAC is 0, the DMAC is in the idle state.	—
3	Specify forced termination for external devices.	(Depends on the external devices.)	The external devices stop sending DMA requests.

Note: Step 2 can be done after step 3.

- To temporarily stop (pause) DMA transfer during operation and then resume it

Step	Overview	Register Operation	Operation after Register Write
1 ↓	Specify temporary stop for DMAC.	Write 1 to DMSPD of DCMDR in DMAC.	The DMAC temporarily stops DMA transfer as soon as the current DMA bus cycle is completed. The DMAC retains its internal status, including unfinished transfer data remaining in the buffer, without change.
2 ↓	Check that the DMAC has entered the temporary stop state.	If DMSPS of DSTSR in DMAC is 1, the DMAC is in the suspended state.	—
3 ↓	A certain period of time has elapsed (the LBSC may detect a DREQ signal from an external device during this period, but the DMAC keeps the temporary stop and the external devices continue to wait for DMA transfer).		
4	Specify cancel of temporary stop (resume transfer).	Write 1 to DMSPC of DCMDR in DMAC.	The paused state is canceled, and the DMAC resumes its operation with the DMA transfer for the DREQ detected by the LBSC.

Note: Step 2 can be done between steps 3 and 4.

- To temporarily stop (pause) DMA transfer during operation and then terminate (cancel) operation

Step	Overview	Register Operation	Operation after Register Write
1 ↓	Specify temporary stop for DMAC.	Write 1 to DMSPD of DCMDR in DMAC.	The DMAC temporarily stops DMA transfer as soon as the current DMA bus cycle is completed.  The DMAC retains its internal status, including unfinished transfer data remaining in the buffer, without change.
2 ↓	Check that the DMAC has entered the temporary stop state.	If DMSPS of DSTSR in DMAC is 1, the DMAC is in the suspended state.	—
3 ↓	A certain period of time has elapsed (the LBSC may detect a DREQ signal from an external device during this period, but the DMAC keeps the temporary stop and the external devices continue to wait for DMA transfer).		
4 ↓	Specify forced termination for DMAC.	Write 1 to DMSTP of DSTPR in DMAC.	The DMAC exits the temporary stop state and enters the idle state.  Unfinished transfer data remaining in the buffer is discarded.  The registers retain the values. No end interrupt is issued.
5 ↓	Check that the DMAC has entered the idle state.	If DMSTS of DSTSR in DMAC is 0, the DMAC is in the idle state.	—
6	Specify forced termination for external devices.	(Depends on the external devices.)	The external devices stop sending DMA requests.

- Notes:
- Step 2 can be done between steps 3 and 4.
  - Step 5 can be done after step 6.

### 17.5.7 Data Alignment in AXI Bus Interface

The AXI bus is always accessed through a handshake using an access request and a request acknowledge. Alignment of data read or written during the access to memory through the AXI bus is always converted.

When the DTAMD bit in the DMA control register (DCR) is 0, the AXI bus data alignment is converted according to the endian mode signal (DMAC input signal: little) and the peripheral data bus width (the SPDS1 and SPDS0 bits or DPDS1 and DPDS0 bits in DCR). When the DTAMD bit in DCR is 1, data alignment is converted according to the DTAC, DTAU, and DTAU1 bit settings in DCR.

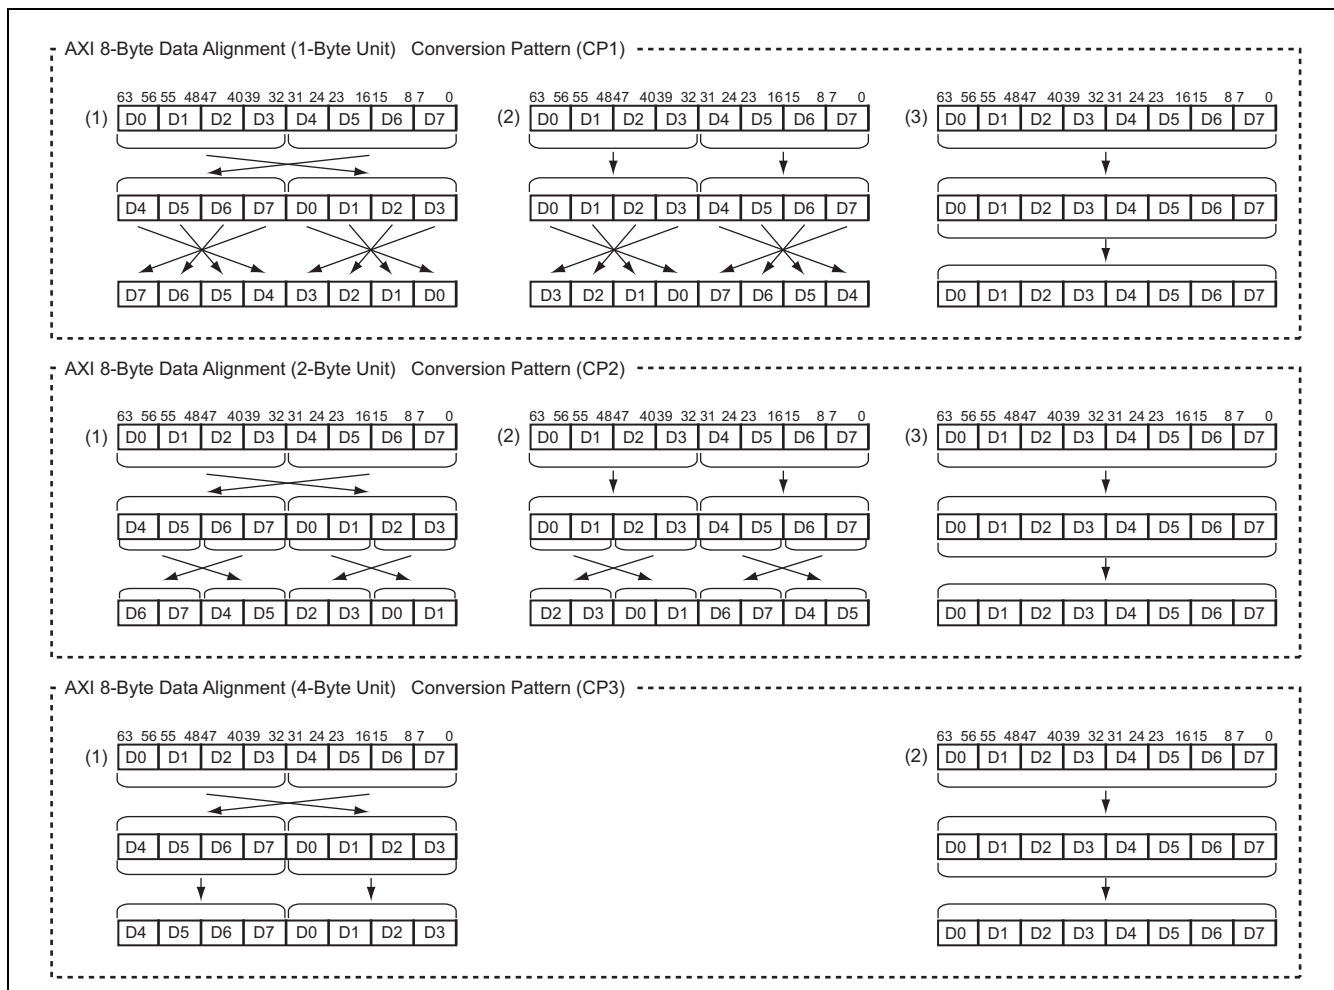

The following table shows the AXI bus data alignment control according to the DTAMD bit in DCR, endian mode signal (DMAC input signal: little), peripheral data bus width (the SPDS1 and SPDS0 bits or DPDS1 and DPDS0 bits in DCR), and DTAC, DTAU, and DTAU1 bits in DCR.

**Table 17.2 Data Alignment Control According to Bit and Signal Settings**

No.	DTAMD	little (MD[8])	PDS [1:0]	DTAC	DTAU	DTAU1	Data Alignment of 4 Bytes	Unit for 4-Byte Data Alignment	8-Byte Data Alignment in 4-Byte Unit	Conversion Pattern	Remarks
1	0	0	00 (8 bits)	*	*	*	Not controlled	8 bits	Not controlled	CP1 (3)	Standard conversion (Software must specify only PDS[1:0])
2	0	0	01 (16 bits)	*	*	*	Not controlled	16 bits	Not controlled	CP2 (3)	
3	0	0	10 (32 bits)	*	*	*	Not controlled	8 bits	Not controlled	CP3 (2)

14	1	*	*	1	1	1	Controlled	16 bits	Controlled	CP2 (1)	

\*: Don't care

The following shows data alignment conversion in the DMAC. Conversion pattern numbers in the table above correspond to the conversion numbers below.

**Figure 17.8 Data Alignment Conversion in the DMAC**

**17.5.8 Data Alignment in EX-BUS Interface**

Setting the DMALGR register in the DMAC allows variable alignment mode for the external bus access as the mode of alignment conversion. For the CPU operation in a variable alignment mode, see section 14.6.3 (1), Data Alignment during LBSC-DMAC Access, in section 14, LBSC within Bus Bridge.

**17.5.9 Timing Charts**

Timing charts are given for DMA operation during the external SRAM bus operation. In the timing charts, the DREQ, DRACK, and DACK signal polarity is indicated as negative; however, these polarity settings, assertion of either the CS# or DACK signal, and switching DREQ to a level signal or to edge detection mode, can be set. In all cases these settings should be made using LBSC internal registers.

**(1) EX-BUS DMA single-read/write operation**

In SRAM bus operation, upon receiving a DREQ signal a DRACK is asserted to send notification of detection of a DMA request. There are no DRACK signals for other than LBSC-DMAC channel 0. In these cases, the device which is the DMA request source must negate the DREQ signal until the end of the bus operation through the DACK signal indicating that the DMA transfer has actually started. The DMAC starts the next DREQ sampling from the next clock cycle after the end of the DMA bus transfer (LBSC-DMAC DMA request mask control register (DRMSKR) settings can be used to delay the start of the next sampling), and upon detection, starts the next DMA transfer bus operation.

In DMA single read and write operations, the number of clock cycles from CS# assertion to RD# (or WE#) signal assertion, the number of RD# (or WE#) pulse clock cycles, and the number of clock cycles from RD# (or WE#) negation to CS# negation, can be set through the LBSC internal register. During the period of RD# (or WE#) assertion, if a WAIT signal from the DMA request source is detected, then during the WAIT assertion period, the RD# (or WE#) pulse width is extended. With respect to specification of WAIT signal sampling also, the internal LBSC register should be used.

**Figure 17.9 External Bus DMA Read Operation (SRAM Bus Single Read)**

**Figure 17.10 External Bus DMA Write Operation (SRAM Bus Single Write)**

**(2) EX-BUS DMA 8-burst read/write operation**

In DMA 8-burst operation, 8-burst bus transfer operation is performed upon detection of a single DREQ signal. In SRAM bus operation, upon receiving a DREQ signal a DRACK is asserted to send notification of detection of a DMA request. There are no DRACK signals for other than LBSC-DMAC channel 0, so that in these cases the device which is the DMA request source must negate the DREQ signal until the end of the 8-burst bus operation through the DACK signal indicating that the DMA transfer has actually started. The DMAC starts the next DREQ sampling from the next clock cycle after the end of the DMA bus operation (LBSC-DMAC DMA request mask control register (DRMSKR) settings can be used to delay the start of the next sampling), and upon detection, starts 8-burst bus operation for the next DMA transfer.

Also in DMA 8-burst operations, the number of clock cycles from CS# assertion to RD# (or WE#) signal assertion, the number of RD# (or WE#) pulse clock cycles, and the number of clock cycles from RD# (or WE#) negation to CS# negation, can be set through the LBSC internal register. During the period of RD# (or WE#) assertion, if a WAIT signal from the DMA request source is detected, then during the WAIT assertion period, the RD# (or WE#) pulse width can be extended. With respect to WAIT signal control also, the internal LBSC register should be used.

## 18. Booting

RZ/G1H

RZ/G1N

RZ/G1M

RZ/G1E

### 18.1 Overview

In this product, the levels on the MD7 and MD6 pins can be set to select the master boot processor. When the Cortex-A7 or Cortex-A15 is selected as the master boot processor, the levels on the MD[3:1] pins can select booting up from the serial flash ROM connected to the QSPI.

### 18.2 Features

- The levels on the MD7 and MD6 pins can select the Cortex-A7\*<sup>1</sup>, or Cortex-A15\*<sup>1</sup> as the master boot processor.
- The external boot device can be selected as either external ROM (area 0) or on-chip ROM by the levels on the MD3 to MD1 pins.
- Booting from the serial flash ROM connected to the QSPI is supported.
  - The master boot processor (if this is the Cortex-A15\*<sup>1</sup> or Cortex-A7\*<sup>1</sup>) executes the instructions in the on-chip ROM, and the specified amount of data are transferred from the serial flash ROM to the on-chip RAM at the specified QSPI clock frequency. After transfer, execution jumps to the top address of the on-chip RAM.
  - After 16 or 4 Kbytes of code are transferred to the on-chip RAM at 39 MHz, execution jumps to the top address of the on-chip RAM.
  - After 16 Kbytes of code are transferred to the on-chip RAM at 48.75 MHz, execution jumps to the top address of the on-chip RAM.

Notes: 1. The presence of CPU cores depends on the product. For details, see the notes under Table 18.1.

### 18.3 Input/Output Pins

**Table 18.1 Mode Pin Configuration**

Name	Pin Name	I/O	Function	RZ/G Series Products

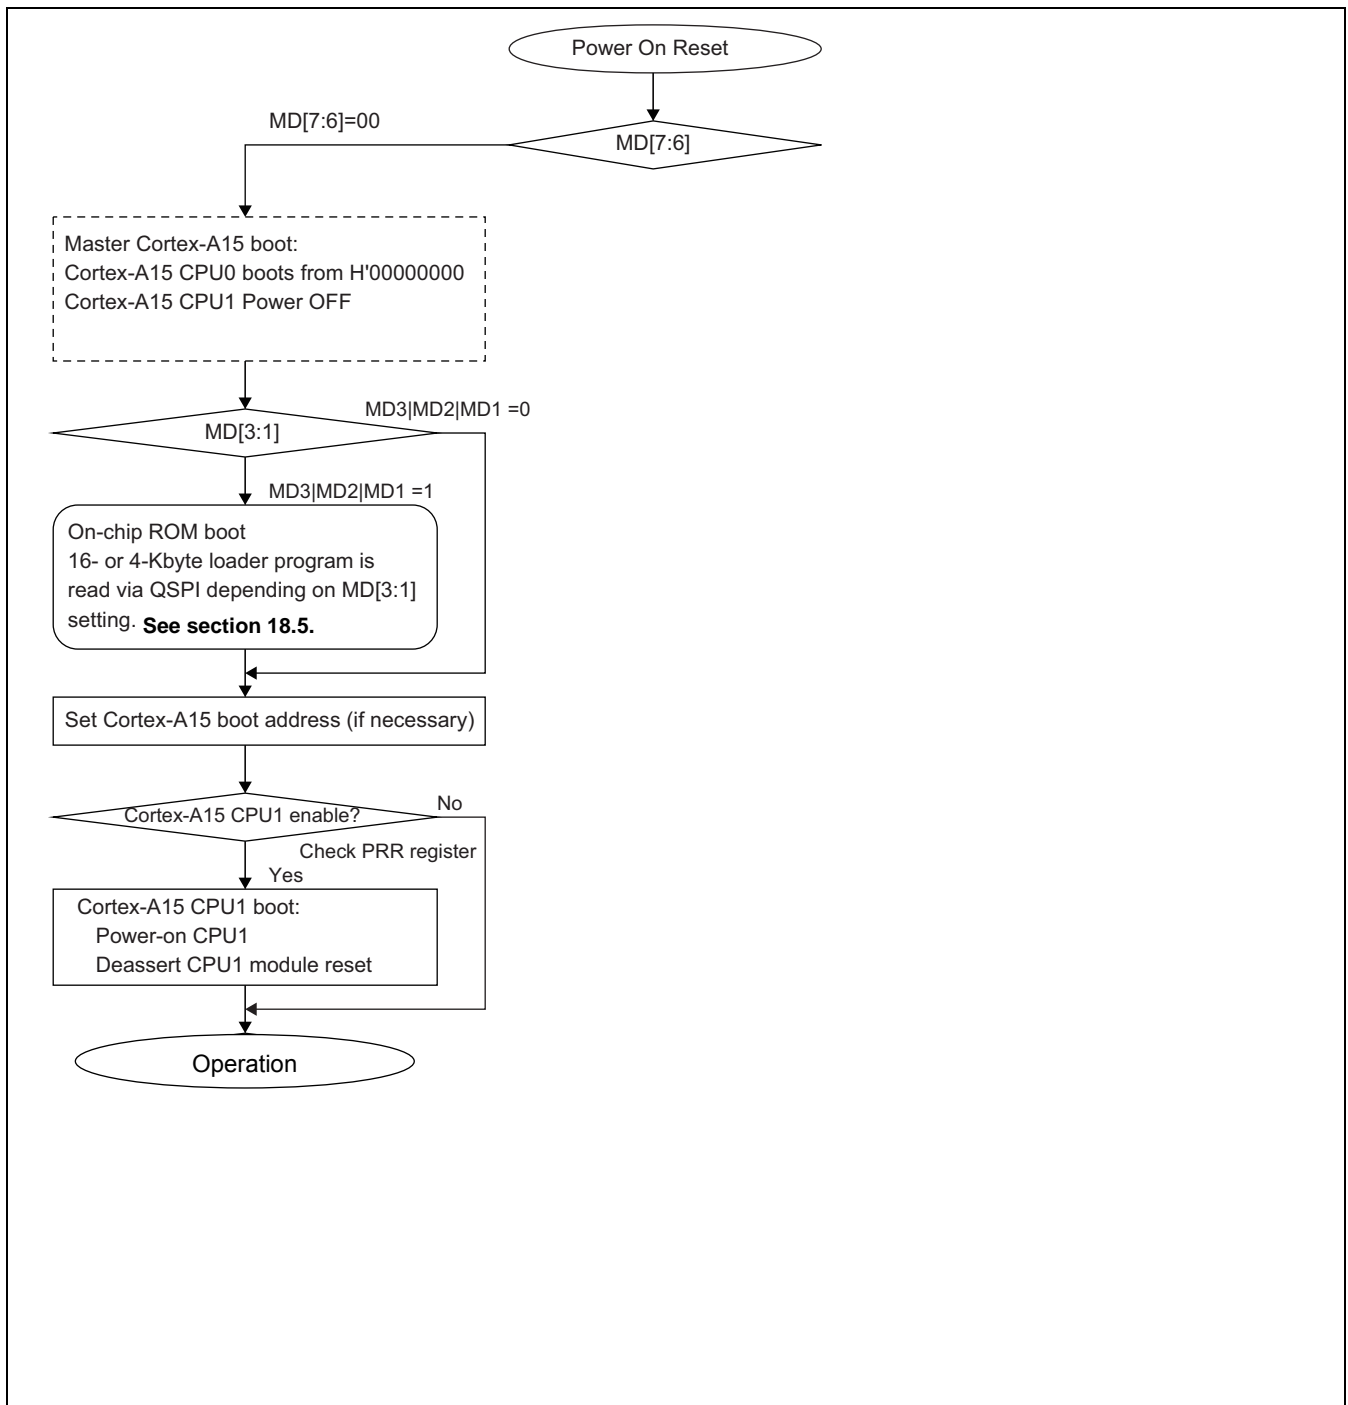

Figure 18.2 Flow of Booting Up

### 18.4.3 Booting Up of RZ/G1E

Figure 18.3 illustrate the flow of booting up.

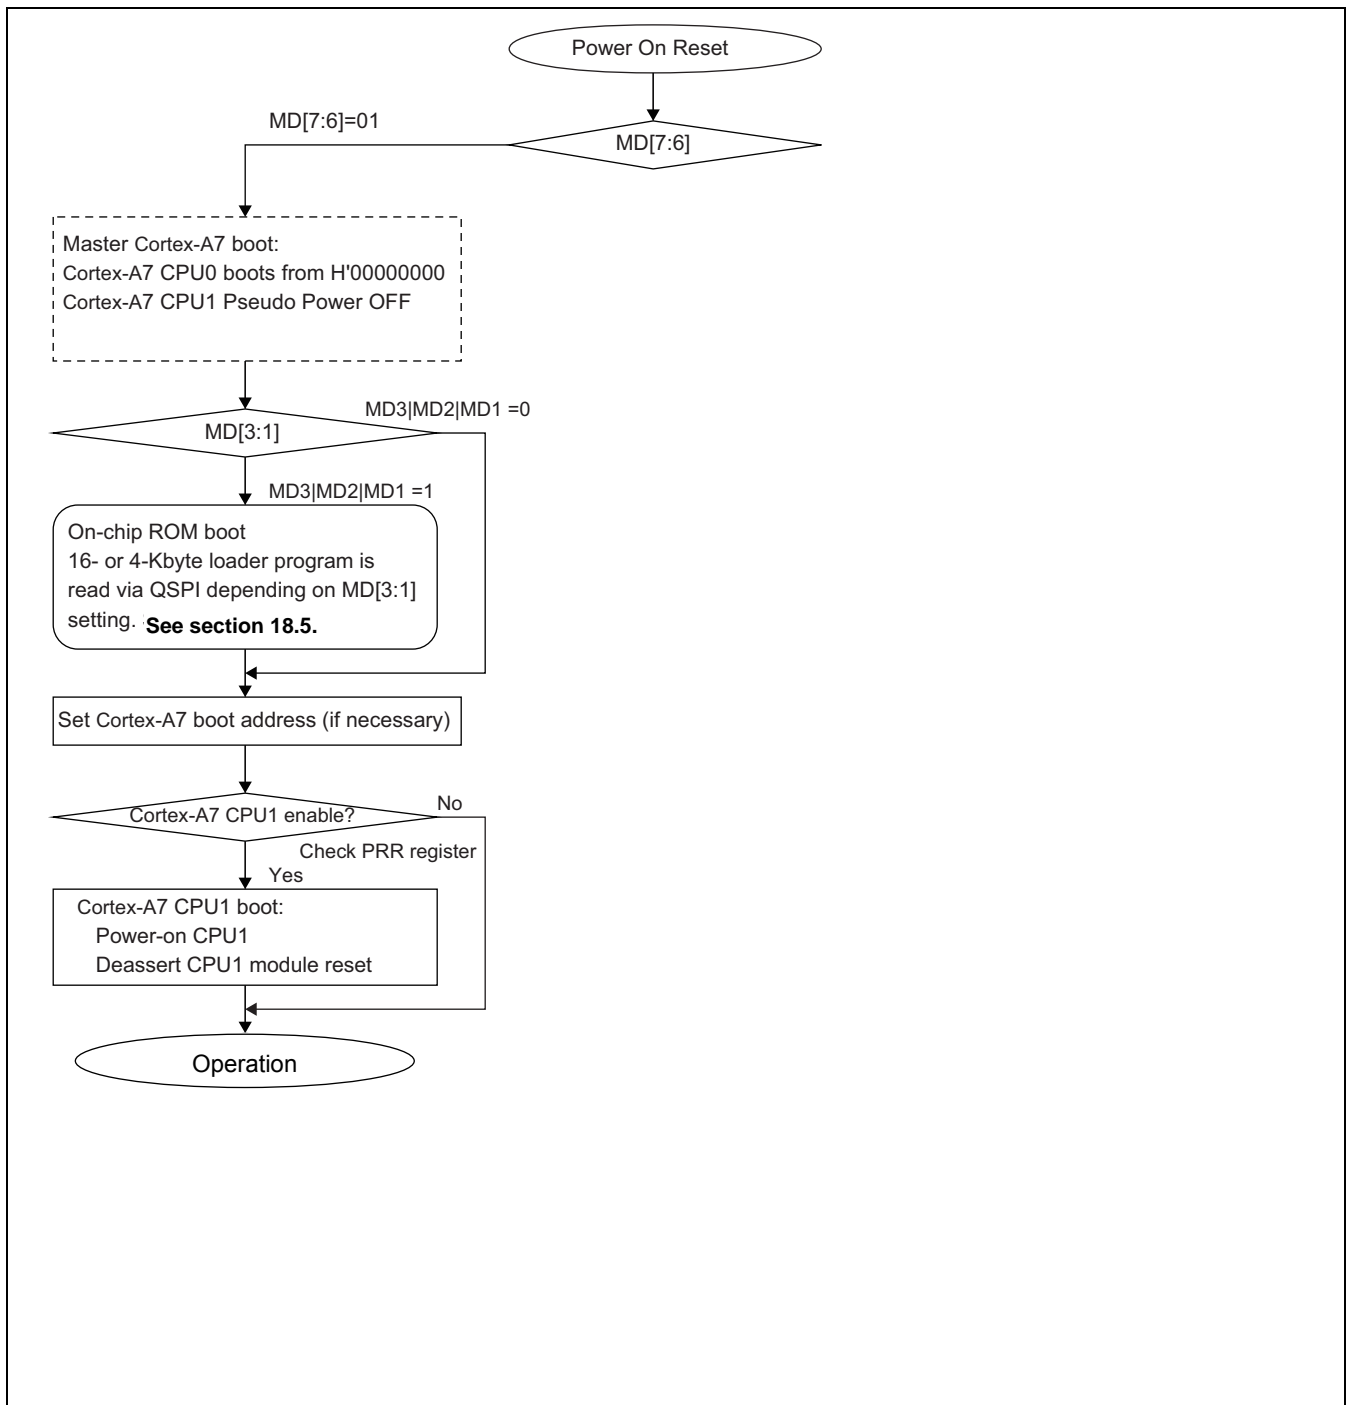

Figure 18.3 Flow of Booting Up

## 18.5 Serial Flash ROM Boot

RZ/G1H	RZ/G1N
RZ/G1M	RZ/G1E

### 18.5.1 Serial Flash ROM Boot

In QSPI boot, the boot program in the on-chip ROM starts up the QSPI and SYS-DMAC channel 1, and transfers the loader program previously stored in the serial flash ROM to the on-chip RAM via the QSPI module. Here, the QSPI module reads the serial flash ROM with the fast read mode. After loader program is transferred, the program automatically jumps to the top address of the loader program. The amount of data to be transferred and QSPI IF frequency depend on the MD[3:1] pin setting. Controlling the device-specific quad serial flash ROM through the loader program enables reduction of program load time after loader program transfer.

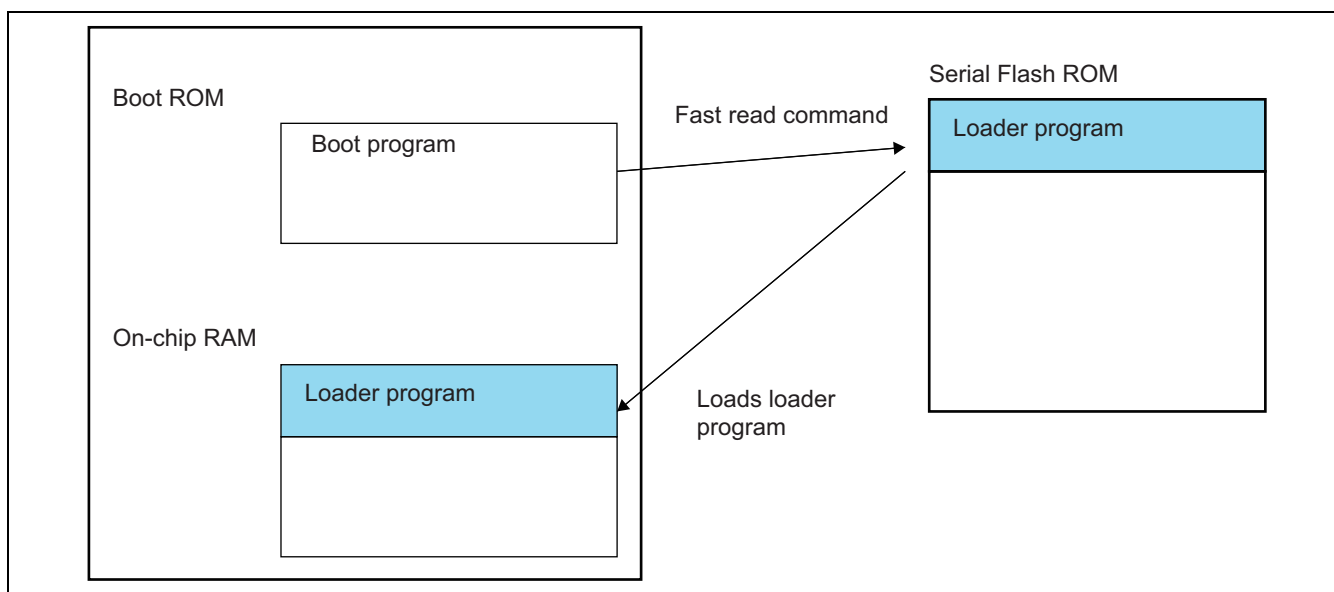

Figure 18.4 Address Space in Serial Flash Memory Boot Mode

## 18.5.2 Usage of QSPI Pins

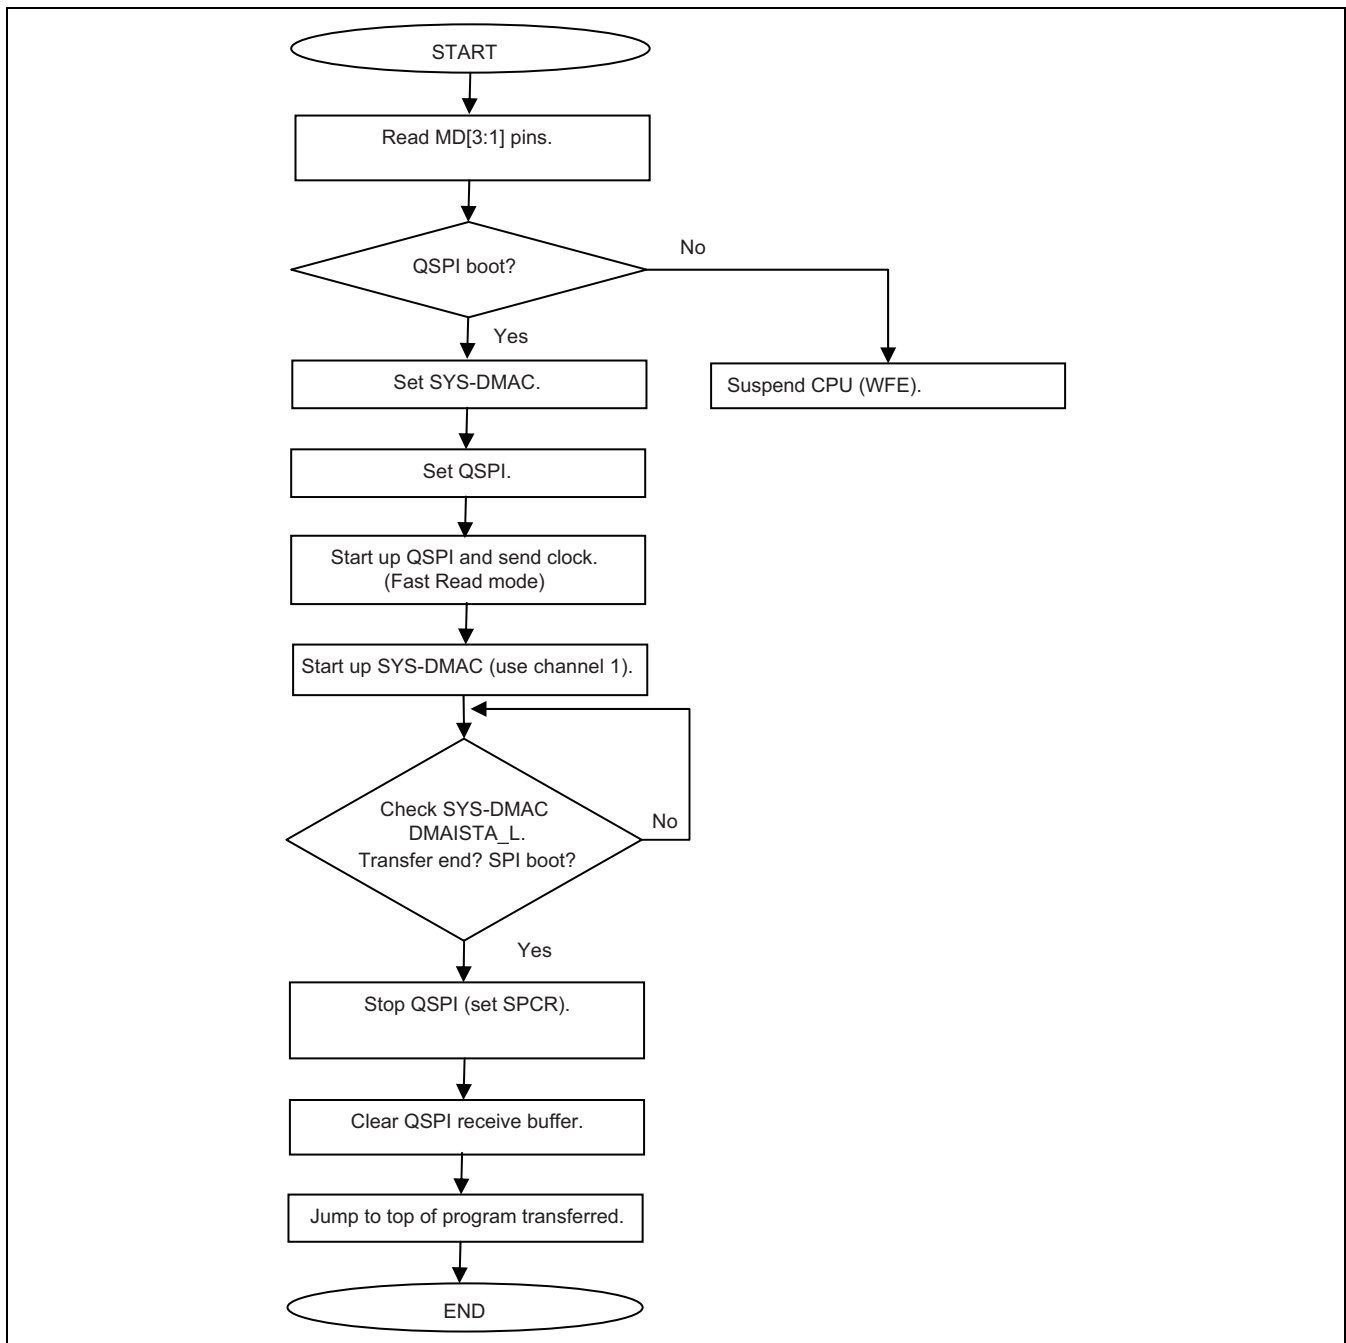

**Table 18.2 QSPI Pin Configuration**

Name	Pin Name	Function Name	I/O	Function
Serial clock	A20	SPCLK	Output	Outputs serial clock.
Transmit data	A21	MOSI	Output	Outputs transmit data.
Receive data	A22	MISO	Input	Inputs receive data.
Chip select	A25	SSL	Output	Outputs chip select signal. To be set to active low using boot ROM code

Note: IO2 (A23) and IO3 (A24) pins are set in High level by the boot program in the on-chip ROM.

### 18.5.3 Serial Flash ROM Boot Flow

Figure 18.5 show the serial flash ROM boot flow by the on-chip ROM boot program.

**Figure 18.5 Serial Flash ROM Boot Flow by the On-chip ROM Boot Program**

**18.5.4 Notes**

- Upon error occurrence, the CPU issues the WFE command and enters in the suspended state.
- The boot ROM program allows no interrupts.
- The boot ROM program does not issue a reset command or mode bit reset command to the serial flash ROM; using a serial flash ROM with a reset pin is recommended.
- All register settings regarding PFC, QSPI and SYS-DMA channel 1 (except the DMA enable) are not initialized after Serial Flash data transfer is end.

## 18.6 Boot Program in On-Chip ROM

RZ/G1H

RZ/G1N

RZ/G1M

RZ/G1E

The on-chip ROM contains the program to control QSPI as the standard boot ROM program. Modifying the ROM code enables booting through another peripheral module.

## 19. R-GP2D

### 19.1 Overview

The R-GP2D is a module that provides a 2D graphics rendering function.

#### 19.1.1 Features

1. Drawing functions
  - 4-vertex screen drawing, polygonal drawing, line drawing, high-functional bold line drawing, anti-aliasing, and BITBLT-type commands with raster operation/alpha blending, line alpha blending.
2. Coordinate transformation
  - Coordinate transformation ( $4 \times 4$  matrix operation + perspective W division)
3. Color mode
  - Source: 1, 8, 16, or 32 bits/pixel
  - Drawing: 8, 16, or 32 bits/pixel
  - Work: 1 bit/pixel
  - $\alpha$  map: 8 bits/pixel
4. Screen coordinates
  - X direction: 0 to 4,095
  - Y direction: 0 to 4,095
5. Register settings
  - Current pointer setting (MOVE/RMOVE), local offset setting (LCOFS/RLCOFS), specific address mapped register setting (WPR), local coordinate transformation offset setting (RGTOFS).
6. Sequence control
  - Waiting for Vsync (VBKEM), jump (JUMP), subroutine (GOSUB) (nesting levels: 1 or 8)
7. Antialias font
  - 8-bit/pixel color format – antialias font drawing
8. Multi-valued source blend referencing  $\alpha$  map
  - $\alpha$  map in the 8-bit/pixel color format
9. Customized bold line
  - Setting of thickness direction switching boundary (BDS), jaggy reduction (WLM)
10. New anti-aliasing
  - Anti-aliasing process to the horizontal, vertical, and 45-degree diagonal line segment is enabled. [NAA]
11. Loop function
  - Creates a closed figure of which starting and final points are linked [LOOP]
12. Anti-aliasing coverage drawing function
  - The function to draw anti-aliasing coverage. [ACDE]

## 19.1.2 List of Commands and Rendering Attributes

- REL: Valid only when SS = 0. Clear this bit to 0 when SS = 1.
- COOF: Clear this bit to 0 in 8-bit/pixel mode (GBM = 0).
- S $\alpha$ E: Valid only for the ARGB format (SPF = DPF = 1). Clear this bit to 0 for the RGB format (SPF = DPF = 0) and 8-bit/pixel mode (GBM = 0).  
Clear this bit to 0 when  $\alpha$ E = 0.
- $\alpha$ E: Clear this bit to 0 in 8-bit/pixel mode (GBM = 0).  
In the POLYGON4A, POLYGON4B, or POLYGON4C command, valid only when BLKE = 1. Clear this bit to 0 when BLKE = 0.  
In the BITBLTA, BITBLTB, or BITBLTC command, valid only when the ROP code = H'CC. Clear this bit to 0 for other codes.  
In the AAFA command, set this bit to 1.
- LREL: Valid only when LINKE = 1. The LREL bit should be cleared to 0 when LINKE = 0.
- STYLE: Set this bit to 1 when BLKE = 1. In the LINEA, LINEB, RLINEA, or RLINEB command, set this bit to 1.
- AA: Clear this bit to 0 when NET = 1. Clear this bit to 0 in 8-bit/pixel mode (GBM = 0).  
In the LINED or RLINED command, set this bit to 1.
- SS: In the LINEA, LINEB, RLINEA, RLINEB, or AAFC command, clear this bit to 0. In the AAFA command, set this bit to 1.
- BLKE: In the FTRAPC, RFTRAPC, or CLRWC command, set this bit to 1.
- Shaded bit: Cannot be used (clear this bit to 0).

### 19.1.3 Block Diagram

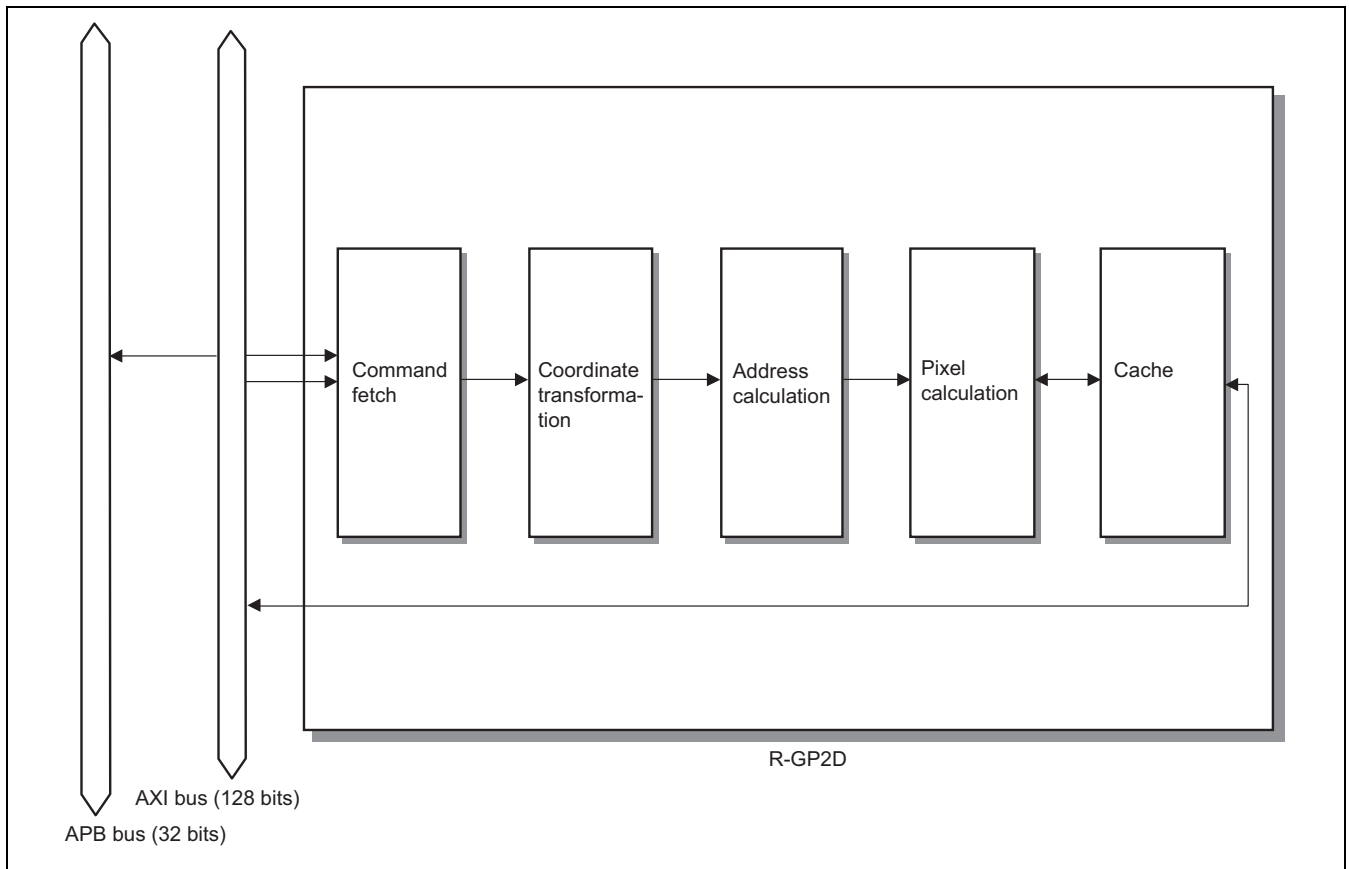

Figure 19.1 R-GP2D Block Diagram

### 19.1.4 Register Configuration

Tables 19.3 through 19.7 show the configuration of the R-GP2D registers.

These registers are 32-bit wide and should be accessed in longword (32-bit) units. If accessed in other sizes, operation is not guaranteed. The R-GP2D register address area is allocated in the range from H'E6EC 0000 to H'E6EE FFFC. Even in this range, however, if an address other than those shown in the following tables is accessed, operation is not guaranteed.

The CPU writing to registers, excluding the system control registers (SCLR), is prohibited during the time from the start of rendering to the TRAP command execution, except for the drawing halted period specified by the INT command. The CPU reading from registers, excluding the status registers, is prohibited.

Note: When writing to the registers to which ByteM control at the WPR command cannot be applied, set B'0000 to the ByteM bits at the WPR command.

## 19.2 Register Description

- Legend for Register Description:

Initial value: Register value after a reset

—: Undefined value

R/W: Readable/writable. The written value can be read.

R/WC0: Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.

R: Read-only. If a bit has a defined initial value (0 or 1), read out the value of the bit and write it back without alteration. (Writing should not change such bits from their initial values, i.e. only the target bits should be modified (read-modify-write).) If a bit has an undefined initial value, write 0.

—/W: Write-only. The read value is undefined.

Set range: [a, b] indicates that the values are included. (a, b) indicates that the values are excluded.

Hereafter, "reset" refers to both a hardware reset and software reset unless specified otherwise.

### Point for Caution

Note that when the R-GP2D registers are read under any of the following conditions, the first value to be read out may be incorrect.

#### Conditions:

- 1) After a power-on reset (PRESET# = L to H)
- 2) After leaving the module stop state (MSTPSR8.MSTPST807 = 1 to 0)
- 3) After certain drawing states; specifically, any of the following states (which involve interrupts)
  - Rendering break (SR.BRK = 1)
  - Command error (SR.CER = 1)
  - Interrupt (SR.INT = 1)
  - Trap (SR.TRA = 1)

#### Workaround:

One dummy read of the R-GP2D registers should be executed after a power-on reset, the R-GP2D leaving the module stop state, and at the beginning of the interrupt handling routines for the R-GP2D.

#### Note:

When using polling of the flags of SR, this usage note and workaround are not necessary because the polling can replace a dummy-read as the read operation.

## 19.2.1 System Control Registers

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	—	—	—

### 19.2.1.1 System Control Register (SCLR)

Address: H'E6EC0000

Bit	Bit Name	Initial Value	R/W	Description
3	RBRK	0	R/W	<p>Rendering Break</p> <p>This bit can be used to stop rendering. Set this bit while the value of the BRK bit in the status register (SR) is 0.</p> <p>0: Drawing is not stopped.</p> <p>1: If the R-GP2D module is in the midst of drawing, the command that is currently being executed is completed, the value of the BRK bit in the status register (SR) becomes 1 at the time the next command is fetched, and drawing is stopped. If drawing by the R-GP2D module is not in progress when the bit is set to 1, the value of the BRK bit is not changed. Furthermore, the address where the next command to be executed after suspension is placed in the command status register.</p> <p>This bit is only cleared to 0 when drawing has been suspended.</p>
2, 1	—	—	R	Reserved
0	RS	0	R/W	<p>Rendering Start</p> <p>Specifies the start of rendering. During the drawing period (from rendering start to TRAP command execution), writing 1 to this bit is prohibited.</p> <p>0: Rendering is not started.</p> <p>1: Rendering is started. This bit is cleared to 0 after rendering starts.</p> <p>Note: Setting the SRES and RS bits to 1 simultaneously is prohibited.</p>

### 19.2.1.2 Status Register (SR)

Address: H'E6EC0004

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	VER				—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	1	1	1	0	—	0	0	0	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	BRK	CER	INT	TRA
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	VER	1110	R	Version Flag This flag is read as B'1110.
27	—	—	R	Reserved
26 to 24	—	All 0	R	Reserved
23 to 4	—	—	R	Reserved
3	BRK	0	R	Rendering Break Flag 0: The values of the SRES bit in SCLR and the BRCL bit in SRCR determine the time from clearing of the BRK flag to the next time drawing is suspended. 1: When suspension of drawing has been specified, this value indicates that the current command is no longer being executed. The BRK flag retains its value until it is cleared by a reset or by the SRCR setting.
2	CER	0	R	Command Error Flag Indicates that an illegal command has been fetched. 0: Normal state. An illegal command has not been fetched since the CER flag has been cleared by the SRES bit in SCLR or the CECL bit in SRCR. An illegal command is one in which the upper eight bits of the command code are undefined. The R-GP2D does not check the legality of the rendering attributes in the lower 16 bits. 1: Drawing operation halt state. Drawing operation remains halted because an illegal command was fetched after the CER flag has been cleared by the SRES bit in SCLR or the CECL bit in SRCR. To resume drawing operation, after executing a software reset, make the bit setting for rendering start. The CER flag retains its state until it is cleared by a reset or by SRCR. A command error occurs if n is 0 or 1 in LINE-type commands and n is 0 in RLINE-type commands.

Bit	Bit Name	Initial Value	R/W	Description
1	INT	0	R	<p>Interrupt Flag</p> <p>Indicates that the NOP/INT command has been fetched (only when the rendering attribute INT bit is 1).</p> <p>0: The NOP/INT command has not been fetched since the INT flag has been cleared by the SRES bit in SCLR or the INCL bit in SRCR.</p> <p>1: Drawing operation halt state. Drawing operation remains halted because the NOP/INT command was fetched after the INT flag has been cleared by the SRES bit in SCLR or the INCL bit in SRCR (only when the rendering attribute INT bit is 1).</p> <p>Clearing the INT flag by the INCL bit in SRCR resumes drawing operation from the next command. The CPU writing to registers, excluding the system control registers (SCLR), is prohibited during the time from the start of drawing to the TRAP command execution.</p> <p>The INT flag retains its state until it is cleared by a reset or by SRCR.</p> <p>Note: Do not rewrite the display list when drawing operation is halted by the INT command.</p>
0	TRA	0	R	<p>Trap Flag</p> <p>Indicates the end of command execution.</p> <p>0: The TRAP command has not been fetched since the TRA flag has been cleared by the SRES bit in SCLR or the TRCL bit in SRCR.</p> <p>1: Command execution has ended, or the current command is not being executed.</p> <p>The TRA flag retains its state until it is cleared by a reset or by SRCR.</p>

### 19.2.1.3 Status Register Clear Register (SRCR)

Address: H'E6EC0008

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	—	R	Reserved
3	BRE	0	R/W	Rendering Break Flag Enable Enables or disables interrupts initiated by the BRK flag in SR. 0: Interrupts initiated by the BRK flag in SR are disabled. 1: Interrupts initiated by the BRK flag in SR are enabled.
2	CEE	0	R/W	Command Error Flag Enable Enables or disables interrupts initiated by the CER flag in SR. 0: Interrupts initiated by the CER flag in SR are disabled. 1: Interrupts initiated by the CER flag in SR are enabled.
1	INE	0	R/W	Interrupt Flag Enable Enables or disables interrupts initiated by the INT flag in SR. 0: Interrupts initiated by the INT flag in SR are disabled. 1: Interrupts initiated by the INT flag in SR are enabled.
0	TRE	0	R/W	Trap Flag Enable Enables or disables interrupts initiated by the TRA flag in SR. 0: Interrupts initiated by the TRA flag in SR are disabled. 1: Interrupts initiated by the TRA flag in SR are enabled.

### 19.2.1.5 Interrupt Command ID Register (ICIDR)

Address: H'E6EC0010

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16		
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—		
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—		
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R		
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		
	—	—	—	—	—	—	—	—	ICID								—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—		
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R		

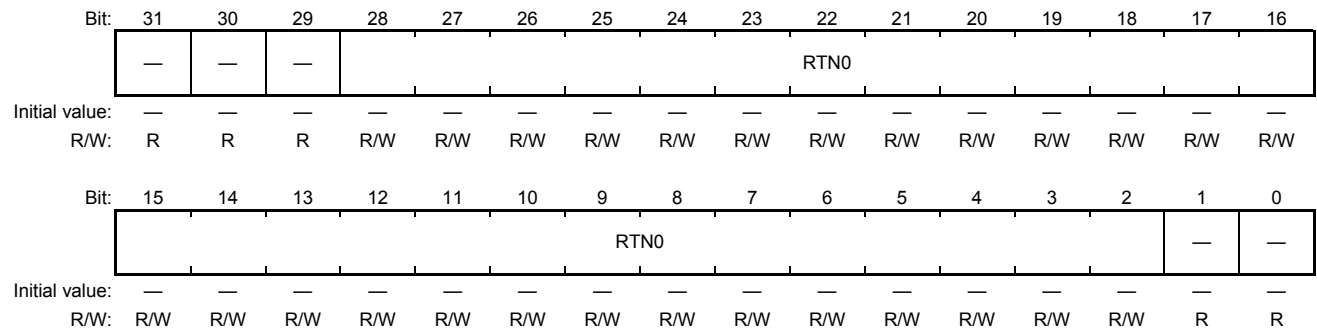

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	—	R	Reserved
7 to 0	ICID	Un-defined	R	Interrupt Command ID Stores the ID specified by the rendering attribute if the rendering attribute INT bit is set to 1 when the NOP/INT command is fetched.

### 19.2.2 Memory Control Registers

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	—	—	—

#### 19.2.2.1 Return Address Register 0 (RTN0R)

Address: H'E6EC0040

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	—	R	Reserved
28 to 2	RTN0	Un-defined	R/W	Return Address 0 (A28 to A2) Stores the return address when the rendering attribute No bit is 0 in the GOSUB command. The address indicated by RTN0R is a longword address (bits A28 to A2).
1, 0	—	—	R	Reserved

### 19.2.2.2 Return Address Register 1 (RTN1R)

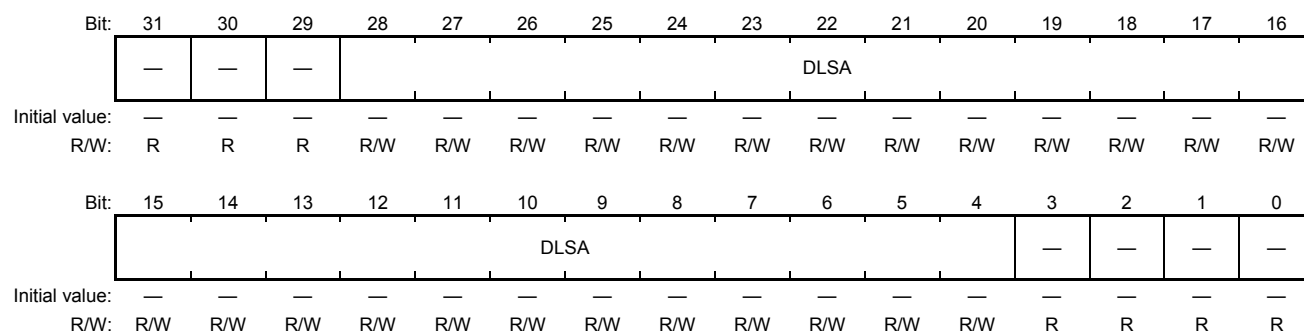

Address: H'E6EC0044

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	—	R	Reserved
28 to 2	RTN1	Un-defined	R/W	Return Address 1 (A28 to A2) Stores the return address when the rendering attribute No bit is 1 in the GOSUB command. The address indicated by RTN1R is a longword address (bits A28 to A2).
1, 0	—	—	R	Reserved

### 19.2.2.3 Display List Start Address Register (DLSAR)

Address: H'E6EC0048

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	—	R	Reserved
28 to 4	DLSA	Un-defined	R/W	Display List Start Address (A28 to A4) Specifies the memory area to be used as the display list. The start physical address (bits A28 to A4) of the display list is set in 16-byte units. Even in 32-bit addressing mode, write the lower 29 bits of the specified 32-bit address to bits 28 to 4.
3 to 0	—	—	R	Reserved

### 19.2.2.4 2-Dimensional Source Area Start Address Register (SSAR)

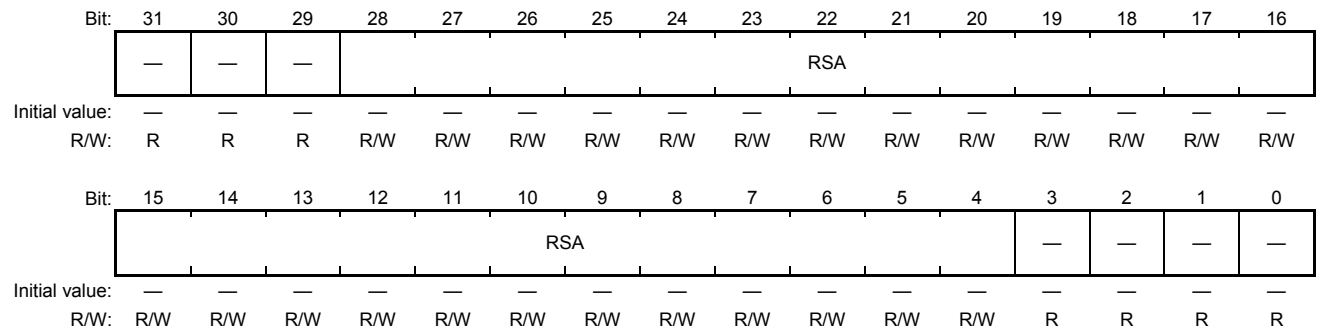

Address: H'E6EC004C

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—			SSA

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	—	R	Reserved
28 to 2	RTNSTK	H'0000000	R	Return Address STK (A28 to A2) Stores the return address when the rendering attribute No bit is 2 in the GOSUB command. The address indicated by RTNSTKR is a longword address (bits A28 to A2).
1, 0	—	—	R	Reserved

### 19.2.3 Color Control Registers

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	—	—	—

#### 19.2.3.1 Source Transparent Color Register (STCR)

Address: H'E6EC0080

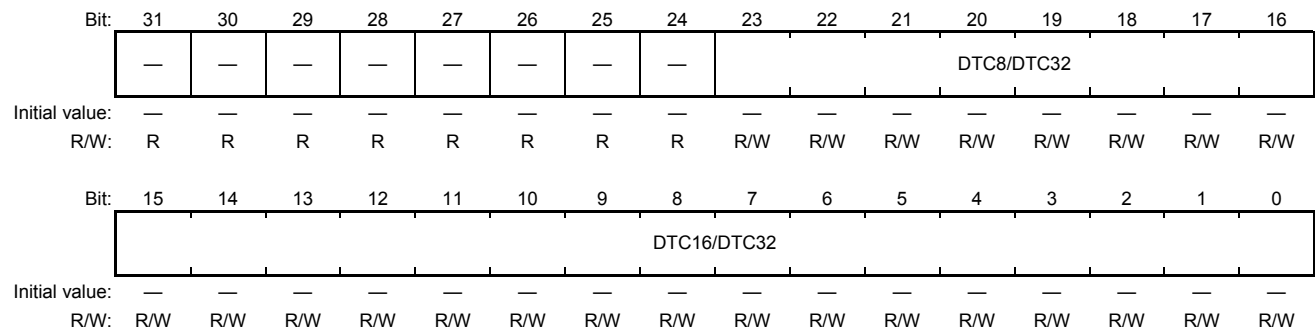

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	—	R	Reserved
24	STC1	Un-defined	R/W	Source Transparent Color 1 Transparent color for 1-bit/pixel source
23 to 16	STC8/ STC32	Un-defined	R/W	Source Transparent Color 8 Transparent color for 8-bit/pixel source Transparent color for 32-bit/pixel source R
15 to 0	STC16/ STC32	Un-defined	R/W	Source Transparent Color 16 Transparent color for 16-bit/pixel source Transparent color for 32-bit/pixel source G and B

- Notes:
- For 16-bit/pixel source data, use the same format specified by the SPF bit in the rendering control register (RCLR).
  - When SPF = 1 (ARGB = 1555), the A value is not compared.
  - If the source data are 32-bit/pixel, specify the R, G, and B components in bits 23 to 0, in that order.

### 19.2.3.2 Destination Transparent Color Register (DTCR)

Address: H'E6EC0084

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	—	R	Reserved
23 to 16	DTC8/ DTC32	Un-defined	R/W	Destination Transparent Color 8 Transparent color for 8-bit/pixel destination Transparent color for 32-bit/pixel destination (R components)
15 to 0	DTC16/ DTC32	Un-defined	R/W	Destination Transparent Color 16 Transparent color for 16-bit/pixel destination Transparent color for 32-bit/pixel destination (G or B components)

- Notes:
1. For 16-bit/pixel destination data, use the same format specified by the DPF bit in the rendering control register (RCLR).
  2. When DPF = 1 (ARGB = 1555), the A value is not compared.
  3. If the destination data are 32-bit/pixel, specify the R, G, and B components in bits 23 to 0, in that order.

### 19.2.3.3 Alpha Value Register (ALPHR)

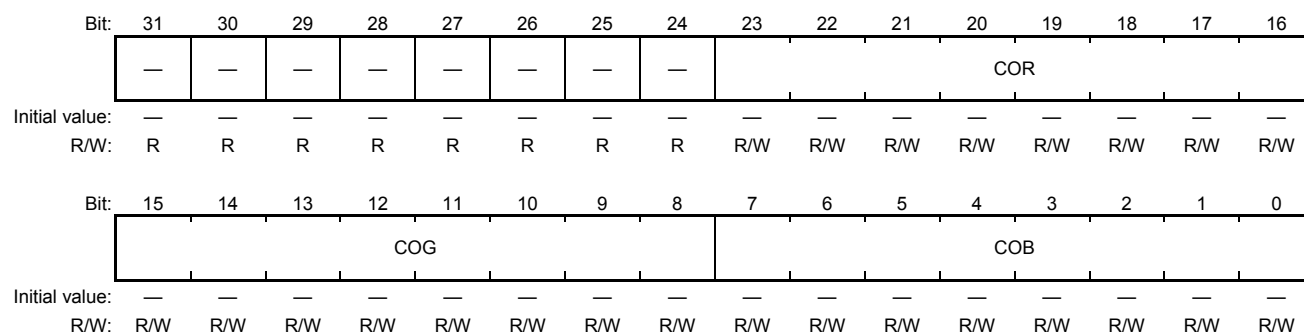

Address: H'E6EC0088

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	—	R	Reserved
7 to 0	ALPH	Un-defined	R/W	Alpha Value (b7 to b0) Specifies the alpha blending value when the rendering attribute $\alpha E$ bit is set to 1. $Destination \approx source \times ALPH/255 + destination \times (1 - ALPH/255)$ (approximate expression when ALPH is an 8-bit value).

### 19.2.3.4 Color Offset Register (COFSR)

Address: H'E6EC008C

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	—	R	Reserved
23 to 16	COR	Un-defined	R/W	Color offset R component (b23 to b16) The offset components are treated as signed integers. Negative numbers are expressed as two's complements.
15 to 8	COG	Un-defined	R/W	Color offset G component (b15 to b8) The offset components are treated as signed integers. Negative numbers are expressed as two's complements.
7 to 0	COB	Un-defined	R/W	Color offset B component (b7 to b0) The offset components are treated as signed integers. Negative numbers are expressed as two's complements.

**19.2.3.5 A Value 8 Register (AVALUE8R)**

Address: H'E6EC0098

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Initial value:	—	0	0	0	—	—	—	—	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	—	—	R	Reserved
30 to 28	SATSEL	000	R/W	Source Alpha Test Mode Select This setting is enabled when GBM2 = 1 and the rendering attribute SαE is set to 1. 000: ALWAYS 001: NEVER 010: LESS 011: LEQUAL 100: EQUAL 101: GEQUAL 110: GREATER 111: NEQUAL
27 to 24	—	—	R	Reserved
23 to 16	SATRV	H'00	R/W	Source Alpha Test Reference Value Reference value of the source alpha test
15	—	—	R	Reserved
14 to 12	DATSEL	000	R/W	Destination Alpha Test Mode Select Enabled when GBM2 = 1 and RCL2R/DAE = 1 000: ALWAYS 001: NEVER 010: LESS 011: LEQUAL 100: EQUAL 101: GEQUAL 110: GREATER 111: NEQUAL
11 to 8	—	—	R	Reserved
7 to 0	DATRV	H'00	R/W	Destination Alpha Test Reference Value Reference value of the destination alpha test

## 19.2.4 Rendering Control Registers

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	—	—	—

### 19.2.4.1 Rendering Control Register (RCLR)

Address: H'E6EC00C0

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	SAEP	—	STP	DTP	—	—	SPF	DPF	—	GBM	SAU	A VALUE
Initial value:	0	0	0	0	0	0	0	0	—	—	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R	R/W	R/W	R	R	R/W	R/W	R	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	BDS	—	—	—	LaE	2DV CLPE	—	—	—	NAA	WLM	LPCE	COM	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0
R/W:	R	R	R/W	R/W	R	R	R/W	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved
27	SAEP	0	R/W	Source Alpha Enable Polarity When source alpha is set to be enabled in the rendering attributes, this bit selects whether alpha blending is performed when the A value of the source data is 1 or 0. 0: Alpha blending is performed when the source data A value is 1. The source data is drawn back as is when the A value is 0. 1: Alpha blending is performed when the source data A value is 0. The source data is drawn back as is when the A value is 1. Note: This setting is ignored when GBM2 = 1.
26	—	0	R	Reserved
25	STP	0	R/W	Source Transparent Color Polarity Selects whether source transparency occurs when the source data and the value set in the source transparent color register match or do not match. 0: Source transparency at a match 1: Source transparency at an unmatched
24	DTP	0	R/W	Destination Transparent Color Polarity Selects whether destination transparency occurs when the destination data and the value set in the destination transparent color register match or do not match. 0: Destination transparency at a match 1: Destination transparency at an unmatched
23, 22	—	—	R	Reserved

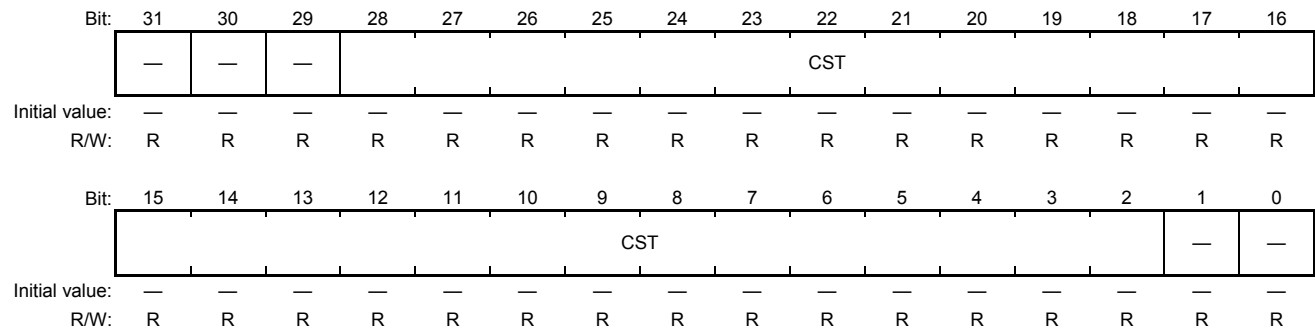

Bit	Bit Name	Initial Value	R/W	Description
21	SPF	0	R/W	<p>Source Pixel Format</p> <p>Specifies the pixel format for the multi-valued source. This setting is valid only for a multi-valued 16-bit/pixel source. This bit should be cleared to 0 for an 8-bit/pixel destination. Set this bit to match the destination pixel format.</p> <p>0: RGB = 565 format 1: ARGB = 1555 format</p>
20	DPF	0	R/W	<p>Destination Pixel Format</p> <p>Specifies the pixel format for the destination. This setting is valid only for a 16-bit/pixel destination. This bit should be cleared to 0 for an 8-bit/pixel destination. Set this bit to match the multi-valued source pixel format.</p> <p>0: RGB = 565 format 1: ARGB = 1555 format</p>
19	—	0	R	Reserved
18	GBM	0	R/W	<p>Graphics Bit Mode</p> <p>Specifies the graphics bit mode for the multi-valued source and destination.</p> <p>0: 8-bit/pixel 1: 16-bit/pixel</p>
17	SAU	0	R/W	<p>Source Value A Use</p> <p>When the pixel format of the source and destination is the ARGB format, drawing is performed while referencing the source value A as the destination value A.</p> <p>GBM2 = 0:</p> <p>0: The destination value A is drawn as AVALUE. 1: The destination value A is drawn referencing the source value A.</p> <p>Note: When SAU = 1, the value A of the command parameter Color0 or Color1 is referenced in a binary source reference command and the value A of the command parameter Color is referenced in a monochrome specification command.</p> <p>In the LINED command, the value A of the destination is written back, regardless of the settings of the SAU and AVALUE bits.</p> <p>GBM2 = 1:</p> <p>0: The destination value A is drawn as AVALUE8R. 1: The destination A values are drawn as the A value of command parameters Color0 or Color1 in the case of a command that refers to a binary source, the A value of the Color parameter in the case of a command that refers to a monochromatic source, and by reference to the A values (8-bit) of the source in the case of a command that refers to a multi-color source.</p>
16	AVALUE	0	R/W	<p>Value A</p> <p>When the pixel format of the source and destination is the ARGB format, drawing is performed with the destination value A as 0 or 1.</p> <p>0: The destination value A is drawn as 0. 1: The destination value A is drawn as 1.</p> <p>Note: This setting is ignored when GBM2 = 1.</p>
15, 14	—	00	R	Reserved

Bit	Bit Name	Initial Value	R/W	Description
13, 12	BDS	00	R/W	<p>Thickness Direction Boundary Select</p> <p>When the LINEA, LINEB, LINEC, RLINEA, RLINEB, or RLINEC command is executed and a bold line has been specified, these bits select the boundary at which the thickness direction changes.</p> <p>00: The thickness direction changes at the boundary A.</p> <p>01: The thickness direction changes at the boundary B.</p> <p>10: The thickness direction changes at the boundary C.</p> <p>11: The thickness direction changes at the boundary D.</p>
11, 10	—	00	R	Reserved
9, 8	LαE	00	R/W	<p>Line Alpha Enable</p> <p>The source data (color expanded data for a binary source and the specified color for the monochrome specification) and ground data are alpha blended and drawn in the LINEA, LINEB, LINEC, RLINEA, RLINEB, or RLINEC command. The alpha value is set in the alpha value register (ALPHR).</p> <p>A thick line is drawn by the 4-point drawing method, so some pixels that have been alpha blended twice appear, and in some cases the result of the drawing is unsatisfactory. Accordingly, to prevent the same pixel from being written over twice, it is recommended that the DAE bit in RCL2R be used at the same time.</p> <p>00: Alpha blending is not performed.</p> <p>01: Reserved</p> <p>10: Alpha blending is performed.</p> <p>11: Only the value A of ARGB = 1555 is rewritten. RGB data are not rewritten. The value A is rewritten in accordance with the SAU and AVALUE settings.</p> <p>Only the value A (8 bit) of ARGB = 8888 is rewritten. RGB data are not rewritten. The value A is rewritten in accordance with the SAU and A VALUE 8 register settings.</p> <p>Notes: 1. When the RGB = 565 format and 8 bits/pixel have been set, specify LαE = 00.</p> <p>2. For commands other than the LINEA, LINEB, LINEC, RLINEA, RLINEB, and RLINEC, specify LαE = 00.</p> <p>3. These bits are not decoded with a command, so these bits must be set or cleared in each relevant command.</p>

Bit	Bit Name	Initial Value	R/W	Description
7	2DVCLPE	0	R/W	<p>2-Dimensional Vertex Clipping Enable</p> <p>Generates intersection points with the 2-dimensional vertex clipping area (ANDed area of the system clipping area, user clipping area, and relative user clipping area) and performs drawing using the generated points in the LINEA/B/C/D, RLINEA/B/C/D, LINEWC, RLINEWC, FTRAPC, RFTRAPC (circumscribed quadrangle and trapezoid vertices), CLRWC, and POLYGON4A/B/C (BLKE = 1) commands.</p> <p>0: Intersection points with the 2-dimensional vertex clipping area are not generated.</p> <p>1: Intersection points with the 2-dimensional vertex clipping area are generated and drawing is performed using the generated points.</p> <p>Notes: 1. This specification is invalid for commands other than above.</p> <p>2. Drawing tracks may not match between 2DVCLPE = 0 and 2DVCLPE = 1.</p> <p>3. Patterns do not match.</p> <p>4. For the intersection edge between the (R)FTRAPC screen and 2-dimensional clipping area screen, (R)LINE and (R)LINEWC commands do not perform drawing.</p>
6 to 4	—	All 0	R	Reserved
3	NAA	0	R/W	<p>New Antialias Mode</p> <p>Performs antialiasing for horizontal, vertical, and 45-degree diagonal line segments.</p> <p>0: Antialiasing is not performed for horizontal, vertical, and 45-degree diagonal line segments.</p> <p>1: Antialiasing is performed for horizontal, vertical, and 45-degree diagonal line segments.</p>
2	WLM	1	R/W	<p>Bold Line Mode</p> <p>Selects thickness mode.</p> <p>0: Jaggy reduction is disabled.</p> <p>1: Jaggy reduction is enabled. (initial value)</p>
1	LPCE	0	R/W	<p>Line Pre-Clipping Enable</p> <p>This bit is valid for the (R)LINE and (R)LINEW type commands. When this bit is set to 1, pre-clipping is performed in line-segment units in the 2-dimensional clipping areas (system clipping, user clipping, and relative user clipping areas). If a line segment in the middle is pre-clipped, the pattern continuity is broken (the pattern starts from the final point of the line segment previously drawn).</p> <p>0: Pre-clipping is not performed.</p> <p>1: Pre-clipping is performed in line-segment units in the 2-dimensional clipping areas.</p>
0	COM	0	R/W	<p>Connection Drawing Mask</p> <p>Selects whether the linkage parts of bold lines are drawn or not.</p> <p>0: Linkage parts of bold lines are drawn.</p> <p>1: Linkage parts of bold lines are not drawn.</p>

### 19.2.4.2 Command Status Register (CSTR)

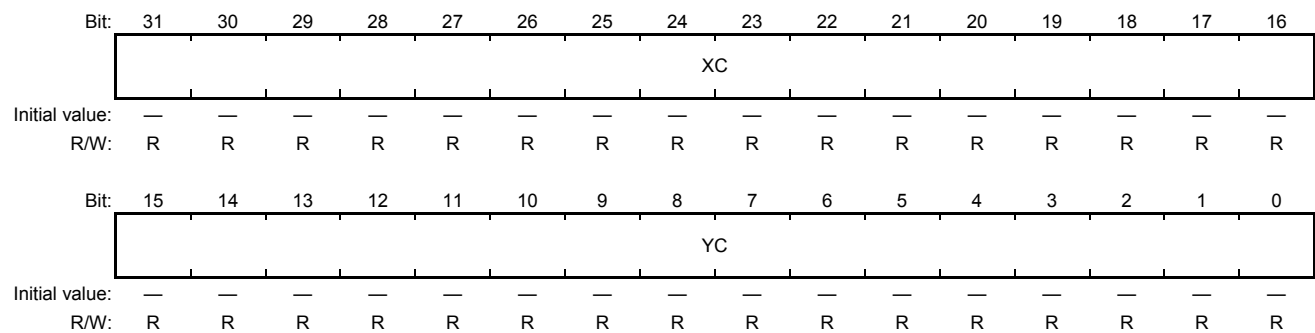

Address: H'E6EC00C4

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	—	R	Reserved
28 to 2	CST	Un-defined	R	Command Status (A28 to A2) Stores the address of the fetched command word (op code word). The address indicated by CSTR is a longword address (bits A28 to A2).
1, 0	—	—	R	Reserved

### 19.2.4.3 Current Pointer Register (CURR)

Address: H'E6EC00C8

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	XC	Un-defined	R	Current Pointer X The X coordinate of the current pointer
15 to 0	YC	Un-defined	R	Current Pointer Y The Y coordinate of the current pointer

### 19.2.4.4 Local Offset Register (LCOR)

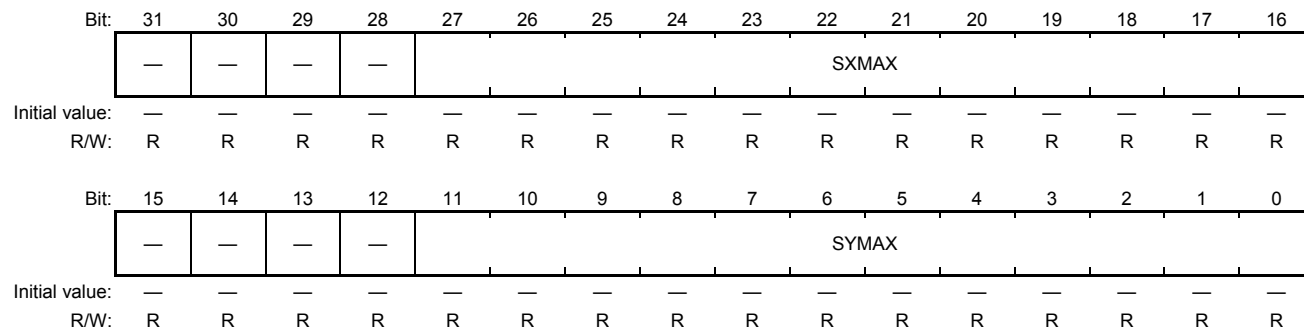

Address: H'E6EC00CC

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	XO	Un-defined	R	Local Offset X The X coordinate of the local offset
15 to 0	YO	Un-defined	R	Local Offset Y The Y coordinate of the local offset

### 19.2.4.5 System Clipping Area MAX Register (SCLMAR)

Address: H'E6EC00D0

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	—	R	Reserved
27 to 16	SXMAX	Un-defined	R	System Clipping XMAX The XMAX of the system clipping coordinates.
15 to 12	—	—	R	Reserved
11 to 0	SYMAX	Un-defined	R	System Clipping YMAX The YMAX of the system clipping coordinates.

Note: When setting this register by the WPR command, set the maximum values of the drawing range (max. 4,095. SXMAX < DSTRR).

### 19.2.4.6 User Clipping Area MIN Register (UCLMIR)

Address: H'E6EC00D4

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—				UXMIN											
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—				UYMIN											
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	—	R	Reserved
27 to 16	UXMIN	Un-defined	R	User Clipping XMIN The XMIN of the user clipping coordinates.
15 to 12	—	—	R	Reserved
11 to 0	UYMIN	Un-defined	R	User Clipping YMIN The YMIN of the user clipping coordinates.

Note: When setting this register by the WPR command, set UXMIN and UYMIN in the following ranges:  
 $0 \leq UXMIN \leq UXMAX \leq SXMAX \leq 4,095$ ,  $0 \leq UYMIN \leq UYMAX \leq SYMAX \leq 4,095$ .

### 19.2.4.7 User Clipping Area MAX Register (UCLMAR)

Address: H'E6EC00D8

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—				UXMAX											
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	—	R	Reserved
27 to 16	RUXMIN	Un-defined	R	Relative User Clipping XMIN The XMIN of the relative user clipping coordinates (offset values added to the local offset).
15 to 12	—	—	R	Reserved
11 to 0	RUYMIN	Un-defined	R	Relative User Clipping YMIN The YMIN of the relative user clipping coordinates (offset values added to the local offset).

Note: When setting this register by the WPR command, set RUXMIN and RUYMIN in the following ranges:  
 $0 \leq \text{RUXMIN} \leq \text{RUXMAX} \leq \text{SXMAX} \leq 4,095 - \text{XO}$ ,  $0 \leq \text{RUYMIN} \leq \text{RUYMAX} \leq \text{SYMAX} \leq 4,095 - \text{YO}$ .  
 For details on the setting ranges, see section 19.3.5 (5), Relative Clipping Specification (RCLIP).

**19.2.4.9 Relative User Clipping Area MAX Register (RUCLMAR)**

Address: H'E6EC00E0

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	RUXMAX											
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	RUYMAX											
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	—	R	Reserved
27 to 16	RUXMAX	Un-defined	R	Relative User Clipping XMAX The XMAX of the relative user clipping coordinates (offset values added to the local offset).
15 to 12	—	—	R	Reserved
11 to 0	RUYMAX	Un-defined	R	Relative User Clipping YMAX The YMAX of the relative user clipping coordinates (offset values added to the local offset).

Note: When setting this register by the WPR command, set RUXMAX and RUYMAX in the following ranges:  
 $0 \leq \text{RUXMIN} \leq \text{RUXMAX} \leq \text{SXMAX} \leq 4,095 - \text{XO}$ ,  $0 \leq \text{RUYMIN} \leq \text{RUYMAX} \leq \text{SYMAX} \leq 4,095 - \text{YO}$ .  
 For details on the setting ranges, see section 19.3.5 (5), Relative Clipping Specification (RCLIP).

### 19.2.4.10 Rendering Control 2 Register (RCL2R)

Address: H'E6EC00F0

### 19.2.5.2 Matrix Parameter A Register (MTRAR)

Address: H'E6EC0104

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	MTRA	H'3F800000	R/W	Matrix Parameter A Matrix parameter A at coordinate transformation. Specify in the single-precision floating-point format defined by the IEEE754 standard.

### 19.2.5.3 Matrix Parameter B Register (MTRBR)

Address: H'E6EC0108

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	MTRB	H'00000000	R/W	Matrix Parameter B Matrix parameter B at coordinate transformation. Specify in the single-precision floating-point format defined by the IEEE754 standard.

### 19.2.5.4 Matrix Parameter C Register (MTRCR)

Address: H'E6EC010C

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	MTRC	H'00000000	R/W	Matrix Parameter C Matrix parameter C at coordinate transformation. Specify in the single-precision floating-point format defined by the IEEE754 standard.

### 19.2.5.5 Matrix Parameter D Register (MTRDR)

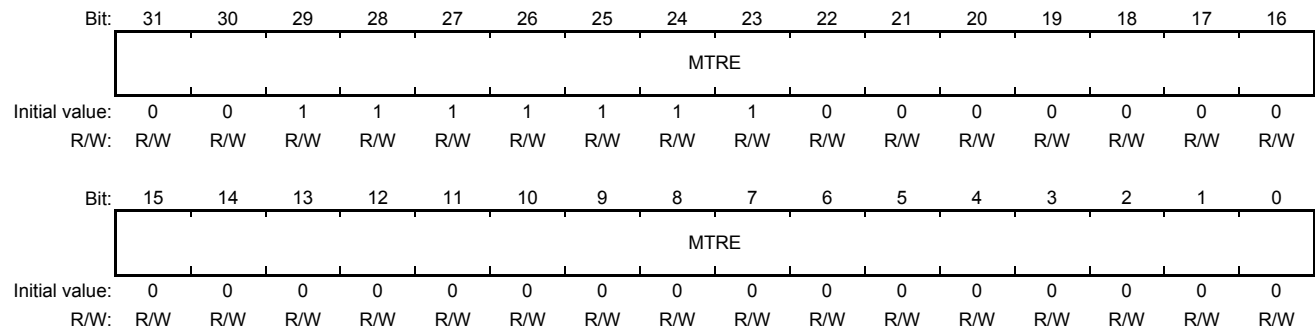

Address: H'E6EC0110

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	MTRD	H'00000000	R/W	Matrix Parameter D Matrix parameter D at coordinate transformation. Specify in the single-precision floating-point format defined by the IEEE754 standard.

**19.2.5.6 Matrix Parameter E Register (MTRER)**

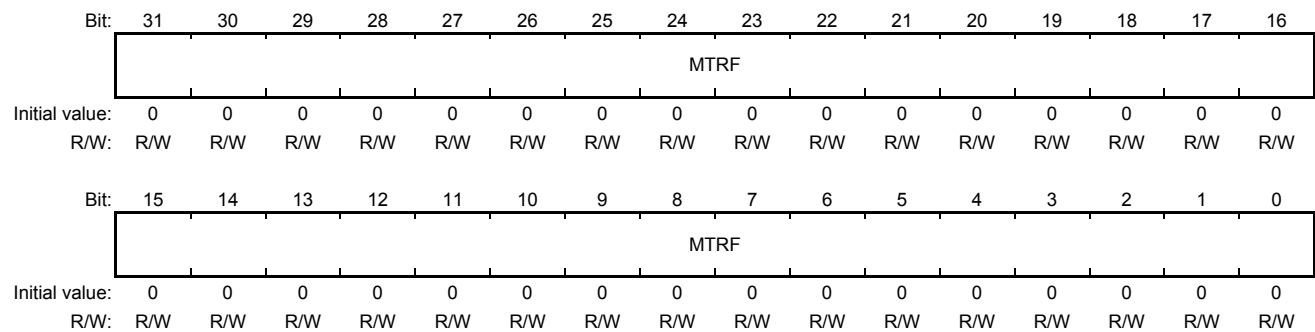

Address: H'E6EC0114

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	MTRER	H'3F800000	R/W	Matrix Parameter E Matrix parameter E at coordinate transformation. Specify in the single-precision floating-point format defined by the IEEE754 standard.

**19.2.5.7 Matrix Parameter F Register (MTRFR)**

Address: H'E6EC0118

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	MTRFR	H'00000000	R/W	Matrix Parameter F Matrix parameter F at coordinate transformation. Specify in the single-precision floating-point format defined by the IEEE754 standard.

**19.2.5.8 Matrix Parameter G Register (MTRGR)**

Address: H'E6EC011C

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	MTRG	H'00000000	R/W	Matrix Parameter G Matrix parameter G at coordinate transformation. Specify in the single-precision floating-point format defined by the IEEE754 standard.

**19.2.5.9 Matrix Parameter H Register (MTRHR)**

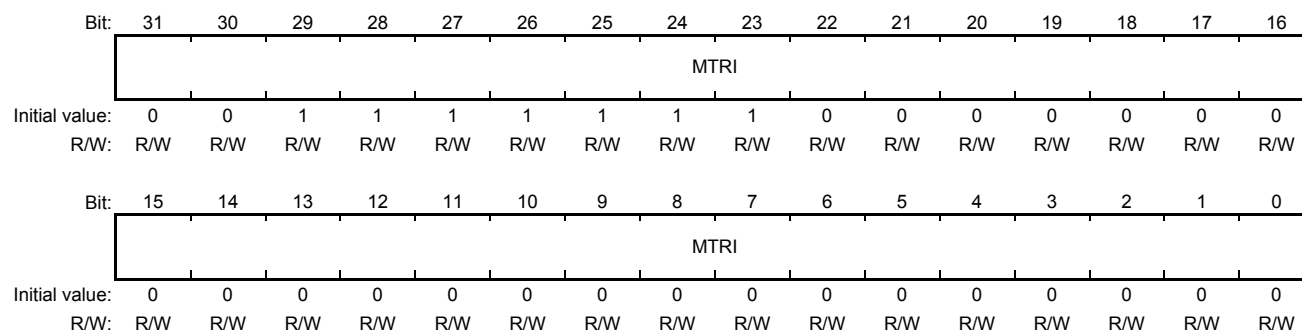

Address: H'E6EC0120

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	MTRH	H'00000000	R/W	Matrix Parameter H Matrix parameter H at coordinate transformation. Specify in the single-precision floating-point format defined by the IEEE754 standard.

### 19.2.5.10 Matrix Parameter I Register (MTRIR)

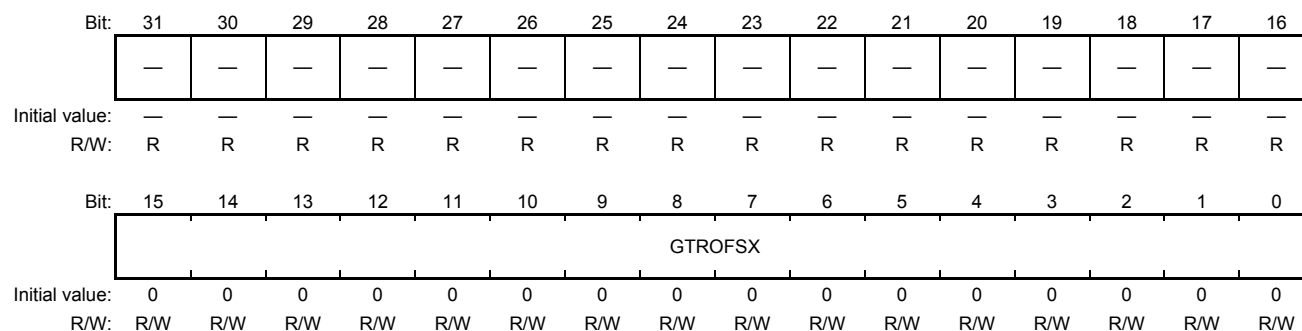

Address: H'E6EC0124

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	MTRI	H'3F800000	R/W	Matrix Parameter I Matrix parameter I at coordinate transformation. Specify in the single-precision floating-point format defined by the IEEE754 standard.

### 19.2.5.11 Coordinate Transformation Offset X Register (GTROFSXR)

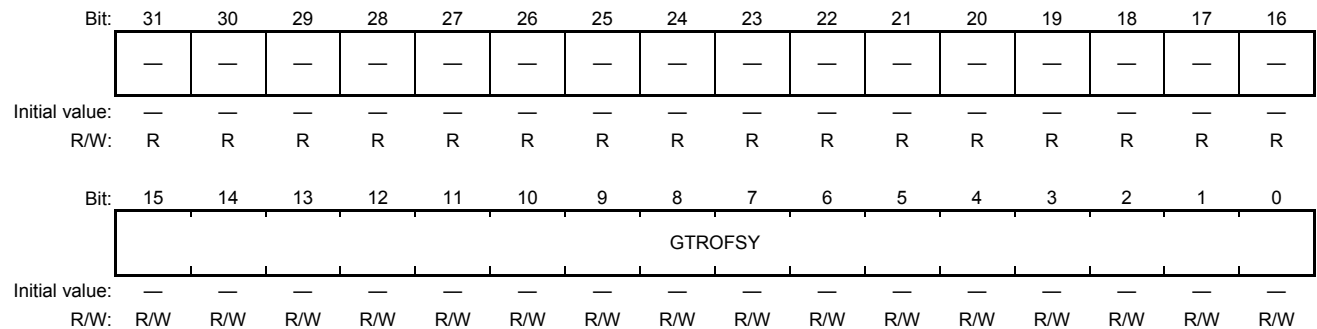

Address: H'E6EC0128

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	—	R	Reserved
15 to 0	GTROFSX	H'0000	R/W	Coordinate Transformation Offset X Specifies the X offset value for a coordinate transformation as a 16-bit integer. Negative numbers are expressed as two's complements. GTROFSXR is initialized to H'0000 at a reset. This register is read as a value added by the RGTOFS command.

**19.2.5.12 Coordinate Transformation Offset Y Register (GTROFSYR)**

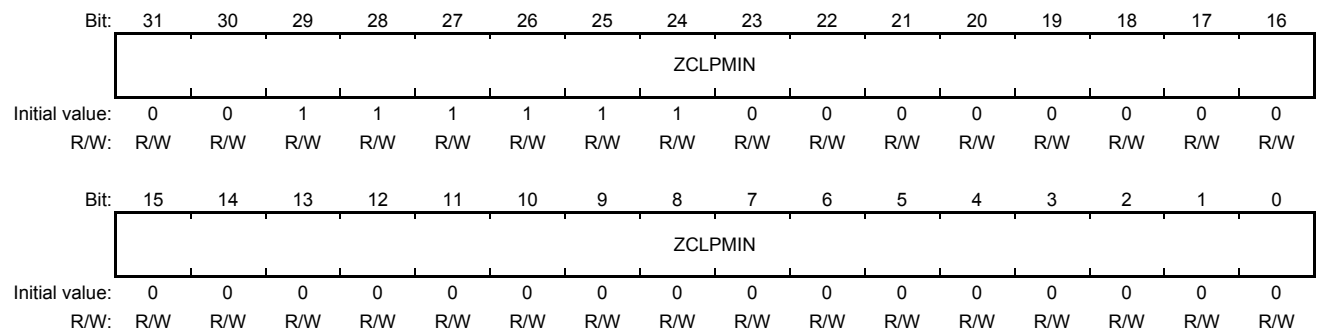

Address: H'E6EC012C

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	—	R	Reserved
15 to 0	GTROFSY	Un-defined	R/W	Coordinate Transformation Offset Y Specifies the Y offset value at coordinate transformation as a 16-bit integer. Negative numbers are expressed as two's complements. GTROFSYR is initialized to H'0000 at a reset. This register is read as a value added by the RGTOFS command.

**19.2.5.13 Z Clipping Area MIN Register (ZCLPMINR)**

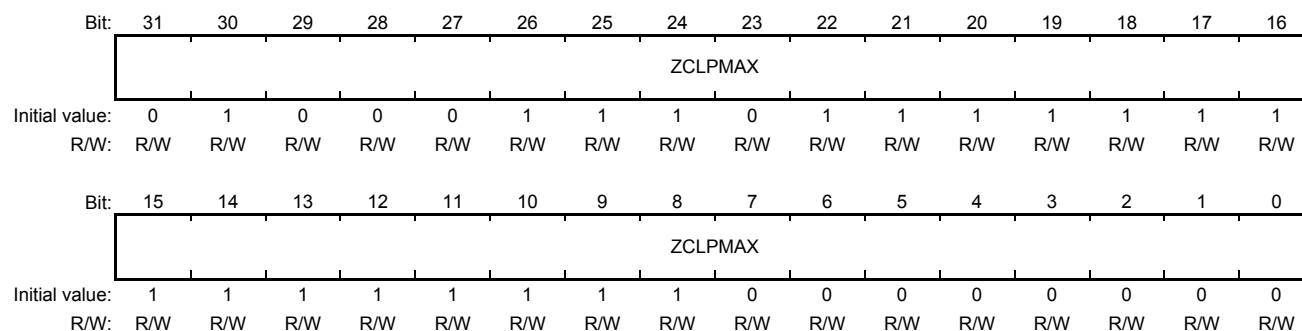

Address: H'E6EC0130

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	ZCLPMIN	H'3F000000	R/W	Z Clipping Area MIN Specifies the minimum value of the Z clipping area in the single-precision floating-point format defined by the IEEE754 standard. Since the setting is compared with the W value, set a value corresponding to W in ZCLPMINR. The value must be set within the ranges of $0 < ZCLPMIN \leq ZCLPMAX$ . (Only positive normalized values are allowed. Setting negative values, 0s, infinity, denormalized values, and NaN is prohibited.)

### 19.2.5.14 Z Clipping Area MAX Register (ZCLPMAXR)

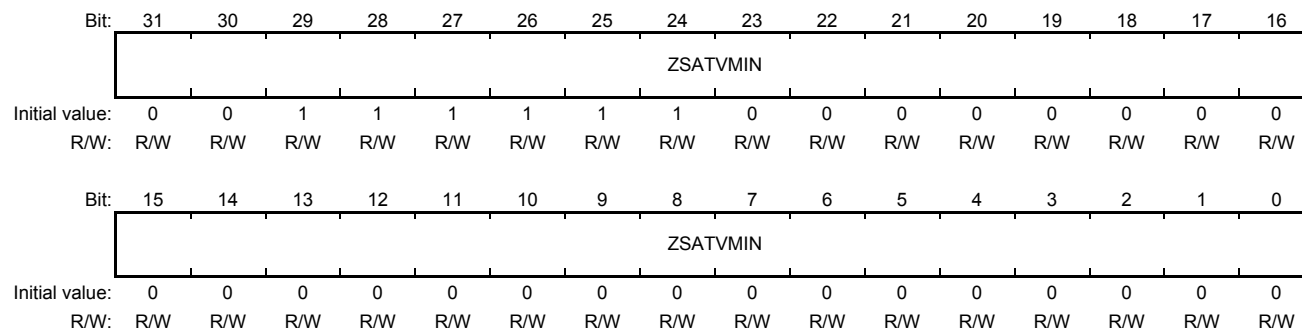

Address: H'E6EC0134

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	ZCLPMAX	H'477FFF00	R/W	<p>Z Clipping Area MAX</p> <p>Specifies the maximum value of the Z clipping area in the single-precision floating-point format defined by the IEEE754 standard. Since the setting is compared with the W value, set a value corresponding to W in ZCLPMAXR.</p> <p>The value must be set within the ranges of <math>0 &lt; ZCLPMIN \leq ZCLPMAX</math>. (Only positive normalized values are allowed. Setting negative values, 0s, infinity, denormalized values, and NaN is prohibited.)</p>

### 19.2.5.15 Z Saturation Value MIN Register (ZSATVMINR)

Address: H'E6EC0138

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	ZSATVMIN	H'3F000000	R/W	<p>Z Saturation Value MIN</p> <p>Specifies the minimum Z saturation value in the single-precision floating-point format defined by the IEEE754 standard. Since the setting is compared with the W value, set a value corresponding to W in ZSATVMINR. The value must be set within the ranges of <math>0 &lt; ZSATVMIN \leq ZCLPMIN \leq ZCLPMAX</math>. (Only positive normalized values are allowed. Setting negative values, 0s, infinity, denormalized values, and NaN is prohibited.)</p>

**19.2.5.16 2-Dimensional Vertex Clip Extension Width Register (2DVCEXTR)**

Address: H'E6EC0160

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	2DVCEXT					
Initial value:	—	—	—	—	—	—	—	—	—	—	0	0	0	1	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	—	—	R	Reserved
5 to 0	2DVCEXT	000101	R/W	<p>2-Dimensional Vertex Clip Extension Width</p> <p>When the 2-dimensional vertex clipping is enabled with the 2DVCLPE bit in RCLR, a 2-dimensional clipping area (ANDed area of the system clipping area, user clipping area, and relative user clipping area) is extended by the amount of the value set by this register, and the extended area is handled as a 2-dimensional vertex clipping area. Usually, a half the maximum value of the line width for bold line drawing is set for this register. The initial value is set as line width of 10.</p> <p>Note: If different values are set for the 2-dimensional clipping area and this register in each command, intersection point coordinates will differ according to the setting and drawn tracks will not match. (Care should be taken when drawing an edge line of a polygon.)</p>

## 19.2.6 Mode Control Register

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	—	—	—

### 19.2.6.1 Mode 0 Register (MD0R)

Address: H'E6EC01FC

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	GBM2	—	—	—	—	—	—	—	—
Initial value:	0	—	—	—	—	—	—	0	—	—	—	—	—	—	—	—

Initial value:	—	—	—	—	—	—	—	0	—	—	—	—	—	—	—	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved
30 to 25	—	—	R	Reserved
24	GBM2	0	R/W	Graphic Bit Mode 0: In accord with GBM 1: ARGB8888 format
23 to 9	—	—	R	Reserved
8	ACDE	0	R/W	Anti-aliasing Coverage Drawing Enable 0: Anti-aliasing Coverage Drawing is not performed (initial value) 1: Anti-aliasing Coverage Drawing is performed When drawing the anti-aliasing line, anti-aliasing coverage is drawn to A value. And, anti-aliasing of RGB is not performed. Use this function in ARGB8888 format. In addition, do not use this function except the LINE type and RLINE type commands because it is not decoded by the commands. When the line of different colors overlap, draw on the different plane for each color.
7 to 1	—	—	R	Reserved
0	DITHERENB	0	R/W	Dither enable 0: Dithering is not performed (initial value) 1: Dithering is performed

### 19.3 Operation

#### 19.3.1 Basic Functions

##### (1) 4 × 4 Matrix Operation

A 4 × 4 matrix is used to transform the input vertex. Setting the coordinate transformation enable bit (GTE) in the coordinate transformation control register (GTRCR) to 1 and then setting the rendering attribute MTRE bit of each command to 1 executes matrix operation for the input vertex.

The following matrix equation is used for transforming the coordinates of the input vertex for 2D commands.

$$\begin{pmatrix} TX \\ TY \\ TZ \\ w \end{pmatrix} = \begin{matrix} \text{Parse transformation matrix} & \text{Affine transformation matrix} \end{matrix} \begin{pmatrix} X \\ Y \\ Z \\ 1 \end{pmatrix}$$

$$\begin{pmatrix} TX \\ TY \\ TZ \\ w \end{pmatrix} = \begin{pmatrix} 1 & 0 & P02 & P03 \\ 0 & 1 & P12 & P13 \\ 0 & 0 & P22 & P23 \\ 0 & 0 & P32 & P33 \end{pmatrix} \begin{pmatrix} m00 & m01 & m02 & m03 \\ m10 & m11 & m12 & m13 \\ m20 & m21 & m22 & m23 \\ 0 & 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} X \\ Y \\ Z \\ 1 \end{pmatrix}$$

$$= \begin{pmatrix} m00+P02m20 & m01+P02m21 & m02+P02m22 & m03+P02m23 \\ m10+P12m20 & m11+P12m21 & m12+P12m22 & m13+P12m23 \\ P22m20 & P22m21 & P22m22 & P22m23 \\ P32m20 & P32m21 & P32m22 & P32m23+P33 \end{pmatrix} \begin{pmatrix} X \\ Y \\ Z \\ 1 \end{pmatrix}$$

Here the input vertex Z is 0 and the TZ output is not used, so the synthesized matrix becomes as follows:

$$\begin{pmatrix} m00+P02m20 & m01+P02m21 & 0 & m03+P02m23 \\ m10+P12m20 & m11+P12m21 & 0 & m13+P12m23 \\ 0 & 0 & 0 & 0 \\ P32m20 & P32m21 & 0 & P32m20+P33 \end{pmatrix}$$

The remaining nine parameters are set to the matrix parameter A to I registers (MTRAR to MTRIR), which are coordinate transformation control registers.

The relationship between the matrix parameter registers and matrix parameters is shown below.

$$\begin{pmatrix} A & B & 0 & C \\ D & E & 0 & F \\ 0 & 0 & 0 & 0 \\ G & H & 0 & I \end{pmatrix}$$

For example, when the view point is  $Z = 0$  as in the figure below, the parse transformation matrix becomes (1). Therefore, the synthesized matrix obtained by combining the parse transformation matrix with the affine transformation matrix becomes (2).

**Figure 19.2 Example of  $4 \times 4$  Matrix Operation**

$$\begin{pmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 1/d & 0 \end{pmatrix} \quad (1)$$

$$\begin{pmatrix} m00 & m01 & 0 & m03 \\ m10 & m11 & 0 & m13 \\ 0 & 0 & 0 & 0 \\ m20/d & m21/d & 0 & m23/d \end{pmatrix} \quad (2)$$

The above nine parameters are set to the matrix parameter A to I registers (MTRAR to MTRIR), which are coordinate transformation control registers.

MTRAR to MTRIR are set in the single-precision floating-point format defined by the IEEE754 standard.

- Notes:
1. Before matrix operation, internally add the local offset to the input coordinates X and Y in the R-GP2D.
  2. For a command with a relative coordinate specification, the coordinates are internally modified to the absolute coordinates in the R-GP2D before matrix operation.
  3. Matrix operation is performed for only the center coordinates (BXC, BYC) in a BITBLTA, BITBLTB, BITBLTC, AAFA, or AAFC command and for only the starting and final coordinate points in bold line drawing.
  4. For internal matrix operation, rounding off and exceptional processing conforming to IEEE754 are not performed to increase the operational speed. If an overflow occurs in the mantissa, truncation is performed.
  5. If NaN (non-numeric data) is input or if NaN or infinity appears in the course of operation, the result is undefined.
  6. If denormalized data is input or if denormalized data appears in the course of operation, the result is regarded as 0.

## (2) 2DZ Clipping

Pre-clipping is performed when all vertices of the drawn figure (see the notes below) are smaller than the value in the Z clipping area MIN register (ZCLPMINR) or greater than the value in the Z clipping area MAX register (ZCLPMAXR). Since the W value is used for comparison in Z clipping, set values corresponding to W in ZCLPMINR, ZCLPMAXR and ZSATVMINR (Zmin/d and Zmax/d in the above example). If pre-clipping is not performed, intersection points with the ZCLPMIN and ZCLPMAX areas are searched for in the LINE, RLINE, FTRAPC, RFTRAPC (trapezoid vertices), LINEWC, and RLINEWC commands. In the POLYGON4 commands with BLKE = 1, FTRAPC or RFTRAPC command circumscribed quadrangle drawing (when BLKE = 1), and CLRWC command (when BLKE = 1), BLKE processing is performed after intersection points with the ZCLPMIN and ZCLPMAX area are searched for in the same way as the LINE, RLINE, FTRAPC, RFTRAPC (trapezoid vertices), LINEWC, and RLINEWC commands. In the POLYGON4 command with BLKE = 0, intersection points with ZCLIPMIN and ZCLPMAX are not searched for, and if the W value is equal to or less than the value set in ZSATVMIN after the matrix operation, saturation processing is performed to become the ZSATVMIN value. ZCLPMINR, ZCLPMAXR, and ZSATVMINR must be set in the single-precision floating-point format defined by the IEEE 754 standard. 2DZ clipping is performed only when GTE = 1 and MTRE = 1 simultaneously. It is not performed when GTE = 0 or MTRE = 0.

- Notes:
1. If Z pre-clipping is performed or intersection points are searched for in a LINE, RLINE, command, the continuity of the pattern is not maintained.
  2. If X pre-clipping is performed in bold-line drawing, the linkage parts may not be drawn.
  3. Drawing is not performed on the edge line between the FTRAPC or RFTRAPC screen and ZCLPMIN and ZCLPMAX screens in LINE, RLINE, LINEWC and RLINEWC commands.
  4. In FTRAPC and RFTRAPC commands, drawing may not be performed on the edge line with the ZCLPMIN and ZCLPMAX screens.
  5. In map drawing with coordinate transformation, such as birds-eye view, a POLYGON4 command used for drawing a polygon is assumed to be used with BLKE = 1 and PSTYLE = 1 (for POLYGON4A or POLYGON4B). If a POLYGON4 command is used with BLKE = 0 or PSTYLE = 0, the drawn figure may be broken.
  6. Meaning of "all vertices":  
 POLYGON4 and CLRWC: Four vertices after coordinate transformation  
 BITBLT, AAFA, and AAFC: The center coordinate vertex after coordinate transformation  
 FTRAPC and RFTRAPC: Four vertices of circumscribed quadrangle after coordinate transformation  
 LINE, RLINE, LINEW, and RLINEW: Two vertices of the line

**Figure 19.3 Example of Z Clipping for LINE, RLINE, FTRAPC, RFTRAPC (Trapezoid Vertices), LINEW, and RLINEW Commands**

**Figure 19.4 Example of Z Clipping for POLYGON4 Commands (BLKE = 1), FTRAPC or RFTRAPC Command (Circumscribed Quadrangle), and CLRWC Command**

Figure 19.5 Example of Z Clipping for POLYGON4 Commands (BLKE = 0)

### (3) Perspective W Division

TX and TY after matrix operation are processed as follows, according to the affine transformation enable bit (AFE) in the coordinate transformation control register (GTRCR).

- AFE = 0

The output X coordinate X' and output Y coordinate Y' become:  $X' = TX/WC + GTROFSX$ ,  $Y' = TY/WC + GTROFSY$ .

GTROFSX and GTROFSY are set in the coordinate transformation offset X register (GTROFSXR) and coordinate transformation offset Y register (GTROFSYR), respectively. GTROFSX and GTROFSY are set as 16-bit integers (two's complements).

- AFE = 1

The output X coordinate X' and output Y coordinate Y' become:  $X' = TX$ ,  $Y' = TY$ . Z clipping, perspective W division, and offset addition are not performed.

Z clipping, perspective W division, and offset addition are not performed.

When AFE = 0, if  $TX/WC + GTROFSX$  or  $TY/WC + GTROFSY$  (offset GTROFSX and GTROFSY added to TX/WC and TY/WC after W division) is smaller than  $-H'7FFF$  or greater than  $H'7FFF$ , respectively, saturation processing is performed. Even if saturation processing has been performed, the command is continuously executed at the vertex coordinates which have been saturated.

An offset (from -2048 to 2047) can be added to GTROFSX and GTROFSY using the RGTOFS command.

Note: In a BITBLT type, AAFA, or AAFC command, the four vertices are obtained by adding the width (LW, RW) and height (TH, BH) to the center coordinate values after they have been transformed.

In bold line drawing, the four vertices are obtained from the final and starting points of the transformed coordinates and the line width (W). Therefore, be careful the rendering coordinates are not exceeded in these two commands because saturation processing is not performed for vertices obtained from the reference points (center coordinates in a BITBLT type command, and starting and final coordinate points in bold line drawing).

### (4) 2-Dimensional Vertex Clipping

When the 2-dimensional vertex clipping enable specification is set to enable with the 2DVCLPE bit in RCLR, generates intersection points with the 2-dimensional vertex clipping area (ANDed area of the system clipping area, user clipping area, and relative user clipping area) and performs drawing using the generated points in the LINEA/B/C/D, RLINEA/B/C/D, LINEWC, RLINWC, FTRAPC, RFTRAPC (circumscribed quadrangle and trapezoid vertices), CLRWC, and POLYGON4A/B/C (BLK = 1) commands.

In addition, setting a value other than 0 in 2DVCEXTR extends the 2-dimensional clipping area to be used for intersection generation by the amount of the set value. This function is effective to prevent end points of a bold line from being cut off since bold-line coordinates are generated from the intersection points generated by 2-dimensional vertex clipping in bold-line drawing. Usually, a half the maximum value of the line width for bold line drawing is set for 2DVCEXTR. The initial value is set as line width of 10.

- Notes:
1. This function is invalid for commands other than above.
  2. Drawing tracks may not match between 2DVCLPE = 0 and 2DVCLPE = 1.
  3. Patterns do not match.
  4. For the intersection edge between the FTRAPC or RFTRAPC screen and 2-dimensional clipping area screen, LINE, RLINE, LINEWC, or RLINWC commands do not perform drawing.
  5. If different values are set for the 2-dimensional clipping area and 2DVCEXTR in each command, intersection point coordinates will differ according to the setting and drawn tracks will not match. (Care should be taken when drawing an edge line of a polygon.)

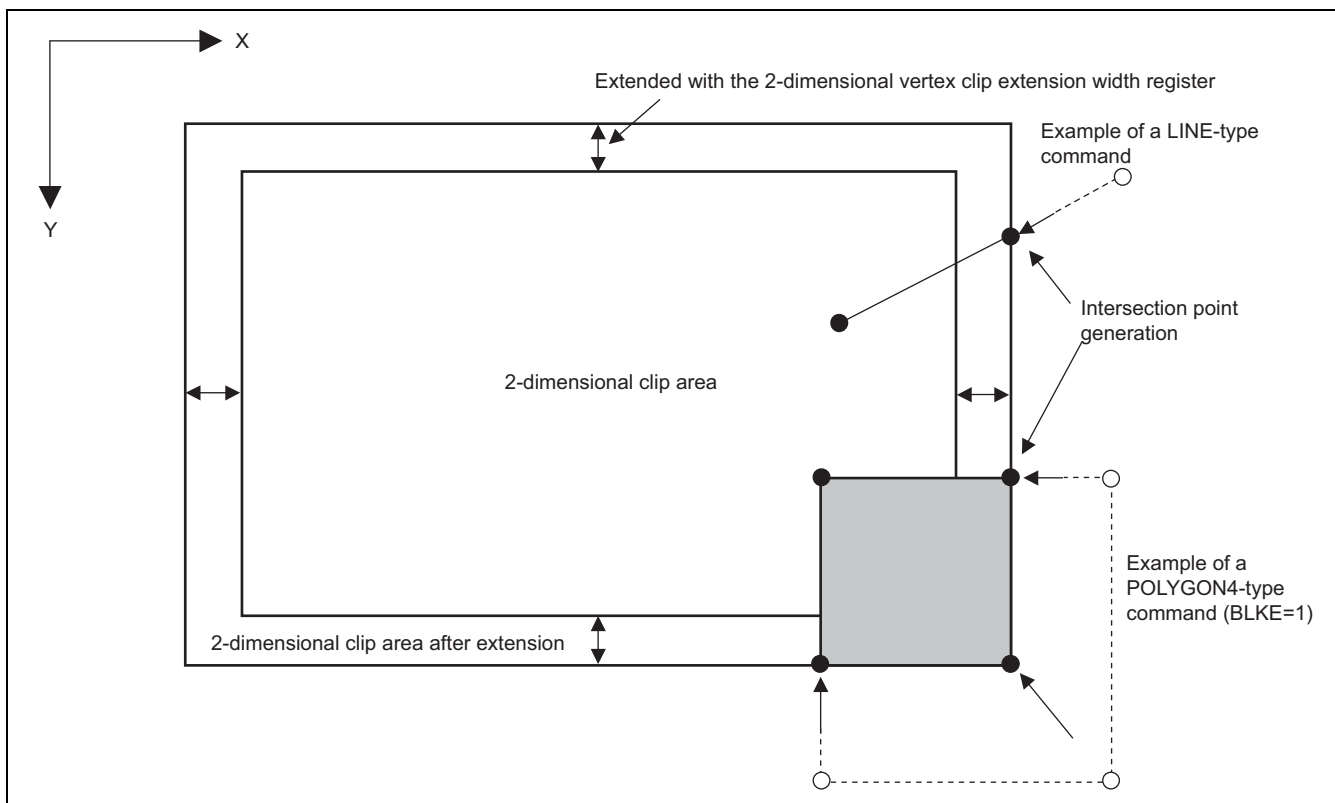

Figure 19.6 2-Dimensional Vertex Clipping

(5) Coordinate Transformation Flow and Saturation Processing

Coordinate transformation is performed in the following sequence.

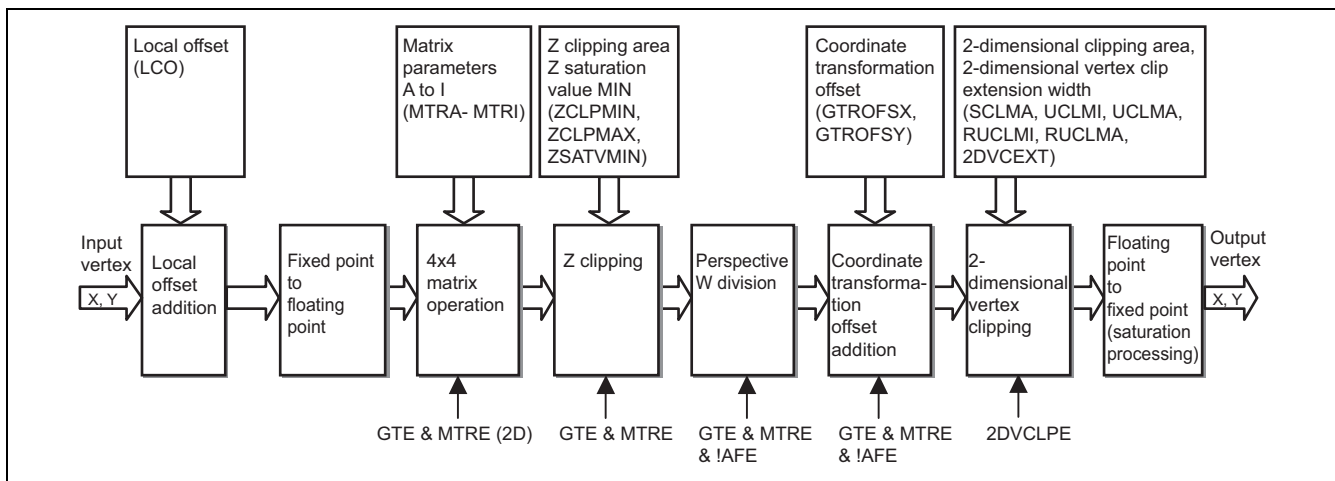

Figure 19.7 Coordinate Transformation Flow Image

**(6) Bold Line Drawing**

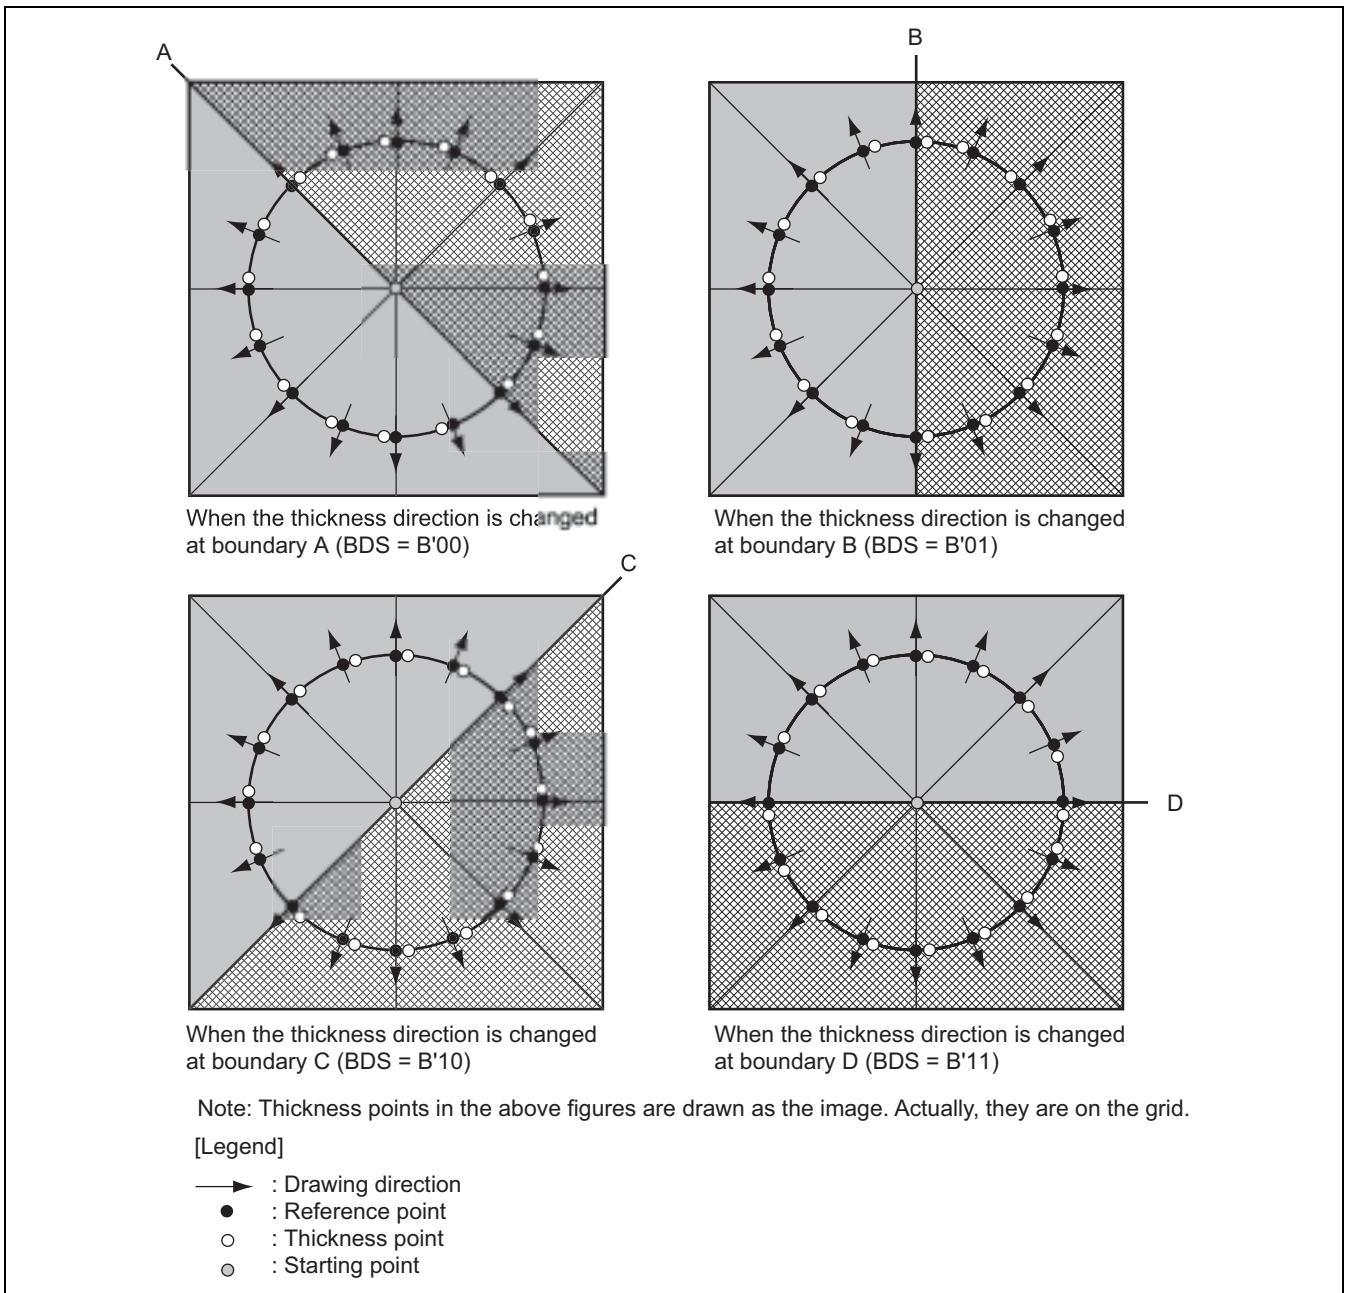

A bold line can be drawn by setting a value greater than 0 as line width  $W$  in a LINEA, LINEB, LINEC type or RLINEA, RLINEB, RLINEC type command. The bold line coordinates  $a$ ,  $b$ ,  $c$ , and  $d$  are obtained from the starting and final coordinate points and line width  $W$ , and the bold line drawn.  $W$  is set in the 6-bit integer part. When 0 is set in  $W$ , a line of line width 1 is drawn. The connection drawing mask bit (COM) in the rendering control register (RCLR) is used to select whether the linkage parts of bold lines are drawn or not. When the starting and final coordinate points of a line segment match in bold line drawing, nothing is drawn.

When the WLM (bold line mode) bit in RCLR is set to 1, jaggy is reduced in bold line drawing.

**Figure 19.8 Bold Line Drawing**

A boundary for switching thickness directions can be set according to the BDS (thickness direction boundary select) bit in RCLR.

**Figure 19.9 Thickness Direction Boundary Select Bit**

## (7) Antialiasing

Antialiasing which reduces alias can be used in a (R)LINEA/B/C/D or 3DLINE command.

For (R)LINEA/B/C/D commands, antialiasing is performed by setting the rendering attribute AA (antialias enable) bit to 1. There are two antialiasing modes. When the NAA (new antialiasing mode) bit in RCLR is set to 0, antialiasing is not performed for horizontal, vertical, and 45-degree diagonal line segments. When the NAA bit is 1, antialiasing is performed for horizontal, vertical, and 45-degree diagonal line segments.

- For a dashed line in LINEA/B or RLINEA/B command, antialiasing is not performed for the gaps in the dashed line.
- When the starting and final coordinate points of a line segment match in the LINEA, LINEB, LINEC, RLINEA, RLINEB, or RLINEC command, a single dot is drawn for a 1-bit-wide line ( $W = 0$ ) without antialiasing and nothing is drawn for bold line drawing.
- When the starting and final coordinate points of a line segment match in the LINED or RLINED command, nothing is drawn.
- Antialiasing is not performed for horizontal, vertical, and 45-degree diagonal line segments in the LINEA, LINEB, LINEC, RLINEA, RLINEB, or RLINEC command. In new antialias mode (when NAA is set to 1), antialiasing is performed for horizontal, vertical, and 45-degree diagonal line segments.
- Antialiasing is not performed for horizontal and vertical line segments in the LINED or RLINED command.

**Figure 19.10 Example of Antialias Specification**

### 19.3.2 Coordinate Systems

The R-GP2D has five 2-dimensional coordinate systems (screen coordinates, rendering coordinates, 2-dimensional source coordinates, work coordinates, and  $\alpha$ -map coordinates), and one 1-dimensional coordinate system (1-dimensional source coordinates).

Screen coordinates are the display control coordinates. Screen coordinate X corresponds to the horizontal dimension of the display screen and Y to the vertical dimension. The origin is the top-left corner in the display screen. The screen coordinate positive directions are right for the X-axis and down for the Y-axis. 32 bits (32 bits/pixel), 16 bits (16 bits/pixel), or 8 bits (8 bits/pixel) can be selected as the data width of one screen coordinate. The maximum values of the screen coordinates are  $X = 4,095$ ,  $Y = 4,095$ .

Rendering coordinates are drawing control coordinates. Rendering coordinates are shifted horizontally and vertically with respect to screen coordinates by the offset amounts specified in drawing commands. According to the drawing commands, the R-GP2D performs drawing operations using these coordinates. 32 bits (32 bits/pixel), 16 bits (16 bits/pixel), or 8 bits (8 bits/pixel) can be selected as the data width of one rendering coordinate.

2-dimensional source coordinates are drawing control coordinates. When a drawing command is executed with  $SS = 1$ , these are the source data (rectangle) coordinates specified by the drawing command. 32 bits (32 bits/pixel), 16 bits (16 bits/pixel), or 8 bits (8 bits/pixel) can be selected as the data width of one 2-dimensional source coordinate.

1-dimensional source coordinates are drawing control coordinates. When a drawing command is executed with  $SS = 0$ , these are the source data (1-dimensional) coordinates specified by the drawing command. 32 bits (32 bits/pixel), 1 bit (1 bit/pixel), 16 bits (16 bits/pixel), or 8 bits (8 bits/pixel) can be selected as the data width of one 1-dimensional source coordinate. For one 1-dimensional source, one physical address (top-left) and the horizontal width and vertical height of the 1-dimensional source are specified.

Work coordinates are drawing control coordinates that correspond one-to-one with the rendering coordinates. When a drawing command is executed, these are the work coordinates specified by the drawing command. The data width of one work coordinate is 1 bit (1 bit/pixel).

$\alpha$ -map coordinates are drawing control coordinates that are specified by the AAFA command. The data width of one  $\alpha$ -map coordinate is 8 bits (8 bits/pixel).

**Figure 19.16  $\alpha$ -Map Coordinates**

### 19.3.3 Data Formats

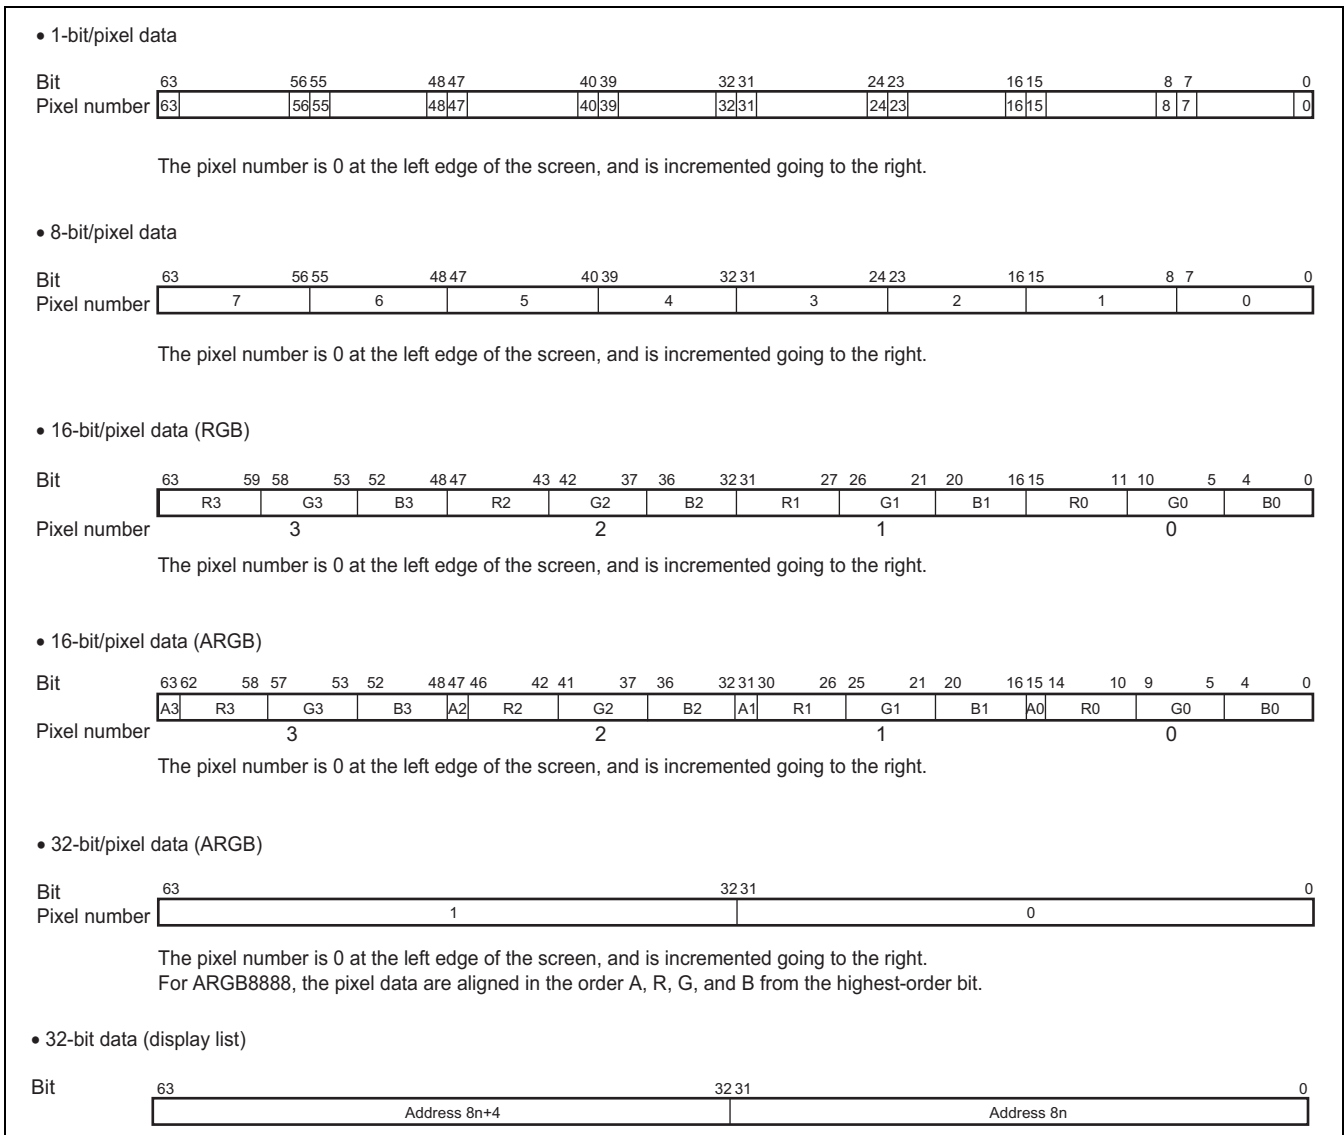

Figure 19.17 Data Formats

### 19.3.4 Endian Conversion

Endian conversion mode can be specified in ENDCVR.

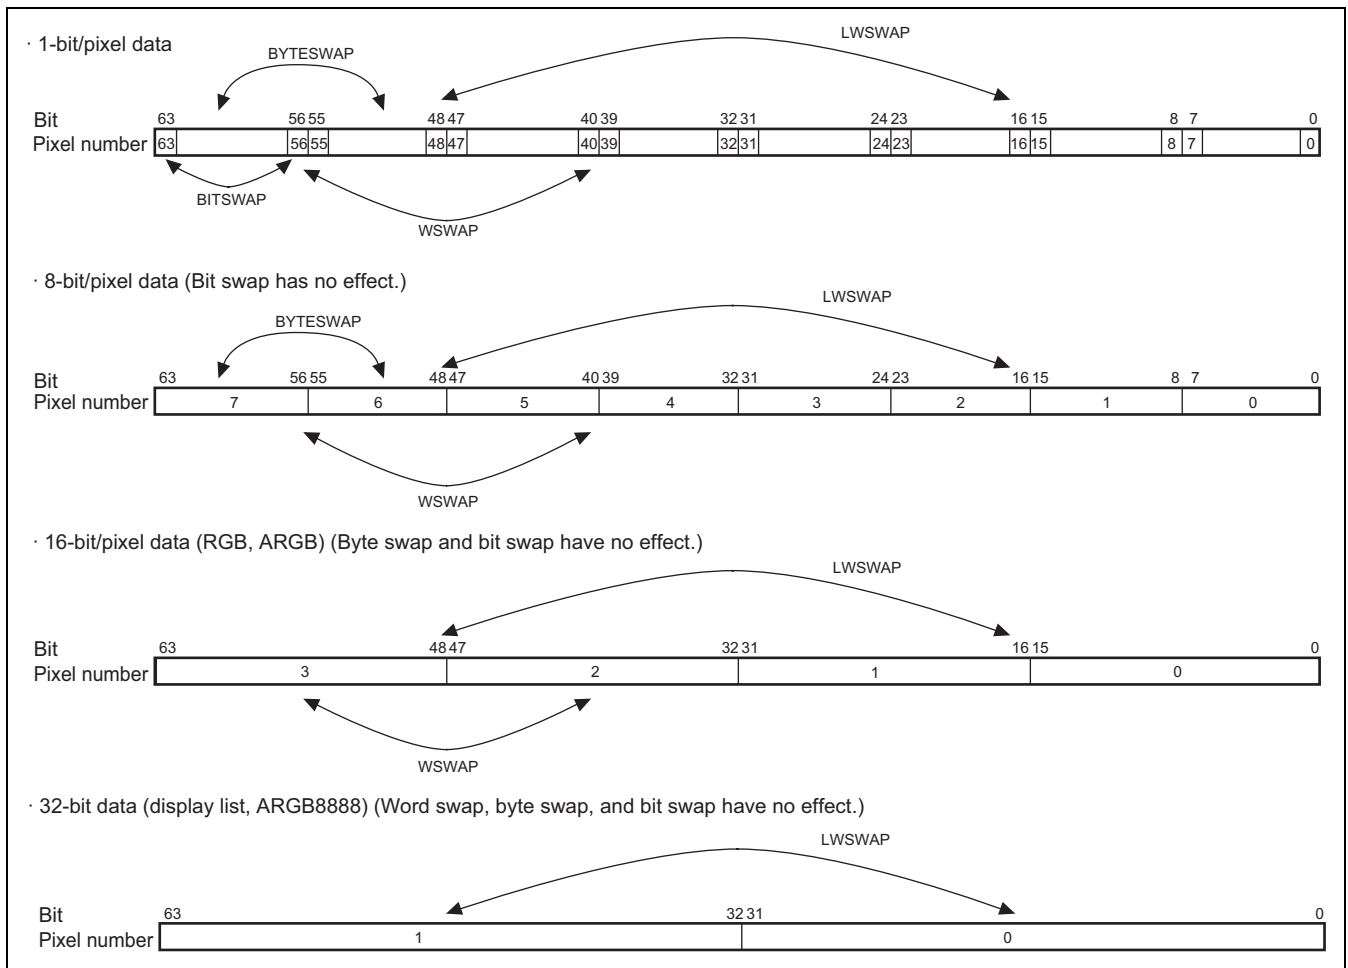

Figure 19.18 Endian Conversion

### 19.3.5 Rendering Attributes

#### (1) Source Transparency Specification (STRANS)

When referencing source data, the STRANS bit can be used to select transparency or non-transparency on an individual drawing command basis. If transparency is selected, the source color becomes transparent at register value = source color when the source transparent color polarity bit (STP) in the rendering control register (RCLR) is 0, and the source color becomes transparent at register value  $\neq$  source color when the STP bit is 1, and the pixels are not drawn in either case. The source transparency specification can be used with the POLYGON4A, POLYGON4B, LINEA, LINEB, RLINEA, RLINEB, BITBLTA, BITBLTB, and AAFA commands. The STRANS bit should be cleared to 0 in other commands. When the source pixel format is ARGB, the A value is not compared. Note that when the STRANS bit is set to 1, the source data is always read in the BITBLTA or BITBLTB command, regardless of the ROP code.

#### (2) Destination Transparency Specification (DTRANS)

When referencing destination data, the DTRANS bit can be used to select transparency or non-transparency on an individual drawing command basis. If transparency is selected, the destination color becomes transparent at register value = source color when the destination transparent color polarity bit (DTP) in the rendering control register (RCLR) is 0, and the destination color becomes transparent at register value  $\neq$  destination color when the DTP bit is 1, and the pixels are not drawn in either case. The destination transparency specification can be used with the BITBLTA, BITBLTB, BITBLTC, AAFA, and AAFC commands. The DTRANS bit should be cleared to 0 in other commands. When the destination pixel format is ARGB, the A value is not compared. Note that when the DTRANS bit is set to 1, the destination data is always read, regardless of the ROP code.

#### (3) Source Style Specification (STYLE)

The STYLE bit can be used to select, on an individual drawing command basis, whether to enlarge or reduce the source data or repeatedly reference it. If no style specification is made, the source data is enlarged or reduced in proportion to the size of the rendering area. When a style specification is made, the source data is referenced repeatedly in proportion to the size of the rendering area. This attribute is therefore used when drawing repeated patterns such as hatch patterns. The source style specification can be used with the POLYGON4A, POLYGON4B, LINEA, LINEB, RLINEA, and RLINEB commands. The STYLE bit should be cleared to 0 in other commands. The STYLE bit must be set to 1 when BLKE = 1 in the POLYGON4A, POLYGON4B, LINEA, LINEB, RLINEA, or RLINEB command.

In the LINEA, LINEB, RLINEA, and RLINEB commands, the source data is repeatedly referenced in only the X direction of the source data. The source data is enlarged or reduced in proportion to the line width in the Y direction of the source data.

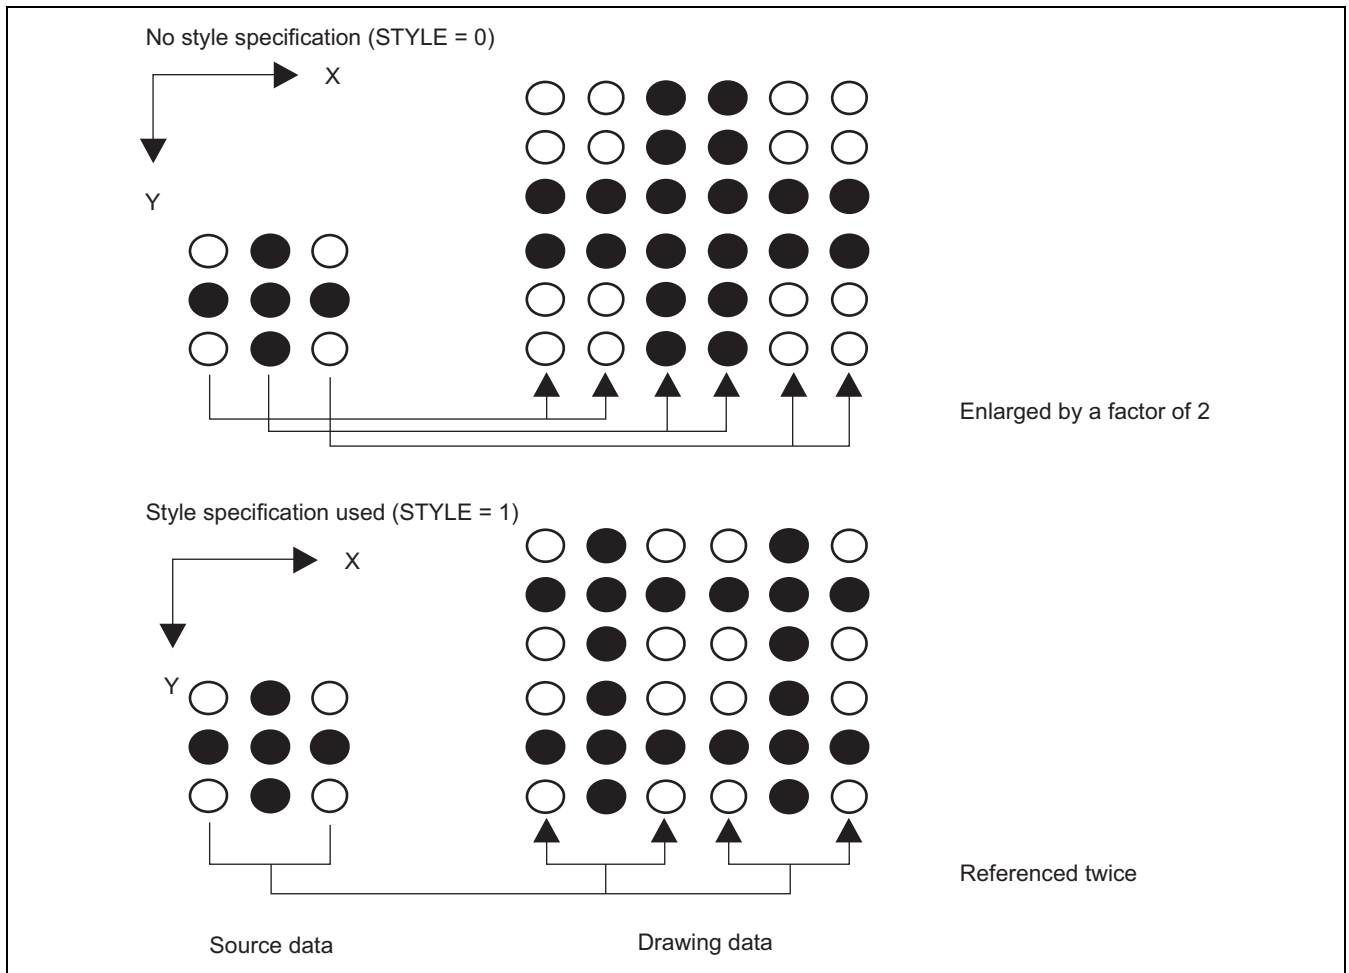

Figure 19.19 Example of Source Style Specification

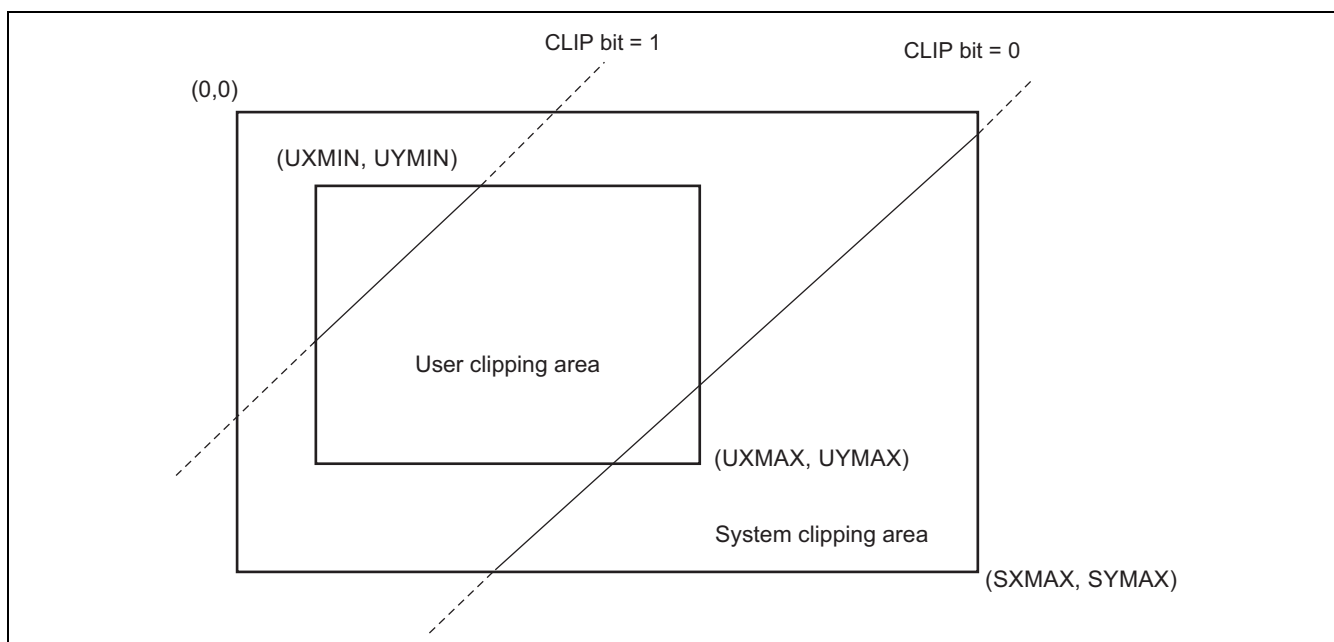

#### (4) Clipping Specification (CLIP)

The R-GP2D can perform clipping area management. There are three kinds of clipping areas: system clipping area, user clipping area, and relative user clipping area.

The system clipping area has a fixed drawing range. The system clipping area is always valid, regardless of attribute specifications.

A user clipping area can be designated as desired within the system clipping area. Whether or not clipping is performed in that area can be selected on an individual command basis with the rendering attribute CLIP bit. The boundary is drawn. The local offset values specified by the LCOFS or RLCOFS command are not added. When setting a user clipping area, the following ranges must be satisfied:  $XMIN < XMAX$ ,  $YMIN < YMAX$ .

Clipping is set with screen coordinates. Since the clipping area is undefined after the power is turned on, set the clipping area by the WPR command at the top of the display list that is executed first. XMAX must be set to a value less than the value set in the destination stride register (DSTRR).

**Figure 19.20 Example of Clipping Specification**

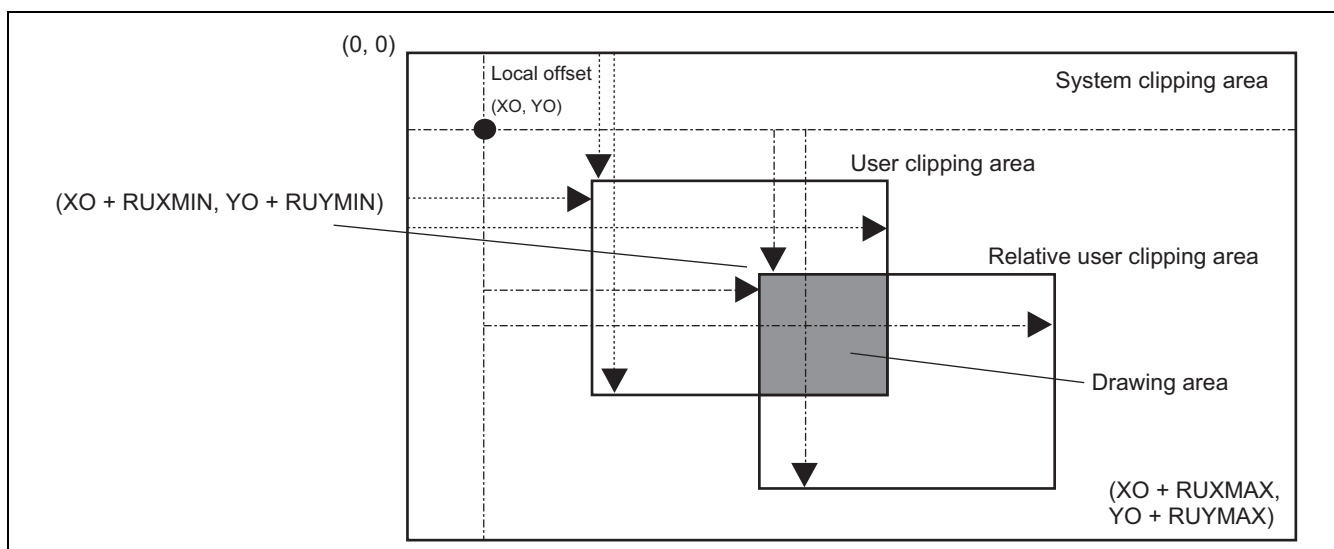

**(5) Relative Clipping Specification (RCLIP)**

The R-GP2D can perform clipping area management. There are three kinds of clipping areas: system clipping area, user clipping area, and relative user clipping area.

The system clipping area has a fixed drawing range. The system clipping area is always valid, regardless of attribute specifications.

A relative user clipping area can be designated as desired within the system clipping area at a relative setting with respect to the local offset. Whether or not clipping is performed in that area can be selected on an individual command basis with the rendering attribute RCLIP bit. The boundary is drawn. The local offset values specified by the LCOFS or RLCOFS command are added.

When setting a relative user clipping area, the following ranges must be satisfied:  $XMIN < XMAX$ ,  $YMIN < YMAX$ . Clipping is set with screen coordinates. Since the clipping area is undefined after the power is turned on, set the clipping area by the WPR command at the top of the display list that is executed first. XMAX must be set to a value less than the value set in the destination stride register (DSTRR). If both the RCLIP and CLIP bits are set to 1 simultaneously, the region where the two clipping areas overlap is drawn.

**Figure 19.21 Example of Relative User Clipping Specification**

When a relative user clipping area  $((XO + RUXMIN, YO + RUYMIN) - (XO + RUXMAX, YO + RUYMAX))$  intersects with the system clipping area, saturation processing is performed as follows:

$$XO + RUXMIN < 0 \rightarrow XO + RUXMIN = 0$$

$$XO + RUXMAX > SXMAX \rightarrow XO + RUXMAX = SXMAX$$

$$YO + RUYMIN < 0 \rightarrow YO + RUYMIN = 0$$

$$YO + RUYMAX > SYMAX \rightarrow YO + RUYMAX = SYMAX$$

Note: Set the local offset values and relative user clipping area without exceeding the following ranges:

$$-4,096 \leq XO + RUXMIN \leq 4,095$$

$$-4,096 \leq YO + RUYMIN \leq 4,095$$

$$0 \leq XO + RUXMAX \leq 8,191$$

$$0 \leq YO + RUYMAX \leq 8,191$$

When  $RCLIP = 1$  and the relative user clipping area satisfies one of the following conditions, the relative user clipping area is disabled internally by the R-GP2D (same operation as  $RCLIP = 0$ ).

$$4,095 < XO + RUXMIN$$

$$4,095 < YO + RUYMIN$$

$$XO + RUXMAX < 0$$

$$YO + RUYMAX < 0$$

### (6) Net Drawing Specification (NET)

The NET bit can be used to select, on an individual drawing command basis, whether or not net drawing is to be performed. Net drawing is a function for drawing only pixels at coordinates for which the condition "rendering coordinates  $X + Y = EOS$  (0: even number, 1: odd number)" is true. For example, if  $EOS = 0$ , drawing is only performed on the pixels at coordinates  $Y = 0, X = 0, 2, 4, 6, 8, \dots$  and  $Y = 1, X = 1, 3, 5, 7, 9, \dots$

This function enables the drawn figure and ground to be mutually semi-composed.

The net drawing specification can be used with the POLYGON4 type, LINEA, LINEB, LINEC, RLINEA, RLINEB, and RLINEC commands. The NET bit should be cleared to 0 in other commands. The NET bit cannot be used together with the antialias enable bit (AA).

### (7) Even/Odd Select Specification (EOS)

Even pixels are selected when  $EOS = 0$ , and odd pixels when  $EOS = 1$ .

The even/odd select specification is used together with the net drawing specification (NET). With the LINEWC and RLINEWC commands, drawing is performed at the work coordinates with 0 when  $EOS = 0$ , and with 1 when  $EOS = 1$ .

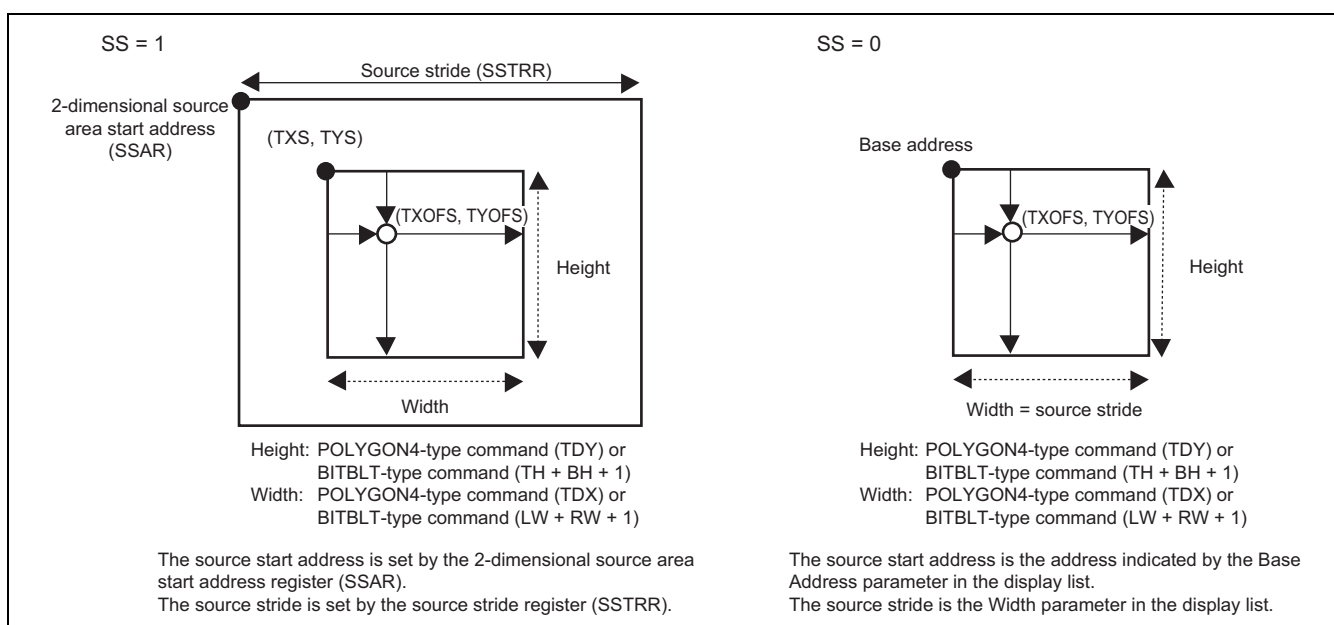

### (8) Work Specification (WORK)

When drawing is performed at rendering coordinates with the POLYGON4 type or BITBLT type command, the WORK bit can be used to select, on an individual drawing command basis, whether or not binary work data is to be referenced.

When binary work data referencing is selected, drawing is performed if the work data for the pixel corresponding to the rendering coordinates is 1, but not if the work data is 0. The same shape as that drawn at work coordinates can thus be drawn at rendering coordinates. Drawing at work coordinates can be performed either by means of the FTRAPC, RFTRAPC, LINEWC, RLINEWC, or CLRWC command. The work specification can be used with the POLYGON4 type, BITBLT type, and AAFA commands. The WORK bit should be cleared to 0 in the other commands.

### (9) Source Address Specification (SS)

The SS bit is used to select whether the source is to be referenced at a 2-dimensional source area address or at the address indicated by the base address parameter in the display list. The source address specification can be used with the POLYGON4A, POLYGON4B, BITBLTA, BITBLTB, and AAFA commands. Set the SS bit to 1 in the AAFA command, and clear to 0 in the commands for which the SS bit cannot be used. If the offset values are set, the source is referenced from (TXOFS, TYOFS).

**Figure 19.22 Example of Source Address Specification**

Note: When SS = 1, settings must be made within the ranges of  $0 \leq \text{TXS} \leq \text{SSTRR} - \text{Width}$  (TDX, LW + RW + 1),  $0 \leq \text{TYS} \leq 4,096 - \text{Height}$  (TDY, TH + BH + 1).

### (10) Source Coordinate Relative Address Specification (REL)

Setting the REL bit to 1 in the POLYGON4A, POLYGON4B, BITBLTA, BITBLTB, AAFC, LINEA, LINEB, RLINEA, RLINEB, JUMP, and GOSUB commands enables source referencing and branching to be performed at an address relative to (before or after) the command code. Clear the SS bit to 0 in the POLYGON4A or BITBLTA command; correct operation is not guaranteed when the SS bit is set to 1.

The command code address is the origin of the relative address (longword address).

Note: With the POLYGON4A, POLYGON4B, BITBLTA, BITBLTB, AAFC, LINEA, LINEB, RLINEA, and RLINEB commands, adding the address (longword: 32-bit units) where the command code is located to the source start relative address (longword: 32-bit units) must result in a quad word address (64-bit units).

**(11) Edge Drawing (EDG)**

With the FTRAPC and RFTRAPC commands, setting the EDG bit to 1 enables edge lines to be drawn after completion of trapezoid painting to the work area. Whether edge line drawing is performed with 0 or with 1 is specified by the EOS bit.

**(12) Color Offset (COOF)**

The color offset specification can be used with the POLYGON4 type, LINEA, LINEB, LINEC, RLINEA, RLINEB, RLINEC, BITBLT type, and AAFA commands. If the rendering attribute COOF bit is set to 1, the result of adding the value in COFSR to the value of the source data (color expanded data for a binary source and the specified color for the monochrome specification) is drawn. In 8-bit/pixel drawing, the COOF bit should be cleared to 0. When the source pixel format is ARGB, the A value is not used in operation.

**(13) Source Direction X, Y (SRCDIRX, SRCDIRY)**

The source direction X, Y specification can be used with the BITBLTA and BITBLTB commands. The directions in which to scan the source data are selected.

(TXS, TYS) or the base address specifies the top-left corner of the rectangle source, regardless of the source scan directions.

**Figure 19.23 Example of Source Direction Specification**

**(14) Destination Direction X, Y (DSTDIRX, DSTDIRY)**

The destination direction X, Y specification can be used with the BITBLTA, BITBLTB, and BITBLTC commands. The directions in which to draw the destination data are selected.

**Figure 19.24 Example of Destination Direction Specification**

**(15) Antialias Enable (AA)**

The antialias enable specification can be used with the LINE type and RLINE type commands to reduce alias. When the destination is set to 8-bits/pixel drawing, the AA bit should be cleared to 0. The AA bit should be set to 1 with the LINED and RLINED commands. The antialias enable specification cannot be used together with the net drawing specification (NET).

**(16) Alpha Blend Enable ( $\alpha E$ )**

The alpha blend enable specification can be used with the POLYGON4 type and BITBLT type commands. The source data (color expanded data for a binary source and the specified color for the monochrome specification) and ground data are alpha blended and drawn. The alpha value is set in the alpha value register (ALPHR). When the destination is set to 8-bit/pixel drawing, the  $\alpha E$  bit should be cleared to 0. In the POLYGON4 type commands, the alpha blend enable specification is enabled only when BLKE = 1. The  $\alpha E$  bit should be cleared to 0 when BLKE = 0. In the BITBLT type commands, the alpha blend enable specification is enabled only when the ROP code is H'CC (source copy). For other ROP codes, the  $\alpha E$  bit should be cleared to 0. The A value in the ARGB format is not alpha blended. The A value is drawn according to the source A value use (SAU) and A value (AVALUE) bits in the rendering control register (RCLR) and A Value 8 Register (AVALUE8R). In the AAFA command, set this bit to 1.

**(17) Source Alpha Enable (S $\alpha E$ )**

The source alpha enable specification can be used with the POLYGON4A, BITBLTA, and AAFA commands. The S $\alpha E$  bit is used together with the alpha blend enable bit ( $\alpha E$ ). When  $\alpha E = 0$ , the S $\alpha E$  bit should be cleared to 0.

In the ARGB1555 format (when the source pixel format bit (SPF) is 1), when the source alpha enable polarity (SAEP) is 0, only the pixels whose source A value is 1 are alpha blended. At this time, pixels whose source A value is 0 are not alpha blended and the source data is drawn back as is. When SAEP is 1, only the pixels whose source A value is 0 are alpha blended. At this time, pixels whose source A value is 1 are not alpha blended and the source data is drawn back as is.

The source alpha enable specification is enabled only when SPF = 1. The S $\alpha E$  bit should be cleared to 0 when SPF = 0.

### (18) Block Enable (BLKE)

The block enable specification can be used with POLYGON4 type commands. When  $BLKE = 1$ , the input vertex coordinates ( $DX_n, DY_n$ ) are internally transformed to circumscribed rectangular coordinates ( $DX'_n, DY'_n$ ) and four-vertex drawing is performed. When coordinate transformation is to be performed, the transformed vertices are internally converted into a rectangle and drawn. This is effective for vertically pasting a pattern even after coordinate transformation. When  $BLKE = 1$ , the direction of drawing is fixed: drawing proceeds from the upper-left corner to the lower-right corner (up-and-down and right-and-left directions cannot be reversed).

When coordinate transformation is performed by the CLRWC command, the four vertices are internally obtained from the input left and right X coordinate values and upper and lower Y coordinate values, and the coordinates for these four vertices are transformed. A circumscribed rectangle around the four vertices is then internally generated and drawn.

When coordinate transformation is performed by the FTRAPC or RFTRAPC command, the four vertices are internally obtained from the coordinate values for the circumscribed rectangle of the input polygon, and the coordinates for these four vertices are transformed. A circumscribed rectangle around the four vertices is then internally generated and drawing proceeds once the left edge is obtained. The BLKE bit should be set to 1 with the CLRWC, FTRAPC, and RFTRAPC commands.

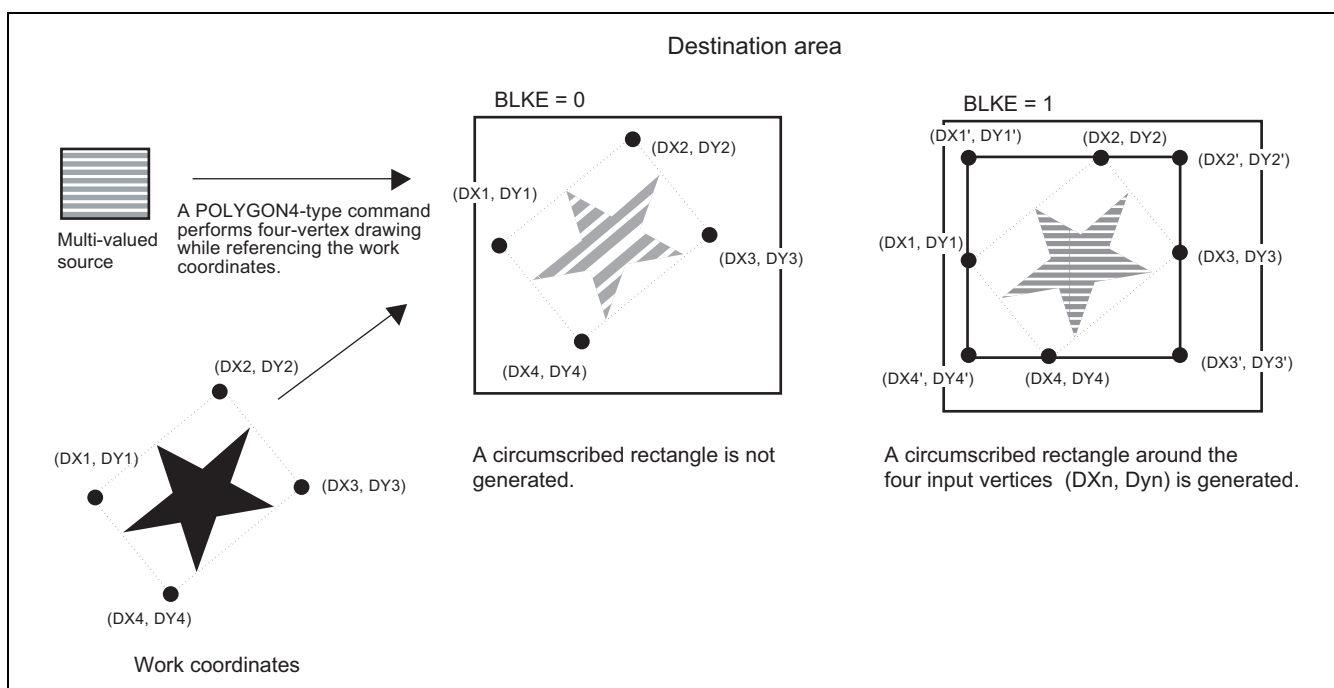

Figure 19.25 Example of Block Enable Specification

### (19) Coordinate Transformation Enable (MTRE)

Setting the MTRE bit to 1 when the coordinate transformation enable bit (GTE) in the coordinate transformation control register (GTRCR) is 1 performs coordinate transformation for the input vertex.

### (20) Link Specification Enable (LINKE)

The link specification enable specification can be used with the LINEC, LINED, RLINEC, RLINED, FTRAPC, RFTRAPC, and WPR commands. From the memory address specified by the LINK Address, the vertex coordinates are read with the LINEC, LINED, RLINEC, RLINED, FTRAPC, and RFTRAPC commands, and the register write data is read with the WPR command.

The longword address following the LINK Address is handled as the next command code. Therefore, do not specify the longword address following the address where the LINK Address is to be assigned as the link destination address specified by the LINK Address.

**(21) Link Address Relative Specification (LREL)**

The link address relative specification can be used with the LINEC, LINED, RLINEC, RLINED, FTRAPC, RFTRAPC, and WPR commands. The LREL bit is used together with the link specification enable bit (LINKE). The LREL bit should be cleared to 0 when LINKE = 0. The link destination address is specified as a relative address. The command code address is the origin of the relative address.

The longword address following the LINK Address is handled as the next command code. Therefore, do not specify the longword address following the address where the LINK Address is to be assigned as the link destination address specified by the LINK Address.

**(22) Clockwise (CLKW)**

The clockwise specification can be used with the LINED and RLINED commands. The CLKW bit is used to specify whether the order in giving the n vertices is clockwise or counterclockwise. The order is clockwise when CLKW = 1 and counterclockwise when CLKW = 0.

**(23) Raster Operation (ROP)**

The raster operation specification can be used with the BITBLT type commands. The ROP code is specified in the ROP field, which is a BITBLT command parameter.

**Table 19.10 ROP Codes**

ROP Code	Operation
H'00	0

H'AA	D
H'BB	$\sim S \mid D$
H'CC	S
H'DD	$S \mid \sim D$
H'EE	$S \mid D$
H'FF	1

Set the ROP code to H'CC when alpha blending is enabled ( $\alpha E = 1$ ). Neither alpha blending nor raster operation is performed for the A value in the ARGB format. The A value is drawn according to the source A value use (SAU) and A value (AVALUE) bits in the rendering control register (RCLR) and A value 8 register (AVALUE8R).

## (24) Loop (LOOP)

The loop specification can be used with the LINE type, RLINE type, FTRAPC, RFTRAPC, LINEWC, and RLINEWC commands. When the loop specification is set, a closed figure, of which starting and final points are linked, is created.

- Notes:
1. Linkage section of a bold line may not be drawn with the Z clipping or 2-dimensional vertex clipping by 2DVCLPE.
  2. "n" should be 3 or greater. (2 or greater for relative specification commands)

### 19.3.6 R-GP2D Internal Cache Structure

The R-GP2D incorporates five caches: a command cache, a source (texture) cache, an  $\alpha$  map cache, a work cache, and a destination cache. The R-GP2D uses these caches for temporal storing of DDR memory data and performs drawing using the stored cached data. The following describes functions of these caches:

1. Command Cache (64 bytes)  
The command cache is used for storing of display lists in the DDR memory. This cache is cleared when rendering is started. However, it is not cleared at a restart from a suspended state with the NOP command (INT = 1).
2. Source (Texture) Cache (16 Kbytes)  
The source (texture) cache is used for storing source (texture) data in the DDR memory. This cache is cleared by TRAP, NOP (INT = 1), and VBKEM commands.
3.  $\alpha$  Map Cache (8 Kbytes)  
The  $\alpha$  map cache is used for storing  $\alpha$  map data in the DDR memory. This cache is cleared by TRAP, NOP (INT = 1), and VBKEM commands.
4. Work Cache (2 Kbytes)  
The work cache is used for drawing a figure on work coordinates and referencing work data in the DDR memory. This cache is flushed by TRAP, NOP (INT = 1), and VBKEM commands.
5. Destination Cache (2 Kbytes)  
The destination cache is used for drawing a figure on rendering coordinates in the DDR memory. This cache is flushed by TRAP, NOP (INT = 1), and VBKEM commands.

If the R-GP2D internal cache contents are not updated (the same address is referenced with data smaller than the cache size or referencing is started from the previous reference start position and ended before a position of data of the cache size is reached), the previous cache content will be used even if the DDR memory data is rewritten. This results that data coherency may not be maintained in the section where cache areas overlap.

To prevent this, contents of the caches should be updated intentionally as follows:

Reference should be made so that an address which exceeds the cache size is accessed. Contents of caches other than the command cache can be updated using the SYNC command.

MTRE	Fixed to 0	CLIP	RCLIP	STRANS	Fixed to 0	WORK	SS	REL	STYLE	BLKE	NET	EOS	COOF	αE	SgE

(e) Command Parameters

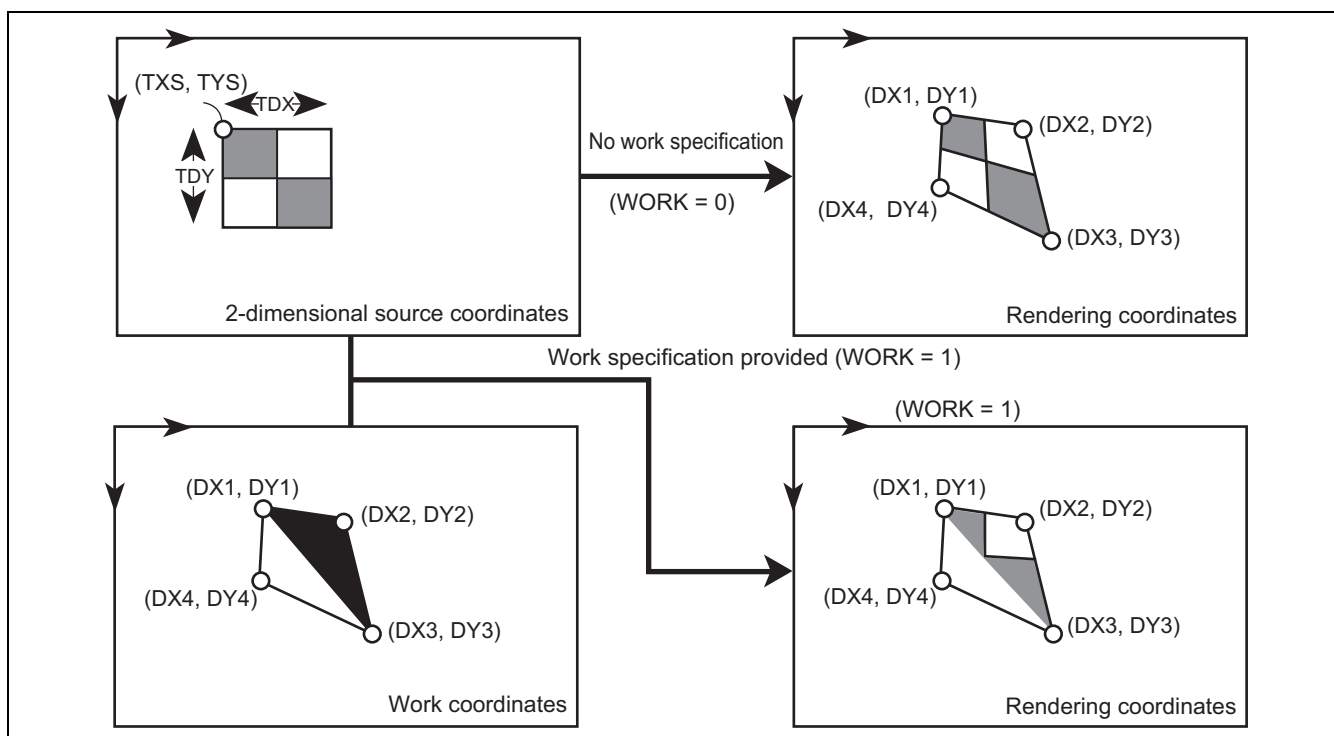

- TXS, TYS: Source starting point. Write 0 to the unused bits.
- Base address: Source start absolute address (Quad word address. Write 0 to bits A31 to A29 and A2 to A0.)  
 Source start relative address (Longword address. Negative numbers are expressed as two's complements. Bits A31 to A29 are used to extend the sign in bit A28. Write 0 to bits A1 and A0.)  
 Note: Even in 32-bit addressing mode, write the values in bits 28 to 3 of the specified 32-bit address to bits A28 to A3.
- TDX, TDY: Source size. Write 0 to the unused bits.
- DXn, DYn (n = 1 to 4): Rendering coordinates (absolute coordinates). Negative numbers are expressed as two's complements.
- TXOFS, TYOFS: Source offset. Write 0 to the unused bits.

**(f) Description**

Transfers multi-valued (8-, 16-, or 32-bit/pixel) source data to any quadrilateral rendering coordinates. The source data is always scanned horizontally, but diagonal scanning may be used in the drawing, depending on the shape. In diagonally-scanned drawing, double-writing occurs to fill in gaps.

When  $SS = 0$ , set a multiple of 8 pixels as the TDX value. When  $SS = 1$ , set 8 or more pixels as the TDX value. If the TDX setting is less than 8 pixels, multi-valued source references will not be performed normally. If TXOFS or TYOFS is set, the source at a location shifted by the offset amount is referenced. Make the TXOFS and TYOFS settings in pixel units.

1. When source style specification is selected as a rendering attribute ( $STYLE = 1$ ), the source data is not enlarged or reduced, but is referenced repeatedly.
2. When work specification is selected as a rendering attribute ( $WORK = 1$ ), only places where the work coordinate pixel is 1 are drawn at rendering coordinates while referencing work coordinates for the same coordinates as the rendering coordinates.
3. When  $SS = 1$ , the source data is referenced from the 2-dimensional source area. When  $SS = 0$ , the source data is referenced from the base address in the display list. When  $REL = 0$ , the source address can be specified as an absolute address. When  $REL = 1$ , the source address can be specified as a relative address with respect to the memory address at which the POLYGON4A command code is located.
4. If the rendering attribute COOF bit is set to 1, the result of adding the value in COFSR to the value of the multi-valued source data is drawn. The operation is performed by saturation processing. In 8-bit/pixel drawing, the COOF bit should be cleared to 0.

**(g) Example**

**Figure 19.26 Example of POLYGON4A Command Operation**

**(2) POLYGON4B****(a) Function**

Performs any four-vertex drawing in the destination area while referencing a binary (1-bit/pixel) source.

### (e) Command Parameters

- TXS, TYS: Source starting point. Write 0 to the unused bits.
- Base address: Source start absolute address (Quad word address. Write 0 to bits A31 to A29 and A2 to A0.)  
 Source start relative address (Longword address. Negative numbers are expressed as two's complements. Bits A31 to A29 are used to extend the sign in bit A28. Write 0 to bits A1 and A0.)  
 Note: Even in 32-bit addressing mode, write the values in bits 28 to 3 of the specified 32-bit address to bits A28 to A3.
- TDX, TDY: Source size. Write 0 to the unused bits.
- DXn, DYn (n = 1 to 4): Rendering coordinates (absolute coordinates). Negative numbers are expressed as two's complements.
- TXOFS, TYOFS: Source offset. Write 0 to the unused bits.
- Color0, Color1: 8-, 16-, or 32-bit/pixel color specification. For 16-bit/pixel drawing, the color specification should match the destination pixel format.  
 For 8-bit/pixel drawing, the same value should be set in the upper and lower bytes.

**(f) Description**

Draws binary (1-bit/pixel) source data in any quadrilateral rendering area, using the colors specified by parameters Color0 and Color1. For the color specifications (Color0 and Color1) in 8-bit/pixel drawing, set the same 8-bit data in the upper and lower bytes. The source data is always scanned horizontally, but diagonal scanning may be used in the drawing, depending on the shape. In diagonally-scanned drawing, double-writing occurs to fill in gaps. A multiple of 8 pixels must be set as the TDX value, regardless of the SS bit value. If TXOFS or TYOFS is set, the source at a location shifted by the offset amount is referenced. Make the TXOFS and TYOFS settings in pixel units.

1. When source style specification is selected as a rendering attribute (STYLE = 1), the source data is not enlarged or reduced, but is referenced repeatedly.
2. When work specification is selected as a rendering attribute (WORK = 1), only places where the work coordinate pixel is 1 are drawn at rendering coordinates while referencing work coordinates for the same coordinates as the rendering coordinates.
3. When REL = 0, the source address can be specified as an absolute address. When REL = 1, the source address can be specified as a relative address with respect to the memory address at which the POLYGON4B command code is located.

**(g) Example**

**Figure 19.27 Example of POLYGON4B Command Operation**

**(3) POLYGON4C****(a) Function**

Performs any four-vertex drawing at rendering coordinates with a monochrome specification.

MTRE	Fixed to 0	CLIP	RCLIP	Fixed to 0	Fixed to 0	WORK	Fixed to 0	Fixed to 0	Fixed to 0	BLKE	NET	EOS	COOF	αE	Fixed to 0

**(e) Command Parameters**

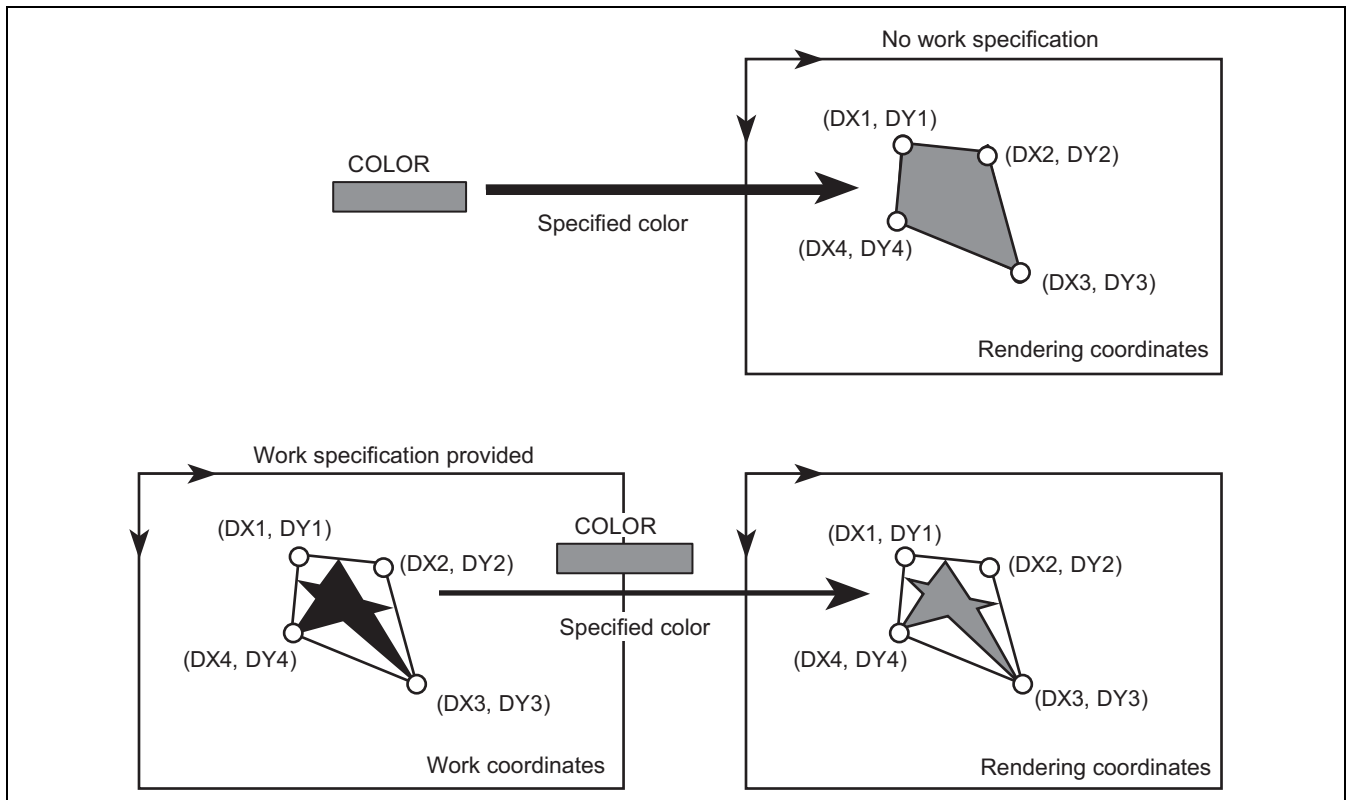

DX<sub>n</sub>, DY<sub>n</sub> (n = 1 to 4): Rendering coordinates (absolute coordinates). Negative numbers are expressed as two's complements.

Color: 8-, 16-, or 32-bit/pixel color specification. For 16-bit/pixel drawing, the color specification should match the destination pixel format.

For 8-bit/pixel drawing, the same value should be set in the upper and lower bytes.

**(f) Description**

Draws any quadrilateral in the rendering area in the single color specified by the Color parameter. When work specification is selected as a rendering attribute ( $WORK = 1$ ), only places where the work coordinate pixel is 1 are drawn at rendering coordinates while referencing work coordinates for the same coordinates as the rendering coordinates.

**(g) Example**

**Figure 19.28 Example of POLYGON4C Command Operation**

## 19.4.2 Line Drawing Commands

### (1) LINEA

#### (a) Function

Draws a polygonal line with any width in the destination area while referencing a multi-valued (8-, 16-, or 32-bit/pixel) source.

#### (b) Command Format

- REL = 0

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
OP CODE = 1011_0010								Reserved (all 0)								Draw mode															
0 0 0			Base address (quad word address)																								0 0 0				
0 0 0 0				TDX ( $8 \leq TDX \leq 4,088$ )												0 0 0 0 0 0 0 0				TDY ( $1 \leq TDY \leq 4,095$ )											
0 0 0 0				TXOFS ( $0 \leq TXOFS \leq TDX - 1$ )												n ( $2 \leq n \leq 65535$ )															
Reserved (all 0)															0 0 0 0 0 0 0 0				W ( $0, 2 \leq W \leq 63$ )												
Sign		DX1 ( $-32,768 \leq DX1 \leq 32,767$ )												Sign		DY1 ( $-32,768 \leq DY1 \leq 32,767$ )

Sign		:												Sign		:															
Sign		DXn ( $-32,768 \leq DXn \leq 32,767$ )												Sign		DYn ( $-32,768 \leq DYn \leq 32,767$ )															

- Notes:
- Adding the address (longword: 32-bit units) where the command code is located to the base address (longword: 32-bit units) must result in a quad word address (64-bit units).
  - When W = 0, set TDY to 1.
  - When n = 0 or 1, correct operation is not guaranteed.

#### (c) Code

B'10110010

**(d) Rendering Attributes**

Reference Data										Drawing Destination						
Multi-Valued Source	Binary Source					Binary Work		Specified Color			Rendering	Work				
√											√					
Draw Mode																
b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0	
MTRE	LOOP	CLIP	RCLIP	STRANS	Fixed to 0	Fixed to 0	SS (0)	REL	STYLE (1)	Fixed to 0	NET	EOS	COOF	AA	Fixed to 0	

- Notes: 1. Clear the SS bit to 0.  
2. Set the STYLE bit to 1.

**(e) Command Parameters**

- Base address: Source start absolute address (Quad word address. Write 0 to bits A31 to A29 and A2 to A0.)  
Source start relative address (Longword address. Negative numbers are expressed as two's complements. Bits A31 to A29 are used to extend the sign in bit A28. Write 0 to bits A1 and A0.)  
Note: Even in 32-bit addressing mode, write the values in bits 28 to 3 of the specified 32-bit address to bits A28 to A3.
- TDX, TDY: Source size. Write 0 to the unused bits.
- TXOFS: Source offset. Write 0 to the unused bits.
- n (n = 2 to 65,535): Number of vertices
- W: Line width. Set a 6-bit integer. Write 0 to the unused bits.  
When 0 is set in W, a polygonal line of line width 1 is drawn. Setting 1 in W is prohibited.
- DX<sub>i</sub> (i = 1 to 65,535): Rendering coordinate (absolute coordinate). Negative numbers are expressed as two's complements.
- DY<sub>i</sub> (i = 1 to 65,535): Rendering coordinate (absolute coordinate). Negative numbers are expressed as two's complements.

**(f) Description**

Draws a polygonal line from vertex 1 (DX<sub>1</sub>, DY<sub>1</sub>), through vertex 2 (DX<sub>2</sub>, DY<sub>2</sub>), ..., vertex n – 1 (DX<sub>n – 1</sub>, DY<sub>n – 1</sub>), to vertex n (DX<sub>n</sub>, DY<sub>n</sub>). Set a multiple of 8 pixels as the TDX value. If TXOFS is set, the source at a location shifted by the offset amount is referenced. Make the TXOFS setting in pixel units. Pattern repetition selected when the STYLE bit = 1 is only performed in the X direction of the source data. The source data is enlarged or reduced in proportion to the line width in the Y direction.

When a value greater than 1 is set in W, a bold line can be drawn.

- Notes: 1. 8-point drawing is used for a line width of 1. 4-point drawing is used for bold line drawing.
2. The final point of each line segment is drawn. When the starting and final coordinate points of a line segment match, a single dot is drawn for a line width of 1 and nothing is drawn for bold line drawing
3. When AA = 1, note the following:
- For a dashed line, antialiasing is not performed for the gaps in the dashed line.
  - When the starting and final coordinate points of a line segment match, antialiasing is not performed.
  - When the NAA (new antialias mode) bit is 0, antialiasing is not performed for horizontal, vertical, and 45-degree diagonal line segments. When the NAA bit is 1, antialiasing is performed for horizontal, vertical, and 45-degree diagonal line segments.

**(2) LINEB****(a) Function**

Draws a polygonal line with any width in the destination area while referencing a binary (1-bit/pixel) source.

- Notes: 1. Clear the SS bit to 0.  
2. Set the STYLE bit to 1.

**(e) Command Parameters**

- Color0, Color1: 8-, 16-, or 32-bit/pixel color specification. For 16-bit/pixel drawing, the color specification should match the destination pixel format.  
For 8-bit/pixel drawing, the same value should be set in the upper and lower bytes.
- Base address: Source start absolute address (Quad word address. Write 0 to bits A31 to A29 and A2 to A0.)  
Source start relative address (Longword address. Negative numbers are expressed as two's complements. Bits A31 to A29 are used to extend the sign in bit A28. Write 0 to bits A1 and A0.)  
Note: Even in 32-bit addressing mode, write the values in bits 28 to 3 of the specified 32-bit address to bits A28 to A3.
- TDX, TDY: Source size. Write 0 to the unused bits.
- TXOFS: Source offset. Write 0 to the unused bits.
- n (n = 2 to 65,535): Number of vertices
- W: Line width. Set a 6-bit integer. Write 0 to the unused bits.  
When 0 is set in W, a polygonal line of line width 1 is drawn. Setting 1 in W is prohibited.
- DX<sub>i</sub> (i = 1 to 65,535): Rendering coordinate (absolute coordinate). Negative numbers are expressed as two's complements.
- DY<sub>i</sub> (i = 1 to 65,535): Rendering coordinate (absolute coordinate). Negative numbers are expressed as two's complements.

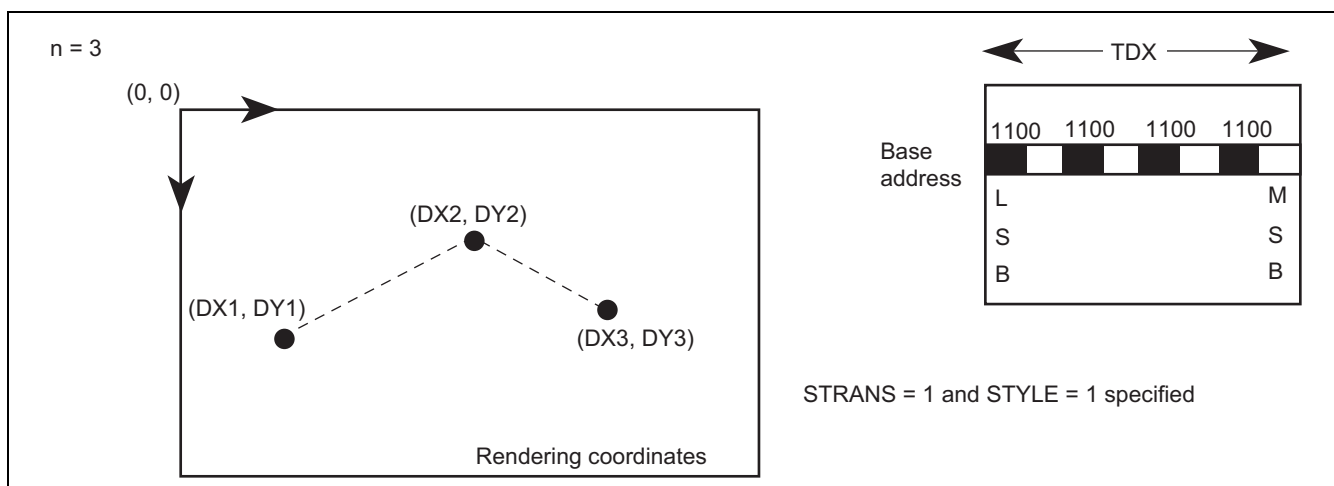

**(f) Description**

Draws a polygonal line from vertex 1 (DX1, DY1), through vertex 2 (DX2, DY2), ..., vertex n - 1 (DXn - 1, DYn - 1), to vertex n (DXn, DYn). Set a multiple of 8 pixels as the TDX value. If TXOFS is set, the source at a location shifted by the offset amount is referenced. Make the TXOFS setting in pixel units. Pattern repetition selected when the STYLE bit = 1 is only performed in the X direction of the source data. The source data is enlarged or reduced in proportion to the line width in the Y direction.

When a value greater than 1 is set in W, a bold line can be drawn.

- Notes:
1. 8-point drawing is used for a line width of 1. 4-point drawing is used for bold line drawing.
  2. The final point of each line segment is drawn. When the starting and final coordinate points of a line segment match, a single dot is drawn for a line width of 1 and nothing is drawn for bold line drawing.
  3. When AA = 1, note the following:
    - For a dashed line, antialiasing is not performed for the gaps in the dashed line.
    - When the starting and final coordinate points of a line segment match, antialiasing is not performed.
    - When the NAA (new antialias mode) bit is 0, antialiasing is not performed for horizontal, vertical, and 45-degree diagonal line segments. When the NAA bit is 1, antialiasing is performed for horizontal, vertical, and 45-degree diagonal line segments.

LINK relative address (Longword address. Negative numbers are expressed as two's complements. Bits A31 to A29 are used to extend the sign in bit A28. Write 0 to bits A1 and A0.)

Note: Even in 32-bit addressing mode, write the values in bits 28 to 3 of the specified 32-bit address to bits A28 to A3.

**(f) Description**

Draws a polygonal line from vertex 1 (DX<sub>1</sub>, DY<sub>1</sub>), through vertex 2 (DX<sub>2</sub>, DY<sub>2</sub>), ..., vertex n – 1 (DX<sub>n – 1</sub>, DY<sub>n – 1</sub>), to vertex n (DX<sub>n</sub>, DY<sub>n</sub>). When a value greater than 1 is set in W, a bold line can be drawn. When LINKE = 1, the vertex coordinates are read from the memory address specified by the LINK address. The LINK address can be specified through the LREL bit as an absolute address or a relative address with respect to the memory address at which the LINEC command code is located.

- Notes:
- 8-point drawing is used for a line width of 1. 4-point drawing is used for bold line drawing.
  - The final point of each line segment is drawn. When the starting and final coordinate points of a line segment match, a single dot is drawn for a line width of 1 and nothing is drawn for bold line drawing.
  - When AA = 1, note the following:
    - When the starting and final coordinate points of a line segment match, antialiasing is not performed.
    - When the NAA (new antialias mode) bit is 0, antialiasing is not performed for horizontal, vertical, and 45-degree diagonal line segments. When the NAA bit is 1, antialiasing is performed for horizontal, vertical, and 45-degree diagonal line segments.

**(g) Example****Figure 19.30 Example of LINEC Command Operation**

**(4) LINED****(a) Function**

Performs antialiasing for the exterior frame of a polygon. This command can only be executed for a 16- or 32-bit/pixel destination.

**(b) Command Format**

- LINKE = 0

MTRE	LOOP	CLIP	RCLIP	Fixed to 0	LINKE	LREL	Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	AA (1)	CLKW

**(e) Command Parameters**

- n (n = 2 to 65,535): Number of vertices
- DX<sub>i</sub> (i = 1 to 65,535): Rendering coordinate (absolute coordinate). Negative numbers are expressed as two's complements.
- DY<sub>i</sub> (i = 1 to 65,535): Rendering coordinate (absolute coordinate). Negative numbers are expressed as two's complements.
- LINK address: LINK absolute address (Longword address. Write 0 to bits A31 to A29, A1, and A0).  
LINK relative address (Longword address. Negative numbers are expressed as two's complements. Bits A31 to A29 are used to extend the sign in bit A28. Write 0 to bits A1 and A0.)

Note: Even in 32-bit addressing mode, write the values in bits 28 to 3 of the specified 32-bit address to bits A28 to A3.

**(f) Description**

Performs antialiasing for the exterior frame of a polygon drawn using work reference.

The CLKW bit specifies whether the order to give the n vertices is clockwise or counterclockwise: CLKW = 1 selects clockwise and CLKW = 0 selects counterclockwise. When clockwise is specified, the left image with respect to the drawing direction is referenced by antialiasing. On the other hand, the right image is referenced when counterclockwise is selected. When LINKE = 1, the vertex coordinates are read from the memory address specified by the LINK address. The LINK address can be specified through the LREL bit as an absolute address or a relative address with respect to the memory address at which the LINED command code is located.

This command can only be executed for a 16- or 32-bit/pixel destination.

When a polygon used in work reference is drawn by the FTRAPC (RFTRAPC) command, perform drawing with both the EDG and EOS bits set to 1.

- Notes:
- 8-point drawing is used.
  - The final point of each line segment is not drawn. When antialiasing is performed for the exterior frame of a polygon drawn by a POLYGON4 type command, the paths may not match.
  - When the starting and final coordinate points of a line segment match, nothing is drawn.
  - Antialiasing is not performed for horizontal, vertical, and 45-degree diagonal line segments, which are pre-clipped inside the R-GP2D.
  - Clipping is performed on a pixel basis when either the referenced pixel or the pixel to be drawn is outside the clipping area, and antialiasing is not performed in such a case.

**(g) Example**

**Figure 19.31 Example of LINED Command Operation**

**(5) RLINEA****(a) Function**

Draws a polygonal line with any width in the destination area with a relative coordinate specification from the current pointer value while referencing a multi-valued (8-, 16-, or 32-bit/pixel) source.

**(b) Command Format**

- REL = 0

- Notes: 1. Clear the SS bit to 0.  
2. Set the STYLE bit to 1.

**(e) Command Parameters**

- Base address: Source start absolute address (Quad word address. Write 0 to bits A31 to A29 and A2 to A0.)  
Source start relative address (Longword address. Negative numbers are expressed as two's complements. Bits A31 to A29 are used to extend the sign in bit A28. Write 0 to bits A1 and A0.)  
Note: Even in 32-bit addressing mode, write the values in bits 28 to 3 of the specified 32-bit address to bits A28 to A3.
- TDX, TDY: Source size. Write 0 to the unused bits.
- TXOFS: Source offset. Write 0 to the unused bits.
- n (n = 1 to 65,535): Number of vertices
- W: Line width. Set a 6-bit integer. Write 0 to the unused bits.  
When 0 is set in W, a polygonal line of line width 1 is drawn. Setting 1 in W is prohibited.
- DX<sub>i</sub> (i = 1 to 65,535): Rendering coordinate (relative coordinate). Negative numbers are expressed as two's complements.
- DY<sub>i</sub> (i = 1 to 65,535): Rendering coordinate (relative coordinate). Negative numbers are expressed as two's complements.

**(f) Description**

Draws a polygonal line comprising line segments  $(XC, YC) - (XC + DX1, YC + DY1)$ ,  $(XC + DX1, YC + DY1) - (XC + DX1 + DX2, YC + DY1 + DY2)$ , ...,  $(XC + \dots + DX_{n-1}, YC + \dots + DY_{n-1}) - (XC + \dots + DX_n, YC + \dots + DY_n)$  to the coordinates specified by the relative shift (DX, DY) from the current pointer values (XC, YC).

The final coordinate point is stored as the current pointer values (XC, YC). Set a multiple of 8 pixels as the TDX value. If TXOFS is set, the source at a location shifted by the offset amount is referenced. Make the TXOFS setting in pixel units.

Pattern repetition selected when the STYLE bit = 1 is only performed in the X direction of the source data. The source data is enlarged or reduced in proportion to the line width in the Y direction.

When a value greater than 0 is set in W, a bold line can be drawn.

- Notes: 1. 8-point drawing is used for a line width of 1. 4-point drawing is used for bold line drawing.  
2. The final point of each line segment is drawn. When the starting and final coordinate points of a line segment match, a single dot is drawn for a line width of 1 and nothing is drawn for bold line drawing.  
3. When AA = 1, note the following:
- For a dashed line, antialiasing is not performed for the gaps in the dashed line.
  - When the starting and final coordinate points of a line segment match, antialiasing is not performed.

- When the NAA (new antialias mode) bit is 0, antialiasing is not performed for horizontal, vertical, and 45-degree diagonal line segments. When the NAA bit is 1, antialiasing is performed for horizontal, vertical, and 45-degree diagonal line segments.
4. The final coordinate point before coordinate transformation is stored as the current pointer values (XC, YC).

**(6) RLINEB****(a) Function**

Draws a polygonal line with any width in the destination area with a relative coordinate specification from the current pointer value while referencing a binary (1-bit/pixel) source.

2. Set the STYLE bit to 1.

**(e) Command Parameters**

- Color0, Color1: 8-, 16-, or 32-bit/pixel color specification. For 16-bit/pixel drawing, the color specification should match the destination pixel format.  
For 8-bit/pixel drawing, the same value should be set in the upper and lower bytes.
- Base address: Source start absolute address (Quad word address. Write 0 to bits A31 to A29 and A2 to A0.)  
Source start relative address (Longword address. Negative numbers are expressed as two's complements. Bits A31 to A29 are used to extend the sign in bit A28. Write 0 to bits A1 and A0.)  
Note: Even in 32-bit addressing mode, write the values in bits 28 to 3 of the specified 32-bit address to bits A28 to A3.
- TDX, TDY: Source size. Write 0 to the unused bits.
- TXOFS: Source offset. Write 0 to the unused bits.
- n (n = 1 to 65,535): Number of vertices
- W: Line width. Set a 6-bit integer. Write 0 to the unused bits.  
When 0 is set in W, a polygonal line of line width 1 is drawn. Setting 1 in W is prohibited.
- DX<sub>i</sub> (i = 1 to 65,535): Rendering coordinate (relative coordinate). Negative numbers are expressed as two's complements.
- DY<sub>i</sub> (i = 1 to 65,535): Rendering coordinate (relative coordinate). Negative numbers are expressed as two's complements.

**(f) Description**

Draws a polygonal line comprising line segments  $(XC, YC) - (XC + DX1, YC + DY1)$ ,  $(XC + DX1, YC + DY1) - (XC + DX1 + DX2, YC + DY1 + DY2)$ , ...,  $(XC + \dots + DX_{n-1}, YC + \dots + DY_{n-1}) - (XC + \dots + DX_n, YC + \dots + DY_n)$  to the coordinates specified by the relative shift  $(DX, DY)$  from the current pointer values  $(XC, YC)$ .

The final coordinate point is stored as the current pointer values  $(XC, YC)$ .

Set a multiple of 8 pixels as the TDX value. If TXOFS is set, the source at a location shifted by the offset amount is referenced. Make the TXOFS setting in pixel units.

Pattern repetition selected when the STYLE bit = 1 is only performed in the X direction of the source data. The source data is enlarged or reduced in proportion to the line width in the Y direction.

When a value greater than 1 is set in W, a bold line can be drawn.

- Notes:
1. 8-point drawing is used for a line width of 1. 4-point drawing is used for bold line drawing.
  2. The final point of each line segment is drawn. When the starting and final coordinate points of a line segment match, a single dot is drawn for a line width of 1 and nothing is drawn for bold line drawing.
  3. When AA = 1, note the following:
    - For a dashed line, antialiasing is not performed for the gaps in the dashed line.
    - When the starting and final coordinate points of a line segment match, antialiasing is not performed.
    - When the NAA (new antialias mode) bit is 0, antialiasing is not performed for horizontal, vertical, and 45-degree diagonal line segments. When the NAA bit is 1, antialiasing is performed for horizontal, vertical, and 45-degree diagonal line segments.
  4. The final coordinate point before coordinate transformation is stored as the current pointer values  $(XC, YC)$ .

MTRE	LOOP	CLIP	RCLIP	Fixed to 0	LINKE	LREL	Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	NET	EOS	COOF	AA	Fixed to 0

### (e) Command Parameters

- Color: 8-, 16-, or 32-bit/pixel color specification. For 16-bit/pixel drawing, the color specification should match the destination pixel format.  
For 8-bit/pixel drawing, the same value should be set in the upper and lower bytes.
- n (n = 1 to 65,535): Number of vertices
- W: Line width. Set a 6-bit integer. Write 0 to the unused bits.  
When 0 is set in W, a polygonal line of line width 1 is drawn. Setting 1 in W is prohibited.
- DX<sub>i</sub> (i = 1 to 65,535): Rendering coordinate (relative coordinate). Negative numbers are expressed as two's complements.
- DY<sub>i</sub> (i = 1 to 65,535): Rendering coordinate (relative coordinate). Negative numbers are expressed as two's complements.
- LINK address: LINK absolute address (Longword address. Write 0 to bits A31 to A29, A1, and A0.)  
LINK relative address (Longword address. Negative numbers are expressed as two's complements. Bits A31 to A29 are used to extend the sign in bit A28. Write 0 to bits A1 and A0.)

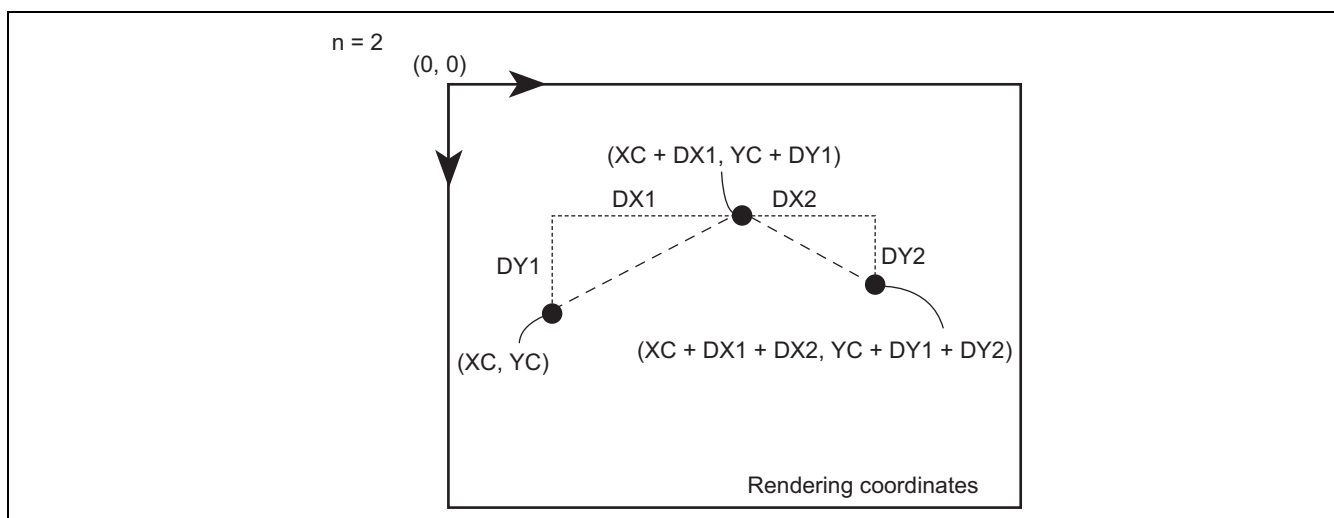

Note: Even in 32-bit addressing mode, write the values in bits 28 to 3 of the specified 32-bit address to bits A28 to A3.

**(f) Description**

Draws a polygonal line comprising line segments  $(XC, YC) - (XC + DX1, YC + DY1)$ ,  $(XC + DX1, YC + DY1) - (XC + DX1 + DX2, YC + DY1 + DY2)$ , ...,  $(XC + \dots + DX_{n-1}, YC + \dots + DY_{n-1}) - (XC + \dots + DX_n, YC + \dots + DY_n)$  to the coordinates specified by the relative shift  $(DX, DY)$  from the current pointer values  $(XC, YC)$ . When a value greater than 1 is set in  $W$ , a bold line can be drawn. When  $LINKE = 1$ , the vertex coordinates are read from the memory address specified by the LINK address. The LINK address can be specified through the LREL bit as an absolute address or a relative address with respect to the memory address at which the RLINEC command code is located.

The final coordinate point is stored as the current pointer values  $(XC, YC)$ .

- Notes:
1. 8-point drawing is used for a line width of 1. 4-point drawing is used for bold line drawing.
  2. The final point of each line segment is drawn. When the starting and final coordinate points of a line segment match, a single dot is drawn for a line width of 1 and nothing is drawn for bold line drawing.
  3. When  $AA = 1$ , note the following:
    - When the starting and final coordinate points of a line segment match, antialiasing is not performed.
    - When the NAA (new antialias mode) bit is 0, antialiasing is not performed for horizontal, vertical, and 45-degree diagonal line segments. When the NAA bit is 1, antialiasing is performed for horizontal, vertical, and 45-degree diagonal line segments.
  4. The final coordinate point before coordinate transformation is stored as the current pointer values  $(XC, YC)$ .

**(g) Example**

**(e) Command Parameters**

- n (n = 1 to 65,535): Number of vertices
- DX<sub>i</sub> (i = 1 to 65,535): Rendering coordinate (relative coordinate). Negative numbers are expressed as two's complements.
- DY<sub>i</sub> (i = 1 to 65,535): Rendering coordinate (relative coordinate). Negative numbers are expressed as two's complements.
- LINK address: LINK absolute address (Longword address. Write 0 to bits A31 to A29, A1, and A0.)  
LINK relative address (Longword address. Negative numbers are expressed as two's complements. Bits A31 to A29 are used to extend the sign in bit A28. Write 0 to bits A1 and A0.)

Note: Even in 32-bit addressing mode, write the values in bits 28 to 3 of the specified 32-bit address to bits A28 to A3.

**(f) Description**

Performs antialiasing for the exterior frame of a polygon drawn using work reference, with a relative coordinate specification from the current pointer value.

The CLKW bit specifies whether the order to give the n vertices is clockwise or counterclockwise: CLKW = 1 selects clockwise and CLKW = 0 selects counterclockwise. When clockwise is specified, the left image with respect to the drawing direction is referenced by antialiasing. On the other hand, the right image is referenced when counterclockwise is selected. When LINKE = 1, the vertex coordinates are read from the memory address specified by the LINK address. The LINK address can be specified through the LREL bit as an absolute address or a relative address with respect to the memory address at which the RLINED command code is located.

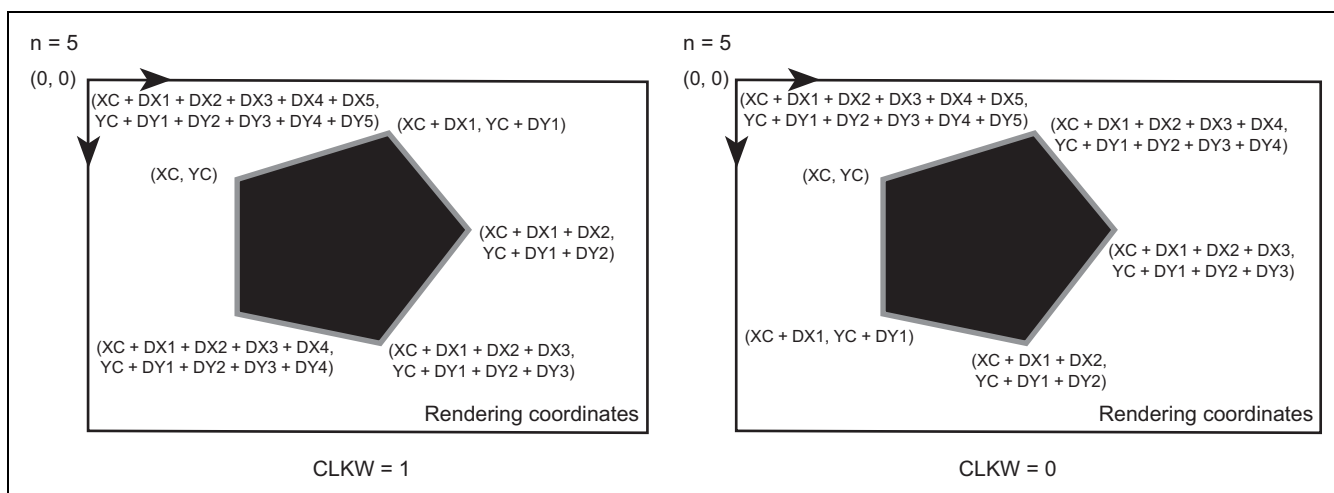

This command can only be executed for a 16- or 32-bit/pixel destination.

When a polygon used in work reference is drawn by the FTRAPC (RFTRAPC) command, perform drawing with both the EDG and EOS bits set to 1.

The final coordinate point is stored as the current pointer values (XC, YC).

Notes: 1. 8-point drawing is used.

2. The final point of each line segment is not drawn. When antialiasing is performed for the exterior frame of a polygon drawn by a POLYGON4 type command, the paths may not match.
3. When the starting and final coordinate points of a line segment match, nothing is drawn.
4. Antialiasing is not performed for horizontal, vertical, and 45-degree diagonal line segments, which are pre-clipped inside the R-GP2D.
5. Clipping is performed on a pixel basis when either the referenced pixel or the pixel to be drawn is outside the clipping area, and antialiasing is not performed in such a case.
6. The final coordinate point before coordinate transformation is stored as the current pointer values (XC, YC).

### (e) Command Parameters

- n (n = 2 to 65,535): Number of vertices
- Xmin: Xmin value in the circumscribed quadrangle of the polygon. Work coordinate (absolute coordinate). Negative numbers are expressed as two's complements.
- Ymin: Ymin value in the circumscribed quadrangle of the polygon. Work coordinate (absolute coordinate). Negative numbers are expressed as two's complements.
- Xmax: Xmax value in the circumscribed quadrangle of the polygon. Work coordinate (absolute coordinate). Negative numbers are expressed as two's complements.
- Ymax: Ymax value in the circumscribed quadrangle of the polygon. Work coordinate (absolute coordinate). Negative numbers are expressed as two's complements.
- DXi (i = 1 to 65,535): Work coordinate (absolute coordinate). Negative number expressed as two's complement.
- DYi (i = 1 to 65,535): Work coordinate (absolute coordinate). Negative number expressed as two's complement.
- LINK address: LINK absolute address (Longword address. Write 0 to bits A31 to A29, A1, and A0.)  
LINK relative address (Longword address. Negative numbers are expressed as two's complements. Bits A31 to A29 are used to extend the sign in bit A28. Write 0 to bits A1 and A0.)

Note: Even in 32-bit addressing mode, write the values in bits 28 to 3 of the specified 32-bit address to bits A28 to A3.

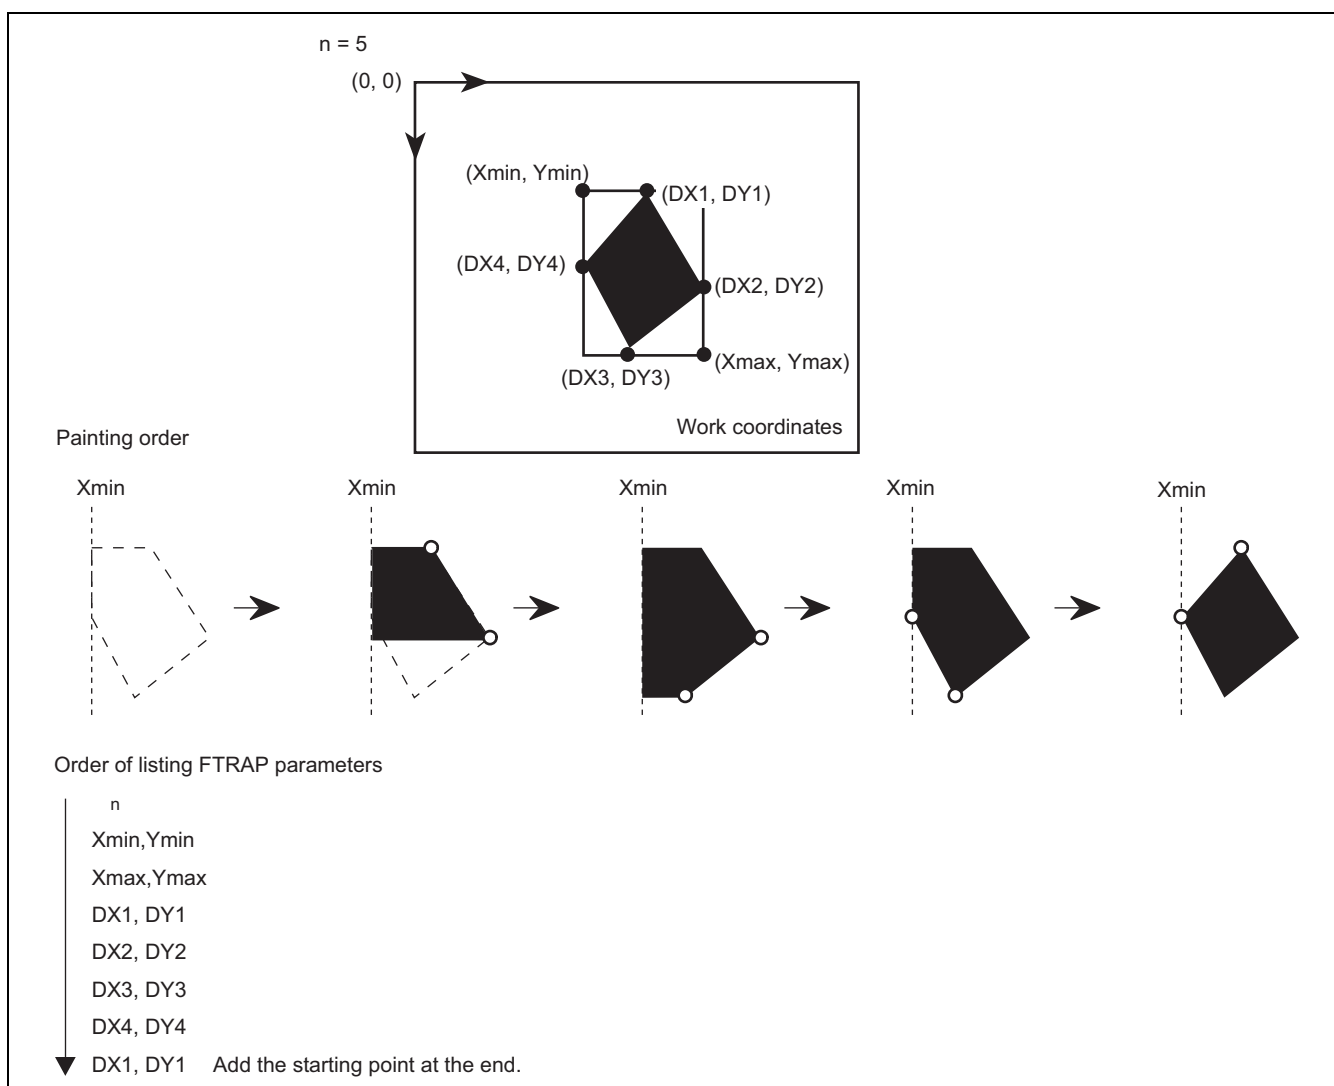

**(f) Description**

Draws a polygon with  $n - 1$  vertices at work coordinates. Paints  $n - 1$  trapezoids at work coordinates using binary EOR, with  $X = X_{min}$  as the left-hand side, and line segments  $(DX1, DY1) - (DX2, DY2), (DX2, DY2) - (DX3, DY3), \dots, (DX_{n-1}, DY_{n-1}) - (DX_n, DY_n)$  as the right-hand sides, and with the top and bottom bases parallel to the X-axis. Bottom base drawing is not performed. Set  $(DX_n, DY_n) = (DX_1, DY_1)$  to give a closed figure. If the rendering attribute EDG bit is set to 1, an edge line is drawn after the paint operation. The line drawing data is selected with the EOS bit.

The FTRAPC command performs coordinate transformation by internally obtaining the four vertices from the coordinates for the circumscribed quadrangle of the input polygon and then transforming the coordinates for these four vertices. The transformed four vertices are then internally converted into a circumscribed rectangle, the left edge obtained, and the polygon drawn.

Note: When enabling edge drawing ( $EDG = 1$ ), Z pre-clipping is not performed on the edge line.

**(g) Example**

Note: Set the BLKE bit to 1.

(e) Command Parameters

- n (n = 1 to 65,535): Number of vertices
- Xmin: Xmin value in the circumscribed quadrangle of the polygon. Work coordinate (absolute coordinate). Negative numbers are expressed as two's complements.
- Ymin: Ymin value in the circumscribed quadrangle of the polygon. Work coordinate (absolute coordinate). Negative numbers are expressed as two's complements.
- Xmax: Xmax value in the circumscribed quadrangle of the polygon. Work coordinate (absolute coordinate). Negative numbers are expressed as two's complements.
- Ymax: Ymax value in the circumscribed quadrangle of the polygon. Work coordinate (absolute coordinate). Negative numbers are expressed as two's complements.
- DXi (i = 1 to 65,535): Work coordinate (relative coordinate). Negative numbers are expressed as two's complements.
- DYi (i = 1 to 65,535): Work coordinate (relative coordinate). Negative numbers are expressed as two's complements.
- LINK address: LINK absolute address (Longword address. Write 0 to bits A31 to A29, A1, and A0.)  
LINK relative address (Longword address. Negative numbers are expressed as two's complements. Bits A31 to A29 are used to extend the sign in bit A28. Write 0 to bits A1 and A0.)

Note: Even in 32-bit addressing mode, write the values in bits 28 to 3 of the specified 32-bit address to bits A28 to A3.

**(f) Description**

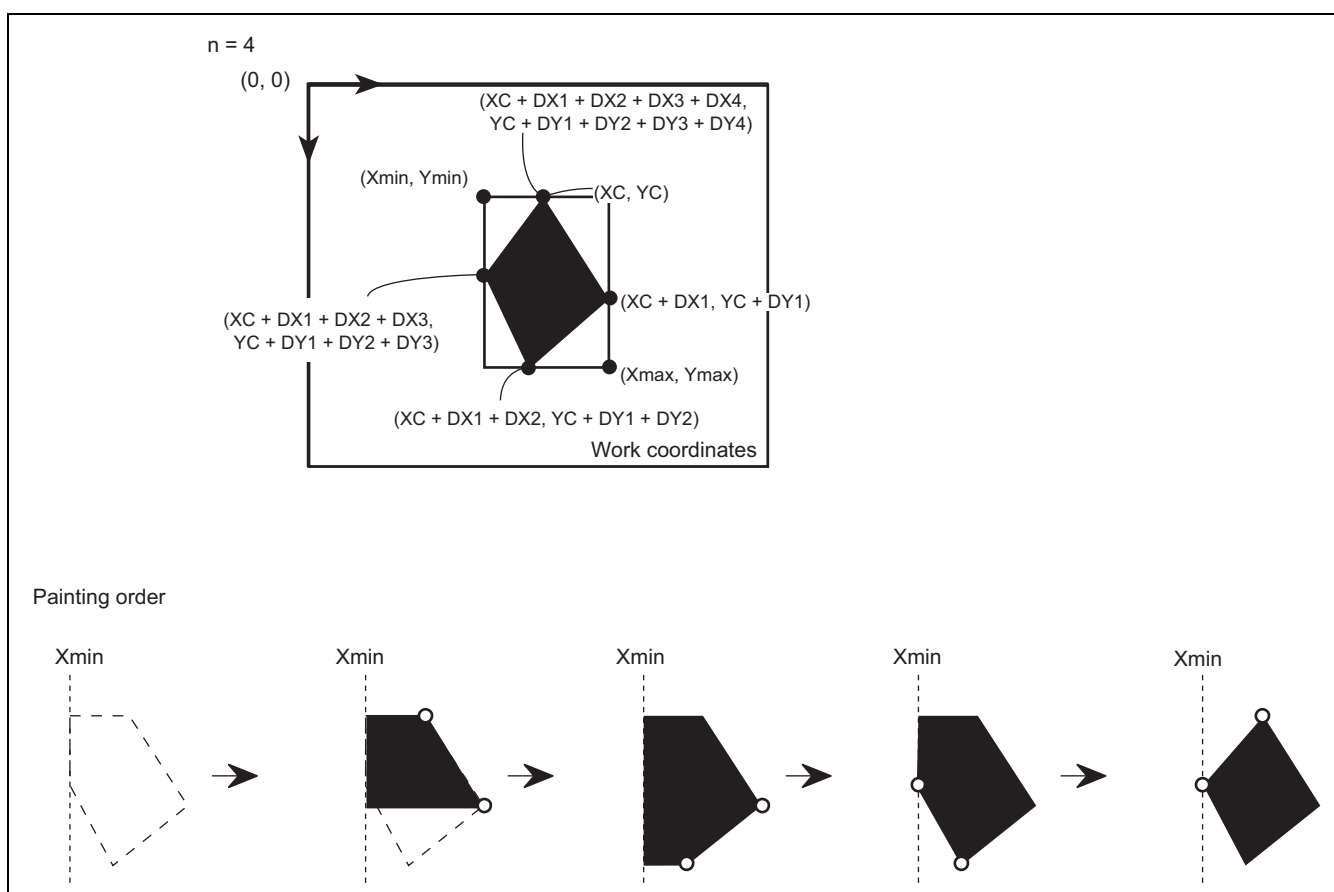

Paints  $n$  trapezoids at work coordinates using binary EOR, with  $X = X_{min}$  as the left-hand side, and line segments specified by the relative shift  $(DX, DY)$  from the current pointer values  $(XC, YC)$   $((XC, YC) - (XC + DX1, YC + DY1), (XC + DX1, YC + DY1) - (XC + DX1 + DX2, YC + DY1 + DY2), \dots, (XC + \dots + DX_{n-1}, YC + \dots + DY_{n-1}) - (XC + \dots + DX_n - 1 + DX_n, YC + \dots + DY_n - 1 + DY_n))$  as the right-hand sides, and with the top and bottom bases parallel to the X-axis. Bottom base drawing is not performed.

The final coordinate point is stored as the current pointer values  $(XC, YC)$ . Set  $(DX1 + DX2 + \dots + DX_n = 0, DY1 + DY2 + \dots + DY_n = 0)$  to give a closed figure. If the rendering attribute EDG bit is set to 1, an edge line is drawn after the paint operation. The line drawing data is selected with the EOS bit.

The RFTRAPC command performs coordinate transformation by internally obtaining the four vertices from the coordinates for the circumscribed quadrangle of the input polygon and then transforming the coordinates for these four vertices. The transformed four vertices are then internally converted into a circumscribed rectangle, the left edge obtained, and the polygon drawn.

- Notes: 1. The final coordinate point before coordinate transformation is stored as the current pointer values  $(XC, YC)$ .  
 2. When enabling edge drawing  $(EDG = 1)$ , Z pre-clipping is not performed on the edge line.

Note: Set the BLKE bit to 1.

**(e) Command Parameters**

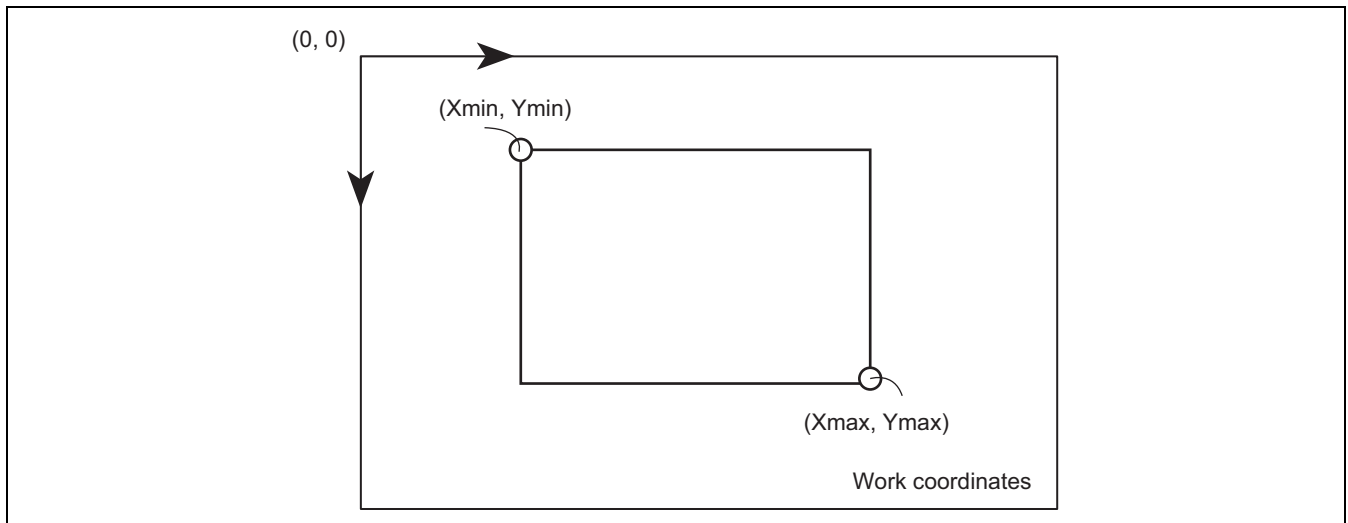

Xmin, Xmax: Left and right X coordinate values. Work coordinates (absolute coordinates). Negative numbers are expressed as two's complements.

Ymin, Ymax: Upper and lower Y coordinate values. Work coordinates (absolute coordinates). Negative numbers are expressed as two's complements.

**(f) Description**

Zero-clears the area specified by upper-left coordinates (Xmin, Ymin) and lower-right coordinates (Xmax, Ymax) at work coordinates.

The CLRWC command performs coordinate transformation by internally obtaining the four vertices from the left and right X coordinate values and upper and lower Y coordinate values, and then transforming the coordinates for these four vertices. The transformed four vertices are then internally converted into a circumscribed rectangle and the polygon drawn.

(e) Command Parameters

- TXS, TYS: Source starting point. Write 0 to the unused bits.
- Base address: Source start absolute address (Quad word address. Write 0 to bits A31 to A29 and A2 to A0.)  
 Source start relative address (Longword address. Negative numbers are expressed as two's complements. Bits A31 to A29 are used to extend the sign in bit A28. Write 0 to bits A1 and A0.)  
 Note: Even in 32-bit addressing mode, write the values in bits 28 to 3 of the specified 32-bit address to bits A28 to A3.
- BXC, BYC: Center X and Y coordinate values. Rendering coordinates (absolute coordinates). Negative numbers are expressed as two's complements.
- LW, RW: Left and right widths. Relative value from (BXC, BYC). Rendering coordinates. Make the setting in pixel units. Write 0 to the unused bits.
- TH, BH: Top and bottom heights. Relative value from (BXC, BYC). Rendering coordinates. Make the setting in pixel units. Write 0 to the unused bits.
- ROP: Raster operation code

**(f) Description**

Transfers multi-valued (8-, 16-, or 32-bit/pixel) rectangle source data to rendering coordinates.

When  $SS = 0$ , set the  $(LW + RW + 1)$  value to be a multiple of 8 pixels. When  $SS = 1$ , set the  $(LW + RW + 1)$  value to be 8 or more pixels.

1. When work specification is selected as a rendering attribute ( $WORK = 1$ ), only places where the work coordinate pixel is 1 are drawn at rendering coordinates while referencing work coordinates for the same coordinates as the rendering coordinates.
2. When  $SS = 1$ , the source data is referenced from the 2-dimensional source area. When  $SS = 0$ , the source data is referenced from the base address in the display list. When  $REL = 0$ , the source address can be specified as an absolute address. When  $REL = 1$ , the source address can be specified as a relative address with respect to the memory address at which the BITBLTA command code is located.
3. In 16-bit/pixel drawing, if the rendering attribute COOF bit is set to 1, the result of adding the value in COFSR to the value of the multi-valued source data is drawn. The operation is performed by saturation processing. In 8-bit/pixel drawing, the COOF bit should be cleared to 0.
4. The direction to reference the source data can be selected by the SRCDIRX and SRCDIRY bits.
5. The drawing direction can be selected by the DSTDIRX and DSTDIRY bits.
6. When  $\alpha E = 1$ , the source data and ground data are alpha blended before drawing. When setting  $\alpha E = 1$ , also set the ROP code = H'CC (source copy). The A value in the ARGB format is not alpha blended. The A value is drawn according to the source A value use (SAU) and A value (AVALUE) bits in the rendering control register (RCLR) and A value 8 register (AVALUE8R). Alpha blending is valid only in 16- or 32-bit/pixel drawing.
7. 16 raster operations are possible. The A value in the ARGB format is not subject to raster operations. The A value is drawn according to the source A value use (SAU) and A value (AVALUE) bits in the rendering control register (RCLR) and A value 8 register (AVALUE8R).

Note: System clipping or (relative) user clipping is performed when drawing a rectangle. Z clipping is performed only at the center coordinates.

MTRE	Fixed to 0	CLIP	RCLIP	STRANS	DTRANS	WORK	SS	REL	SRCDIRX	SRCDIRY	DSTDIRX	DSTDIRY	COOF	αE	Fixed to 0

**(e) Command Parameters**

TXS, TYS:	Source starting point. Write 0 to the unused bits.
Base Address:	Source start absolute address (Quad word address. Write 0 to bits A31 to A29 and A2 to A0.) Source start relative address (Longword address. Negative numbers are expressed as two's complements. Bits A31 to A29 are used to extend the sign in bit A28. Write 0 to bits A1 and A0.) Note: Even in 32-bit addressing mode, write the values in bits 28 to 3 of the specified 32-bit address to bits A28 to A3.
BXC, BYC:	Center X and Y coordinate values. Rendering coordinates (absolute coordinates). Negative numbers are expressed as two's complements.
LW, RW:	Left and right widths. Relative value from (BXC, BYC). Rendering coordinates. Make the setting in pixel units. Write 0 to the unused bits.
TH, BH:	Top and bottom heights. Relative value from (BXC, BYC). Rendering coordinates. Make the setting in pixel units. Write 0 to the unused bits.
ROP:	Raster operation code
Color0, Color1:	8-, 16-, or 32-bit/pixel color specification. For 16-bit/pixel drawing, the color specification should match the destination pixel format. For 8-bit/pixel drawing, the same value should be set in the upper and lower bytes.

**(f) Description**

Transfers binary (1-bit/pixel) rectangle source data to rendering coordinates.

A multiple of 8 pixels must be set as the  $(LW + RW + 1)$  value, regardless of the SS bit value.

1. When work specification is selected as a rendering attribute ( $WORK = 1$ ), only places where the work coordinate pixel is 1 are drawn at rendering coordinates while referencing work coordinates for the same coordinates as the rendering coordinates.
2. The binary source data is arranged in memory in a linear fashion. When  $REL = 0$ , the source address can be specified as an absolute address. When  $REL = 1$ , the source address can be specified as a relative address with respect to the memory address at which the BITBLTB command code is located.
3. If the rendering attribute COOF bit is set to 1, the result of adding the value in COFSR to the value of the binary source data that has been color expanded is drawn. The operation is performed by saturation processing. In 8-bit/pixel drawing, the COOF bit should be cleared to 0.
4. The direction to reference the source data can be selected by the SRCDIRX and SRCDIRY bits.
5. The drawing direction can be selected by the DSTDIRX and DSTDIRY bits.
6. When  $\alpha E = 1$ , the data obtained by color expanding the binary source data and the ground data are alpha blended before drawing. When setting  $\alpha E = 1$ , also set the ROP code = H'CC (source copy). The A value in the ARGB format is not alpha blended. The A value is drawn according to the source A value use (SAU) and A value (AVALUE) bits in the rendering control register (RCLR) and A value 8 register (AVALUE8R). Alpha blending is valid only in 16- or 32-bit/pixel drawing.
7. 16 raster operations are possible. The A value in the ARGB format is not subject to raster operations. The A value is drawn according to the source A value use (SAU) and A value (AVALUE) bits in the rendering control register (RCLR) and A value 8 register (AVALUE8R).

Note: System clipping or (relative) user clipping is performed when drawing a rectangle. Z clipping is performed only at the center coordinates.

- Notes:
- Set the SS bit to 1.
  - Set the  $\alpha$ E bit to 1.

**(e) Command Parameters**

- RAXS, RAYS: Starting point of  $\alpha$  map for drawing. Write 0 to the unused bits.
- TXS, TYS: Source starting point. Write 0 to the unused bits.
- BXC, BYC: Center X and Y coordinate values. Rendering coordinates (absolute coordinates). Negative numbers are expressed as two's complements.
- LW, RW: Left and right widths. Relative value from (BXC, BYC). Rendering coordinates. Make the setting in pixel units. Write 0 to the unused bits.
- TH, BH: Top and bottom heights. Relative value from (BXC, BYC). Rendering coordinates. Make the setting in pixel units. Write 0 to the unused bits.

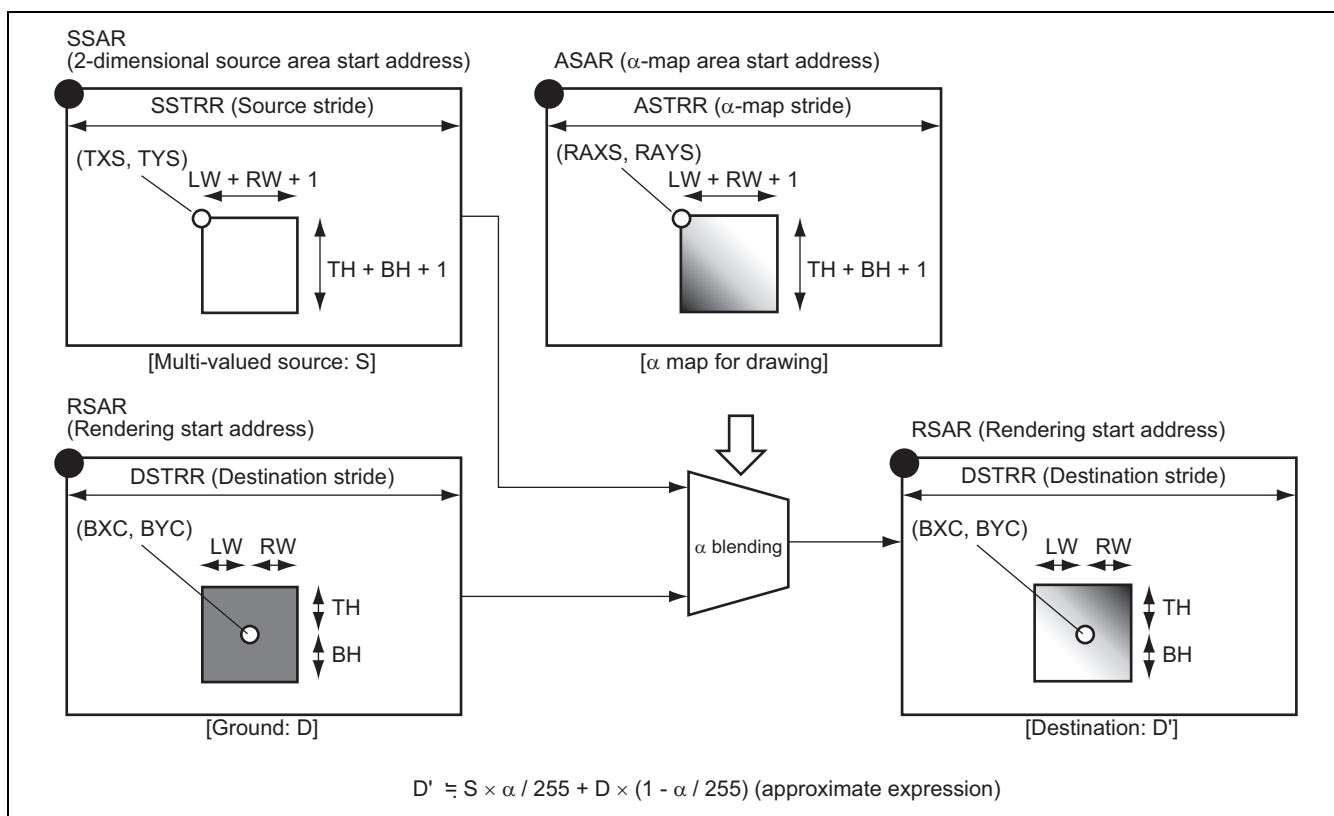

**(f) Description**

AAFA commands perform alpha blending of the multi-valued source (S) and ground data (D) with reference to the  $\alpha$  map for drawing (8 bits/pixel) and draw the result in the destination area (D'). The multi-valued source and the  $\alpha$  map for drawing can only be used for 2-dimensional positioning, so set SS to 1. If it is desired to use the multi-valued source and  $\alpha$  map for drawing in 1 dimension, set the stride of the multi-valued source and the  $\alpha$  map for drawing to LW + RW + 1. The stride of the multi-valued source and the  $\alpha$  map for drawing is set in 8-pixel units, so in the case of use in 1 dimension, LW + RW + 1 is also set in 8-pixel units.

- Notes:
1. System clipping or (relative) user clipping is performed when drawing a rectangle. Z clipping is performed only at the center coordinates.
  2. The scan direction for the multi-valued source and the  $\alpha$  map for drawing and the direction of drawing to the destination are fixed to upper left to lower right.
  3. If the  $\alpha$  map for drawing are all 0, the pixel is not drawn (the value A also is not changed).

**(g) Example**

**Figure 19.43 Example of AAFA Command Operation**

**(5) AAFC****(a) Function**

AAFC commands perform alpha blending of the specified color and the ground data with reference to the  $\alpha$  map for drawing (8 bits/pixel) as the alpha value and draw the result in the destination area. This command can only be executed for a 16- or 32-bit/pixel destination.

Note: Clear the SS bit to 0.

**(e) Command Parameters**

Base address:	<p><math>\alpha</math>-map address for drawing start absolute address (Quad word address. Write 0 to bits A31 to A29 and A2 to A0.)</p> <p><math>\alpha</math>-map address for drawing start relative address (Longword address. Negative numbers are expressed as two's complements. Bits A31 to A29 are used to extend the sign in bit A28. Write 0 to bits A1 and A0.)</p> <p>Note: Even in 32-bit addressing mode, write the values in bits 28 to 3 of the specified 32-bit address to bits A28 to A3.</p>
BXC, BYC:	Center X and Y coordinate values. Rendering coordinates (absolute coordinates). Negative numbers are expressed as two's complements.
LW, RW:	Left and right widths. Relative value from (BXC, BYC). Rendering coordinates. Make the setting in pixel units. Write 0 to the unused bits.
TH, BH:	Top and bottom heights. Relative value from (BXC, BYC). Rendering coordinates. Make the setting in pixel units. Write 0 to the unused bits.
Color:	16- or 32-bit/pixel color specification. The color specification should match the destination pixel format.

**(f) Description**

AAFC commands perform alpha blending of the specified color and the ground data with reference to the  $\alpha$  map for drawing use (8 bits/pixel) as the alpha value and draw the result in the destination area. A multiple of 8 pixels must be set as the  $(LW + RW + 1)$  value.

The 8-bit  $\alpha$  map for drawing is arranged linearly in memory. When  $REL = 0$ , the source address can be specified as an absolute address.

When  $REL = 1$ , the address of  $\alpha$  map for drawing can be specified as a relative address with respect to the memory address at which the AAFC command code is located.

- Notes:
1. System clipping or (relative) user clipping is performed when drawing a rectangle. Z clipping is performed only at the center coordinates.
  2. The scan direction for the  $\alpha$  map for drawing and the direction of drawing to the destination are fixed to upper left to lower right.
  3. If the  $\alpha$  map for drawing are all 0, the pixel is not drawn (the value A also is not changed).

(g) Example

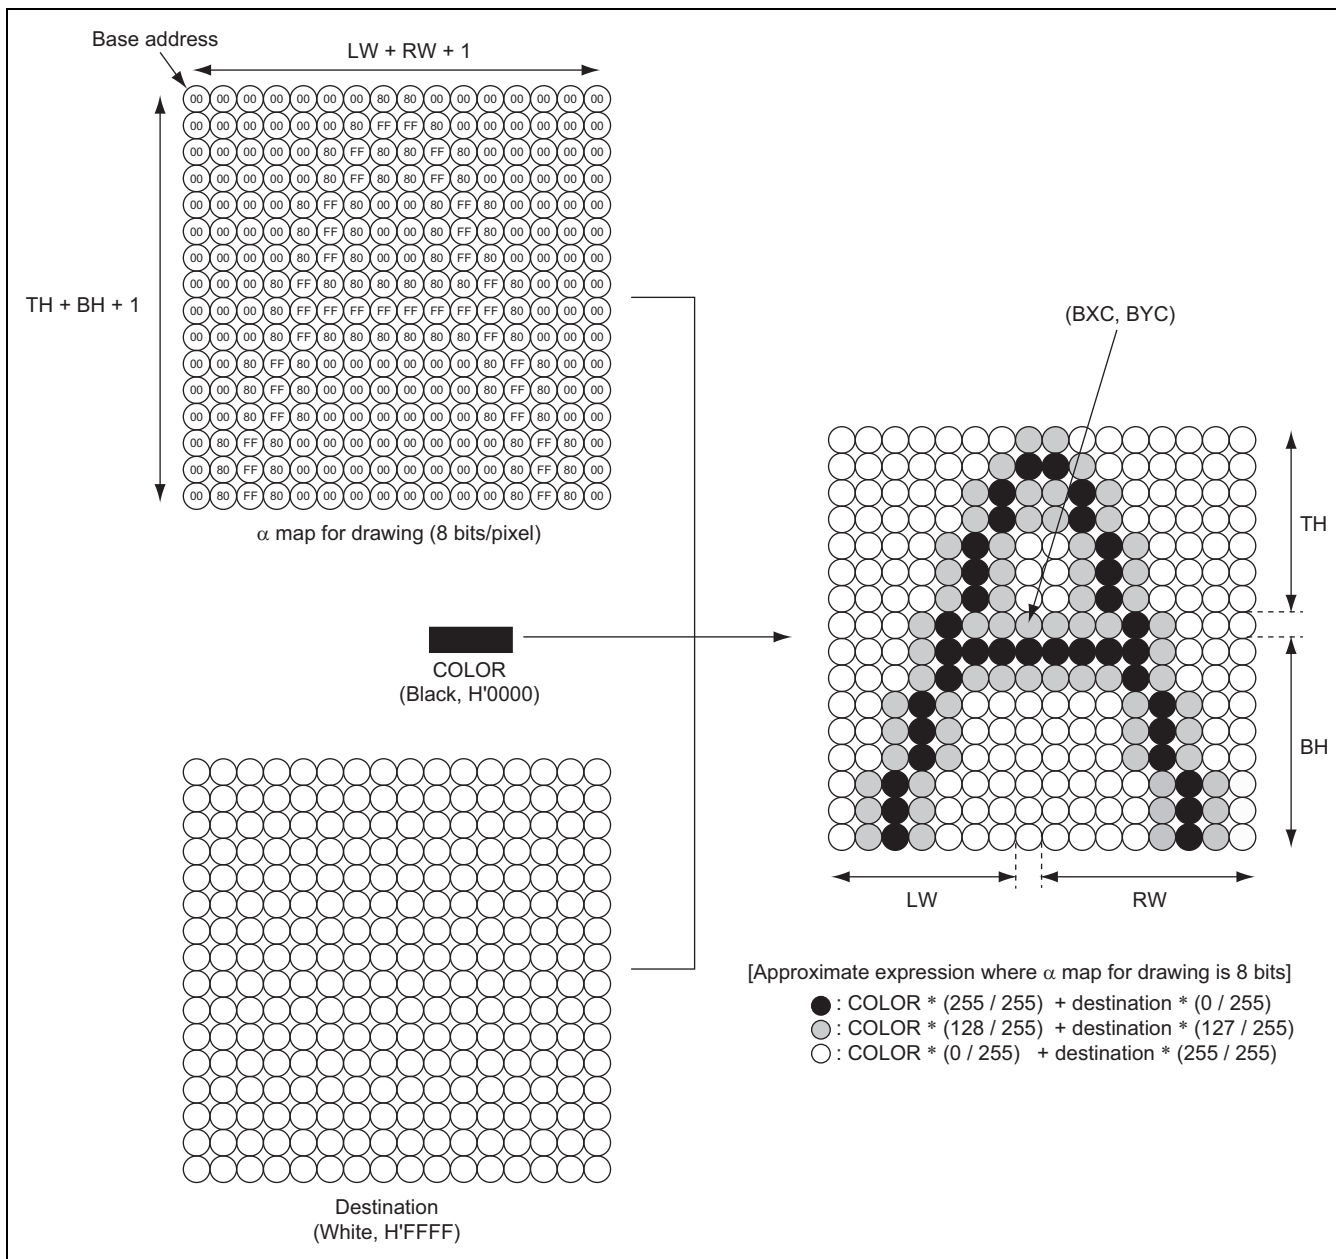

Figure 19.44 Example of AAFC Command Operation

## 19.4.6 Control Commands

### (1) MOVE

#### (a) Function

Sets the current pointer.

#### (b) Command Format

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0

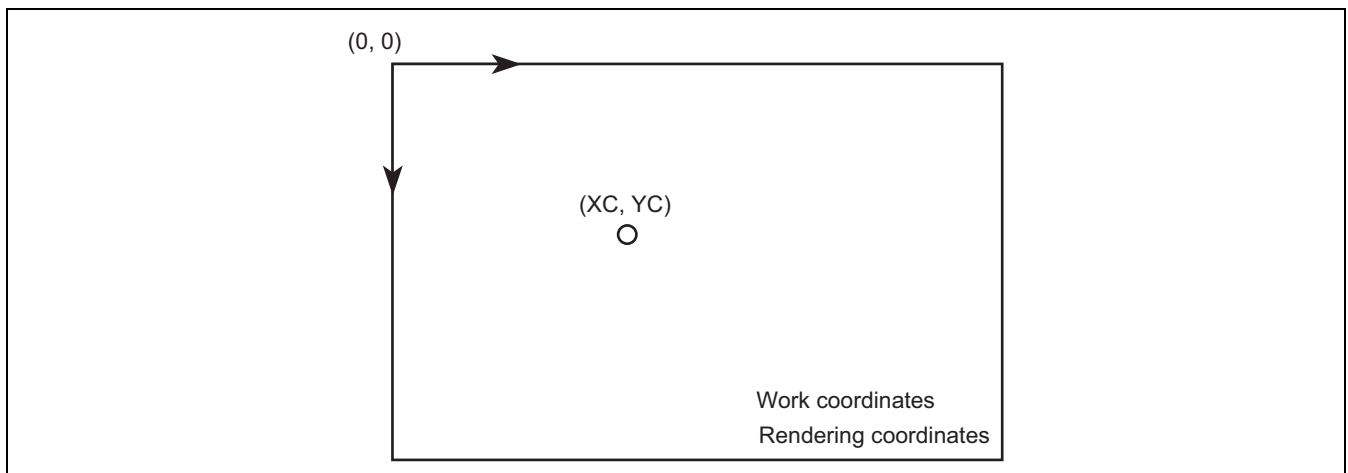

#### (e) Command Parameters

XC: Rendering coordinate (absolute coordinate) or work coordinate (absolute coordinate).  
Negative numbers are expressed as two's complements.

YC: Rendering coordinate (absolute coordinate) or work coordinate (absolute coordinate).  
Negative numbers are expressed as two's complements.

#### (f) Description

Sets the values obtained by adding the local offset values to XC and YC in the current pointers. XC and YC are set as absolute coordinates. The current pointers are used by relative drawing commands only. After issuing a MOVE command, use relative drawing commands in succession. If an absolute drawing command is used during this sequence, the current pointers will be used as registers for internal computation, and the current pointer values will be lost. A MOVE command must therefore be issued before using relative drawing commands again.

**(g) Example****Figure 19.45 Example of MOVE Command Operation**

**(2) RMOVE**

**(a) Function**

Adds XC and YC to the current pointers.

**(b) Command Format**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

XO (-32,768 ≤ XO ≤ 32,767)																YO (-32,768 ≤ YO ≤ 32,767)															

**(c) Code**

B'01000000

**(d) Rendering Attributes**

Draw Mode															
b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0

**(e) Command Parameters**

- XO: Local offset value. Rendering coordinate (absolute coordinate) or work coordinate (absolute coordinate). Negative numbers are expressed as two's complements.
- YO: Local offset value. Rendering coordinate (absolute coordinate) or work coordinate (absolute coordinate). Negative numbers are expressed as two's complements.

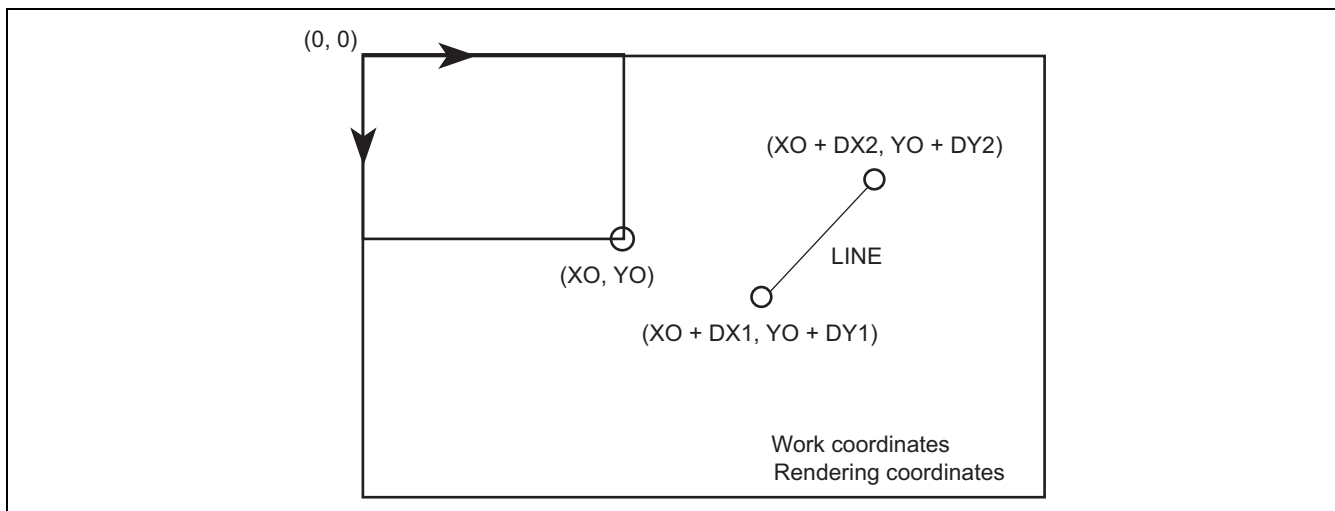

**(f) Description**

After the local offset values are set, these offset values are added in all subsequent coordinate specifications made in drawing commands.

These settings must be made at the start of the display list (the initial values are undefined).

To reflect the local offset values in the current pointers, issue a MOVE command after the LCOFS command.

**(g) Example**

**Figure 19.47 Example of LCOFS Command Operation**

**(4) RLCOFS****(a) Function**

Adds XO and YO to the local offset.

**(b) Command Format**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

XO (-32,768 ≤ XO ≤ 32,767)																YO (-32,768 ≤ YO ≤ 32,767)															

**(c) Code**

B'01000100

**(d) Rendering Attributes**

Draw Mode															
b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0

**(e) Command Parameters**

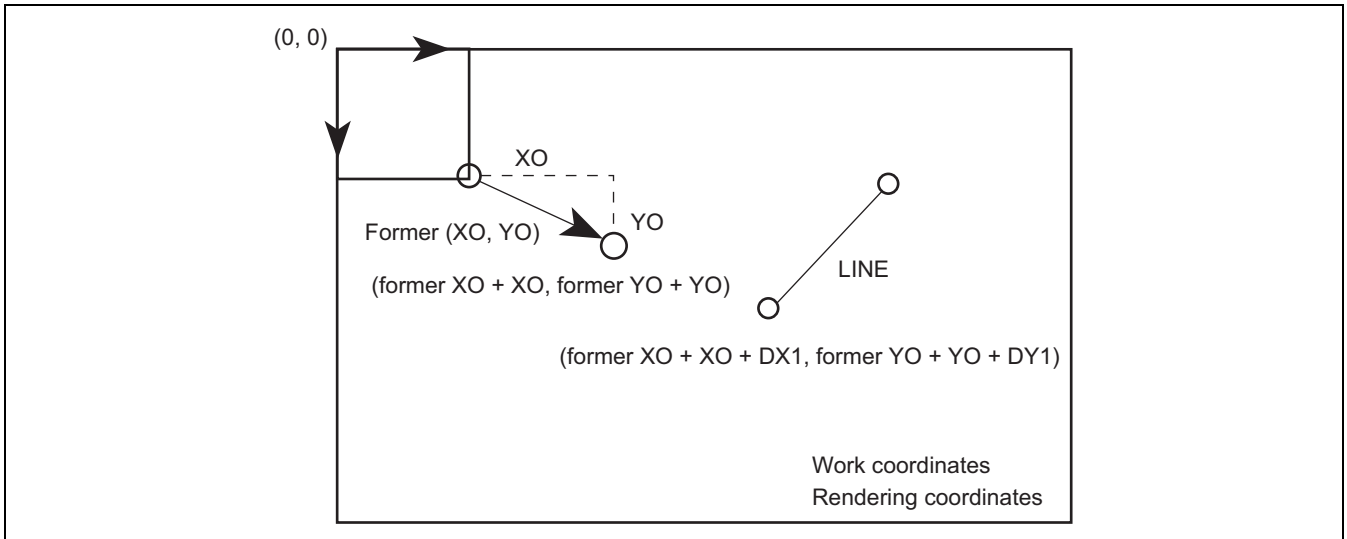

- XO: Local offset value. Rendering coordinate (relative coordinate) or work coordinate (relative coordinate). Negative numbers are expressed as two's complements.
- YO: Local offset value. Rendering coordinate (relative coordinate) or work coordinate (relative coordinate). Negative numbers are expressed as two's complements.

**(f) Description**

Adding XO and YO to the local offset makes the local offset values. After the local offset values are set, these offset values are added in all subsequent coordinate specifications made in drawing commands.

To reflect the local offset values in the current pointers, issue a MOVE command after setting the local offset with the LCOFS or RLCOFS command.

**(g) Example**

**Figure 19.48 Example of RLCOFS Command Operation**

**(5) WPR**

**(a) Function**

Sets a value in a specific address-mapped register.

**(b) Command Format**

- LINKE = 0

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Reserved (all 0)								n - 1 (0 ≤ n - 1 ≤ 255)								0 0 0 0				W reg No											
Sign extended		Sign		LINK address (longword address)													0 0														

Note: The longword address following the LINK address is handled as the next command code. Therefore, do not specify the longword address following the address where the LINK address is to be assigned as the link destination address specified by the address where the command code is located plus the LINK address.

**(c) Code**

B'00011000

**(d) Rendering Attributes**

Draw Mode															
b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	LINKE	LREL	Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	ByteM3	ByteM2	ByteM1	ByteM0

**(e) Command Parameters**

W reg No:	Register number
Data i (i = 0 to n – 1):	Write data
n – 1:	The number of write data
LINK Address:	LINK absolute address (Longword address. Write 0 to bits A31 to A29, A1, and A0.) LINK relative address (Longword address. Negative numbers are expressed as two's complements. Bits A31 to A29 are used to extend the sign in bit A28. Write 0 to bits A1 and A0.)

Note: Even in 32-bit addressing mode, write the values in bits 28 to 3 of the specified 32-bit address to bits A28 to A3.

**(f) Description**

Writes data to the address-mapped registers. The register number is set in W reg No, and the write data in Data n.

Also ensure that there is no conflict with access by the CPU.

1. When the LINKE bit is set to 1, data is read from the memory address specified by the LINK address and written to a register.
2. The LINK address can be specified through the LREL bit as an absolute address or a relative address with respect to the memory address at which the WPR command code is located.
3. Setting the ByteM3 to ByteM0 bits to 1 allows writing to a register to be masked in byte units.

Note: When writing to the registers to which ByteM control at the WPR command cannot be applied, set 0000 to the ByteM bits at the WPR command.

**(6) JUMP**

**(a) Function**

Changes the display list fetch destination.

**(b) Command Format**

- REL = 0

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**(e) Command Parameter**

JUMP address:            Jump destination absolute address (Longword address. Write 0 to bits A31 to A29, A1, and A0.)  
                                  Jump destination relative address (Longword address. Negative numbers are expressed as two's complements. Bits A31 to A29 are used to extend the sign in bit A28. Write 0 to bits A1 and A0.)

Note: Even in 32-bit addressing mode, write the values in bits 28 to 3 of the specified 32-bit address to bits A28 to A3.

**(f) Description**

Changes the display list fetch destination to the specified address.

When REL = 0, the jump destination address can be specified as an absolute address. When REL = 1, the jump destination address can be specified as a relative address with respect to the memory address at which the command code is located.

(g) Example

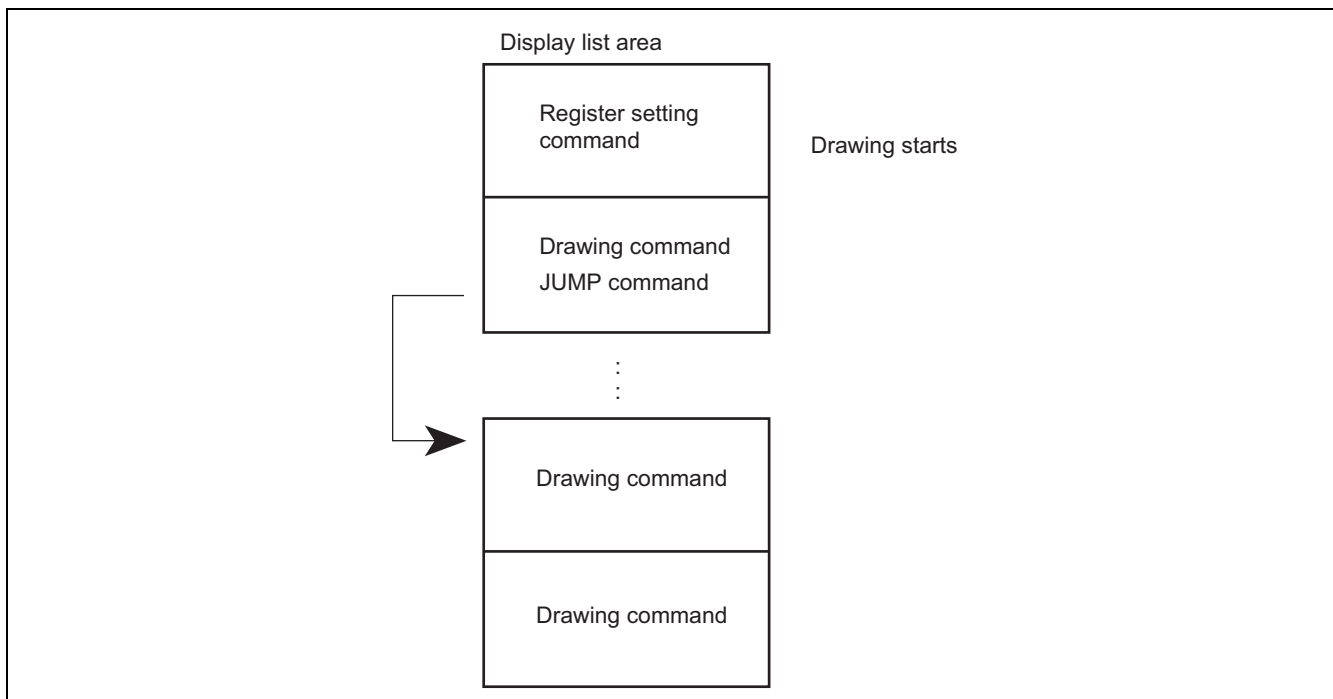

Figure 19.49 Example of JUMP Command Operation

**(7) GOSUB****(a) Function**

Makes a subroutine call for the display list.

**(b) Command Format**

- REL = 0

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

OP CODE = 0011_0000								Reserved (all 0)								Draw mode															
Sign extended	Sign	GOSUB address (longword address)														0	0														

**(c) Code**

B'00110000

**(d) Rendering Attributes****Draw Mode**

b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	REL	Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	No	No

**(e) Command Parameter**

GOSUB address: Subroutine absolute address (Longword address. Write 0 to bits A31 to A29, A1, and A0.)  
 Subroutine relative address (Longword address. Negative numbers are expressed as two's complements. Bits A31 to A29 are used to extend the sign in bit A28. Write 0 to bits A1 and A0.)

Note: Even in 32-bit addressing mode, write the values in bits 28 to 3 of the specified 32-bit address to bits A28 to A3.

**(f) Description**

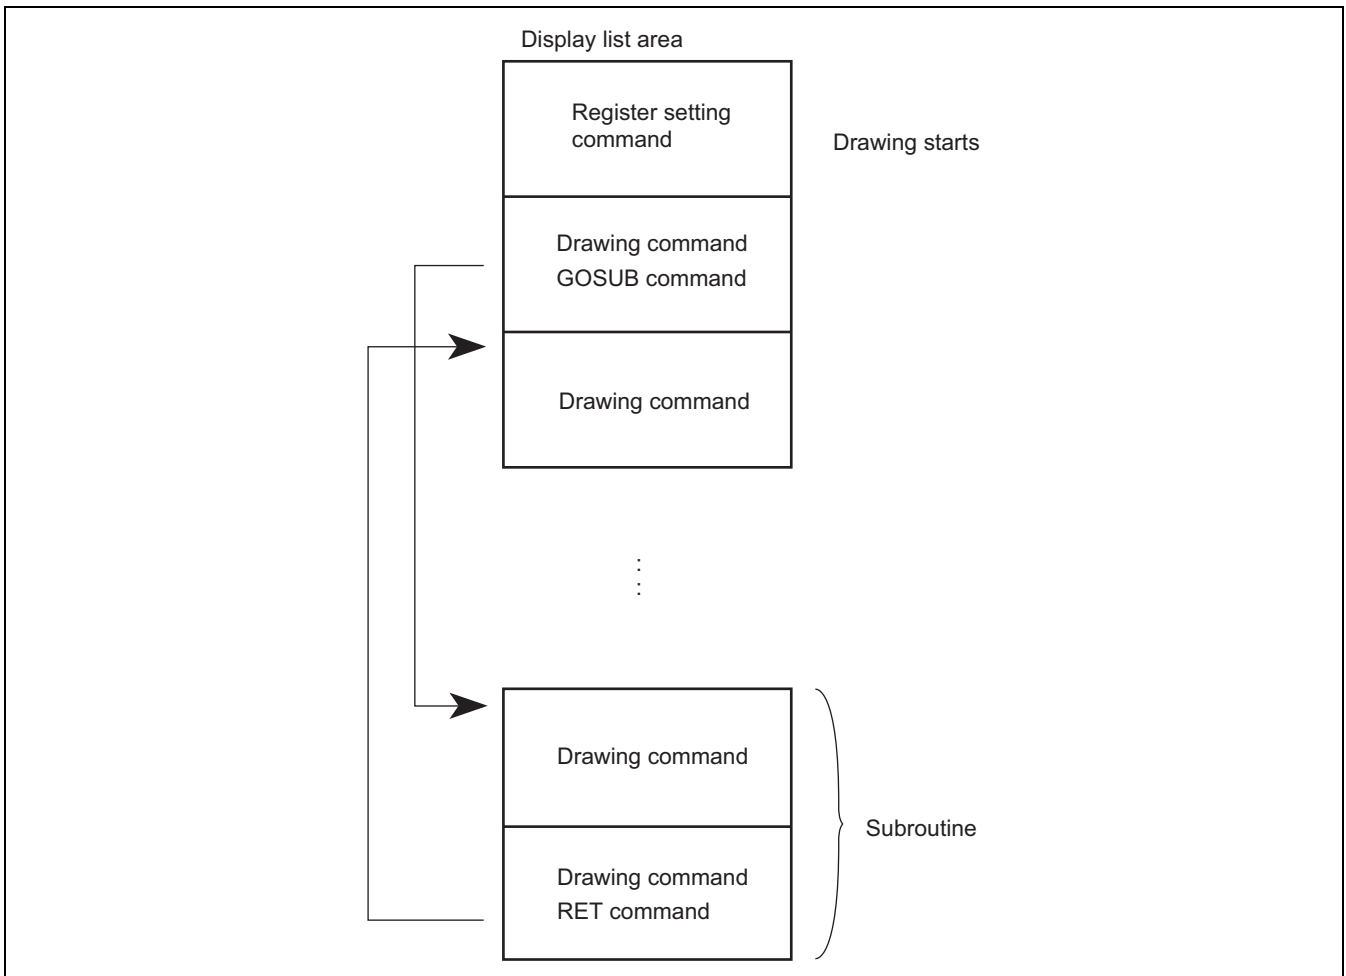

Changes the display list fetch destination to the specified subroutine address. The fetch address is restored by an RET instruction. As only one level of nesting is permitted, it will not be possible to return if a subroutine call is issued within the subroutine.

When REL = 0, the subroutine address can be specified as an absolute address. When REL = 1, the jump destination address can be specified as a relative address with respect to the memory address at which the command code is located.

When the No bit is 0, the return address is set in the return address 0 register (RTN0R). When the No bit is 1, the return address is set in the return address 1 register (RTN1R). When the No bit is 2, the return address is set in the return address STK register (RTNSTKR). When the No bit is 2, a maximum of eight levels of nesting are permitted.

Note: The GOSUB and RET commands should be appropriately allocated to prevent overflows or underflows in consideration that the maximum nesting level is eight. If an overflow or an underflow occurs, a hang up may be caused.

**(g) Example**

**Figure 19.50 Example of GOSUB Command Operation**

**(8) RET****(a) Function**

Returns from a subroutine call made by the GOSUB command.

**(b) Command Format**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
OP CODE = 0011_1000								Reserved (all 0)								Draw mode															

**(c) Code**

**(d) Rendering Attributes**

Draw Mode															
b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0

**(e) Description**

When this command is executed, the drawing operation is kept waiting until the timing for a frame change. As soon as the frame change timing has elapsed, control passes to the next command. The frame change timing is the next VSYNC in non-interlace mode display or interlace sync & video mode display, and the starting point of the next frame in interlace sync mode display.

Note: This command can only be used in manual display change mode or auto-rendering mode.

**(11) TRAP****(a) Function**

Informs the end of the display list.

**(b) Command Format**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
OP CODE = 0000_0000								Reserved (all 0)								Draw mode															

**(c) Code**

B'00000000

**(d) Rendering Attributes**

Draw Mode															
b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	Flip7	Flip6	Flip5	Flip4	Flip3	Flip2	Flip1	Flip0

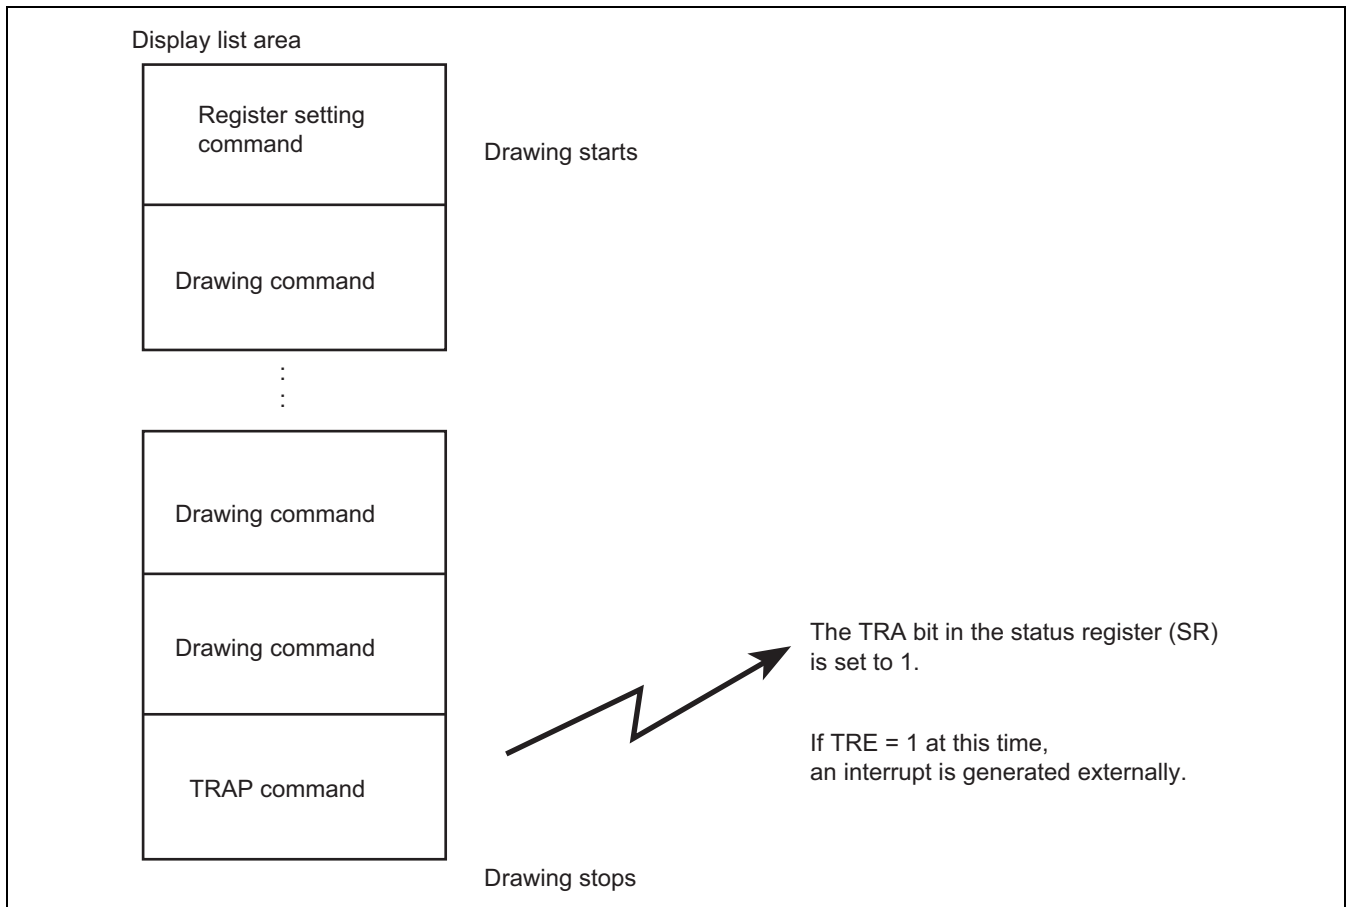

**(e) Description**

Halts the drawing operation and sets the TRA bit in the status register (SR) to 1. If the TRE bit in the interrupt enable register (IER) is set to 1, an interrupt is sent to the CPU.

This command must be placed at the end of the display list.

If the Flip7 to Flip0 bits are set, the corresponding plane is flipped (only valid in auto-rendering mode). The flip timing is the next VSYNC in non-interlace mode display or interlace sync & video mode display, and the starting point of the next frame in interlace sync mode display.

**(f) Example**

**Figure 19.51 Example of TRAP Command Operation**

**(12) SYNC****(a) Function**

Controls cache clearing/flushing.

**(b) Command Format**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
OP CODE = 0001_0010								Reserved (all 0)								Draw mode															

**(c) Code**

B'00010010

**(d) Rendering Attributes**

Draw Mode															
b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	Fixed to 0	WCLR	WFLSH	ACLR	Fixed to 0	Fixed to 0	TCLR	Fixed to 0	Fixed to 0	DCLR	DFLSH

**(e) Description**

SYNC is used to flush or clear cache data intentionally. When all of the rendering attributes are 0, NOP operation is performed.

1. When TCLR = 1, the source (texture) cache is cleared.
2. When DCLR = 1, the destination cache is cleared.
3. When DFLSH = 1, the destination cache is flushed.
4. When WCLR = 1, the work cache is cleared.
5. When WFLSH = 1, the work cache is flushed.
6. When ACLR = 1, the  $\alpha$  map cache is cleared.

- Notes:
1. All caches are cleared when rendering starts.
  2. When a TRAP, NOP (INT = 1), or VBKEM command is issued and a command error occurs, the destination cache and working cache are flushed, and the texture cache and  $\alpha$  map cache are cleared.
  3. For the destination cache and working cache, do not set both the cache clearing and flushing bits to 1 at the same time.

**(13) RGTOFS****(a) Function**

Adds RXOFS or RYOFS to a coordinate transformation offset.

**(b) Command Format**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
OP CODE = 0110_0100										RXOFS ( $-2048 \leq \text{RXOFS} \leq 2047$ )										RYOFS ( $-2048 \leq \text{RYOFS} \leq 2047$ )											

**(c) Code**

B'01100100

**(d) Description**

This command is used to obtain a coordinate transformation offset value by adding RXOFS and RYOFS to the coordinate transformation offset (GTROFSX, GTROFSY).

- $\text{GTROFSX} = \text{GTROFSX} + \text{RXOFS}$
- $\text{GTROFSY} = \text{GTROFSY} + \text{RYOFS}$

After this command is set, the coordinate transformation offset value is added to the coordinates after the perspective W division for a drawing command which allows a coordinate transformation offset.

- Notes:
1. The results of this command addition are read from GTROFSXR and GTROFSYR.
  2. The addition results must satisfy the following condition because saturation processing is not performed:  
 $-32,768 \leq \text{GTROFSX}$  and  $\text{GTROFSY} \leq 32,767$ .

## 20. 3D Graphics Engine

RZ/G1H

RZ/G1N

RZ/G1M

RZ/G1E

### 20.1 Overview

The table below lists the graphics engine supported by each of RZ/G series products. See the relevant section for each product.

	GPU Core	Section
RZ/G1H	PowerVR Series6 G6400	20.2
RZ/G1M/N	PowerVR Series5-XT SGX544-MP2	20.3
RZ/G1E	PowerVR Series5 SGX540	20.4

This section only introduces the features of each 3D graphics engine. The graphics processing performed by each graphics engine is provided as the graphics driver software.

### 20.2 PowerVR Series6 G6400

RZ/G1H

RZ/G1N

RZ/G1M

RZ/G1E

The description of this section is quoted from the press release ‘Imagination announces first PowerVR Series6 GPU cores’ on January 10, 2012.

(<http://www.imgtec.com/news/Release/index.asp?NewsID=666>)

#### 20.2.1 Features of PowerVR Series6

PowerVR Series6 sets a new benchmark for high performance, ultra-low power GPU cores, scalable for markets from mobile and tablet to high end gaming and computing.

The innovative PowerVR Rogue architecture, on which Series6 is based, builds on the maturity and unrivalled success of the previous generations of PowerVR GPUs. It enables Imagination’s partners to deliver amazing user experiences in devices from innovative ‘natural’ user interfaces to ultra-realistic gaming, as well as enabling new applications never before thought of from advanced content creation and image processing to sophisticated augmented reality and environment-aware solutions.

Based on a scalable number of compute clusters the PowerVR Rogue architecture is designed to target the requirements of a growing range of demanding markets from mobile to the highest performance embedded graphics including smartphones, tablets, PC, console, DTV and other Rich Graphics Applications. Compute clusters are arrays of programmable computing elements that are designed to offer high performance and efficiency while minimizing power and bandwidth requirements. The PowerVR G6400 has four compute clusters.

#### 20.2.2 Register Base Address

Base address of registers is allocated to H'00\_FD00\_0000.

## 20.3 PowerVR Series5-XT SGX544MP2

RZ/G1H	RZ/G1N
RZ/G1M	RZ/G1E

The description of this section is quoted from 'POWERVR SGX Series5XT Factsheet'.

([http://www.imgtec.com/factsheets/powervr/PowerVR\\_SGX\\_Series5XT\\_IP\\_Core\\_Family\\_\[3.2\].pdf](http://www.imgtec.com/factsheets/powervr/PowerVR_SGX_Series5XT_IP_Core_Family_[3.2].pdf))

### 20.3.1 Features of POWERVR SGX Series5XT

The POWERVR SGX Series5XT GPU IP core family is a series of highly efficient graphics acceleration IP cores that meet the multimedia requirements of the next generation of consumer, communications and computing applications.

POWERVR SGX Series5XT architecture is fully scalable for a wide range of area and performance requirements, enabling it to target markets from low cost feature-rich mobile multimedia products to very high performance consoles and computing devices.

The family incorporates the second-generation Universal Scalable Shader Engine (USSE2), with a feature set that exceeds the requirements of OpenGL 2.0 and Microsoft Shader Model 3, enabling 2D, 3D and general purpose (GP-GPU) processing in a single core.

- Most comprehensive IP core family and roadmap in the industry
- USSE2 delivers twice the peak floating point and instruction throughput of Series5 USSE
- YUV and color space accelerators for improved performance
- Upgraded POWERVR Series5XT shader-driven tile-based deferred rendering (TBDR) architecture
- Multi-processor options enable scalability to higher performance
- Support for all industry standard mobile and desktop graphics APIs and operating systems
- Fully backwards compatible with POWERVR MBX and SGX Series5

### 20.3.2 Register Base Address

Base address of registers is allocated to H'FD80\_0000.

## 20.4 PowerVR Series5 SGX540

RZ/G1H	RZ/G1N
RZ/G1M	<b>RZ/G1E</b>

The description of this section is quoted from 'POWERVR SGX Series5 Factsheet'.

(PowerVR\_SGX\_Series5\_IP\_Core\_Family\_[3.4].pdf, available at [www.imgtec.com](http://www.imgtec.com)).

### 20.4.1 Features of POWERVR SGX Series5

The POWERVR SGX Series5 GPU IP core family is a series of highly efficient graphics acceleration IP cores that meet the multimedia requirements of the next generation of consumer, communications and computing applications.

POWERVR SGX Series5 architecture is fully scalable for a wide range of area and performance requirements, enabling it to target markets from low cost feature-rich mobile multimedia products to very high performance consoles and computing devices.

The family incorporates the revolutionary Universal Scalable Shader Engine (USSE), with a feature set that exceeds the requirements of OpenGL 2.0 and Microsoft Shader Model 3, enabling 2D, 3D and general purpose (GP-GPU) processing in a single core.

- Most comprehensive IP core family and roadmap in the industry
- Series5 shader-driven tile-based deferred rendering (TBDR) architecture
- Fully programmable GPU using unique USSE architecture
- Support for all industry standard mobile and desktop graphics APIs and operating systems
- Fully backwards compatible with PowerVR MBX

### 20.4.2 Register Base Address

See section 20.3.2, Register Base Address.

## 21. Display Unit (DU)

RZ/G1H

RZ/G1N

RZ/G1M

RZ/G1E

### 21.1 Overview

#### 21.1.1 Features

##### (1) Display Channel

Three\*<sup>1</sup>/Two\*<sup>2</sup> independently controllable channels are provided. Using the DU0 and DU1, different images or the same image can be displayed on two monitors.

Notes: 1. Only for RZ/G1H  
2. For RZ/G1M/N/E

##### (2) Plane

The display surfaces normally called the foreground, background, and cursor, are called planes in this section. Parameters for each plane can be set independently through the settings of an internal register. The internal register settings can also be used to set the display priority order.

- Display size
- Display position
- Display data format (8-bit/pixel, 16-bit/pixel, 32-bit/pixel, ARGB, or YC)
- Plane superpositioning
- Scrolling
- Wrapping-around
- Blinking
- Buffering control

The internal register settings can be used to select four different control modes.

- Auto rendering mode (double buffering)
- Manual display change mode (double buffering)
- Auto display change mode (double buffering)
- Video capture mode (triple buffering)

##### (3) Type and Number of Planes

In the DU0 or DU1 and the DU2\*<sup>1</sup>, there are eight planes (display planes) available, each using both image data and an alpha ratio. Also, there are two special planes (alpha-ratio planes) available, each using only an alpha ratio.

Up to eight display planes can be superposed on each other. Correspondences between the DU0 and DU1 planes are not fixed but can be selected as desired through register settings.

For the number of planes which can be used at the same time, refer to the description in section 1, Overview.

Notes: 1. Only for RZ/G1H

#### (4) Synchronization Method

Internal register settings can be used to select any of three synchronization modes for the display output timing.

- Master mode (internal sync mode)
- TV sync mode (external sync mode)
- Sync method switching mode

#### (5) CRT Scan Mode (CRT Scan Method)

Internal register settings can be used to select from among three scan modes.

- Non-interlaced mode
- Interlaced sync mode
- Interlaced sync & video mode

#### (6) YC → RGB Color Space Conversion Functions

Image data stored in YC format can be converted into the RGB color space and displayed in a window. The conversion coefficients can be set in a register.

However, data for two or more pixels cannot be converted into the RGB color space at the same time.

Data in YUV422 and YUV420 format are convertible into the RGB color space.

#### (7) RBG → YC Color Space Conversion Functions [RZ/G1M/N/E]

Display data superposed in RGB format can be converted into the YC color space and output from the DU0 pin as the YC data.

#### (8) Color Palette

Eight\*<sup>1</sup> /Four\*<sup>2</sup> internal color palette planes are provided, capable of simultaneously displaying 256 colors out of 262 thousand colors

Eight-bit blending ratios are provided for every 256 colors. The color palettes are only accessible by superposition processors 0 and 2\*<sup>1</sup>.

Notes: 1. Only for RZ/G1H  
2. For RZ/G1M/N/E

#### (9) Display Capture

The RGB-888 or RGB-666 data for output on the three\*<sup>1</sup>/two\*<sup>2</sup> display channels is convertible into ARGB-888 or RGB-565 or ARGB-1555 data for separate storage in external memory.

Notes: 1. Only for RZ/G1H  
2. For RZ/G1M/N/E

#### (10) Register Access Control

The module has internal control registers; these are writable/readable by the APB protocol over the APB. The unit of access is fixed to 32 bits.

#### (11) DRC Connection [RZ/G1H]

Connection with the DRC allows the contrast correction of image data, superimposed data, or display data. To apply the correction, select the DU0, DU1 or DU2.

Connection with the DRC allows contrast correction of the image data, superposed data, or display data separately for each channel.

**(12) VSP1 Connection**

Connection with the VSP1 allows the image data processed by the VSP1 to be output directly to the display unit without an external memory. VSP1-ch0 has been connected with plane 1 for the DU0 or DU1, VSP1-ch1 has been connected with either plane 2 for DU0 or DU1 or plane 1 for the DU2\*<sup>1</sup>. VSP1-ch0 has been connected with plane 1 for the DU0 or DU1, VSP1-ch1 has been connected with plane 2 for the DU0 or DU1\*<sup>2</sup>. VSP1-ch0 has been connected with plane 1 for the DU0 or DU1\*<sup>3</sup>.

Notes: 1. Only for RZ/G1H  
2. For RZ/G1M/N  
3. Only for RZ/G1E

**(13) LVDS Connection [RZ/G1H/M/N]**

Connection with the LVDS allows the output of image data from the LVDS. The DU0 has been connected with the LVDS, for the DU1 and DU2, either one should be selected for connection\*<sup>1</sup>. The DU0 has been connected with the LVDS\*<sup>2</sup>.

Notes: 1. Only for RZ/G1H  
2. For RZ/G1M/N

**(14) DPAD Connection**

Connection with the DPAD allows the output of the digital RGB data from a pin.

To output the RGB data, select the DU0, DU1 or DU2\*<sup>1</sup>. Either DU0 or DU1 is chosen and outputted\*<sup>2</sup>.

Connection with the DPAD allows the output of the digital RGB data from a pin separately for each channel\*<sup>3</sup>.

Notes: 1. Only for RZ/G1H  
2. For RZ/G1M/N  
3. Only for RZ/G1E

21.1.2 Block Diagram

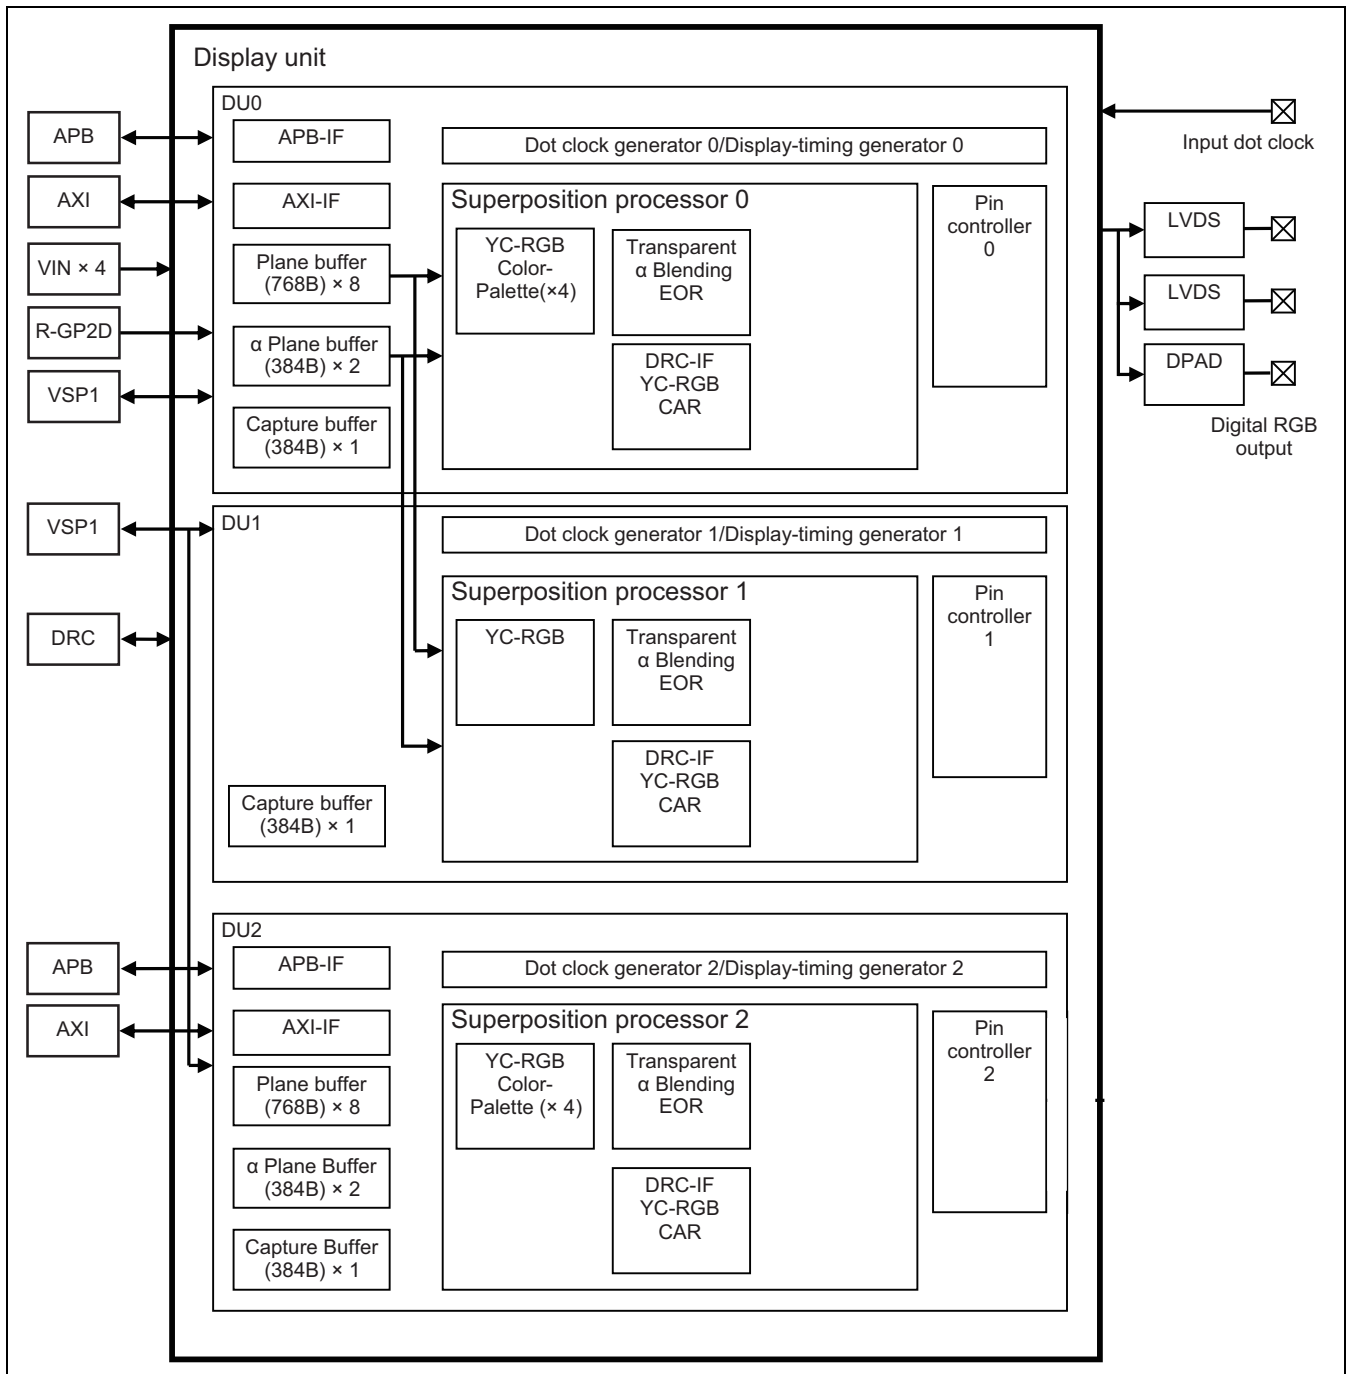

Figure 21.1a Block Diagram of the Display Unit (DU) [RZ/G1H]

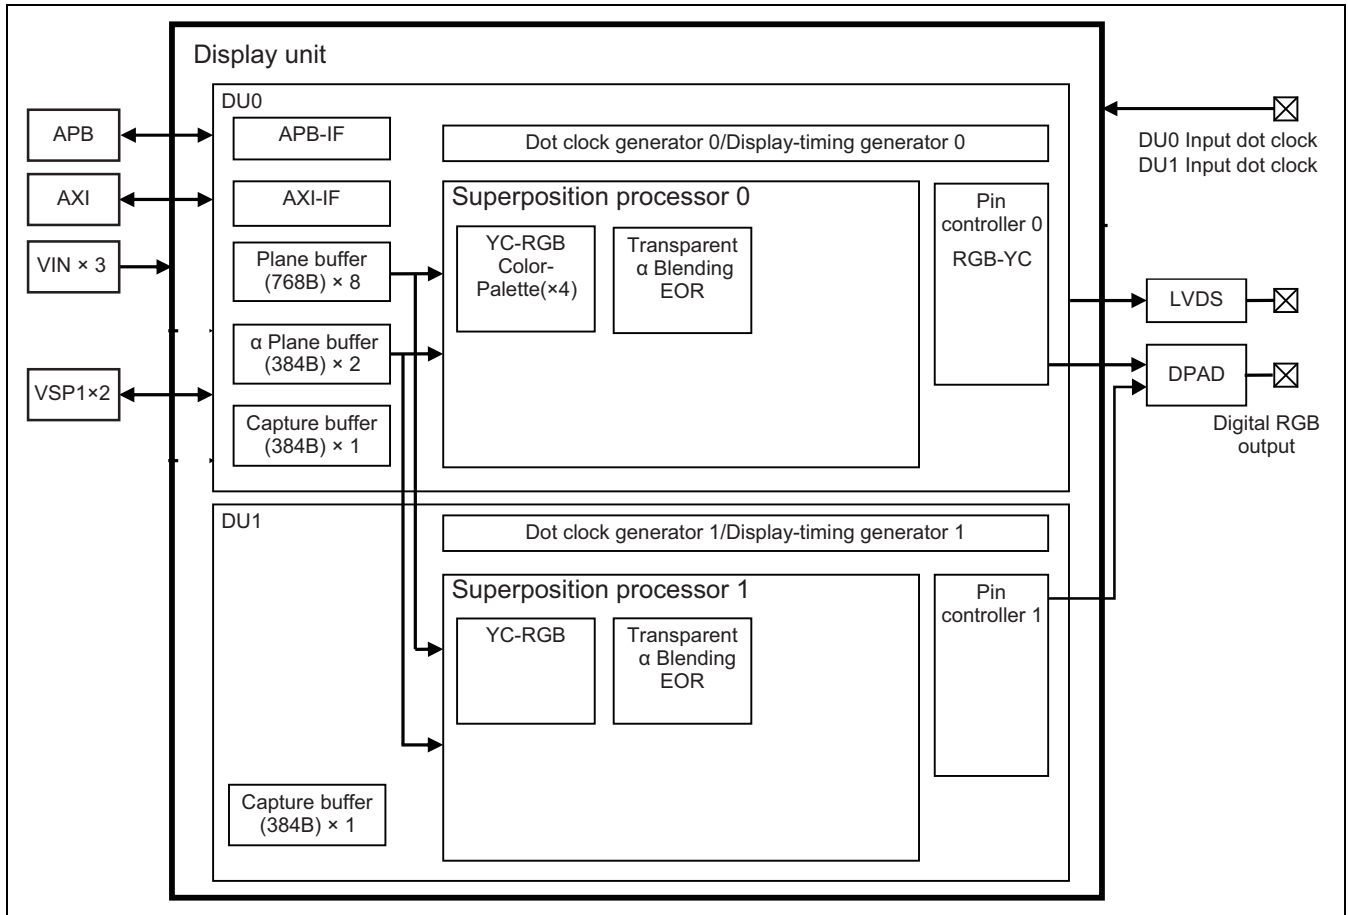

Figure 21.1b Block Diagram of the Display Unit (DU) [RZ/G1M/N]

Notes: 1. These are expressed as EXHSYNC, EXVSYNC, and EXODDF in explanations of the functions as input signals and as HSYNC, VSYNC and ODDF otherwise.

2. When DU0 and DU1 are output at the same time, DU0 and DU1 are output in synchronization with rising and falling edges of the dot clock, respectively.

3. Synchronization for the output of digital 0 only is in accord with the setting of the output signal timing adjustment register m (OTARm). m = 0 to 2 for RZ/G1H, m = 0 and 1 for RZ/G1M/N.
4. In this section, unless otherwise noted, "dot clock" refers to the output dot clock.
5. In YC format display, please refer to Table 21.39a. [RZ/G1M/N]

  4. In YC format display, please refer to Table 21.39b.

## 21.2 Register Configuration

In the display unit (DU), register update methods include external update and internal update.

### (1) External Update

An "external update" is an update which reflects the address-mapped register settings made by the CPU after the end of CPU access. Registers related to display control (for example, the display unit system control register) and the settings of which are updated through external updates can be overwritten without display flicker by using bits 11 and 14 in the display unit status register n (DSSRn) \*4 indicating the start position of the vertical blanking interval.

### (2) Internal Update

An "internal update" is an update that reflects the address-mapped register settings with the internal update timing of the display unit (DU). Hence in the case of a register with an internal update function, even when the CPU overwrites address-mapped registers related to display operation without being aware of the display timing, display flicker can be prevented.

An internal update is performed during the interval in which the display reset (DRES) bit in the display unit system control register (m (DSYSRm)\*1/ (0 (DSYSR0))\*2 is 1 and at the beginning of each frame. The internal update performed at the beginning of each frame is disabled using the internal update disable (IUPD) bit in the display unit system control register (m (DSYSRm))\*1/ (0 (DSYSR0))\*2.

Bits which are internally updated in response to setting of the display reset (DRES) bit in the display unit system control register (m (DSYSRm))\*1/ (0 (DSYSR0))\*2 are listed in the column headed "Bit with Internal Update Function" in tables on the following pages.

The registers for the X and Y start positions for plane n in the interlaced sync & video mode (PnSPXRm\*3, PnSPYRm\*3) are also internally updated at the beginning of a field.

Updates are performed at the falling edge of VSYNC output when the sync method of the display unit system control register n (DSYSRn)\*4 is master mode (bit 7 = 0, bit 6 = 0), or at the falling edge of EXVSYNC detected in TV sync mode (bit 7 = 1, bit 6 = 0). In sync transition mode (bit 7 = 0, bit 6 = 1), internal updates are not performed.

However, plane n display area start address 0 register (PnDSA0Rm\*3), plane n display area start address 1 register (PnDSA1Rm\*3), and plane n display area start address 2 register (PnDSA2Rm\*3) are internally updated in display operation and externally updated when the video data and rendering data are written to addresses specified for these registers.

The address-mapped registers with an internal update function are shown in Tables 21.2 to 21.23. The initial settings for these registers should be made during the interval in which the DRES bit in (DSYSRm)\*1/ (DSYSR0)\*2 is 1.

- Notes:
1. m = 0 and 2 only for RZ/G1H
  2. For RZ/G1M/N/E
  3. m = 0 and 2, suffix "m" is only for RZ/G1H.  
n = 1 to 8.
  4. n = 0 to 2 only for RZ/G1H  
n = 0 and 1 for RZ/G1M/N/E

**(3) Register Configuration**

The suffixes m and n which are added to the register names and their abbreviations represent the DU channel numbers ( $m = 0$  and  $2^{*1}$ ;  $n = 0$  to  $2^{*2}$ ).

- Notes: 1. Only for RZ/G1H.  
 2. "n=0 and 1" For RZ/G1M/N/E.  
 "n=0 to 2" Only for RZ/G1H.

## 21.3 Register Description

### Legend for Register Description

Initial value: Register value after a reset.

—: Undefined value

R/W: Readable/writable. The written value can be read.

R/WC0: Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.

R: Read-only. The write value should always be 0.

—/W: Write-only. The read value is undefined.

Plane n: Indicates plane 1 to plane 8

Note: Do not access locations that appear empty in the address map. Operation is not guaranteed in case of access to change the value at any location other than those of the registers listed in Tables 21.2 to 21.23.

### 21.3.1 Display Unit System Control Registers

#### 21.3.1.1 Display Unit System Control Register m (DSYSRm, m = 0 and 2 / m = 0)

Note. m = 0 and 2 for RZ/G1H, DU2 is only for RZ/G1H.  
m = 0 for RZ/G1M/N/E.

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Address: DU0: H'FEB0 0000, DU2: H'FEB4 0000

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	ILTS	—	—	—	—	—	—	—	—	DSEC	—	—	—	IUPD

R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31, 30	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
29	ILTS	0	R/W	Not available	Input Pad Latch Timing Select To enable this bit, the DEFE bit in the display unit extensional function control register m (DEFERm) should be set to 1. In the initial state, this bit is fixed to 0. 0: A signal of the input pad is latched at the DCLKIN rising edge. 1: A signal of the input pad is latched at the DCLKIN falling edge. Electrical characteristics do not apply.
28 to 21	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
20	DSEC	0	R/W	Available	Display Data Endian Change For details on data swapping, see section 21.4.7, Endian Conversion. 0: Display data on memory is not swapped in byte or word units. 1: Display data on memory is swapped in byte or word units.
19 to 17	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
16	IUPD	0	R/W	Not available	<p>Internal Updating Disable</p> <p>When DRES = 1, internal register updating occurs regardless of this bit setting.</p> <p>For details on internal updating, see section 21.2 (2), Internal Update.</p> <p>0: Internal register updating occurs for each vertical synchronous signal (VSYNC) assertion.</p> <p>1: If this bit is set to 1, internal register updating does not occur.</p> <ul style="list-style-type: none"> <li>If this bit is set to 0, register updating occurs according to the next vertical synchronous signal (VSYNC).</li> <li>This bit is shared by DU0 and DU1.</li> </ul>
15 to 10	—	—	R	—	<p>Reserved</p> <p>The read value is undefined. The write value should always be 0.</p>
9	DRES	1	R/W	Not available	Display Reset
8	DEN	0	R/W	Available	<p>Display Enable</p> <p>00: Display synchronous operation starts.</p> <p>If any register has not been set yet, the display unit may perform unexpected operation, thus set DRES to 0 after setting all registers in the display unit.</p> <p>For DEN = 0, the display data becomes values set with the display off mode output register n (DOORn).</p> <p>01: Display synchronous operation starts.</p> <p>If any register has not been set yet, the display unit may perform unexpected operation, thus set DRES = 0, DEN = 1 after setting all registers in the display unit.</p> <p>To re-set DRES to 1 following the start of operations for synchronization of the display with this setting, proceed with steps 1 and 2 in section 21.6.2, Transition to Module Standby Mode before doing so.</p> <p>For DEN = 1, the display data becomes values stored on the unified memory from the next frame.</p> <p>10: Display operation stops.</p> <p>Display operation and synchronization operation stop. The set values except for the following bits in the display unit status register n (DSSRn) are retained. In this setting, the following operations occur:</p> <ol style="list-style-type: none"> <li>All 0s are output as display data.</li> <li>The following bits of the display unit status register n (DSSRn) are cleared to 0: <ul style="list-style-type: none"> <li>TV synchronization signal error flag (TVR and TVR1)</li> <li>Frame flag (FRM and FRM1)</li> <li>Vertical blanking flag (VBK and VBK1)</li> <li>Raster interrupt flag (RINT and RINT1)</li> <li>Horizontal blanking flag (HBK and HBK1)</li> </ul> </li> <li>HSYNC, VSYNC, and ODDF pins function as inputs.</li> </ol> <p>However, the ODDF pin functions as a CLAMP output when the ODPM bit in the display unit mode register m (DSMRm) is 1.</p> <p>11: Setting prohibited</p> <ul style="list-style-type: none"> <li>This bit is shared by DU0 and DU1.</li> </ul>

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
7, 6	TVM	10	R/W	Not available	<p>TV Synchronized Mode</p> <p>00: Master Mode HSYNC, VSYNC, and CSYNC are output.</p> <p>01: The switching mode of synchronous mode is set. Use this mode if necessary when switching from TV synchronized mode to master mode or vice versa is performed. In this mode, display operation forcibly stops and the DISP pin outputs the low level. Moreover, clock supply to DCLKIN can be stopped (input invalid) (the inside of the LSI is fixed to the high level). The EXHSYNC, EXVSYNC, and EXODDF pins are used as input pins.</p> <p>10: TV synchronized mode EXHSYNC, EXVSYNC, and EXODDF are input. When the ODPM bit in the display unit mode register m (DSMRm) is set to 1, the ODDF pin functions as an output pin.</p> <p>11: Setting prohibited</p>
5, 4	SCM	00	R/W	Not available	<p>Scan Mode</p> <p>00: Non-interlaced mode</p> <p>01: Setting prohibited</p> <p>10: Interlace sync mode</p> <p>11: Interlace sync &amp; video mode</p>
3 to 0	—	—	R	—	<p>Reserved</p> <p>The read value is undefined. The write value should always be 0.</p>

Note: m = 0 and 2, n = 0 to 2 for RZ/G1H.  
m = 0, n = 0 and 1 for RZ/G1M/N/E.

**21.3.1.2 Display Unit System Control Register 1 (DSYSR1)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Address: DU1: H'FEB3 0000

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
9	RINT	0	R	Not available	<p>Raster Interrupt Flag</p> <p>0: Indicates the period from the time when the RINT bit is cleared by the DRES bit of the display unit system control register 0 (DSYSR0) or by the RICL bit of the display unit status register clear register 0 (DSRCR0) to the time when the period of the rasters set in the raster interrupt offset register 0 (RINTOFSR0) has elapsed after the beginning of the next field display.</p> <p>1: Indicates the period from the time when the period of the rasters set in the raster interrupt offset register 0 (RINTOFSR0) has elapsed after the beginning of the next field display after the RINT bit is cleared by the DRES or RICL bit, to the time when the RINT bit is cleared again.</p>
8	HBK	0	R	Not available	<p>Horizontal Blanking Flag</p> <p>0: Indicates the period from the time when the HBK bit is cleared by the DRES bit of the display unit system control register 0 (DSYSR0) or by the HBCL bit of the display unit status register clear register 0 (DSRCR0) to the time of the next HSYNC assertion.</p> <p>1: Indicates the period from the start of the first horizontal blanking period after the HBK bit is cleared by the DRES or HBCL bit, to the time when the HBK bit is cleared again.</p>
7	ADC8	0	R	Not available	<p>Auto Rendering Display Change Flag 8</p> <p>0: Indicates that the frame buffer for plane 8 has not been switched.</p> <p>1: Indicates that the frame buffer for plane 8 has been switched. The ADC8 bit state is held until it is cleared.</p>
6	ADC7	0	R	Not available	<p>Auto Rendering Display Change Flag 7</p> <p>0: Indicates that the frame buffer for plane 7 has not been switched.</p> <p>1: Indicates that the frame buffer for plane 7 has been switched. The ADC7 bit state is held until it is cleared.</p>
5	ADC6	0	R	Not available	<p>Auto Rendering Display Change Flag 6</p> <p>0: Indicates that the frame buffer for plane 6 has not been switched.</p> <p>1: Indicates that the frame buffer for plane 6 has been switched. The ADC6 bit state is held until it is cleared.</p>
4	ADC5	0	R	Not available	<p>Auto Rendering Display Change Flag 5</p> <p>0: Indicates that the frame buffer for plane 5 has not been switched.</p> <p>1: Indicates that the frame buffer for plane 5 has been switched. The ADC5 bit state is held until it is cleared.</p>
3	ADC4	0	R	Not available	<p>Auto Rendering Display Change Flag 4</p> <p>0: Indicates that the frame buffer for plane 4 has not been switched.</p> <p>1: Indicates that the frame buffer for plane 4 has been switched. The ADC4 bit state is held until it is cleared.</p>
2	ADC3	0	R	Not available	<p>Auto Rendering Display Change Flag 3</p> <p>0: Indicates that the frame buffer for plane 3 has not been switched.</p> <p>1: Indicates that the frame buffer for plane 3 has been switched. The ADC3 bit state is held until it is cleared.</p>
1	ADC2	0	R	Not available	<p>Auto Rendering Display Change Flag 2</p> <p>0: Indicates that the frame buffer for plane 2 has not been switched.</p> <p>1: Indicates that the frame buffer for plane 2 has been switched. The ADC2 bit state is held until it is cleared.</p>

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
0	ADC1	0	R	Not available	Auto Rendering Display Change Flag 1 0: Indicates that the frame buffer for plane 1 has not been switched. 1: Indicates that the frame buffer for plane 1 has been switched. The ADC1 bit state is held until it is cleared.

Note: m = 0. suffix "m" as register name is only for RZ/G1H.  
n = 1 to 8.

- Description of the ADC bits

For animation, although the display of moving images can be performed in auto rendering mode, at this time

1. A check for a TRAP interrupt proceeds,
2. A check for a VBK interrupt proceeds, and
3. Rendering starts after a VBK interrupt has occurred, so two rounds of flag checking are required before this.

With these flag bits (ADC), an ADC interrupt is generated after a single flag check, and rendering can then start.

The display unit interrupt enable register 2 (DIER2) allows the generation of interrupts for the CPU by aspects of the internal state of the display unit as reflected in bits of the display unit status register 2 (DSSR2) as the sources. When a bit of this register is set, setting of the bit in the same position within the DSSR2 will lead to the generation of an interrupt for the CPU.

For conditions for issuing an interrupt to the CPU from the display unit, see section 21.3.1.10, Display Unit Interrupt Enable Register 0 (DIER0).

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 16	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
15	TVE	0	R/W	Not available	TV Synchronization Signal Error Flag Interrupt Enable 0: Disables the TVR flag interrupt of the display unit status register 2 (DSSR2). 1: Enables the TVR flag interrupt of the display unit status register 2 (DSSR2).
14	FRE	0	R/W	Not available	Frame Flag Interrupt Enable 0: Disables the FRM flag interrupt of the display unit status register 2 (DSSR2). 1: Enables the FRM flag interrupt of the display unit status register 2 (DSSR2).
13	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
12	BUE	0	R/W	Not available	Buffer Underflow Flag Interrupt Enable Set the DEFE8 bit in the display unit extensional function control 8 register 2 (DEF8R2) to 1 to enable bit 12. In the initial state, bit 12 is fixed to 0. 0: Disables the BUF flag interrupt of the display unit status register 2 (DSSR2). 1: Enables the BUF flag interrupt of the display unit status register 2 (DSSR2).

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
11	VBE	0	R/W	Not available	Vertical Blanking Flag Interrupt Enable 0: Disables the VBK flag interrupt of the display unit status register 2 (DSSR2). 1: Enables the VBK flag interrupt of the display unit status register 2 (DSSR2).
10	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
9	RIE	0	R/W	Not available	Raster Interrupt Flag Interrupt Enable 0: Disables the RINT flag interrupt of the display unit status register 2 (DSSR2). 1: Enables the RINT flag interrupt of the display unit status register 2 (DSSR2).
8	HBE	0	R/W	Not available	HBK Flag Interrupt Enable 0: Disables the HBK flag interrupt of the display unit status register 2 (DSSR2). 1: Enables the HBK flag interrupt of the display unit status register 2 (DSSR2).
7 to 0	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 16	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
15	TVR	0	R	Not available	TV Synchronization Error Flag 0: Indicates that, after the TVR bit is cleared with the DRES bit of the display unit system control register 0 (DSYSR0) or the TVCL bit of the display unit domain 1 status register clear register 0 (DD1SRCR0), the EXVSYNC rising edge is detected every time within the vertical cycle determined with the setting of the vertical cycle register 0 (VCR0). 1: Indicates that, in TV synchronized mode, the EXVSYNC rising edge was not detected within the vertical cycle determined with the setting of the vertical cycle register 0 (VCR0). The TVR bit retains its status until it is cleared with the DRES or TVCL bit.
14	FRM	0	R	Not available	Frame Flag 0: Indicates the period from the time when the FRM bit is cleared by the DRES bit of the display unit system control register 0 (DSYSR0) or by the FRCL bit of the display unit domain 1 status register clear register 0 (DD1SRCR0) to the time when display of the next field is completed in the non-interlaced mode, or when display of the next even field is completed in interlace sync mode or interlace sync & video mode. 1: Indicates the period (in units of frames) from the start of the vertical blanking period of the first even field after the FRM bit is cleared by the DRES or FRCL bit, to the time when the FRM bit is cleared again.
13	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
12	BUF	0	R	Not available	Buffer Underflow Flag Set the DEFE8 bit in the display unit extensional function control 8 register m (DEF8Rm*) to 1 to enable bit 12. In the initial state, bit 12 is fixed to 0. 0: The buffer underflow has not occurred. 1: The buffer underflow has occurred.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
11	VBK	0	R	Not available	<p>Vertical Blanking Flag</p> <p>0: Indicates the period from the time when the VBK bit is cleared by the DRES bit of the display unit system control register 0 (DSYSR0) or by the VBCL bit of the display unit domain 1 status register clear register 0 (DD1SRCR0) to the time when display of the next field is completed.</p> <p>1: Indicates the period (in units of fields) from the start of the first vertical blanking period after the VBK bit is cleared by the DRES or VBCL bit, to the time when the VBK bit is cleared again.</p>
10	—	—	R	—	<p>Reserved</p> <p>The read value is undefined. The write value should always be 0.</p>
9	RINT	0	R	Not available	<p>Raster Interrupt Flag</p> <p>0: Indicates the period from the time when the RINT bit is cleared by the DRES bit of the display unit system control register 0 (DSYSR0) or by the RICL bit of the display unit domain 1 status register clear register 0 (DD1SRCR0) to the time when the period of the rasters set in the raster interrupt offset register 0 (RINTOFSR0) has elapsed after the beginning of the next field display.</p> <p>1: Indicates the period from the time when the period of the rasters set in the raster interrupt offset register 0 (RINTOFSR0) has elapsed after the beginning of the next field display after the RINT bit is cleared by the DRES or RICL bit, to the time when the RINT bit is cleared again.</p>
8	HBK	0	R	Not available	<p>Horizontal Blanking Flag</p> <p>0: Indicates the period from the time when the HBK bit is cleared by the DRES bit of the display unit system control register 0 (DSYSR0) or by the HBCL bit of the display unit domain 1 status register clear register 0 (DD1SRCR0) to the time of the next HSYNC assertion.</p> <p>1: Indicates the period from the start of the first horizontal blanking period after the HBK bit is cleared by the DRES or HBCL bit, to the time when the HBK bit is cleared again.</p>
7	ADC8	0	R	Not available	<p>Auto Rendering Display Change Flag 8</p> <p>0: Indicates that the frame buffer for plane 8 has not been switched.</p> <p>1: Indicates that the frame buffer for plane 8 has been switched. The ADC8 bit state is held until it is cleared.</p>
6	ADC7	0	R	Not available	<p>Auto Rendering Display Change Flag 7</p> <p>0: Indicates that the frame buffer for plane 7 has not been switched.</p> <p>1: Indicates that the frame buffer for plane 7 has been switched. The ADC7 bit state is held until it is cleared.</p>
5	ADC6	0	R	Not available	<p>Auto Rendering Display Change Flag 6</p> <p>0: Indicates that the frame buffer for plane 6 has not been switched.</p> <p>1: Indicates that the frame buffer for plane 6 has been switched. The ADC6 bit state is held until it is cleared.</p>
4	ADC5	0	R	Not available	<p>Auto Rendering Display Change Flag 5</p> <p>0: Indicates that the frame buffer for plane 5 has not been switched.</p> <p>1: Indicates that the frame buffer for plane 5 has been switched. The ADC5 bit state is held until it is cleared.</p>

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
3	ADC4	0	R	Not available	Auto Rendering Display Change Flag 4 0: Indicates that the frame buffer for plane 4 has not been switched. 1: Indicates that the frame buffer for plane 4 has been switched. The ADC4 bit state is held until it is cleared.
2	ADC3	0	R	Not available	Auto Rendering Display Change Flag 3 0: Indicates that the frame buffer for plane 3 has not been switched. 1: Indicates that the frame buffer for plane 3 has been switched. The ADC3 bit state is held until it is cleared.
1	ADC2	0	R	Not available	Auto Rendering Display Change Flag 2 0: Indicates that the frame buffer for plane 2 has not been switched. 1: Indicates that the frame buffer for plane 2 has been switched. The ADC2 bit state is held until it is cleared.
0	ADC1	0	R	Not available	Auto Rendering Display Change Flag 1 0: Indicates that the frame buffer for plane 1 has not been switched. 1: Indicates that the frame buffer for plane 1 has been switched. The ADC1 bit state is held until it is cleared.

Note: \* m = 0. suffix "m" as register name is only for RZ/G1H.

- Defines the order of planes in image composition and turns the display of planes on or off
- When the DPRS bit in the display unit output route control register m (DORCRm\*) is 0, the display of planes from among planes 1 to 8 for which display is enabled is switched on.
- This register can only be used to set the priority order for superposition processor m. To use superposition processor 1, set the DPRS bit in the display unit output route control register m (DORCRm\*) to 1 and make other settings as required in the display superimpose 1 priority register.
- After setting a desired value in a register listed in section 21.3.4, Display Plane Registers (Alpha Plane Registers), set the corresponding bit in the DPPRm (bit 31, 27, 23, 19, 15, 11, 7, or 3) to 1.

Note: \* m = 0 and 2, suffix "m" is only for RZ/G1H.

R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W*	R/W*	R	R	R/W*	R/W*

Note: \* For reserved bit (bit name: —), initial value is undefined, writing is not available and writing value should be specified. For details, refer to following table.

This register is used to adjust the latency of two display data items output from the DU0 and DU1 when two image data items are output from the DU pins on both edges (rising and falling edges) of the output dot clock. This register should not be changed from its initial value when the DR0D bit in the display unit output route control register m (DORCRm, m = 0) is 0. When the DR0D bit is set to 1 (when two image data items are output from the DU pins on both edges of the output dot clock), set the necessary bits in this register to 1. Suffix "m" as register name is only for RZ/G1H.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 16	CODE	—	—/W	Not available	DDLTRm Enabling Code (register available code) For a value written to DDLTRm to be effective, the value must include H'7766 in these bits.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 10	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
9 to 0	HDS	—	R/W	Available	Horizontal Display Start To enable bit 9, set the DEFE5 bit in the display unit extensional function control 5 register m (DEF5Rm) to 1. In the initial state, bit 9 cannot be written to. These bits are used to set the horizontal display start position in dot clock units. The set value is retained at a reset.

### 21.3.2.2 Horizontal Display End Register n (HDERn)

Address: DU0: H'FEB0 0044, DU1: H'FEB3 0044 DU2: H'FEB4 0044

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	HDE											
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 12	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
11 to 0	HDE	—	R/W	Available	Horizontal Display End To enable bit 11, set the DEFE5 bit in the display unit extensional function control 5 register m (DEF5Rm) to 1. In the initial state, bit 11 cannot be written to. These bits are used to set the horizontal display end position in dot clock units. The set value is retained at a reset.

### 21.3.2.3 Vertical Display Start Register n (VDSRn)

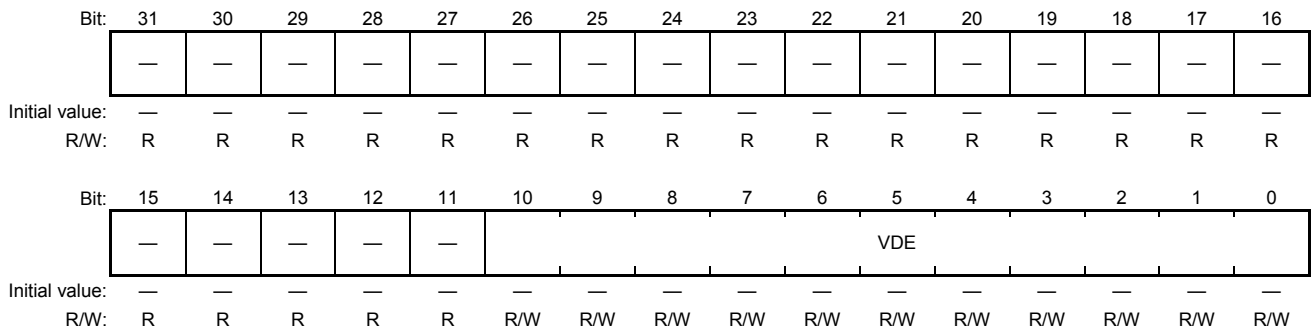

Address: DU0: H'FEB0 0048, DU1: H'FEB3 0048, DU2: H'FEB4 0048

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	VDS								
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 9	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
8 to 0	VDS	—	R/W	Available	Vertical Display Start These bits are used to set the vertical display start position in raster line units. The set value is retained at a reset.

**21.3.2.4 Vertical Display End Register n (VDERn)**

Address: DU0: H'FEB0 004C, DU1: H'FEB3 004C, DU2: H'FEB4 004C

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 11	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
10 to 0	VDE	—	R/W	Available	Vertical Display End To enable bit 10, set the DEFE5 bit in the display unit extensional function control 5 register m (DEF5Rm) to 1. In the initial state, bit 10 cannot be written to. These bits are used to set the vertical display end position in raster line units. The set value is retained at a reset.

### 21.3.2.5 Horizontal Cycle Register n (HCRn)

Address: DU0: H'FEB0 0050, DU1: H'FEB3 0050, DU2: H'FEB4 0050

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	HC											
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 12	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
11 to 0	HC	—	R/W	Available	Horizontal Cycle To enable bit 11, set the DEFE5 bit in the display unit extensional function control 5 register m (DEF5Rm) to 1. In the initial state, bit 11 cannot be written to. These bits are used to set one horizontal scan cycle including the horizontal blanking period in dot clock units. In TV synchronized mode, set this register so that the HSYNC cycle set with this register is equal to or greater than the EXHSYNC cycle. The set value is retained at a reset.

### 21.3.2.6 Horizontal Sync Width Register n (HSWRn)

Address: DU0: H'FEB0 0054, DU1: H'FEB3 0054, DU2: H'FEB4 0054

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	HSW								
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 9	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
8 to 0	HSW	—	R/W	Available	Horizontal Sync Width These bits are used to set the low-level pulse width of the horizontal synchronous signal in dot clock units. The set value is retained at a reset.

### 21.3.2.7 Vertical Cycle Register n (VCRn)

Address: DU0: H'FEB0 0058, DU1: H'FEB3 0058, DU2: H'FEB4 0058

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	VC										
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 11	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
10 to 0	VC	—	R/W	Available	Vertical Cycle To enable bit 10, set the DEFE5 bit in the display unit extensional function control 5 register m (DEF5Rm) to 1. In the initial state, bit 10 cannot be written to. These bits are used to set the vertical scan cycle including the vertical blanking period in raster line units. In TV synchronized mode, set the time limit of the EXVSYNC rising edge detection. If the EXVSYNC rising edge is not detected within the time limit, the result is reflected in bit 15 of the display unit status register n (DSSRn). The set value is retained at a reset.

### 21.3.2.8 Vertical Sync Point Register n (VSPRn)

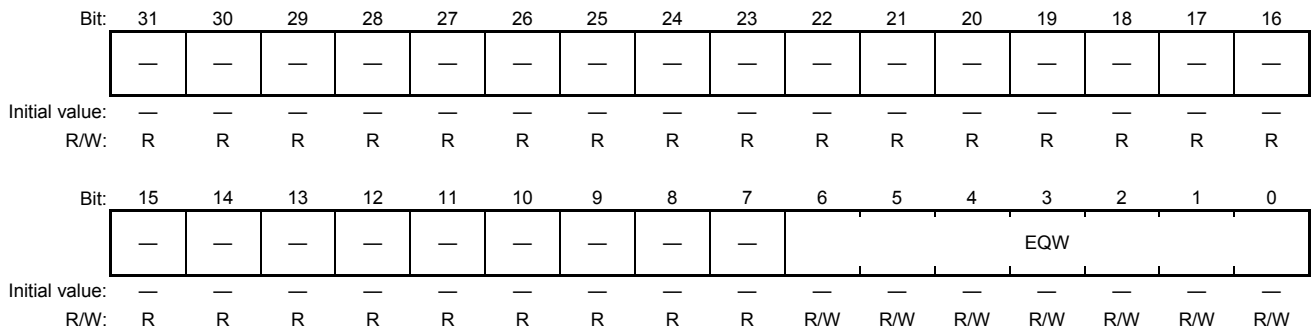

Address: DU0: H'FEB0 005C, DU1: H'FEB3 005C, DU2: H'FEB4 005C

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	VSP										
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 11	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
10 to 0	VSP	—	R/W	Available	Vertical Sync Point To enable bit 10, set the DEFE5 bit in the display unit extensional function control 5 register m (DEF5Rm) to 1. In the initial state, bit 10 cannot be written to. These bits are used to set the vertical synchronous signal start position in raster line units. In TV synchronized mode, set this register so that the VSYNC falling edge setting position set with this register is the same as or comes after that of the EXVSYNC falling edge. The set value is retained at a reset.

**21.3.2.9 Equal Pulse Width Register n (EQWRn)**

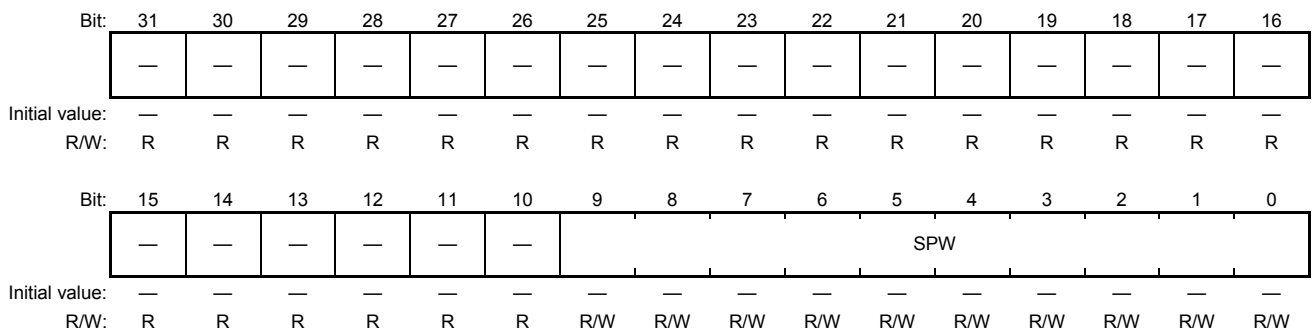

Address: DU0: H'FEB0 0060, DU1: H'FEB3 0060, DU2: H'FEB4 0060

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 7	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
6 to 0	EQW	—	R/W	Available	Equal Pulse Width These bits are used to set the low-level equalizing pulse width of the CSYNC signal in dot clock units. To validate this setting, set bit 7 in the display unit mode register n (DSMRn)/CSYNC mode (CSY) to 1. The set value is retained at a reset.

**21.3.2.10 Serration Width Register n (SPWRn)**

Address: DU0: H'FEB0 0064, DU1: H'FEB3 0064, DU2: H'FEB4 0064

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 10	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
9 to 0	SPW	—	R/W	Available	Serration Width These bits are used to set the low-level serration pulse width of the CSYNC signal in dot clock units. Set a value smaller than 1/2 of HC. To validate this setting, set bit 7 in the display unit mode register n (DSMRn)/CSYNC mode (CSY) to 1. The set value is retained at a reset.

**21.3.2.11 CLAMP Signal Start Register n (CLAMPSRn)**

Address: DU0: H'FEB0 0070, DU1: H'FEB3 0070, DU2: H'FEB4 0070

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	CLAMPS											
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 12	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
11 to 0	CLAMPS	—	R/W	Available	<p>CLAMP Signal Start</p> <p>To enable bit 11, set the DEFE5 bit in the display unit extensional function control 5 register m (DEF5Rm) to 1. In the initial state, bit 11 cannot be written to.</p> <p>These bits are used to set the CLAMP signal rising edge position in dot clock units, using as the reference the HSYNC signal falling edge.</p> <p>The CLAMP signal rises (setting value + 1) cycle after the HSYNC signal falls. Therefore, the CLAMP signal cannot rise in the same cycle as the HSYNC signal falling edge.</p> <p>The set value is retained at a reset.</p>

**21.3.2.12 CLAMP Signal Width Register n (CLAMPWRn)**

Address: DU0: H'FEB0 0074, DU1: H'FEB3 0074, DU2: H'FEB4 0074

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
	—	—	—	—	CLAMPW												—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 12	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
11 to 0	CLAMPW	—	R/W	Available	<p>CLAMP Signal Width</p> <p>To enable bit 11, set the DEFE5 bit in the display unit extensional function control 5 register m (DEF5Rm) to 1. In the initial state, bit 11 cannot be written to.</p> <p>These bits are used to set the high-level width of the CLAMP signal in dot clock units.</p> <p>When the CLAMP signal is high, if the HSYNC signal falls, the CLAMP signal falls.</p> <p>The set value is retained at a reset.</p>

**21.3.2.13 DE Signal Start Register n (DESRn)**

Address: DU0: H'FEB0 0078, DU1: H'FEB3 0078, DU2: H'FEB4 0078

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 12	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
11 to 0	DES	—	R/W	Available	<p>DE Signal Start</p> <p>To enable bit 11, set the DEFE5 bit in the display unit extensional function control 5 register m (DEF5Rm) to 1. In the initial state, bit 11 cannot be written to.</p> <p>These bits are used to set the DE signal rising edge position in dot clock units, using as the reference the HSYNC signal falling edge.</p> <p>The DE signal rises (setting value + 1) cycle after the HSYNC signal falls. Therefore, the DE signal cannot rise in the same cycle as the HSYNC signal falling edge.</p> <p>During a vertical blanking period, the DE signal is fixed to the low level.</p> <p>The set value is retained at a reset.</p>

**21.3.2.14 DE Signal Width Register n (DEWRn)**

Address: DU0: H'FEB0 007C, DU1: H'FEB3 007C, DU2: H'FEB4 007C

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	DEW											
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 12	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
11 to 0	DEW	—	R/W	Available	DE Signal Width To enable bit 11, set the DEFE5 bit in the display unit extensional function control 5 register m (DEF5Rm) to 1. In the initial state, bit 11 cannot be written to. These bits are used to set the high-level width of the DE signal in dot clock units. When the DE signal is high, if the HSYNC signal falls, the DE signal falls. The set value is retained at a reset.

### 21.3.3 Display Attribute Registers

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Note: All registers in section 21.3.3 are common to RZ/G1H, M, N and E.

In section 21.3.3, n = 0 to 2 for RZ/G1H, 0 and 1 for RZ/G1M/N/E. Without instructions in particular, m = 0 and 2, suffix "m" as register name and DU2 are only for RZ/G1H.

#### 21.3.3.1 Color Palette 1 Transparent Color Register m (CP1TRm, m = 0 and 2)

Address: DU0: H'FEB0 0080, DU2: H'FEB4 0080

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CP1IF	CP1IE	CP1ID	CP1IC	CP1IB	CP1IA	CP1I9	CP1I8	CP1I7	CP1I6	CP1I5	CP1I4	CP1I3	CP1I2	CP1I1	CP1I0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 16	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
15	CP1IF	0	R/W	Available	Color Palette 1 Index F This bit is used to specify the color palette 1 transparent color. 0: Does not set the color of the color palette 1 index F to the transparent color. 1: Sets the color of the color palette 1 index F to the transparent color.
14	CP1IE	0	R/W	Available	Color Palette 1 Index E This bit is used to specify the color palette 1 transparent color. 0: Does not set the color of the color palette 1 index E to the transparent color. 1: Sets the color of the color palette 1 index E to the transparent color.
13	CP1ID	0	R/W	Available	Color Palette 1 Index D This bit is used to specify the color palette 1 transparent color. 0: Does not set the color of the color palette 1 index D to the transparent color. 1: Sets the color of the color palette 1 index D to the transparent color.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
12	CP1IC	0	R/W	Available	<p>Color Palette 1 Index C</p> <p>This bit is used to specify the color palette 1 transparent color.</p> <p>0: Does not set the color of the color palette 1 index C to the transparent color.</p> <p>1: Sets the color of the color palette 1 index C to the transparent color.</p>
11	CP1IB	0	R/W	Available	<p>Color Palette 1 Index B</p> <p>This bit is used to specify the color palette 1 transparent color.</p> <p>0: Does not set the color of the color palette 1 index B to the transparent color.</p> <p>1: Sets the color of the color palette 1 index B to the transparent color.</p>
10	CP1IA	0	R/W	Available	<p>Color Palette 1 Index A</p> <p>This bit is used to specify the color palette 1 transparent color.</p> <p>0: Does not set the color of the color palette 1 index A to the transparent color.</p> <p>1: Sets the color of the color palette 1 index A to the transparent color.</p>
9	CP1I9	0	R/W	Available	<p>Color Palette 1 Index 9</p> <p>This bit is used to specify the color palette 1 transparent color.</p> <p>0: Does not set the color of the color palette 1 index 9 to the transparent color.</p> <p>1: Sets the color of the color palette 1 index 9 to the transparent color.</p>
8	CP1I8	0	R/W	Available	<p>Color Palette 1 Index 8</p> <p>This bit is used to specify the color palette 1 transparent color.</p> <p>0: Does not set the color of the color palette 1 index 8 to the transparent color.</p> <p>1: Sets the color of the color palette 1 index 8 to the transparent color.</p>

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 16	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
15	CP3IF	0	R/W	Available	Color Palette 3 Index F This bit is used to specify the color palette 3 transparent color. 0: Does not set the color of the color palette 3 index F to the transparent color. 1: Sets the color of the color palette 3 index F to the transparent color.
14	CP3IE	0	R/W	Available	Color Palette 3 Index E This bit is used to specify the color palette 3 transparent color. 0: Does not set the color of the color palette 3 index E to the transparent color. 1: Sets the color of the color palette 3 index E to the transparent color.
13	CP3ID	0	R/W	Available	Color Palette 3 Index D This bit is used to specify the color palette 3 transparent color. 0: Does not set the color of the color palette 3 index D to the transparent color. 1: Sets the color of the color palette 3 index D to the transparent color.
12	CP3IC	0	R/W	Available	Color Palette 3 Index C This bit is used to specify the color palette 3 transparent color. 0: Does not set the color of the color palette 3 index C to the transparent color. 1: Sets the color of the color palette 3 index C to the transparent color.
11	CP3IB	0	R/W	Available	Color Palette 3 Index B This bit is used to specify the color palette 3 transparent color. 0: Does not set the color of the color palette 3 index B to the transparent color. 1: Sets the color of the color palette 3 index B to the transparent color.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
10	CP3IA	0	R/W	Available	Color Palette 3 Index A This bit is used to specify the color palette 3 transparent color. 0: Does not set the color of the color palette 3 index A to the transparent color. 1: Sets the color of the color palette 3 index A to the transparent color.
9	CP3I9	0	R/W	Available	Color Palette 3 Index 9 This bit is used to specify the color palette 3 transparent color. 0: Does not set the color of the color palette 3 index 9 to the transparent color. 1: Sets the color of the color palette 3 index 9 to the transparent color.
8	CP3I8	0	R/W	Available	Color Palette 3 Index 8 This bit is used to specify the color palette 3 transparent color. 0: Does not set the color of the color palette 3 index 8 to the transparent color. 1: Sets the color of the color palette 3 index 8 to the transparent color.
7	CP3I7	0	R/W	Available	Color Palette 3 Index 7 This bit is used to specify the color palette 3 transparent color. 0: Does not set the color of the color palette 3 index 7 to the transparent color. 1: Sets the color of the color palette 3 index 7 to the transparent color.
6	CP3I6	0	R/W	Available	Color Palette 3 Index 6 This bit is used to specify the color palette 3 transparent color. 0: Does not set the color of the color palette 3 index 6 to the transparent color. 1: Sets the color of the color palette 3 index 6 to the transparent color.
5	CP3I5	0	R/W	Available	Color Palette 3 Index 5 This bit is used to specify the color palette 3 transparent color. 0: Does not set the color of the color palette 3 index 5 to the transparent color. 1: Sets the color of the color palette 3 index 5 to the transparent color.
4	CP3I4	0	R/W	Available	Color Palette 3 Index 4 This bit is used to specify the color palette 3 transparent color. 0: Does not set the color of the color palette 3 index 4 to the transparent color. 1: Sets the color of the color palette 3 index 4 to the transparent color.
3	CP3I3	0	R/W	Available	Color Palette 3 Index 3 This bit is used to specify the color palette 3 transparent color. 0: Does not set the color of the color palette 3 index 3 to the transparent color. 1: Sets the color of the color palette 3 index 3 to the transparent color.
2	CP3I2	0	R/W	Available	Color Palette 3 Index 2 This bit is used to specify the color palette 3 transparent color. 0: Does not set the color of the color palette 3 index 2 to the transparent color. 1: Sets the color of the color palette 3 index 2 to the transparent color.

---

<b>Bit</b>	<b>Bit Name</b>	<b>Initial Value</b>	<b>R/W</b>	<b>Internal Update</b>	<b>Description</b>
1	CP3I1	0	R/W	Available	Color Palette 3 Index 1 This bit is used to specify the color palette 3 transparent color. 0: Does not set the color of the color palette 3 index 1 to the transparent color. 1: Sets the color of the color palette 3 index 1 to the transparent color.
0	CP3I0	0	R/W	Available	Color Palette 3 Index 0 This bit is used to specify the color palette 3 transparent color. 0: Does not set the color of the color palette 3 index 0 to the transparent color. 1: Sets the color of the color palette 3 index 0 to the transparent color.

### 21.3.3.5 Display Off Mode Output Register n (DOORn)

Address: DU0: H'FEB0 0090, DU1: H'FEB3 0090, DU2: H'FEB4 0090

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	DOR						—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DOG						—	—	DOB						—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R

The three registers are for the respective channels and have the same functions.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 24	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
23 to 18	DOR	—	R/W	Available	Display Off Mode Output Red These bits are used to set the red display data to be output when the display is off (DRES and DEN bits in the display unit system control register m (DSYSRm *) are B'00). The set value is retained at a reset.
17, 16	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
15 to 10	DOG	—	R/W	Available	Display Off Mode Output Green These bits are used to set the green display data to be output when the display is off (DRES and DEN bits in the display unit system control register m (DSYSRm *) are B'00). The set value is retained at a reset.
9, 8	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
7 to 2	DOB	—	R/W	Available	Display Off Mode Output Blue These bits are used to set the blue display data to be output when the display is off (DRES and DEN bits in the display unit system control register m (DSYSRm *) are B'00). The set value is retained at a reset.
1, 0	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.

Note: m = 0 and 2 for RZ/G1H, m = 0 for RZ/G1M/N/E.

### 21.3.3.6 Color Detection Register n (CDERn)

Address: DU0: H'FEB0 0094, DU1: H'FEB3 0094, DU2: H'FEB4 0094

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	CDR						—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CDG						—	—	CDB						—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R

The three registers are for the respective channels and have the same functions.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 24	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
23 to 18	CDR	—	R/W	Available	Color Detection Red These bits are used to set the red data for color detection. The set value is retained at a reset.
17, 16	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
15 to 10	CDG	—	R/W	Available	Color Detection Green These bits are used to set the green data for color detection. The set value is retained at a reset.
9, 8	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
7 to 2	CDB	—	R/W	Available	Color Detection Blue These bits are used to set the blue data for color detection. The set value is retained at a reset.
1, 0	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.

Note: When output data matches the setting value of this register, the high level is output from the CDE pin. For details about the output color data format, see section 21.4.6, Data Formats for Output and Display Capture.

### 21.3.3.7 Background Plane Output Register n (BPORn)

Address: DU0: H'FEB0 0098, DU1: H'FEB3 0098, DU2: H'FEB4 0098

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	BPOR						—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BPOG						—	—	BPOB						—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R

The three registers are for the respective channels and have the same functions.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 24	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
23 to 18	BPOR	—	R/W	Available	Background Plane Output Red These bits are used to set the red color to be displayed if no plane to be displayed exists due to a display size, transparent color, and so on. The set value is retained at a reset.
17, 16	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
15 to 10	BPOG	—	R/W	Available	Background Plane Output Green These bits are used to set the green color to be displayed if no plane to be displayed exists due to a display size, transparent color, and so on. The set value is retained at a reset.
9, 8	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
7 to 2	BPOB	—	R/W	Available	Background Plane Output Blue These bits are used to set the blue color to be displayed if no plane to be displayed exists due to a display size, transparent color, and so on. The set value is retained at a reset.
1, 0	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.

### 21.3.3.8 Raster Interrupt Offset Register n (RINTOFSRn)

Address: DU0: H'FEB0 009C, DU1: H'FEB3 009C, DU2: H'FEB4 009C

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
	—	—	—	—	—	RINTOFS											—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	

The three registers are for the respective channels and have the same functions.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 11	—	—	R	—	Reserved
10 to 0	RINTOFS	—	R/W	Available	<p>Raster Interrupt Offset</p> <p>To enable bit 10, set the DEFE5 bit in the display unit extensional function control 5 register m (DEF5Rm) to 1. In the initial state, bit 10 cannot be written to.</p> <p>These bits are used to set the raster offset value (number of Hs) that is based on the number of rasters set with the vertical display start register n (VD5SRn).</p> <p>If the offset value is assumed to be n, bit 9 in the display unit status register n (D5SSRn) is set to 1 at the HSYNC falling edge after the horizontal display period of (VDS + n-th raster).</p> <p>The set value is retained at a reset.</p>

Note: n = 0 to 2 for RZ/G1H, n = 0 and 1 for RZ/G1M/N/E.

### 21.3.4 Display Plane Registers (Alpha Plane Registers)

In descriptions of registers that are common to planes 1 to 8, the planes are generically referred to as plane n. The meanings of characters m, n, and # are given below.

m: Indicates the display unit channel number (0 or 2). (RZ/G1H only)

n: 1 to 8

#: Replaces n (in hexadecimal) in addresses. For example, address H'FEB00#00 for the plane 3 mode register corresponds to H'FEB00300.

Descriptions of the registers for the alpha-ratio planes are also given in this section, because a given register for the alpha-ratio planes has almost the same functionality as the corresponding register for the display planes.

#### Register names:

The names of corresponding registers for the alpha-ratio planes start with the string "Alpha".

#### Abbreviation:

Abbreviations of the names of corresponding registers for the alpha-ratio planes start with "A".

For alpha plane registers, n is given as follows;

n: 1, 2

#### Address:

The addresses of registers for the alpha-ratio planes are given to the right of the address information for the corresponding display-plane registers (# = 1, 2).

The plane n memory width register (PnMWR) for the alpha-ratio planes, for example, is the alpha plane n memory width register (APnMWR).

The alpha plane n mode register (APnMR) is described separately because its functionality differs from that of a plane n mode register (PnMR).

### 21.3.4.1 Plane n Mode Register m (PnMRm, m = 0 and 2)

Note: Suffix "m" as register name and DU2 are only for RZ/G1H.

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Address: DU0: H'FEB00#00, DU2: H'FEB40#00 (for alpha-ratio planes; refer to section 21.3.4.24, Alpha Plane n Mode Register m (APnMRm, m = 0 and 2))

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	PnVISL		—	—	—	—	—	PnYCDF	—	—	PnTC	PnWAE
Initial value:	—	—	—	—	0	0	—	—	—	—	—	0	—	—	0	0
R/W:	R	R	R	R	R/W	R/W	R	R	R	R	R	R/W	R	R	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	PnSPIIM			—	PnCPSL			PnDC	—	PnBM		—	—	PnDDF	
Initial value:	—	0	0	0	—	0	0	0	0	—	0	0	—	—	0	0
R/W:	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R	R/W	R/W	R	R	R/W	R/W

Note: \* For reserved bit (bit name: —), initial value is undefined, writing is not available and writing value should be specified. For details of bit description, refer to following table.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 28	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
27, 26	PnVISL	00	R/W	Available	Plane n Video Input Select To enable these bits, set the DEFE bit in the display unit extensional function control register m/0 (DEFRm/DEFR0*) to 1. In the initial state, these bits cannot be set to 1. 00: Video input 0 (VIN0) is selected. 01: Video input 1 (VIN1) is selected. 10: Video input 2 (VIN2) is selected. [RZ/G1H/M/N] Setting prohibited [RZ/G1E] 11: Video input 3 (VIN3) is selected. [RZ/G1H] Setting prohibited [RZ/G1M/N/E] Note: * DEFR0 is for RZ/G1M/N/E
25 to 21	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
20	PnYCDF	0	R/W	Available	Plane n YC Data Format 0: Sets the alignment of YC data to UYVY format. 1: Sets the alignment of YC data to YUYV format.
19, 18	—	—	R	—	Reserved The setting is invalid when an 8-bit/pixel display has not been selected.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
17	PnTC	0	R/W	Available	<p>Plane n Transparent Color</p> <p>0: When an 8-bit/pixel display has been selected, the transparent color is that indicated by the value of PnTC1Rm</p> <p>1: When an 8-bit/pixel display has been selected, the transparent color is that indicated by the value of CPT1Rm to CPT4Rm</p> <p>The setting is invalid when an 8-bit/pixel display has not been selected. For details, refer to section 21.4.9 (2), Transparent Colors.</p>
16	PnWAE	0	R/W	Available	<p>Plane n Wrap-Around Enable</p> <p>0: Wrapping-around for plane n is disabled.</p> <p>1: Wrapping-around for plane n is enabled.</p>
15	—	—	R	—	<p>Reserved</p> <p>The read value is undefined. The write value should always be 0.</p>
14 to 12	PnSPIM	000	R/W	Available	<p>Plane n Super Impose Mode</p> <p>000: Transparent color processing is performed for plane n. When plane n is in the transparent color, the lower plane is displayed.</p> <p>001: <math>\alpha</math> blending of plane n and the lower plane is performed. When plane n is the transparent color, <math>\alpha</math> blending is not performed, and the lower plane is displayed.</p> <p>010: An EOR operation is performed on plane n and the lower plane. When plane n is the transparent color the EOR operation is not performed, and the lower plane is displayed.</p> <p>011: Setting prohibited</p> <p>100: Transparent color processing is not performed for plane n. Plane n is displayed.</p> <p>101: <math>\alpha</math> blending of plane n and the lower plane is performed. The transparent color specification for plane n is ignored, and <math>\alpha</math> blending is performed between all the pixels of plane n and the lower plane.</p> <p>110: An EOR operation is performed on plane n and the lower plane. The transparent color specification for plane n is ignored, and EOR operation is performed on all the pixels of plane n and the lower plane.</p> <p>111: Setting prohibited</p> <p>Transparent color processing for YC data is not possible.</p> <p>Transparent color processing is not possible when the PnLRGB1 bit or PnLRGB0 bit in the plane n display data control register m (PnDDCRm) specifies 32-bit/pixel data. Transparent color processing is possible when 32-bit/pixel data is specified by plane n display data control 4 register m (PnDDC4Rm).</p>
11	—	—	R	—	<p>Reserved</p> <p>The read value is undefined. The write value should always be 0.</p>

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
10 to 8	PnCPSL	000	R/W	Available	<p>Plane n Color Palette Select</p> <p>These bits indicate whether the color palette is to be used when the value of the PnDDF bits is B'00 (i.e. the plane n display data format is 8-bit/pixel).</p> <p>000: Use color palette 1  001: Use color palette 2  010: Use color palette 3  011: Use color palette 4  100: Setting prohibited  101: Setting prohibited  110: Setting prohibited  111: Setting prohibited</p>
7	PnDC	0	R/W	Available	<p>Plane n Display Area Change</p> <p>0: In manual display change mode, switching of the frame buffer is not performed.  1: In manual display change mode, switching of the frame buffer is performed.  When the PnDC bit is 0, bit setting is possible.  Switching is performed in frame units.  After frame buffer switching (after vertical blanking detection), this bit is cleared to 0.</p>
6	—	—	R	—	<p>Reserved</p> <p>The read value is undefined. The write value should always be 0.</p>
5, 4	PnBM	00	R/W	Available	<p>Plane n Buffer Mode</p> <p>00: Manual display change mode  01: Auto rendering mode  10: Auto display change mode (blinking mode)  11: Video capture mode</p> <p>In manual display change mode, auto rendering mode, or auto display change mode (blinking mode), double-buffering control is performed using addresses 0 and 1, respectively indicated by the PnDSA0 and PnDSA1 bits in PnDSA0Rm and PnDSA1Rm. In video capture mode, triple-buffering control is performed using addresses 0 to 2 indicated by bits 31 to 26 of the display unit status register m/0 (DSSRm/DSSR0*) or the display unit video capture status register m (DVCSRm).</p> <p>Note: * DSSR0 is for RZ/G1M/N/E</p>
3, 2	—	—	R	—	<p>Reserved</p> <p>The read value is undefined. The write value should always be 0.</p>
1, 0	PnDDF	00	R/W	Available	<p>Plane n Display Data Format</p> <p>00: 8-bit/pixel  01: 16-bit/pixel  10: ARGB (ARGB1555)  11: YC (YUV422 is converted to RGB888). For RZ/G1M, N and E, when bits 9 and 8 in the Display Unit Extensional Function Control Register n (DEFRn) are set to B'10 or B'11, conversion to RGB888 is not performed. (n = 1)</p> <p>In the case of 32-bit/pixel data, set these bits to B'01.</p>

**21.3.4.2 Plane n Memory Width Register m (PnMWRm, m = 0 and 2)**

Note: Suffix "m" as register name and DU2 are only for RZ/G1H.

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Address: DU0: H'FEB00#04, DU2: H'FEB40#04 (Alpha ratio plane address: DU0: H'FEB0A#04, DU2: H'FEB4A#04)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

0	PnSPBY	0	R/W	Available	Plane n Byte Swap Enable  This bit is used in combination with bit 4 to control swapping of data in byte (8-bit) units.  The following combinations of values are possible when bit 20 of DSYSRn is 0. (n = 0 to 2 for RZ/G1H ;0 and 1 for RZ/G1M/N/E) 00: Data are not swapped. 01: Data are not swapped. 10: Data are swapped in byte (8-bit) units if the value of the PnDDF bits in PnMRm is 00 or 11. In other cases, data are not swapped. 11: Data are swapped in byte (8-bit) units.

Note: The settings of bit 20 (DSEC) of the display unit system control register n (DSYSRn), the PnDDF bit of the plane n mode register m(PnMRm), and this register are listed with their results below (n = 0 to 2 for RZ/G1H ;0 and 1 for RZ/G1M/N/E).

All combinations of the values of the bits in PnSWAPRm, the DSEC bit in DSYSRn, and the PnDDF bits in PnMRm are shown below.

**Table 21.25 Summary of Endian Conversion**

DSEC	PnSPQW	PnSPLW	PnSPWD	PnSPBY	PnDIGN	PnDDF	Data Format	Swap Unit	
1	—	—	—	—	—	00	8-bit/pixel	128 bits in byte units	
						01	16-bit/pixel (RGB data)	128 bits in word units	
						10	ARGB	128 bits in word units	
						11	YC	128 bits in byte units	
0	0	0	0	0	—	—	—	No conversion	
						1	—	64 bits units	
	—	1	—	—	—	—	—	—	32 bits units
							—	1	—
	—	—	—	1	0	—	00	8-bit/pixel	8 bits units
							01	16-bit/pixel (RGB data)	No conversion
							10	ARGB	No conversion
							11	YC	8 bits units
	1	—	—	—	—	—	—	8 bits units	

### 21.3.4.21 Plane n Display Data Control Register m (PnDDCRm, m = 0 and 2)

Note: Suffix "m" as register name and DU2 are only for RZ/G1H.

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Address: DU0: H'FEB00#84, DU2: H'FEB40#84 (unused for the alpha-ratio planes)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CODE															
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	Pn LRGB1	Pn LRGB0	—	—	—	—	—	—	—	—	—	—
Initial value:	—	—	—	—	0	0	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R/W	R/W	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 16	CODE	—	—/W	Not available	PnDDCRm Enabling Code (register available code) For a value written to PnDDCRm to be effective, the value must include H'7775 in these bits.
15 to 12	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
11	PnLRGB1	0	R/W	Available	Plane n 32-bit/pixel display control 1 (Plane n Long (32 bits) RGB1) 0: Data are not handled as 32-bit/pixel (ARGB8888). 1: Data in the plane are used as the lower-order bits (G: 8 bits and B: 8 bits) of 32-bit/pixel data (ARGB8888). When a 32-bit/pixel display is specified with this bit, the following restrictions apply. When specifying a 32-bit/pixel display with the PnEDF bits in plane n display data control 4 register m (PnDDC4Rm), refer to the description of the PnEDF bits. Only ARGB8888 can be specified for 32-bit/pixel data. This bit must be set for plane n after setting of bit 10 for plane n-1 to 1. For example, if bit 10 of P1DDCRm is set to 1, bit 11 of P2DDCRm must be set to 1. The value of the PnDDF bits in PnMRm must be 01. Do not set bits 11 and 10 to 1 at the same time. When bit 10 is set to 1, data are handled as 32-bit/pixel even if bit 11 is set to 0, and thus the function that bit 10 is set to 1 is realized. Since transparent color processing is not possible with 32-bit/pixel data, set the PnSPIM bit in PnMRm to 1. $\alpha$ blending or EOR operations for 32-bit/pixel data and a lower plane must be performed in an area where the lower plane exists. If there is no lower plane, display of 32-bit/pixel data will not be possible after $\alpha$ blending or an EOR operation.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
10	PnLRGB0	0	R/W	Available	<p>Plane n Long (32 Bits) RGB 0</p> <p>0: Data are not handled as 32-bit/pixel (ARGB8888).</p> <p>1: Data in the plane are used as the higher-order bits (A: 8 bits and R: 8 bits) of 32-bit/pixel data (ARGB8888).</p> <p>When a 32-bit/pixel display is specified with this bit, the following restrictions apply. When specifying a 32-bit/pixel display with the PnEDF bits in plane n display data control 4 register m (PnDDC4Rm), refer to the description of the PnEDF bits.</p> <p>Only ARGB8888 can be specified for 32-bit/pixel data.</p> <p>The value of A (8 bits) will be used as the alpha ratio. This means that the alpha ratio selected in the plane n blending ratio register m (PnALPHARm) is invalid.</p> <p>Also, the value of the PnDDF bits in PnMRm must be B'01. Use planes 1 and 2 for a 32-bit/pixel display. Do not set bits 11 and 10 to 1 at the same time.</p> <p>When bit 11 is set to 1, data are handled as 32-bit/pixel even if bit 10 is set to 0, and thus the function that bit 11 is set to 1 is realized.</p> <p>Since transparent color processing is not possible with 32-bit/pixel data, set the PnSPIM bit in PnMRm to 1.</p> <p><math>\alpha</math> blending or EOR operations for 32-bit/pixel data and a lower plane must be performed in an area where the lower plane exists. If there is no lower plane, display of 32-bit/pixel data will not be possible after <math>\alpha</math> blending or an EOR operation.</p>
9 to 0	—	—	R	—	<p>Reserved</p> <p>The read value is undefined. The write value should always be 0.</p>

Use planes 1 and 2 if the display is to have 32-bit/pixel. In this display unit, a 32-bit/pixel display by a single plane is possible. For a 32-bit/pixel display using a single plane, refer to the description of the PnEDF bits in plane n display data control 4 register m (PnDDC4Rm). Register settings for using planes 1 and 2 in a 32-bit/pixel display are given below. Note that the setting of (d) shown below must be made at the last. All other settings can be made in any order.

- (a) Set the LRUO bit in display unit extensional function control 4 register m (DEF4Rm) to 1.  
 (b) The settings for this register are shown below.

Bit:	15	14	13	12	11	10	9	8
					PnLRGB1 PnLRGB0			
Plane 1 (A, R)	—	—	—	—	0	1	—	—
Plane 2 (G, B)	—	—	—	—	1	0	—	—

- (c) The same settings should be made in the plane 1 and plane 2 registers of display plane registers other than this register.
- (d) Turn on the display of planes 1 and 2, and give plane 2 the next order of priority for processing after plane 1. For details on turning on the display, see section 21.4.2, Display On/Off.
- (e) A 32-bit/pixel display should always be specified in lower-numbered planes. For example, when the 32- and 16-bit/pixel display planes are to be superimposed, the 32-bit/pixel display should be specified in planes 1 and 2, and the 16-bit/pixel display should be specified in plane 3 or in higher-numbered planes.
- (f) When the video input module is to be used, refer to the specifications for the video input module.
- (g) If the DU operates in big-endian, set bits 3 and 2 in the plane n swap control register m (PnSWAPRm) to 1 and bits 1 and 0 to 0. Bit 4 may be set to either 1 or 0. Set bit 20 in the display system control register n (DSYSRn) to 0 (n = 0 to 2 for RZ/G1H ;0 and 1 for RZ/G1M/N/E).

### 21.3.4.22 Plane n Display Data Control 2 Register m (PnDDC2Rm, m = 0 and 2)

Note: Suffix "m" as register name and DU2 are only for RZ/G1H.

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Address: DU0: H'FEB00#88, DU2: H'FEB40#88 (unused for the alpha-ratio planes)

2 to 0	PnEDF	000	R/W	Available	<p>Plane n Extensional Data Format</p> <p>000: The data format will be determined by the PnDDF bits in PnMRm, the PnLRGB1 or PnLRGB0 bit in PnDDCRm, or the PnDIVU or PnDIVY bit in PnDDC2Rm.</p> <p>001: ARGB8888</p> <p>010: RGB888</p> <p>011: RGB666</p> <p>100: Setting prohibited</p> <p>101: Setting prohibited</p> <p>110: Setting prohibited</p> <p>111: Setting prohibited</p> <p>This data format cannot be used for alpha-ratio planes.</p> <p>If the DU operates in big-endian, set bits 3 and 2 in PnSWAPRm to 1 and bits 1 and 0 to 0. Bit 4 may be set to either 1 or 0. Set bit 20 in DSYSRn to 0 (n = 0 to 2 for RZ/G1H; 0 and 1 for RZ/G1M/N/E).</p>

### 21.3.4.24 Alpha-ratio Plane n Mode Register m (APnMRm, m = 0 and 2)

Note: Suffix "m" as register name and DU2 are only for RZ/G1H.

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Address: DU0: H'FEB0A#00, DU2: H'FEB4A#00

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PnWAE
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	PnDC	—	PnBM	—	—	—	—	—
Initial value:	—	—	—	—	—	—	—	—	0	—	0	0	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R/W	R	R/W	R/W	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 17	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
16	PnWAE	0	R/W	Available	Plane n Wrap-Around Enable 0: Wrapping-around for plane n is disabled. 1: Wrapping-around for plane n is enabled.
15 to 8	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
7	PnDC	0	R/W	Available	Plane n Display Area Change 0: In manual display change mode, switching of the frame buffer is not performed. 1: In manual display change mode, switching of the frame buffer is performed. When the PnDC bit is 0, bit setting is possible. Switching is performed in frame units. After frame buffer switching (after vertical blanking detection), this bit is cleared to 0.
6	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
5, 4	PnBM	00	R/W	Available	Plane n Buffer Mode 00: Manual display change mode 01: Setting prohibited 10: Auto display change mode (blinking mode) 11: Setting prohibited In manual display change mode or auto display change mode (blinking mode), double-buffering control is performed using addresses 0 and 1, respectively indicated by the PnDSA0 and PnDSA1 bits in PnDSA0Rm and PnDSA1Rm.
3 to 0	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.

The functions of the plane n mode register m(PnMRm) are partially unavailable in the alpha-ratio plane n mode register m(APnMRm) because the functions of the planes dedicated to the  $\alpha$  value are limited more than those of the display planes. The following bits are unavailable, and thus absent.

Bit 20 (PnYCDF) is absent because the display data format is fixed to 8-bit/pixel.

Bit 17 (PnTC) is absent because the alpha ratios cannot be treated as a transparent color.

Bits 14 to 12 (PnSPIM) are absent because superpositioning is not available.

Bits 10 to 8 (PnCPSL) are absent because the use of a color palette is not possible.

Bits 1 and 0 (PnDDF) are absent because the display data format is fixed to 8-bit/pixel.

### 21.3.5 Display Capture Registers

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Note: All registers in section 21.3.5 are common to RZ/G1H, M, N and E. Suffix "m" as register name and DU2 are only for RZ/G1H.

In descriptions that are common to display capture units 1 and 2, the display capture units are generically referred to as display capture n. This meaning of character n and the meaning of # are given below.

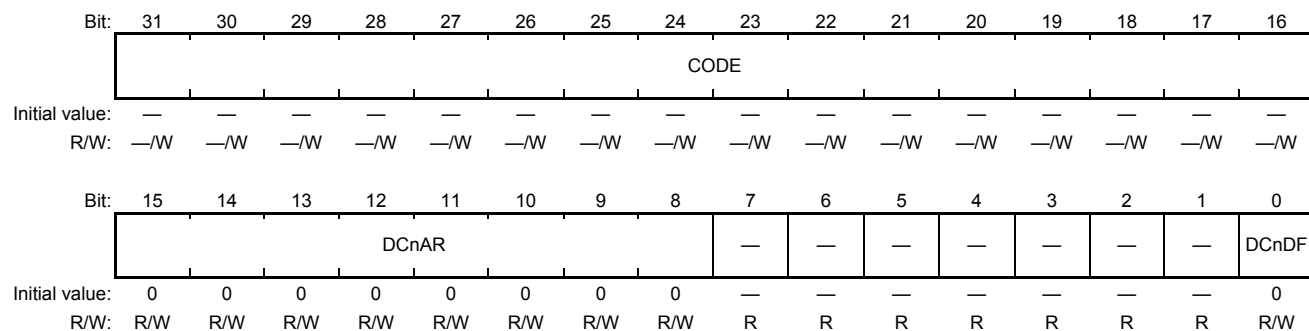

m: Indicates the display unit channel number (0 and 2). (RZ/G1H only)

n: no number or 2 (m = 2 and n = 2 as register name not exist)

#: Corresponds to n but represents a hexadecimal digit in an address. For example, address H'FEBC#04 for the capture 1 memory width register corresponds to H'FEBC104.

#### 21.3.5.1 Display Capture n Mode Register m (DCnMRm, m = 0 and 2)

Address: DU0: H'FEBC#00, DU2: H'FEBC#00

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 16	CODE	—	—/W	Not available	DCnMRm Enabling Code (register available code) For a value written to DCnMRm to be effective, the value must include H'7790 in these bits.
15 to 8	DCnAR	0	R/W	Available	Display Capture n Alpha Ratio This bit is effective when bit 0 in this register is set to 1.
7 to 1	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
0	DCnDF	0	R/W	Available	Display Capture n Data Format 0: The data format is determined by bits 5 and 4 in DCPCRm. 1: The data format is ARGB8888. The "A" value is specified by bits 15 to 8 in this register.

### 21.3.5.2 Display Capture n Memory Width Register m (DCnMWRm, m = 0 and 2)

Address: DU0: H'FEB0C#04, DU2: H'FEB4C#04

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	DCnMWX								—	—	—	—	
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 13	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
12 to 4	DCnMWX	—	R/W	Available	Display Capture n Memory Width X Select the memory width for display capture n to a value between 16 and 4096 pixels, in 16-pixel units. When the width of captured data exceeds this size, the excess data will not be captured. The value is retained during a reset.
3 to 0	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.

### 21.3.5.3 Display Capture n Area Start Address Register m (DCnSARm, m = 0 and 2)

Address: DU0: H'FEB0C#20, DU2: H'FEB4C#20

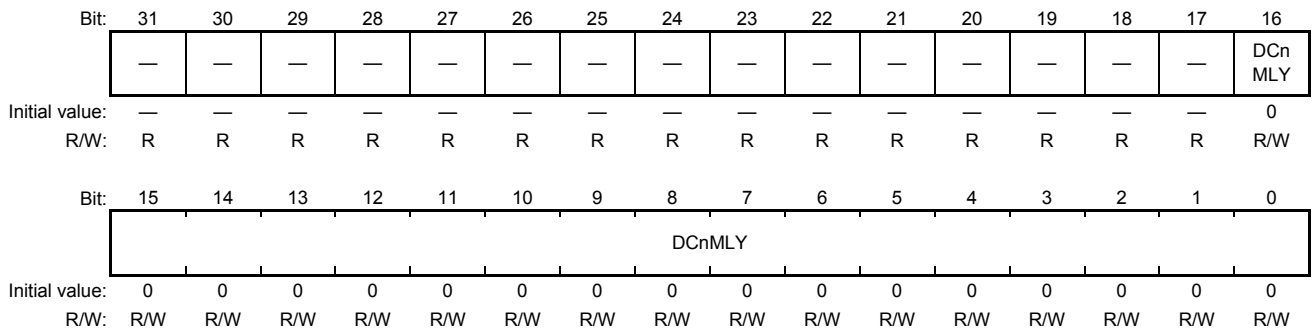

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DCnSA															
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DCnSA												—	—	—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 4	DCnSA	—	R/W	Available	Display Capture n Area Start Address To enable bits 31 to 29, the DEFE bit in DEFRm/DEFRO* must be set to 1. In the initial state, these bits are not enabled. The value is retained during a reset. Note: * DEFRO is for RZ/G1M/N/E
3 to 0	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.

**21.3.5.4 Display Capture n Memory Length Register m (DCnMLRm, m = 0 and 2)**

Address: DU0: H'FEB0C#50, DU2: H'FEB4C#50

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 17	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
16 to 0	DCnMLY	H'0 0000	R/W	Available	Display Capture n Memory Length Y Select the memory length (Y-direction memory area) for display capture n. When the value of these bits is 0 (default), the size is unlimited.

### 21.3.6 Color Palette Registers

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Note: All registers in section 21.3.6 are common to RZ/G1H, M, N and E. Suffix "m" as register name and DU2 are only for RZ/G1H.

#### 21.3.6.1 Color Palette 1 (000 to 255) Register m (CP1\_000Rm to CP1\_255Rm, m = 0 and 2)

Address: DU0: H'FEB01000 to H'FEB013FC, DU2: H'FEB41000 to H'FEB413FC

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 24	CP1_000A to CP1_255A	—	R/W	Available	Color Palette 1_000 to 255 Blending Ratio When the PnBRSLS bits in PnALPHARm are B'10, the value is the alpha ratio, which is the $\alpha$ blending ratio. The value is retained during a reset.
23 to 18	CP1_000R to CP1_255R	—	R/W	Available	Color Palette 1_000 to 255 Red Red-color data of color palette 1. The value is retained during a reset.
17, 16	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
15 to 10	CP1_000G to CP1_255G	—	R/W	Available	Color Palette 1_000 to 255 Green Green-color data of color palette 1. The value is retained during a reset.
9, 8	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
7 to 2	CP1_000B to CP1_255B	—	R/W	Available	Color Palette 1_000 to 255 Blue Blue-color data of color palette 1. The value is retained during a reset.
1, 0	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.

- Notes:
1. CP1\_000R to CP1\_255R form a group of 256 registers in which six bits are set for each of the R, G, and B components of a color, setting up the color palette of 256 colors from among the 262 thousand colors for display. The values are valid for 8-bit/pixel data display.  
After the CP1CE bit in CPCRm has been set to 1, settings for CP1\_000R to CP1\_255R become effective on the next falling edge of VSYNC (timing of an internal update) or when the display is reset. When you update the color palette, rewrite the entire palette. Reading of the color palette by the CPU must proceed before the CP1CE bit has been set to 1. The color palette is accessible in longword units.
  2. m = 0 and 2, suffix "m" is only for RZ/G1H.

### 21.3.6.2 Color Palette 2 (000 to 255) Register m (CP2\_000Rm to CP2\_255Rm, m = 0 and 2)

Address: DU0: H'FEB02000 to H'FEB023FC, DU2: H'FEB42000 to H'FEB423FC

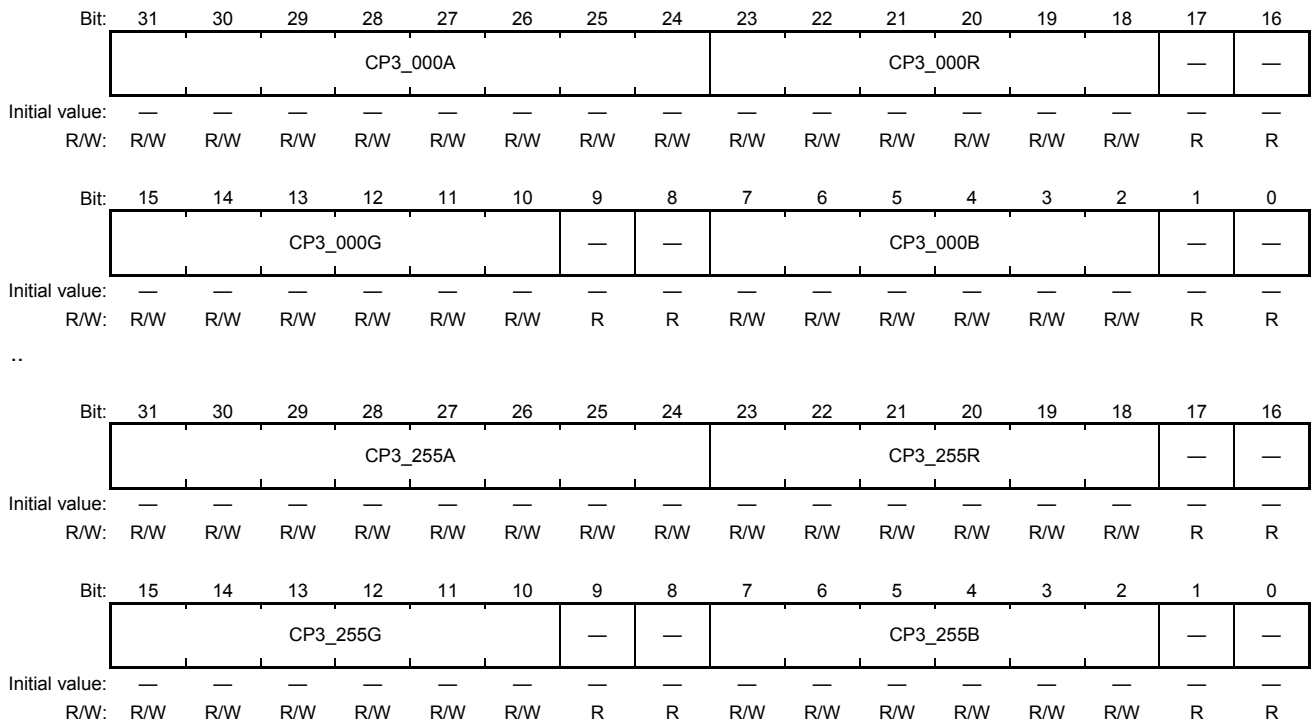

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 24	CP2_000A to CP2_255A	—	R/W	Available	Color Palette 2_000 to 255 Blending Ratio When the PnBRSL bits in PnALPHARm are B'10, the value is the alpha ratio, which is the $\alpha$ blending ratio. The value is retained during a reset.
23 to 18	CP2_000R to CP2_255R	—	R/W	Available	Color Palette 2_000 to 255 Red Red-color data of color palette 2. The value is retained during a reset.
17, 16	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
15 to 10	CP2_000G to CP2_255G	—	R/W	Available	Color Palette 2_000 to 255 Green Green-color data of color palette 2. The value is retained during a reset.
9, 8	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
7 to 2	CP2_000B to CP2_255B	—	R/W	Available	Color Palette 2_000 to 255 Blue Blue-color data of color palette 2. The value is retained during a reset.
1, 0	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.

- Notes: 1. CP2\_000R to CP2\_255R form a group of 256 registers in which six bits are set for each of the R, G, and B components of a color, setting up the color palette of 256 colors from among the 262 thousand colors for display. The values are valid for 8-bit/pixel data display.  
After the CP2CE bit in CPCRM has been set to 1, settings for CP2\_000R to CP2\_255R become effective on the next falling edge of VSYNC (timing of an internal update) or when the display is reset. When you update the color palette, rewrite the entire palette. Reading of the color palette by the CPU must proceed before the CP2CE bit has been set to 1. The color palette is accessible in longword units.
2. m = 0 and 2, suffix "m" is only for RZ/G1H.

**21.3.6.3 Color Palette 3 (000 to 255) Register m (CP3\_000Rm to CP3\_255Rm, m = 0 and 2)**

Address: DU0: H'FEB03000 to H'FEB033FC, DU2: H'FEB43000 to H'FEB433FC

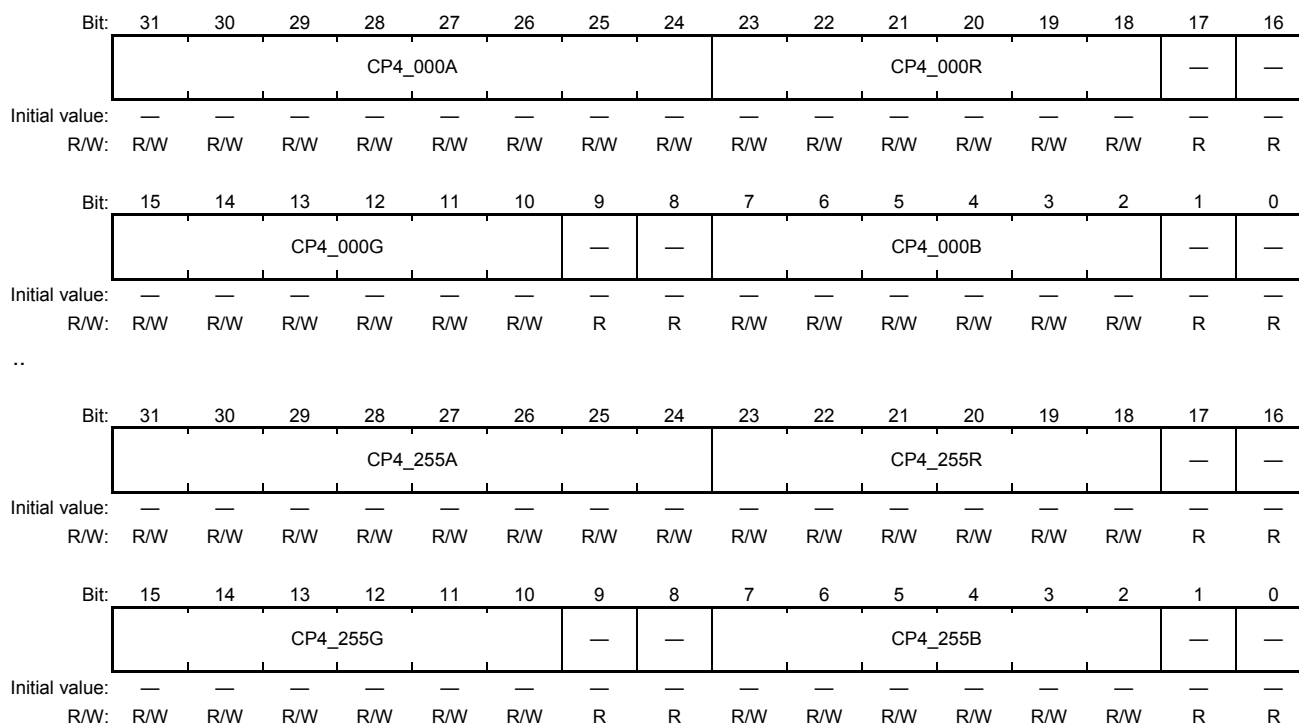

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 24	CP3_000A to CP3_255A	—	R/W	Available	Color Palette 3_000 to 255 Blending Ratio When the PnBRSL bits in PnALPHARm are B'10, the value is the alpha ratio, which is the α blending ratio. The value is retained during a reset.
23 to 18	CP3_000R to CP3_255R	—	R/W	Available	Color Palette 3_000 to 255 Red Red-color data of color palette 3. The value is retained during a reset.
17, 16	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
15 to 10	CP3_000G to CP3_255G	—	R/W	Available	Color Palette 3_000 to 255 Green Green-color data of color palette 3. The value is retained during a reset.
9, 8	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
7 to 2	CP3_000B to CP3_255B	—	R/W	Available	Color Palette 3_000 to 255 Blue Blue-color data of color palette 3. The value is retained during a reset.
1, 0	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.

- Notes:
- CP3\_000R to CP3\_255R form a group of 256 registers in which six bits are set for each of the R, G, and B components of a color, setting up the color palette of 256 colors from among the 262 thousand colors for display. The values are valid for 8-bit/pixel data display.  
After the CP3CE bit in CPCRm has been set to 1, settings for CP3\_000R to CP3\_255R become effective on the next falling edge of VSYNC (timing of an internal update) or when the display is reset. When you update the color palette, rewrite the entire palette. Reading of the color palette by the CPU must proceed before the CP3CE bit has been set to 1. The color palette is accessible in longword units.
  - m = 0 and 2, suffix "m" is only for RZ/G1H.

### 21.3.6.4 Color Palette 4 (000 to 255) Register m (CP4\_000Rm to CP4\_255Rm, m = 0 and 2)

Address: DU0: H'FEB04000 to H'FEB043FC, DU2: H'FEB44000 to H'FEB443FC

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 24	CP4_000A to CP4_255A	—	R/W	Available	Color Palette 4_000 to 255 Blending Ratio When the PnBRSL bits in PnALPHARm are B'10, the value is the alpha ratio, which is the $\alpha$ blending ratio. The value is retained during a reset.
23 to 18	CP4_000R to CP4_255R	—	R/W	Available	Color Palette 4_000 to 255 Red Red-color data of color palette 4. The value is retained during a reset.
17, 16	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
15 to 10	CP4_000G to CP4_255G	—	R/W	Available	Color Palette 4_000 to 255 Green Green-color data of color palette 4. The value is retained during a reset.
9, 8	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
7 to 2	CP4_000B to CP4_255B	—	R/W	Available	Color Palette 4_000 to 255 Blue Blue-color data of color palette 4. The value is retained during a reset.
1, 0	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.

- Notes:
- CP4\_000R to CP4\_255R form a group of 256 registers in which six bits are set for each of the R, G, and B components of a color, setting up the color palette of 256 colors from among the 262 thousand colors for display. The values are valid for 8-bit/pixel data display.  
After the CP4CE bit in CPCRm has been set to 1, settings for CP4\_000R to CP4\_255R become effective on the next falling edge of VSYNC (timing of an internal update) or when the display is reset. When you update the color palette, rewrite the entire palette. Reading of the color palette by the CPU must proceed before the CP4CE bit has been set to 1. The color palette is accessible in longword units.
  - m = 0 and 2, suffix "m" is only for RZ/G1H.

### 21.3.7 External Synchronization Control Registers

The three sets of external synchronization control registers are for the respective channels and have the same functions; they are described as one here.

In section 21.3.7, n = 0 to 2 for RZ/G1H, 0 and 1 for RZ/G1M/N/E. DU2 is only for RZ/G1H.

#### 21.3.7.1 External Synchronization Control Register n (ESCRn)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Address: DU0: H'FEB10000, DU1: H'FEB31000, DU2: H'FEB50000[Only RZ/G1H]

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	DCKOINV	—/DCKOSEL*	—	—	—	DCLKSEL	—	—	—	DCLKDIS
Initial value:	—	—	—	—	—	—	0	—/0*	—	—	—	0	—	—	—	0
R/W:	R	R	R	R	R	R	R/W	R/W*	R	R	R	R/W	R	R	R	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	SYNCSEL		—	—	FRQSEL					
Initial value:	—	—	—	—	—	—	0	0	—	—	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Note: \* Value of reserved bit (bit name: —) is undefined. For details of bit description, refer to following table.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 26	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
25	DCKOINV	0	R/W	Not available	DCLKOUT Invert To enable this bit, set the DEFE bit in the display unit extensional function control register m*1 (DEFRm*1) to 1. In the initial state, this bit is fixed to 0. 0: DCLKOUT is output in normal phase. 1: DCLKOUT is output in counter phase.
24	—	—	R	—	Reserved [RZ/G1H] The read value is undefined. The write value should always be 0.
	DCKOSEL	0	R/W	Not available	Output Dot Clock Select (DCLKOUT Select) [RZ/G1M/N/E] To enable this bit, set DEFE to 1 in the display unit extensional function control register 0 (DEFR0). In the initial state, this bit is fixed at 0. Set this bit to 1 to specify display output in YC data format. 0: The DCLKOUT division ratio is determined by bits 5 to 0 in this register. 1: DCLKIN is used as DCLKOUT, regardless of the division ratio.
23 to 21	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
20	DCLKSEL	0	R/W	Not available	DCLKIN Select 0: The input dot clock source is the DCLKIN pin 1: The input dot clock source is the ZX $\phi$ clock. If this setting is made, ensure that the frequency of the input dot clock is divided by two or a greater value (so that the result of dividing the frequency is more than or equal to half the ZX $\phi$ frequency).
19 to 17	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
16	DCLKDIS	0	R/W	Not available	DCLKOUT Disable 0: DCLKOUT is output. 1: DCLKOUT is not output. DCLKOUT is fixed to low level.
15 to 10	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
9, 8	SYNCSEL	00	R/W	Not available	SYNC Select 00: Phases are not synchronized 01: Phases are not synchronized 10: Phases are synchronized by using the EXVSYNC signal 11: Phases are synchronized by using the EXHSYNC signal
7, 6	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
5 to 0	FRQSEL	000000	R/W	Not available	<p>Frequency Select</p> <p>To enable bit 5, the DEFE bit in DEFRm*1 must be set to 1. In the initial state, bit 5 is fixed to 0.</p> <p>If frequency division is by an odd number, the duty cycle of the frequency divided dot clock will be below 50%.</p> <p>000000: Frequency division of the input dot clock (clock for division) is not performed.</p> <p>000001: Division by 2 of the input dot clock (clock for division)</p> <p>000010: Division by 3 of the input dot clock (clock for division)</p> <p>000011: Division by 4 of the input dot clock (clock for division)</p> <p>000100: Division by 5 of the input dot clock (clock for division)</p> <p>000101: Division by 6 of the input dot clock (clock for division)</p> <p>000110: Division by 7 of the input dot clock (clock for division)</p> <p>000111: Division by 8 of the input dot clock (clock for division)</p> <p>001000: Division by 9 of the input dot clock (clock for division)</p> <p>001001: Division by 10 of the input dot clock (clock for division)</p> <p>001010: Division by 11 of the input dot clock (clock for division)</p> <p>001011: Division by 12 of the input dot clock (clock for division)</p> <p>001100: Division by 13 of the input dot clock (clock for division)</p> <p>001101: Division by 14 of the input dot clock (clock for division)</p> <p>001110: Division by 15 of the input dot clock (clock for division)</p> <p>001111: Division by 16 of the input dot clock (clock for division)</p> <p>010000: Division by 17 of the input dot clock (clock for division)</p> <p>010001: Division by 18 of the input dot clock (clock for division)</p> <p>010010: Division by 19 of the input dot clock (clock for division)</p> <p>010011: Division by 20 of the input dot clock (clock for division)</p> <p>010100: Division by 21 of the input dot clock (clock for division)</p> <p>010101: Division by 22 of the input dot clock (clock for division)</p> <p>010110: Division by 23 of the input dot clock (clock for division)</p> <p>010111: Division by 24 of the input dot clock (clock for division)</p> <p>011000: Division by 25 of the input dot clock (clock for division)</p> <p>011001: Division by 26 of the input dot clock (clock for division)</p> <p>011010: Division by 27 of the input dot clock (clock for division)</p> <p>011011: Division by 28 of the input dot clock (clock for division)</p> <p>011100: Division by 29 of the input dot clock (clock for division)</p>

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
5 to 0	FRQSEL	000000	R/W	Not available	011101: Division by 30 of the input dot clock (clock for division) 011110: Division by 31 of the input dot clock (clock for division) 011111: Division by 32 of the input dot clock (clock for division) 100000: Division by 33 of the input dot clock (clock for division) 100001: Division by 34 of the input dot clock (clock for division) 100010: Division by 35 of the input dot clock (clock for division) 100011: Division by 36 of the input dot clock (clock for division) 100100: Division by 37 of the input dot clock (clock for division) 100101: Division by 38 of the input dot clock (clock for division) 100110: Division by 39 of the input dot clock (clock for division) 100111: Division by 40 of the input dot clock (clock for division) 101000: Division by 41 of the input dot clock (clock for division) 101001: Division by 42 of the input dot clock (clock for division) 101010: Division by 43 of the input dot clock (clock for division) 101011: Division by 44 of the input dot clock (clock for division) 101100: Division by 45 of the input dot clock (clock for division) 101101: Division by 46 of the input dot clock (clock for division) 101110: Division by 47 of the input dot clock (clock for division) 101111: Division by 48 of the input dot clock (clock for division) 110000: Division by 49 of the input dot clock (clock for division) 110001: Division by 50 of the input dot clock (clock for division) 110010: Division by 51 of the input dot clock (clock for division) 110011: Division by 52 of the input dot clock (clock for division) 110100: Division by 53 of the input dot clock (clock for division) 110101: Division by 54 of the input dot clock (clock for division) 110110: Division by 55 of the input dot clock (clock for division) 110111: Division by 56 of the input dot clock (clock for division) 111000: Division by 57 of the input dot clock (clock for division) 111001: Division by 58 of the input dot clock (clock for division) 111010: Division by 59 of the input dot clock (clock for division) 111011: Division by 60 of the input dot clock (clock for division) 111100: Division by 61 of the input dot clock (clock for division) 111101: Division by 62 of the input dot clock (clock for division) 111110: Division by 63 of the input dot clock (clock for division) 111111: Division by 64 of the input dot clock (clock for division)

Notes: 1. m = 0 and 2 for RZ/G1H, m = 0 for RZ/G1M/N/E.

### 21.3.7.2 Output Signal Timing Adjustment Register n (OTARn)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Address: DU0: H'FEB10004, DU1: H'FEB31004, DU2: H'FEB50004 [Only RZ/G1H]

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

### 21.3.8.6 Display Superimpose 1 Priority Register (DS1PR)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Address: DU1: H'FEB11024

- The setting of this register is valid when the DPRS bit in the display unit output route control register m (DORCRm \*1) is 1.
- After setting a desired value in a register listed in section 21.3.54, Display Plane Registers (Alpha Plane Registers), set DS1PR to the value indicating the plane number (0001 to 1000).

Notes: 1. m = 0 and 2, suffix "m" as register name is only for RZ/G1H.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 28	S1S8	0000	R/W	Available	Display Superimposition 1 Priority 8 Select 0000: Priority level 8 is not used in display generation by superposition processor 1. 0001: Plane 1 has priority level 8 in display generation by superposition processor 1. 0010: Plane 2 has priority level 8 in display generation by superposition processor 1. 0011: Plane 3 has priority level 8 in display generation by superposition processor 1. 0100: Plane 4 has priority level 8 in display generation by superposition processor 1. 0101: Plane 5 has priority level 8 in display generation by superposition processor 1. 0110: Plane 6 has priority level 8 in display generation by superposition processor 1. 0111: Plane 7 has priority level 8 in display generation by superposition processor 1. 1000: Plane 8 has priority level 8 in display generation by superposition processor 1. Others: Setting prohibited

### 21.3.9 YC-RGB Conversion Coefficient Registers

Registers at addresses H'FEB11080 to H'FEB1109C and H'FEB51080\*<sup>1</sup> to H'FEB5109C\*<sup>1</sup> are for the YC→RGB conversion circuit located in the initial stage of the superposition processor in Figure 21.1.

Registers at addresses FEB14080\*<sup>1</sup> to FEB1409C\*<sup>1</sup> and FEB54080\*<sup>1</sup> to FEB5409C\*<sup>1</sup> are for the YC→RGB conversion circuit located in the latter stage of the superposition processor in Figure 21.1

Notes: 1. For RZ/G1H.

#### 21.3.9.1 Y Normalization Coefficient Register m (YNCRm, m = 0 and 2)

Note: Suffix "m" as register name and DU2 are only for RZ/G1H.

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Address: DU0: H'FEB11080, H'FEB14080[RZ/G1H], DU2: H'FEB51080 and H'FEB54080

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	YNC1

R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 28	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
27 to 16	GCBC1	H'2B0	R/W	Available	Green Cb Coefficient 1 Cb is multiplied by this coefficient to create the green component in YC-RGB conversion by the YC-RGB conversion generation by superposition processor 1. The coefficient is a fixed-point 12-bit value. The 11th bit represents the integer one or zero and the 10th to 0th bits represent the value below the fixed point. The default value is 0.336.
15 to 12	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
11 to 0	GCBC0	H'2B0	R/W	Available	Green Cb Coefficient 0 Cb is multiplied by this coefficient to create the green component in YC-RGB conversion by the YC-RGB conversion generation by superposition processors 0 and 2*. The coefficient is a fixed-point 12-bit value. The 11th bit represents the integer one or zero and the 10th to 0th bits represent the value below the fixed point. The default value is 0.336.

Note: \* For RZ/G1H.

### 21.3.9.8 Blue Cb Coefficient Register m (BCBCRm, m = 0 and 2)

Note: Suffix "m" as register name and DU2 are only for RZ/G1H.

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Address: DU0: H'FEB1109C, H'FEB1409C[RZ/G1H], DU2: H'FEB5109C and H'FEB5409C

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	BCBC1											
Initial value:	—	—	—	—	1	1	0	1	1	1	1	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	BCBC0											
Initial value:	—	—	—	—	1	1	0	1	1	1	1	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 28	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
27 to 16	BCBC1	H'DE0	R/W	Available	Blue Cb Coefficient 1 Cb is multiplied by this coefficient to create the blue component in YC-RGB conversion by the YC-RGB conversion generation by superposition processor 1. The coefficient is a fixed-point 12-bit value. The 11th bit represents the integer one or zero and the 10th to 0th bits represent the value below the fixed point. The default value is 1.73.
15 to 12	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
11 to 0	BCBC0	H'DE0	R/W	Available	Blue Cb Coefficient 0 Cb is multiplied by this coefficient to create the blue component in YC-RGB conversion by the YC-RGB conversion generation by superposition processors 0 and 2*. The coefficient is a fixed-point 12-bit value. The 11th bit represents the integer one or zero and the 10th to 0th bits represent the value below the fixed point. The default value is 1.73.

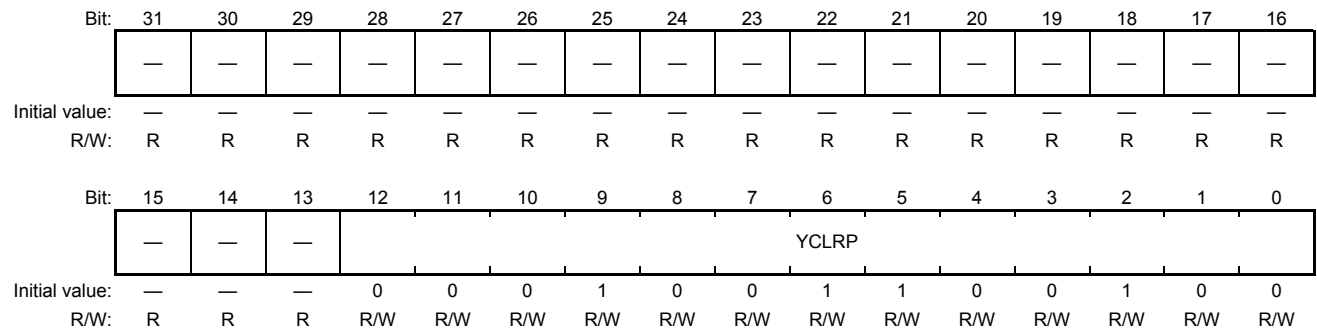

Note: \* For RZ/G1H.

**21.3.10 RGB-YC Conversion Coefficient Registers**

## 21.4 Display Function

RZ/G1H

RZ/G1N

RZ/G1M

RZ/G1E

Note: From section 21.4 on, descriptions of suffixes n and m are provided as the last paragraph or a note for the last table in each subsection.

### 21.4.1 Configuration of Output Screen

The display unit (DU) executes window displays with up to a maximum of eight window layers. Each of these windows is called a "plane", and the order of stacking of the planes can be set arbitrarily. For each plane, display can be turned on and off, and the display data format (8-bit/pixel, 16-bit/pixel, 32-bit/pixel, ARGB, YC), blending functions, and other settings can be changed independently. In addition to the window display plane, a plane that is dedicated to the  $\alpha$  value can be synthesized (a maximum of one layer).

Each plane has a double-buffer configuration (triple buffer only for a video capture plane), so that smooth display is possible.

Note: In cases of high-resolution display, the unified memory traffic volume may be considerable depending on the number of combined planes and display size, and constraints may arise owing to the traffic volume; but there are no constraints on display functions.

**Table 21.26 Display Functions of Planes**

	Display On/Off	Display Data Format					Super-positioning	Blinking	Size	Scroll-ing	Wrap-around	$\alpha$ -Ratio Plane
		8-bit/pixel	16-bit/pixel	ARGB	YC	32-bit/pixel						
Plane 1	✓	✓*1	✓	✓	✓*2	✓*4	$\alpha$ blending/ transparent color*4/ EOR operation	✓	X, Y (as desired)	✓	✓	✓
Plane 2	✓	✓*1	✓	✓	✓*2	✓*4	Same as above	✓	Same as above	✓	✓	✓
Plane 3	✓	✓*1	✓	✓	✓*2	✓*4	Same as above	✓	Same as above	✓	✓	✓
Plane 4	✓	✓*1	✓	✓	✓*2	✓*4	Same as above	✓	Same as above	✓	✓	✓
Plane 5	✓	✓*1	✓	✓	✓	✓*4	Same as above	✓	Same as above	✓	✓	✓
Plane 6	✓	✓*1	✓	✓	✓	✓*4	Same as above	✓	Same as above	✓	✓	✓
Plane 7	✓	✓*1	✓	✓	✓	✓*4	Same as above	✓	Same as above	✓	✓	✓
Plane 8	✓	✓*1	✓	✓	✓	✓*4	Same as above	✓	Same as above	✓	✓	✓
$\alpha$ plane 1	✓	✓	—	—	—	—	—	✓	Same as above	✓	✓	✓
$\alpha$ plane 2	✓	✓	—	—	—	—	—	✓	Same as above	✓	✓	✓
Back-ground color*3	—	—	—	—	—	—	—	—	—	—	—	—

- Notes:
1. Any among color palettes 1, 2, 3, and 4 is selected.
  2. YC→RGB conversion can be performed only for the YUV data of the uppermost plane.
  3. The data format for background color is RGB666.
  4. Transparent color processing is not possible for a 32-bit/pixel display specified with the PnLRGB1 or PnLRGB0 bit in PnDDCRm. Transparent color processing is possible when the PnEDF bits in PnDDC4Rm are used to specify a 32-bit/pixel display.
  5.  $m = 0$  and 2, suffix "m" is only for RZ/G1H.  
 $n = 1$  to 8.

**Figure 21.2 Block Diagram of Plane Configuration and Superpositioning**

### 21.4.2 Display On/Off

All plane display can be turned on and off using the DEN bit in DSYSRm\*<sup>1</sup>. When the DEN bit is 0, the display data set in DOORn\*<sup>2</sup> is displayed.

When the value of the DPRS bit in DORCRm\*<sup>3</sup> is 0, DPPRm\*<sup>3</sup> is used to turn the display of planes 1 to 8 on and off. When the value of the DPRS bit in DORCRm\*<sup>3</sup> is 1, on the other hand, DS0PRm\*<sup>3</sup> and DS1PR are used to turn the display of planes 1 to 8 on and off. Under the following display conditions, display data set in BPORn\*<sup>2</sup> is displayed.

1. When display of all planes 1 to 8 is turned off
2. In an area with no plane for display, due to the display size and display position
3. When the pixels in a plane for display are all a transparent color

**Table 21.27 Turning On and Off the Display of Planes 1 to 8 (when the DPRS Bit of DORCRm\*<sup>3</sup> is 0)**

Display Plane	Display Plane Priority Register m (DPPRm* <sup>3</sup> )
Plane 1	Plane 1 is selected in one among priority positions 1 to 8, and the corresponding enable bit is set to 1
Plane 2	Plane 2 is selected in one among priority positions 1 to 8, and the corresponding enable bit is set to 1
Plane 3	Plane 3 is selected in one among priority positions 1 to 8, and the corresponding enable bit is set to 1
Plane 4	Plane 4 is selected in one among priority positions 1 to 8, and the corresponding enable bit is set to 1
Plane 5	Plane 5 is selected in one among priority positions 1 to 8, and the corresponding enable bit is set to 1
Plane 6	Plane 6 is selected in one among priority positions 1 to 8, and the corresponding enable bit is set to 1
Plane 7	Plane 7 is selected in one among priority positions 1 to 8, and the corresponding enable bit is set to 1
Plane 8	Plane 8 is selected in one among priority positions 1 to 8, and the corresponding enable bit is set to 1

**Table 21.28 Turning On and Off the Display of Planes 1 to 8 (when the DPRS Bit of DORCRm\*<sup>3</sup> is 1)**

Display Plane	Display Superimpose 0 Priority Register m (DS0PRm* <sup>3</sup> ) Display Superimpose 1 Priority Register (DS1PR)
Plane 1	Plane 1 is selected in one among priority positions 1 to 8 (setting to select the plane: 0001)
Plane 2	Plane 2 is selected in one among priority positions 1 to 8 (setting to select the plane: 0010)
Plane 3	Plane 3 is selected in one among priority positions 1 to 8 (setting to select the plane: 0011)
Plane 4	Plane 4 is selected in one among priority positions 1 to 8 (setting to select the plane: 0100)
Plane 5	Plane 5 is selected in one among priority positions 1 to 8 (setting to select the plane: 0101)
Plane 6	Plane 6 is selected in one among priority positions 1 to 8 (setting to select the plane: 0110)
Plane 7	Plane 7 is selected in one among priority positions 1 to 8 (setting to select the plane: 0111)
Plane 8	Plane 8 is selected in one among priority positions 1 to 8 (setting to select the plane: 1000)

Note: Even if display on is set using DPPRm\*<sup>3</sup>, DS0PRm\*<sup>3</sup>, or DS1PR under the following conditions, the setting is handled as display off, and the corresponding plane is not displayed.

- Planes for which the value set in PnDPXRm\*<sup>4</sup> is greater than the screen size (horizontal display end (HDE) - horizontal display start (HDS))
- Planes for which the value set in PnDPYRm\*<sup>4</sup> is greater than the screen size (vertical display end (VDE) - vertical display start (VDS))
- Planes for which the value set in PnDSXRm\*<sup>4</sup> is 0
- Planes for which the value set in PnDSYRm\*<sup>4</sup> is 0
- Planes for which the value set in PnMWRm\*<sup>4</sup> is 0
- Planes for which the value set in PnSPXRm\*<sup>4</sup> is equal to or greater than twice the value set in PnMWRm\*<sup>4</sup>

1. m = 0 and 2 for RZ/G1H, m = 0 for RZ/G1M/N/E

2. n = 0 to 2 for RZ/G1H, n = 0 and 1 for RZ/G1M/N/E
3. m = 0 and 2, suffix “m” is only for RZ/G1H.
4. m = 0 and 2, suffix “m” is only for RZ/G1H. n = 1 to 8

### 21.4.3 Plane Parameter

For each plane, a display area start position, memory width, display start position, and display size are set using registers.

The followings are the schematic diagram of start positions and sizes related to planes and the registers used for setting start positions and sizes.

**Figure 21.3 Parameters**

**Table 21.29 Memory Parameter/Monitor Parameter Setting Registers**

No.	Name Used in the Figure	Register	Description
1	MWX (Plane memory width)	PnMWRm*	The plane X-direction memory width is set between 16 and 4096 pixels, in 16 pixel units.
2	DSA (Display area start address)	PnDSA0Rm* to PnDSA2Rm*	The start address in memory area is set for plane.
3	WASPY (Wrap-around start position)	PnWASPRm*	The Y direction start position of the wrap-around area is set in line units, with the address set by DSA as reference.
4	WAMWY (Wrap-around memory width)	PnWAMWRm*	The wrap-around Y-direction memory width is set to a desired value in the range from 240 to 4095 (representing line units).
5	SPX (Start position X)	PnSPXRm*	The distance in the X direction to the display start position is set in pixel units, taking the address set by DSA as the origin.
6	SPY (Start position Y)	PnSPYRm*	The distance in the Y direction to the display start position is set in raster line units, taking the address set by DSA as the origin.
7	DSX (Display size X)	PnDSXRm*	The X-direction display size of plane is set in dot-clock units.
8	DSY (Display size Y)	PnDSYRm*	The Y-direction display size of plane is set in raster line units.
9	DPX (Display position X)	PnDPXRm*	The X-direction distance to the display position is set in dot-clock units, taking the upper-left corner of the monitor as the origin.
10	DPY (Display position Y)	PnDPYRm*	The Y-direction distance to the display position is set in raster line units, taking the upper-left corner of the monitor as the origin.
11	MLY (Memory length Y)	PnMLRm*	The Y-direction memory area of plane is set in line units.

Note: m = 0 and 2 for RZ/G1H, suffix "m" is only for RZ/G1H  
n = 1 to 8

#### 21.4.4 Memory Allocation

A display start address for the display screen, drawing screen 1, and drawing screen 2 used for video display can be set individually for each plane. The start addresses for the memory areas used are set in each of the display area start address registers.

In the display unit (DU), when the display plane is video captured, the display area start addresses 0, 1, and 2 for each plane are used to perform triple-buffering control and display the plane. When the display plane is not video captured, the display area start addresses 0 and 1 for each plane are used to perform double-buffering control and display the plane.

The double-buffering control can be performed for alpha planes. In display capture, only a single area can be set to store the data.

Below is a list of display area start address registers used for each of the planes.

**Table 21.30 Memory Allocation Registers**

Display Screen	Register Name	
Plane n	Plane n display area start address 0 register o	PnDSA0Ro
	Plane n display area start address 1 register o	PnDSA1Ro
	Plane n display area start address 2 register o	PnDSA2Ro
$\alpha$ plane m	Alpha plane m display area start address 0 register o	APmDSA0Ro
	Alpha plane m display area start address 1 register o	APmDSA1Ro
Display capture	Display capture area start address register o	DCSARo
Display capture 2	Display capture 2 area start address register p	DC2SARp

Notes: n = 1 to 8.

m = 1 and 2.

o = 0 and 2 for RZ/G1H, suffix "o" is only for RZ/G1H

p = 0 for RZ/G1H, suffix "p" is only for RZ/G1H.

### 21.4.5 Display Data Format

The following format is used for color data used in display. A data configuration is shown in which data is allocated to the unified memory in little endian.

#### (1) 8-bit/pixel

A color palette index is used. The color palette is used to convert and display image data into RGB data with 6 bits for each RGB color (RGB666).

#### 8-bit/pixel data (index color)

#### (2) 16-bit/pixel: RGB

The RGB levels are represented using 5 bits for R, 6 bits for G, and 5 bits for B (RGB565).

#### 16-bit/pixel data (RGB data) format

#### (3) 16-bit/pixel: ARGB

Levels for A, R, G, and B are represented by 1, 5, 5, and 5 bits respectively (ARGB1555). In addition to the R, G, and B values, this format includes a bit that represents  $\alpha$  blending control. In this section, "ARGB" indicates ARGB1555 and "ARGB8888" indicates the 32-bit/pixel format unless otherwise specified.

$\alpha$  blending control using the A value is valid when the PnSPIM\* bit in PnMRm\* is set to perform  $\alpha$  blending. When the PnABIT\* bits of PnALPHARm\* are B'00,  $\alpha$  blending is performed when A = 1. When the PnABIT\* bits are B'01,  $\alpha$  blending is performed when A = 0. When the PnABIT\* bits are B'10 or B'11,  $\alpha$  blending is performed regardless of the A value. When the PnSPIM\* bit is not set to perform  $\alpha$  blending,  $\alpha$  blending is not performed regardless of the A value.

#### 16-bit/pixel data (ARGB data) format

#### (4) YC: YUV422

Image data has the format YC (YCbCr) = 4:2:2. A calculation circuit is used to convert each of the 8 bits of the RGB colors (RGB888) of image data. Transparent color processing is not possible.

The YC data order corresponds to the UYVY format and YUYV format. The UYVY format and YUYV format can be selected using the PnYCDF\* bits in PnMRm\*.

The formulae for YC-RGB conversion are given below. The underlined coefficients are defined by the settings in the corresponding registers.

$$\begin{aligned}
 R &= \underline{YNC} \times (Y - \underline{YNO}) + \underline{RCRC} \times (Cr - \underline{CRNO}) \\
 G &= \underline{YNC} \times (Y - \underline{YNO}) - \underline{GCRCR} \times (Cr - \underline{CRNO}) - \underline{GCBC} \times (Cb - \underline{CBNO}) \\
 B &= \underline{YNC} \times (Y - \underline{YNO}) + \underline{BCBC} \times (Cb - \underline{CBNO})
 \end{aligned}$$

The formulae for YC-RGB conversion in the default state are thus as follows.

$$R = Y + 1.37 \times (Cr - 128)$$

$$G = Y - 0.698 \times (Cr - 128) - 0.336 \times (Cb - 128)$$

$$B = Y + 1.73 \times (Cb - 128)$$

**(a) UYVY format**

D63 to D48	63	56	55	48
Image data 3 and 4	Y3		V2	
D47 to D32	47	40	39	32
Image data 3 and 4	Y2		U2	
D31 to D16	31	24	23	16
Image data 1 and 2	Y1		V0	
D15 to D0	15	8	7	0
Image data 1 and 2	Y0		U0	

**(b) YUYV format**

D63 to D48	63	56	55	48
Image data 3 and 4	V2		Y3	
D47 to D32	47	40	39	32
Image data 3 and 4	U2		Y2	
D31 to D16	31	24	23	16
Image data 1 and 2	V0		Y1	
D15 to D0	15	8	7	0
Image data 1 and 2	U0		Y0	

**(c) RGB color-space conversion format**

Image data 4	23	16	15	8	7	0
	Y3		U2		V2	
Image data 3	23	16	15	8	7	0
	Y2		U2		V2	
Image data 2	23	16	15	8	7	0
	Y1		U0		V0	
Image data 1	23	16	15	8	7	0
	Y0		U0		V0	

**(5) YC: YUV420**

Image data has the format YC (YCbCr) = 4:2:0. A calculation circuit is used to convert each of the 8 bits of the RGB colors (RGB888) of image data. Transparent color processing is not possible.

The UV data order corresponds to the NV12 format and NV21 format. The NV12 format and NV21 format can be selected using the PnNV21\* bit in PnDDC2Rm\*.

The formulae for YC-RGB conversion are the same as those for YC:YUV422.

**(a) Y data**

D63 to D48	63	56	55	48
Image data 8 and 7	Y7		Y6	
D47 to D32	47	40	39	32
Image data 6 and 5	Y5		Y4	
D31 to D16	31	24	23	16
Image data 4 and 3	Y3		Y2	
D15 to D0	15	8	7	0
Image data 2 and 1	Y1		Y0	

**(b) UV data (NV12)**

D63 to D48	63	56	55	48
Image data 8 and 7	V6		U6	
D47 to D32	47	40	39	32
Image data 6 and 5	V4		U4	
D31 to D16	31	24	23	16
Image data 4 and 3	V2		U2	
D15 to D0	15	8	7	0
Image data 2 and 1	V0		U0	

**(c) UV data (NV21)**

D63 to D48	63	56	55	48
Image data 8 and 7	U6		V6	
D47 to D32	47	40	39	32
Image data 6 and 5	U4		V4	
D31 to D16	31	24	23	16
Image data 4 and 3	U2		V2	
D15 to D0	15	8	7	0
Image data 2 and 1	U0		V0	

**(d) RGB color-space conversion format**

Image data 4 (Line 0)	23	16	15	8	7	0
	Y3 (Line 0)		U2 (Line 0)		V2 (Line 0)	
Image data 3 (Line 0)	23	16	15	8	7	0
	Y2 (Line 0)		U2 (Line 0)		V2 (Line 0)	
Image data 2 (Line 0)	23	16	15	8	7	0
	Y1 (Line 0)		U0 (Line 0)		V0 (Line 0)	
Image data 1 (Line 0)	23	16	15	8	7	0
	Y0 (Line 0)		U0 (Line 0)		V0 (Line 0)	
Image data 4 (Line 1)	23	16	15	8	7	0
	Y3 (Line 1)		U2 (Line 0)		V2 (Line 0)	
Image data 3 (Line 1)	23	16	15	8	7	0
	Y2 (Line 1)		U2 (Line 0)		V2 (Line 0)	
Image data 2 (Line 1)	23	16	15	8	7	0
	Y1 (Line 1)		U0 (Line 0)		V0 (Line 0)	
Image data 1 (Line 1)	23	16	15	8	7	0
	Y0 (Line 1)		U0 (Line 0)		V0 (Line 0)	

**(6) 32-bit/pixel: ARGB8888**

Levels for A, R, G, and B are represented by 8 bits each (ARGB8888). Note that the format includes a setting for alpha ratio in addition to the R, G, and B values. In this section, "32-bit/pixel" refers to the ARGB8888 format unless otherwise specified.

$\alpha$  blending control using the A value is valid when the PnSPIM\* bit in PnMRm\* is set so that  $\alpha$  blending is performed. This means that the blending ratio selected in the plane n blending ratio register m (PnALPHARm\*) is invalid.

A 32-bit/pixel (ARGB8888) display should be specified with the PnLRGB1\* or PnLRGB0\* bit in the plane n display data control register m (PnDDCRm\*) or the PnEDF\* bits in plane n display data control 4 register (PnDDC4Rm\*). When using the PnLRGB1\* or PnLRGB0\* bit in PnDDCRm\*, the following restrictions apply.

- Two planes, plane 1 and plane 2, need to be used.
- Transparent color processing is not possible.
- $\alpha$  blending or EOR operations must be performed in an area where a lower plane exists. If the setting of the PnSPIM\* bits allows  $\alpha$  blending or an EOR operation but there is no lower plane, display of 32-bit/pixel data will not be possible without superposition.

**32-bit/pixel data (ARGB8888 data) format****(7) 32-bit/pixel: RGB888**

Levels for R, G, and B are represented by 8 bits each (RGB888). "—" indicates any desired value.

A 32-bit/pixel (RGB888) display should be specified with the PnEDF\* bits in plane n display data control 4 register m (PnDDC4Rm\*).

**32-bit/pixel data (RGB888 data) format****(8) 32-bit/pixel: RGB666**

Levels for R, G, and B are represented by 6 bits each (RGB666). "—" indicates any desired value.

A 32-bit/pixel (RGB666) display should be specified with the PnEDF\* bits in plane n display data control 4 register m (PnDDC4Rm\*).

**32-bit/pixel data (RGB666 data) format**

Note: \* m = 0 and 2 for RZ/G1H, suffix "m" is only for RZ/G1H.  
n = 1 to 8.

### 21.4.6 Data Formats for Output and Display Capture

In the case of digital RGB output from a display unit (DU), superpositioning in the form of  $\alpha$  blending and EOR operations is performed after the display data format has been expanded into the RGB888 format, and then the data are output. In data capture, display data are captured and stored as RGB888 or the five higher-order bits from both the red pins and blue pins and six bits from the green pins. The supplementary formats and data formats in the case of expansion to RGB888 are as indicated in the following table.

**Table 21.31 Output Data Format**

		Red								Green								Blue							
		7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0
Expanded data	8-bit/pixel (after conversion from a color palette)	R (6 bits)						0	0	G (6 bits)						0	0	B (6 bits)						0	0
	16-bit/pixel	R (5 bits)					0	0	0	G (6 bits)					0	0	0	B (5 bits)					0	0	0
	ARGB	R (5 bits)					0	0	0	G (5 bits)					0	0	0	B (5 bits)					0	0	0
	YC after RGB conversion	R (8 bits)								G (8 bits)								B (8 bits)							
	32-bit/pixel (ARGB8888)	R (8 bits)								G (8 bits)								B (8 bits)							
	32-bit/pixel (RGB888)	R (8 bits)								G (8 bits)								B (8 bits)							
	32-bit/pixel (RGB666)	R (6 bits)						0	0	G (6 bits)						0	0	B (6 bits)						0	0
After superpositioning		R (8 bits)								G (8 bits)								B (8 bits)							
DU0 display data		R (8 bits)								G (8 bits)								B (8 bits)							
DU1 display data		R (8 bits)								G (8 bits)								B (8 bits)							
DU2 display data [RZ/G1H]		R (8 bits)								G (8 bits)								B (8 bits)							

### 21.4.7 Endian Conversion

The display unit (DU) can perform big-endian/little-endian conversion according to the setting of bit 20 in DSYSRn\*<sup>1</sup>. If image data are in 32-bit/pixel format, big-endian/little-endian conversion for the data involves the use of the plane n swap control register m (PnSWAPRm\*<sup>2</sup>). Then set bit 20 in DSYSRn\*<sup>1</sup> to 0.

The internal data format in the display unit (DU) is fixed to little-endian; by setting bit 20 in DSYSRn\*<sup>1</sup> to 1, image data arranged in big-endian format in memory are converted into little-endian format and read.

The unit for endian conversion (byte/word) is determined by the setting of the PnDDF\*<sup>2</sup> bits in PnMRm\*<sup>2</sup>.

**Table 21.32 Endian Conversion**

PnMRm/PnDDF* <sup>2</sup>	Data Format	Units for Endian Conversion
B'00	8-bit/pixel	Byte
B'01	16-bit/pixel	Word
B'10	ARGB	Word
B'11	YC	Byte

Endian conversion in each of the units indicated below is shown in Figure 21.4.

**Figure 21.4 Endian Conversion**

Since bits 3 and 2 in the plane n swap control register m ( $PnSWAPRm^{*2}$ ) are set to 1 and bits 1 and 0 in  $PnSWAPRm^{*2}$  are set to 0 in the 32-bit/pixel case, the endian must be converted as shown in the figure below. Bit 4 in  $PnSWAPRm^{*2}$  may be set to either 1 or 0. At this time, set bit 20 in the display unit system control register n ( $DSYSRn^{*1}$ ) to 0.

**Figure 21.5 Endian Conversion for 32-bit/pixel**

- Notes: 1.  $n = 0$  to 2 for RZ/G1H,  $n = 0$  to 1 for RZ/G1M/N/E  
 2.  $m = 0$  and 2, suffix “m” is only for RZ/G1H.  
 $n = 1$  to 8.

### 21.4.8 Color Palette

8-bit/pixel data employs color palettes. The DU has four color palettes which are only accessible to superposition processors 0<sup>\*1</sup> and 2<sup>\*2</sup>.

The color palette for use in plane n is determined by the setting of the  $PnCPSL^{*3}$  bits in  $PnMRm^{*3}$ . Each of the color palettes consists of two alternate buffers; one serves as a display buffer, and the other is for CPU access. After setting each color palette, by setting the color palette switching enable bit CP4CE, CP3CE, CP2CE, or CP1CE in  $CPCRm^{*4}$  to 1, the color palette thus set becomes valid at the next VSYNC falling edge (internal update timing), or upon display reset (when the DRES bit in  $DSYSRm^{*5}$  is changed from 1 to 0).

#### (1) Notes on Use of Color Palettes

1. Because palettes consist of alternate buffers, complete overwriting is necessary upon a color palette update. However, when the details of color palette updates are being managed, there is no problem with overwriting only the relevant part.
2. Upon completion of color palette settings, the switching enable bit must always be set to 1.
3. When reading a color palette from the CPU, reading should be performed before setting the switching enabled bit to 1.

#### (2) Procedure for Setting a Color Palette

##### (a) Procedure for switching from the initial state

The initial state (after power-on reset) is the display reset state.

1. Set the display unit system control register.
2. Set color palette 1, 2, 3, or 4.
3. After setting the color palette, set the color palette switching enable bit to 1.
4. Cancel the display reset.

##### (b) Procedure for switching from display state

In the display state, the DRES bit and DEN bit in  $DSYSRm^{*5}$  are 0 and 1 respectively.

1. Confirm that the color palette switching enable bit is 0.
2. Set color palette 1, 2, 3, or 4.
3. After setting the color palette, set the color palette switching enable bit to 1.

Notes:

1. Superposition processor 0 is valid for RZ/G1H/M/N/E.
2. Superposition processors 2 is valid for RZ/G1H.
3.  $m = 0$  and 2, suffix “m” is only for RZ/G1H.  
 $n = 1$  to 8.
4.  $m = 0$  and 2, suffix “m” is only for RZ/G1H.
5.  $m = 0$  and 2 for RZ/G1H,  $m = 0$  for RZ/G1M/N/E.

### 21.4.9 Superpositioning of Planes

For each plane, three types of combined superpositioning are possible:  $\alpha$  blending, transparent colors, and EOR operations. By setting the PnSPIM\*<sup>3</sup> bits in PnMRm\*<sup>3</sup>, the superpositioned display type can be selected.

However,  $\alpha$  blending and EOR operation cannot be performed simultaneously on the same plane.

Transparent color processing for YC data is not possible.

When 32-bit/pixel data is specified with the PnLRGB1\*<sup>3</sup> or PnLRGB0\*<sup>3</sup> bit in the plane n display data control register m (PnDDCRm\*<sup>3</sup>), the following restrictions apply to superpositioning. These restrictions do not apply when using the PnEDF\*<sup>3</sup> bits in plane n display data control 4 register m (PnDDC4Rm\*<sup>3</sup>).

- Transparent color processing is not possible. Bit 2 in PnSPIM\*<sup>3</sup> must be set to 1.
- When  $\alpha$  blending or an EOR operation has been specified but all of the lower planes are off, the display of 32-bit/pixel data is not possible.
- The alpha ratio of the 32-bit/pixel data (ARGB8888) can only be the higher-order eight bits (A value).

**Table 21.33 Superpositioning**

PnSPIM	Superpositioning	YC Data or 32-bit/pixel Data* <sup>2</sup>
B'000	Transparent color processing is performed for the specified plane. When the specified plane is a transparent color, the lower plane is displayed. (Default)	Prohibited
B'001	Blending of the specified plane with the lower plane is performed. When the specified plane is a transparent color, blending is not performed and the lower plane is displayed.	Prohibited
B'010	EOR operation of the specified plane and the lower plane is performed. When the specified plane is a transparent color, EOR operation is not performed and the lower plane is displayed.	Prohibited
B'011	Setting prohibited (The lower plane is displayed.)	Prohibited
B'100	Transparent color processing is not performed for the specified plane. The specified plane is displayed.	Possible
B'101	Blending of the specified plane with the lower plane is performed. Transparent color specification for the specified plane is ignored, and blending of all the pixels in the specified plane with the lower plane is performed.	Possible* <sup>1</sup>
B'110	EOR operation of the specified plane and the lower plane is performed. Transparent color specification for the specified plane is ignored, and EOR operation of all the pixels in the specified plane and the lower plane is performed	Possible* <sup>1</sup>
B'111	Setting prohibited (The lower plane is displayed.)	Prohibited

After the image data format has been expanded to RGB888,  $\alpha$  blending or EOR operation is performed. The complementary format of each display data format is shown in Table 21.31.  $\alpha$  blending and EOR operation are performed in the sequence of the lower plane to the upper plane. The block diagram is shown below.

**Figure 21.6 Plane Processing Sequence in  $\alpha$  Blending and EOR Operation**

When the format of display data for  $\alpha$  blending or EOR operation is 8-bit/pixel, after selection in advance of the color palette to be used, the  $\alpha$  blending or EOR operation on/off should be specified. At this time, when both planes for  $\alpha$  blending or for EOR operation have the same color palette selected (color palette contention), only the specified plane is displayed, with no  $\alpha$  blending or EOR operation performed. When display of all lower planes is turned off, the specified plane is displayed. That is,  $\alpha$  blending or EOR operation of the specified plane with the image data specified in  $BPOR_n^{*3}$  is not performed. Note however that when a 32-bit/pixel display is set by the  $PnLRGB1^{*3}$  or  $PnLRGB0^{*3}$  bit in the plane  $n$  display data control register  $m$  ( $PnDDCRm^{*3}$ ), display of 32-bit/pixel data is not possible when  $\alpha$  blending or an EOR operation has been specified but all of the lower planes are off.

### (1) $\alpha$ Blending

In  $\alpha$  blending, blending processing is performed according to the alpha ( $\alpha$ ) ratio set by the  $PnALPHA^{*3}$  bits in  $PnALPHARm^{*3}$ , the alpha ( $\alpha$ ) ratio set by the blending ratio bits in the color palette, the alpha ( $\alpha$ ) ratio of the image data of the display plane, or the data in an  $\alpha$  plane.

In the case of 32-bit/pixel data (ARGB8888), the alpha ratio can only be the higher-order eight bits (A value) of the 32-bit/pixel data (ARGB8888).

$$\text{Result of blending} \approx (\text{specified plane} \times \alpha/255 + \text{lower plane} \times (1 - \alpha/255)) \quad (\text{Approximation})$$

In the above formula, the blending result,  $\alpha$ , the specified plane, and the lower plane are all given as 8-bit data.

When the alpha ratio is set to H'00, only the lower plane is displayed. When the alpha ratio is set to H'FF, only the specified plane is displayed. When the  $PnDDF^{*3}$  bits in  $PnMRm^{*3}$  are set to ARGB, and moreover the  $PnSPIM^{*3}$  bit in  $PnMRm^{*3}$  is set to perform  $\alpha$  blending,  $\alpha$  blending is performed according to the A value of the ARGB data format and by the  $\alpha$  value specified by the  $PnALPHA^{*3}$  bits in  $PnALPHARm^{*3}$ .

When the  $PnABIT^{*3}$  bits of  $PnALPHARm^{*3}$  are B'00,  $\alpha$  blending is performed when the A value is 1. When the  $PnABIT^{*3}$  bits are B'01,  $\alpha$  blending is performed when the A value is 0. When the  $PnABIT^{*3}$  bits are B'10 or B'11,  $\alpha$  blending is performed regardless of the A value.

### (2) Transparent Colors

For each plane, transparent color processing can be performed between the specified plane and the lower plane by setting  $PnSPIM^{*3}$  bit in  $PnMRm^{*3}$  to 0. However, transparent color processing cannot be performed for YC data and 32-bit/pixel data (when set with the  $PnLRGB1^{*3}$  or  $PnLRGB0^{*3}$  bit in  $PnDDCRm^{*3}$ ).

**(a) 8-bit/pixel Mode**

When the PnTC\*<sup>3</sup> bit in PnMRm\*<sup>3</sup> is 0 (initial value), transparent color processing is performed according to the setting in the plane n transparent color 1 register m (PnTC1Rm\*<sup>3</sup>). When the PnTC\*<sup>3</sup> bit in PnMRm\*<sup>3</sup> is 1, CP1TRm\*<sup>3</sup> to CP4TRm\*<sup>3</sup> can be used to set up to 16 colors in each of color palettes 1 to 4 as transparent colors. Only the indexes H'00 to H'0F can be specified as transparent colors; H'10 to H'FF cannot be specified as transparent colors.

The color palette transparent color register m 1 to 4 (CP1TRm\*<sup>3</sup> to CP4TRm\*<sup>3</sup>) can be selected using the PnCPSL\*<sup>3</sup> bits in PnMRm\*<sup>3</sup>.

**(b) 16-bit/pixel Mode and ARGB Mode**

Transparent color processing is performed according to PnTC2Rm\*<sup>3</sup>, regardless of the setting of the PnTC\*<sup>3</sup> bit in PnMRm\*<sup>3</sup>.

In the case of ARGB, bits 14 to 0 of PnTC2Rm\*<sup>3</sup> are compared, and bit 15 is ignored.

**(c) 32-bit/pixel Mode**

Transparent color processing is performed according to PnTC3Rm\*<sup>3</sup>, regardless of the setting of the PnTC\*<sup>3</sup> bit in PnMRm\*<sup>3</sup>.

For the bits to be compared, see Table 21.24.

The above is summarized in Table 21.34, which indicates the transparent color specification registers which are valid when the PnTC\*<sup>3</sup> bit is 0 and 1.

**Table 21.34 Transparent Color Specification Registers**

Data Format	Transparent Color Specification Bit (PnMRm* <sup>3</sup> ) /PnTC* <sup>3</sup>	Color Palette Select Bit (PnMRm* <sup>3</sup> ) /PnCPSL* <sup>3</sup>	Transparent Color Specification Register
8-bit/pixel	0	—	PnTC1R* <sup>3</sup>
	1	B'000	CP1TR
	1	B'001	CP2TR
	1	B'010	CP3TR
	1	B'011	CP4TR
16-bit/pixel	—	—	PnTC2R* <sup>3</sup>
ARGB	—	—	PnTC2R* <sup>3</sup>
32-bit/pixel	—	—	PnTC3R* <sup>3</sup>

**(3) EOR Operation**

EOR operation of the specified plane with the lower plane is performed.

- Notes: 1. Display of 32-bit/pixel data is not possible when all of the lower planes are off.  
 2. When a 32-bit/pixel display is set by the PnLRGB1\*<sup>3</sup> or PnLRGB0\*<sup>3</sup> bit in PnDDCRm\*<sup>3</sup>.  
 3. m = 0 and 2, suffix “m” is only for RZ/G1H.  
 n = 1 to 8.

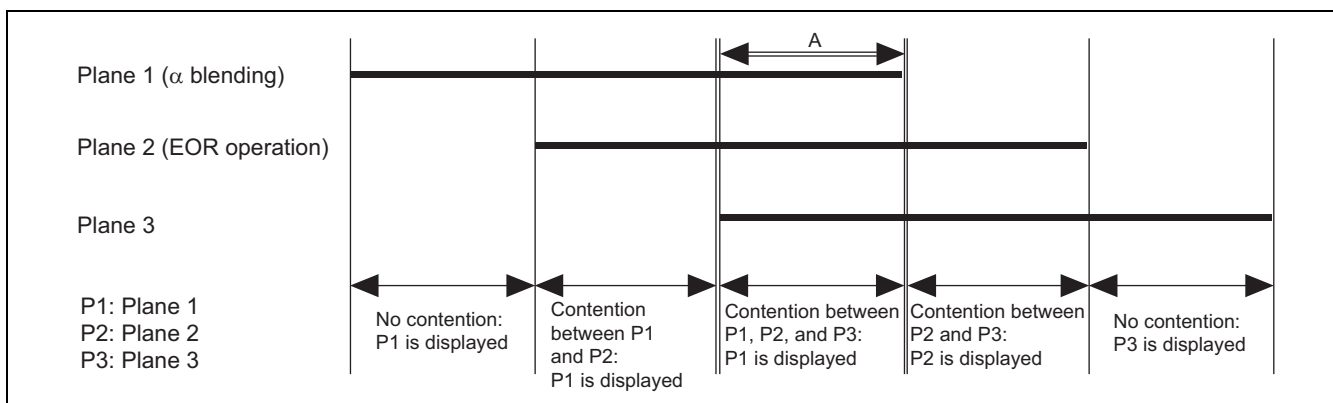

### 21.4.10 Contention

#### (1) Contention for a Color Palette

When the same color palette has been specified for two or more planes in the 8-bit/pixel format, contention for that color palette between the planes may arise in  $\alpha$  blending and EOR operations. Whether or not contention has occurred is judged on a per-pixel rather than per-plane basis.

In the figure below, planes 1 to 3 are in 8-bit/pixel format with  $\alpha$  blending specified for plane 1 and an EOR operation specified for planes 2 and 3. The figure shows the results in cases where contention has arisen because the same color palette has been specified for all of the planes (we assume that none of these planes includes transparent-color pixels).

In the event of contention,  $\alpha$  blending and EOR operations do not proceed and the uppermost plane is displayed.

**Figure 21.7 Contention for a Color Palette  
(When Multiple Planes Have the Same Color Palette)**

Figure 21.8 shows the results of all patterns of contention and the presence of transparent colors to be displayed during period A in the above figure.

- $P1 \alpha P2$  indicates  $\alpha$  blending of planes 1 and 2.
- $P2 \odot P3$  indicates an EOR operation for planes 2 and 3.
- $P1 \alpha (P2 \odot P3)$  indicates  $\alpha$  blending of plane 1 with the result of the EOR operation for planes 2 and 3.
- BPOR indicates data specified by the background plane output register n (BPORn\*).

Note: \* n = 0 to 2 for RZ/G1H. n = 0 and 1 for RZ/G1M/N/E.

				√: Contention, —: No contention					
				P1	√	√	√	—	—
				P2	√	√	—	√	—
				P3	√	—	√	√	—
○: Transparent, ●: Non-transparent	P1	P2	P3		P1	P1	P1 α P2	P1 α P2	P1 α (P2⊕P3)
	●	●	●		P1	P1	P1 α P2	P1 α P2	P1 α P2
	●	●	○		P1	P1	P1 α P2	P1 α P2	P1 α P2
	●	○	●		P1	P1 α P3	P1	P1 α P3	P1 α P3
	●	○	○		P1	P1	P1	P1	P1
	○	●	●		P2	P2⊕P3	P2⊕P3	P2	P2⊕P3
	○	●	○		P2	P2	P2	P2	P2
	○	○	●		P3	P3	P3	P3	P3
○	○	○		BPOR	BPOR	BPOR	BPOR	BPOR	

Figure 21.8 Contention for a Color Palette and Transparent Colors

**(2) YC Data Contention**

The display unit (DU) has only one YC-RGB conversion circuit internally, and so YC-RGB conversion cannot be performed simultaneously for two or more planes. When there are pixels requiring YC-RGB conversion on two or more planes simultaneously, the pixels on the uppermost plane are YC-RGB converted, and the lower plane is not displayed. Figure 21.9 describes YC-RGB conversion when the data for three planes is in YC format.

**Figure 21.9 YC Data Contention**

**(3) Plane Priority Order**

The display priority order for planes is set using DPPRm\*, DS0PRm\*, or DS1PR; if one plane is set in two or more places in the priority order, the place with highest priority is selected.

For example, if the setting in DPPRm\* is H'00CB\_D888, then the results of the priority order and display on/off settings are as follows.

Plane with priority 1	Plane 1
Plane with priority 2	No corresponding plane
Plane with priority 3	No corresponding plane
Plane with priority 4	Plane 6
Plane with priority 5	Plane 4
Plane with lowest priority	Plane 5
Display off planes	Plane 2, plane 3, plane 7, and plane 8

Note \* m = 0 and 2, suffix "m" is only for RZ/G1H.

### 21.4.11 Blinking

For each plane, blinking operation can be performed by using the display area start addresses 0 and 1.

Usually, double-buffering control is performed for each plane according to the setting of the PnBM\* bit in PnMRm\*. However, blinking is performed with the period specified by the PnBTA\* and PnBTB\* bits in PnBTRm\* by setting the PnBM\* bits in PnMRm\* to B'10 (auto display change mode (blinking mode)). When the blinking period is set to 1, the display area start addresses 0 and 1 can be switched for every VSYNC; the same function as the auto display change mode can be achieved.

Notes: Set a value other than 0 to the PnBTA\* and PnBTB\* bits in PnBTRm\*.

- \* m = 0 and 2, suffix "m" is only for RZ/G1H.
- n = 1 to 8.

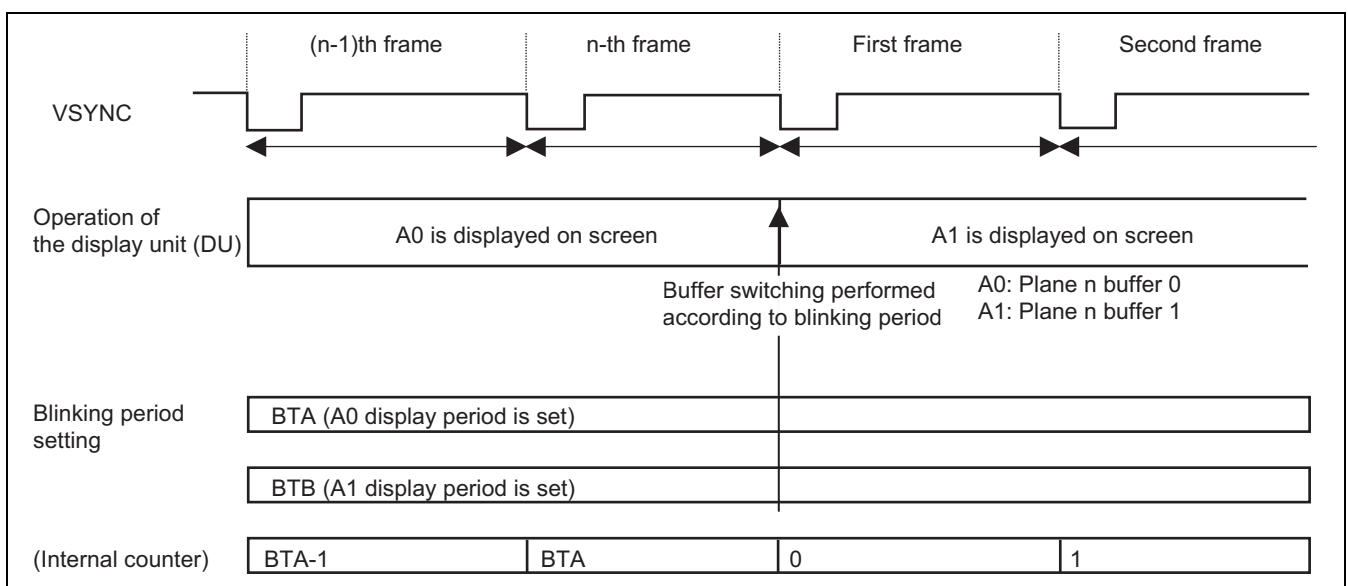

Figure 21.10 Blinking

### 21.4.12 Scroll Display

By setting display area and display screen sizes and start positions independently for each plane, smooth scroll processing can be performed independently for each plane.

The display can be scrolled by cyclically setting the values of display start positions X and Y (coordinates specified by PnSPXRm\* and PnSPYRm\*), taking as the origin the start address in memory specified by PnDSA0Rm\* to PnDSA2Rm\* for each plane.

Figure 21.11 summarizes display scrolling. The display is scrolled by setting the display start position from A to B.

Notes: Display sizes and other area settings for each plane should be set such that there is no data display outside the memory configuration area.

- \* m = 0 and 2, suffix “m” is only for RZ/G1H.
- n = 1 to 8.

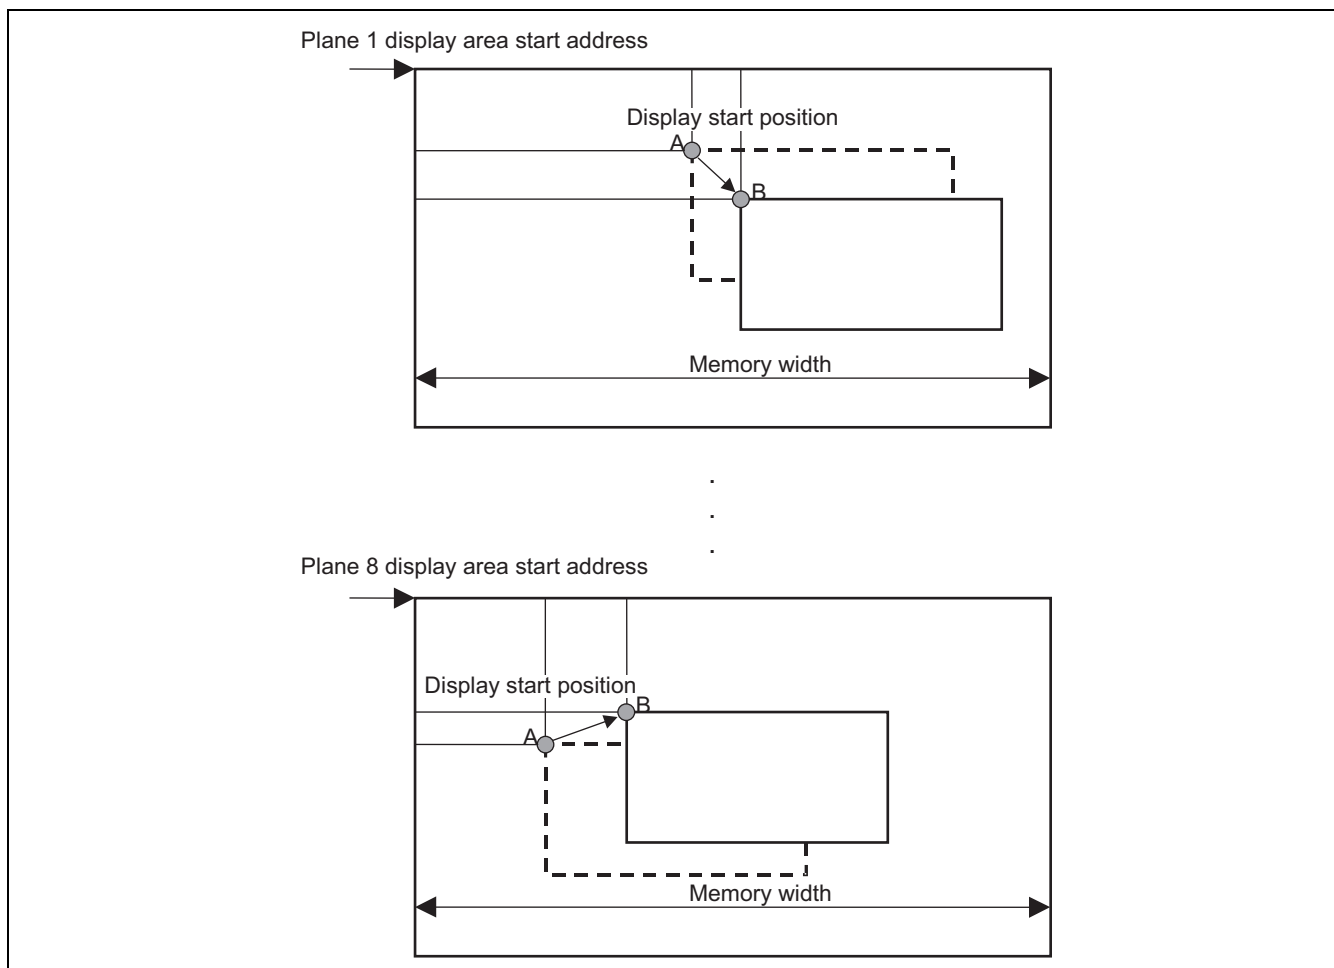

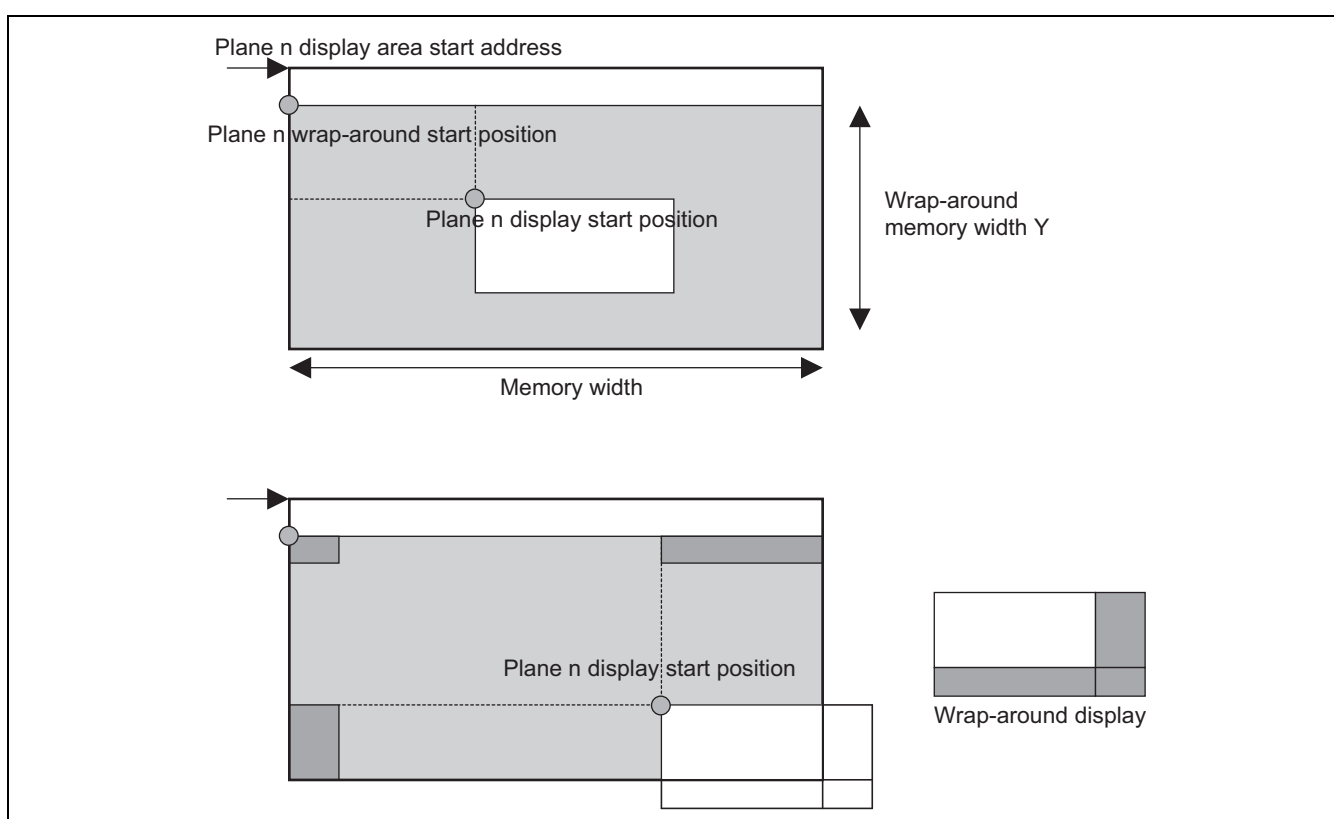

Figure 21.11 Schematic Diagram of Scroll Display

### 21.4.13 Wrap-Around Display

In addition to display scrolling, wrap-around display, which can be used in spherical scrolling, is possible for each plane. When enabling wrap-around display, the  $PnWAE^{*1}$  bit in  $PnMRm^{*1}$  is set to 1. As a result of changing the values of display start positions X and Y (the plane n start position X set in  $PnSPXRm^{*1}$  and the plane n start position Y set in  $PnSPYRm^{*1}$ ) in order to scroll the display, even when plane n overflows the wrap-around area, the wrap-around area is seen as a spherical surface in wrap-around display, as in Figure 21.12, and the part overflowing is complemented and displayed. The method used to specify the wrap-around area is described below.

1. The start address of the memory used for plane n is specified in  $PnDSA0Rm^{*1}$  to  $PnDSA2Rm^{*1}$ .
2. With the beginning of the specified memory as origin, the upper-left coordinates of the wrap-around area are specified in  $PnWASPRm^{*1}$ . The X-direction width of the wrap-around area is the memory width set in  $PnMWRm^{*1}$ .
3. The Y-direction width of the wrap-around area is set in  $PnWAMWRm^{*1}$ .

**Figure 21.12 Schematic Diagram of Wrap-Around Display**

Note: When wrap-around display is disabled (when the  $PnWAE^{*1}$  bit in  $PnMRm^{*1}$  is 0), the part overflowing the wrap-around area becomes the color specified by  $BPORn^{*2}$ , and superposition processing using this color is performed.

1.  $m = 0$  and 2, suffix “m” is only for RZ/G1H.  
 $n = 1$  to 8.
2.  $n = 0$  to 2 for RZ/G1H,  $n = 0$  and 1 for RZ/G1M/N/E.

### 21.4.14 Upper-Left Overflow Display

For each plane, a display start position in memory ( $PnSPXRm^*$ ,  $PnSPYRm^*$ ) and display size ( $PnDSXRm^*$ ,  $PnDSYRm^*$ ) can be set arbitrarily, so that by combining and using these registers, areas overflowing the upper-left relative to the monitor origin (upper-left corner) can be displayed without overwriting display data in memory.

For a picture of size ( $DSX$ ,  $DSY$ ) and with start position ( $SPX$ ,  $SPY$ ), by setting the size to  $(DSX-\Delta X, DSY-\Delta Y)$  and the start position to  $(SPX+\Delta X, SPY+\Delta Y)$ , the  $\Delta X$  part overflowing on the left side and the  $\Delta Y$  part overflowing on top can be displayed. At this time, the display position ( $PnDPXRm^*$ ,  $PnDPYRm^*$ ) is fixed at 0.

Note: \*  $m = 0$  and  $2$ , suffix “m” is only for RZ/G1H.  
 $n = 1$  to  $8$ .

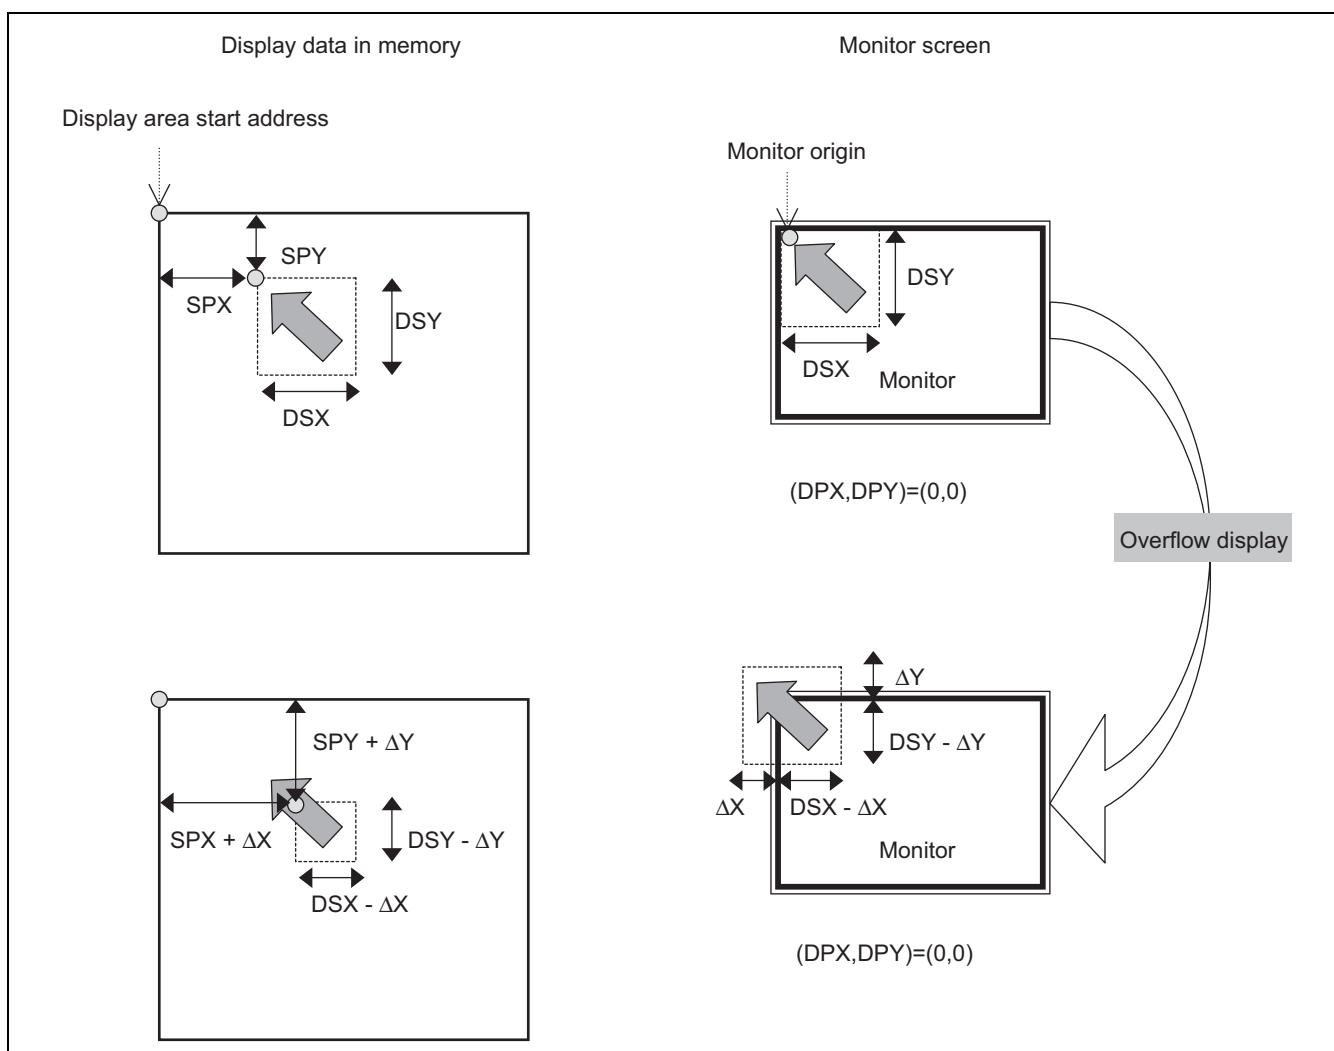

Figure 21.13 Schematic Diagram of Upper-Left Overflow Display

### 21.4.15 Double-Buffering Control

The double-buffering control of the display unit (DU) includes four types of functions, which are a auto rendering mode that does not switch the display until drawing is completed, a manual display change mode in which display or drawing switching is all controlled by software, an auto display change mode that realize blinking, and a video capture mode that is based on a frame ID of the video input (VIN) module.

In the case of auto rendering mode and manual display change mode, the display change is performed in frame units for non-interlaced and interlaced sync display, and in field units for interlaced sync & video display. In the case of auto display change mode, all switching is performed in field units. For video capture mode, all switching is performed in frame units.

**Auto Rendering Mode:** In auto rendering mode, display is not switched until drawing is completed. Even if drawing is not completed within a single frame period, drawing operation continues as it is.

**Manual Display Change Mode:** In manual display change mode, display frame switching and start of drawing are controlled by software. Display switching can either be performed by software using the PnDC\*1 bit in PnMRm\*1, or by setting the buffer 0 or buffer 1 start address in PnDSA0Rm\*1 and PnDSA1Rm\*1 indicated by the DFBn\*1 bit in DSSRm\*2.

The rendering start bit (i.e. the RS bit in the system control register (SCLR) in the R-GP2D) controls the start of drawing. An interrupt set up by using bit 11 in DSSRn\*3 or the trap flag (i.e. the TRA bit in the status register (SR) in the R-GP2D) determines the timing of this control. When making a transition from this mode to another mode, the PnDC\*1 bit in PnMRm\*1 should always be set to 1 first.

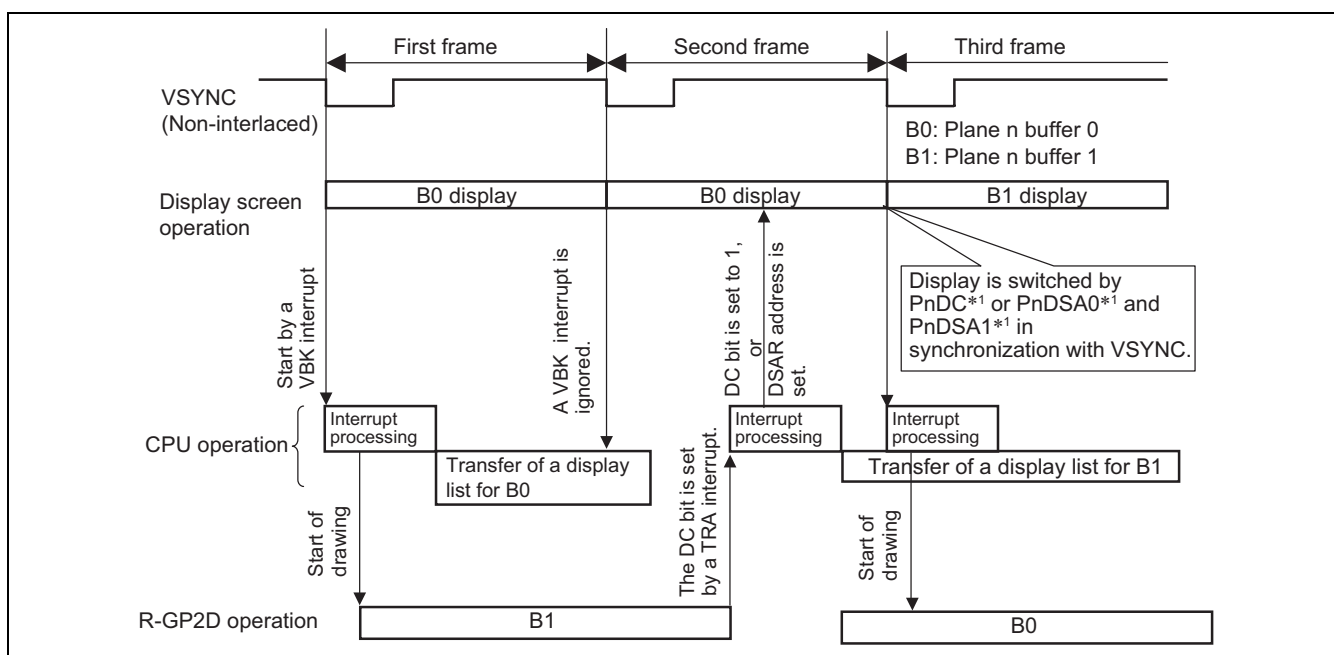

Figure 21.14 Manual Display Change Mode

**Auto Display Change Mode:** For information on the auto display change mode, refer to section 21.4.11, Blinking.

**Video Capture Mode:** In video capture mode, a display frame buffer is switched in frame units according to a frame ID, indicating the latest capture frame, output from the video input modules 0 to m (VIN0 to VINm\*4).

The video input modules 0 to m (VIN0 to VINm\*4) are selected by the PnVISL\*1 bit in the plane n mode register (PnMRm\*1).

Notes 1. m = 0 and 2, suffix "m" is only for RZ/G1H.

- n = 1 to 8.
2. RZ/G1H is valid. m = 0 and 2.
  3. n = 0 to 2 for RZ/G1H, n = 0 and 1 for RZ/G1M/N/E.
  4. m = 3 for RZ/G1H, m = 2 for RZ/G1M/N, m = 1 for RZ/G1E.

### 21.4.16 Sync Mode

In order to facilitate synchronization with external equipment, in addition to master mode, a TV synchronization function is provided. Selection of master mode and TV sync mode is performed using bits 7 and 6 in DSYSRn\*. In master mode (internal sync mode), the position of the falling edge of the vertical sync signal (VSYNC) set by VSPRn\* is detected. In TV sync mode (external sync mode), the position of the falling edge of the EXVSYNC signal is detected. The results are then reflected in the bits 14 and 11 of DSSRn\*.

**Master Mode (Internal Sync Mode):** By setting the period and pulse width of the horizontal and vertical sync signals (HSYNC, VSYNC) in the display timing generation registers, the corresponding waveforms are output. Also, display data is output in sync with these signals.

In interlaced sync mode and interlaced sync & video mode, a signal is output to the ODDF pin indicating odd/even fields.

**TV Sync Mode (External Sync Mode):** In TV sync mode, display data is output in sync with a horizontal sync signal and vertical sync signal (EXHSYNC, EXVSYNC) input from a TV, video, or other external sync signal generation circuit. Display data is output with reference to the falling edge of the EXHSYNC signal and the rising edge of the EXVSYNC signal.

The horizontal sync signal, vertical sync signal, and clock signal from the external sync signal generation circuit are input to the EXHSYNC, EXVSYNC, and DCLKIN pins, respectively. CSYNC is at high level. In interlaced sync mode and interlaced sync & video mode, a signal should be input to the EXODDF pin indicating odd/even fields. In non-interlaced mode, the input to the EXODDF pin should be fixed at low level or at high level.

When operating the unit in TV sync mode also, values must be set in horizontal sync width register n (HSWRn\*), horizontal cycle register n (HCRn\*), vertical sync point register n (VSPRn\*), and vertical cycle register n (VCRn\*) in section 21.3.2, Display Timing Generation Registers.

When the EXVSYNC signal is input, either before or after completion of display of the display size portion set in the display unit (DU), the display unit (DU) performs vertical display completion operation and transitions to control for the next screen. When the EXVSYNC signal is not input, the unit continues to wait for the EXVSYNC signal while remaining in the vertical blanking interval (auto-control is not performed). Similarly, when the EXHSYNC signal is input the display unit (DU) performs horizontal display completion operation and transitions to control for the next raster line; but if the EXHSYNC signal is not input, the unit continues to wait for the EXHSYNC signal while remaining in the horizontal blanking interval (auto-control is not performed).

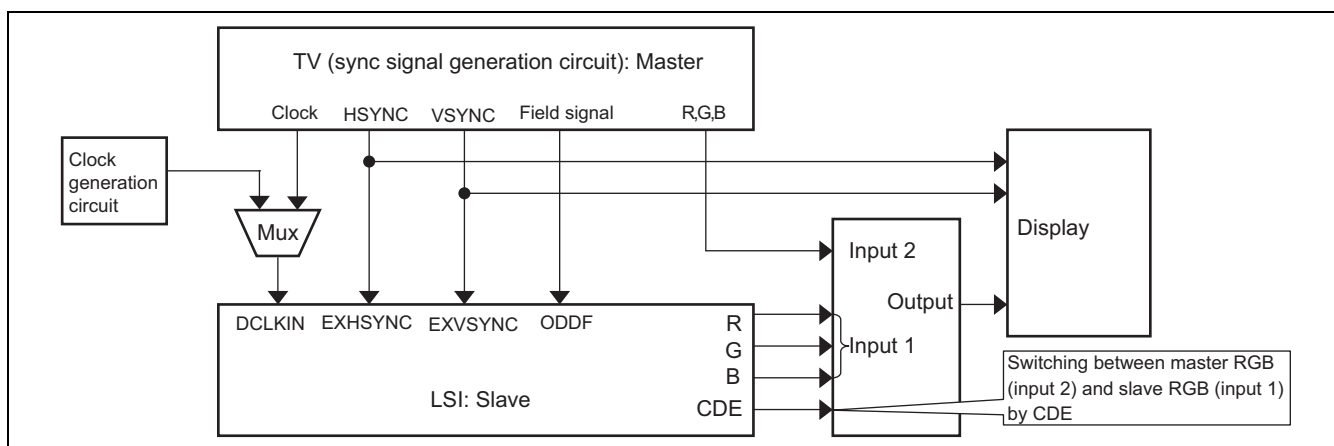

Figure 21.15 Signal Flow in TV Sync Mode

**Sync Method Switching Mode:** When switching from master mode into TV sync mode, or from TV sync mode into master mode, when necessary this mode should be switched into first. Even if a transition to this mode is not made first, switching of the synchronization method is possible.

In this mode, input/output pins connected to the display unit (DU) are for input, and so collision of pin signals can be avoided. Also, in this mode the internal dot clock is stopped, so that disorder in the input dot clock has no effect on display operation.

Notes: \* n = 0 to 2 for RZ/G1H, n = 0 and 1 for RZ/G1M/N/E

#### 21.4.17 Alpha-Ratio Planes

$\alpha$  blending can be performed by using the eight planes (display planes) that can display the current image data with the alpha ratio, plus two planes for the alpha ratio (alpha-ratio planes). Data in the alpha ratio planes are limited to the alpha ratio; they cannot be composed as display data.

To enable the alpha-ratio planes, set the AP1E or AP2E bit of DAPCRm\*<sup>1</sup> to 1. PnALPHARm\*<sup>1</sup> is used to select the alpha-ratio planes. Set the PnBRSL\*<sup>1</sup> bits in PnALPHARm\*<sup>1</sup> to B'111 and bits 2 to 0 in PnALPHA\*<sup>1</sup> to B'000 or B'001.

Notes: These alpha-ratio planes are not usable when 32-bit/pixel data are being displayed.

1. m = 0 and 2, suffix "m" is only for RZ/G1H.  
n = 1 to 8.

#### 21.4.18 Display Capture

In display capture, display data (RGB888 or RGB666) that have been composed for output on the relevant pins are converted to ARGB888, RGB565 or ARGB1555 data, stored in a buffer having the same configuration as the read buffer, and then stored in the area specified by DCnSARm\* via AXI. To capture the display data, set the DCE or DC2E bit of DCPCRm\* to 1. Capturing starts from the next frame after this setting has been made. The specifications for display capturing are as follows:

<b>Data formats:</b>	Refer to Table 21.31, Output Data Format. In the case of ARGB1555, the A value is determined by the setting of DCPCRm*. In the case of ARGB8888, the A value is determined by the setting of DCnMRm*.
<b>Capture area start address:</b>	Only a single address can be specified.
<b>Capture size X:</b>	The same as the monitor size (horizontal display end position (HDE) – horizontal display start position (HDS))
<b>Capture size Y:</b>	The same as the monitor size (vertical display end position (VDE) – vertical display start position (VDS))
<b>Memory width X:</b>	Specified by a register. Writing to the buffer ends when the memory width is exceeded.
<b>Memory length Y:</b>	Specified by a register. Storage of data in the memory ends when the memory length (in lines) is exceeded.

When the following display functions are set, the display capture function cannot be used.

- RGB-YC conversion performed by setting the RGBYC0 bits in the Display Unit Extensional Function Control 5 Register (DEF5R) [RZ/G1M/N/E]
- DRC processing performed by setting the DRC0 bits in the display unit extensional function control 5 register m (DEF5Rm\*) [RZ/G1H]

- DRC processing performed by setting the DRC1 bits in the display unit extensional function control 5 register m (DEF5Rm\*) [RZ/G1H]
- YC-RGB conversion performed by setting the YCRGB0 bits in the display unit extensional function control5 register m (DEF5Rm\*) [RZ/G1H]
- YC-RGB conversion performed by setting the YCRGB1 bits in the display unit extensional function control 5 register m (DEF5Rm\*) [RZ/G1H]

Notes: \* m = 0 and 2, suffix "m" is only for RZ/G1H.  
n = no number or 2.

### 21.4.19 Dual Display Output

The display unit (DU) has superposition processors, display-timing generators, pin controllers, and dot-clock generators, each of which is independently controllable. The DU0 and DU1 realize various types of display because two channels are available for selecting from among the eight display planes and two alpha-ratio planes.

This section describes the dual display output using the DU0 and DU1.

#### (1) Independent Display

Different images can be displayed with different sizes by specifying different superposition processors, display-timing generators, pin controllers, and dot-clock generators. Captured video data can also be separately stored.

However, separate output images cannot be produced from a single plane. To display a single set of image data in separate output images, two planes must be used.

It is impossible to output the image data only via the digital RGB pins; the image data is output only via the LVDS pins [RZ/G1H] or via both the LVDS pins and digital RGB pins.[RZ/G1H/M/N]

**Figure 21.16 Independent Display**

#### (2) Display of Different Images on Monitors of the Same Size

Different images can be displayed on monitors of the same size when the same display-timing generator and dot-clock generator have been specified but the superposition processors and pin controllers are different. Captured video data can also be separately stored.

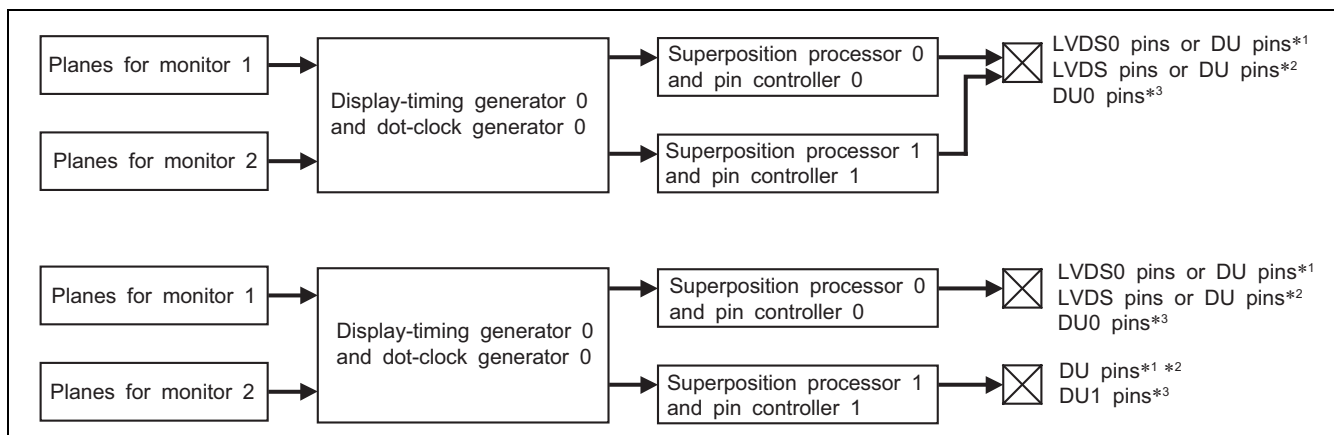

Images can be output to two monitors through a single set of pins by switching the display data in synchronization with the output dot clock. Output through two sets of pins is also possible.

When images are output to two monitors through a single set of pins, the image data can be output only via the digital RGB or LVDS0. [RZ/G1H]

When images are output to two monitors through a single set of pins, the image data can be output only via the digital RGB or LVDS. [RZ/G1M/N]

When images are output through two sets of pins, it is impossible to output the image data only via the digital RGB pins; the image data is output only via the LVDS pins or via both the LVDS pins and digital RGB pins.[RZ/G1H]

When images are output through two sets of pins, it is impossible to output the image data only via the digital RGB pins; the image data is output via both the LVDS pins and digital RGB pins. [RZ/G1M/N]

**Figure 21.17 Display of Different Images on Monitors of the Same Size**

**(3) Display of the Same Image on Monitors of the Same Size**

The same image can be displayed on different monitors when the same superposition processor, display-timing generator, and dot-clock generator have been specified but the pin controllers are different.

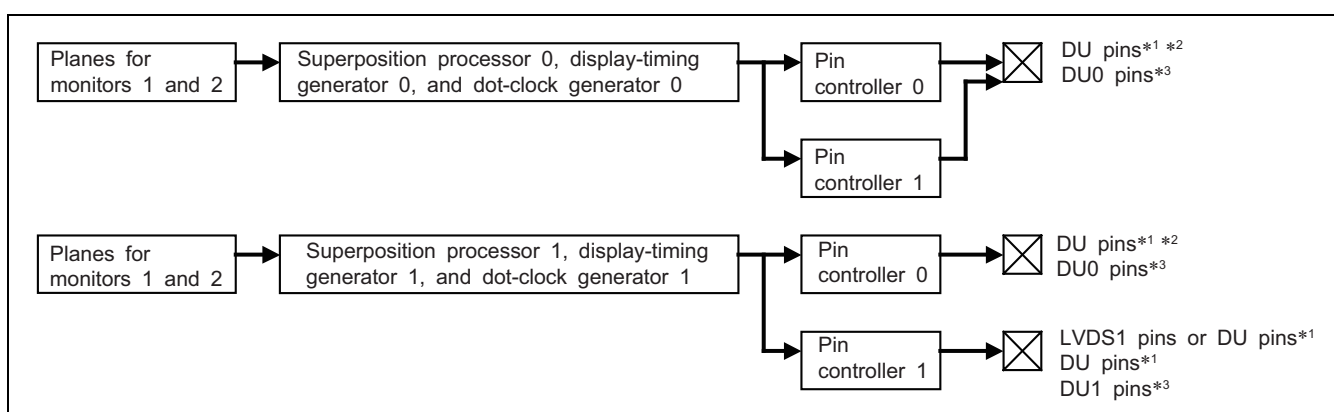

Images can be output to two monitors through a single set of pins by switching the display data in synchronization with the output dot clock. Output through two sets of pins is also possible.

When images are output to two monitors through a single set of pins, the image data can be output only via the digital RGB or LVDS0. [RZ/G1H]

When images are output to two monitors through a single set of pins, the image data can be output only via the digital RGB or LVDS. [RZ/G1M/N]

When images are output through two sets of pins, it is impossible to output the image data only via the digital RGB pins; the image data is output only via the LVDS pins or via both the LVDS pins and digital RGB pins. [RZ/G1H]

When images are output through two sets of pins, it is impossible to output the image data only via the digital RGB pins; the image data is output via both the LVDS pins and digital RGB pins. [RZ/G1M/N]

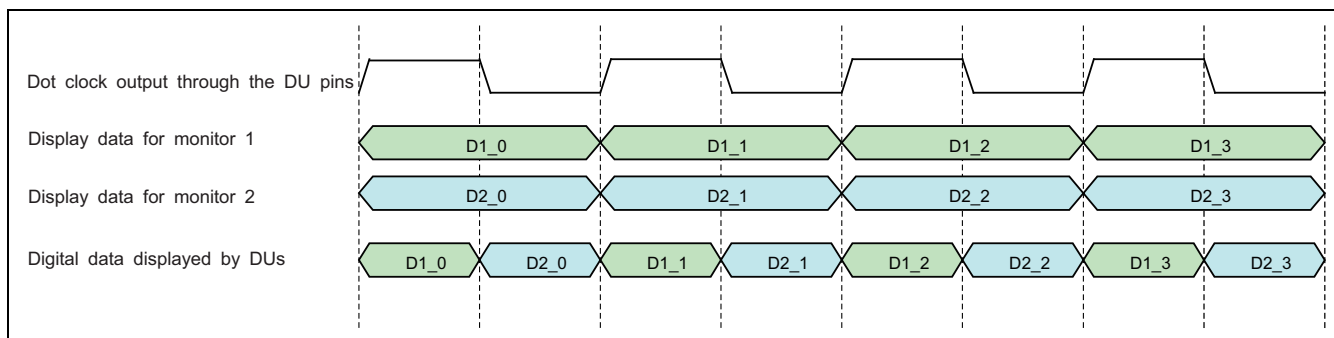

**Figure 21.18 Display of the Same Image on Monitors of the Same Size**

The timing for switching of display data in synchronization with the output dot clock is shown below. This feature is only supported by DU0 or DU0 via LVDS0\*1 or DU0 via LVDS\*2.

With the DU1 pin, data cannot be displayed by switching in synchronization with the output dot clock. For switching display data in synchronization with the output dot clock, the output dot clock should be set to be division by two or more of the input dot clock.

**Figure 21.19 Switching Display Data in Synchronization with the Output Dot Clock**

#### (4) Combinations of Blocks for Dual Display Output

For dual display output, the dot clock to be supplied to blocks in the display unit (DU), timing signals including SYNC, and display data are specifiable by setting the corresponding registers. Table 21.35 is a matrix of the combinations of blocks, and Table 21.36 gives the meanings of the symbols used in Table 21.35.

When the input block is superposition processor 0, for example, the information indicated in the table is as follows.

- The dot clock is that from dot-clock generator 0 or 1 as selected by the DR0D and DK1S bits of DORCR0\*<sup>1</sup> / DORCR\*<sup>2\*3</sup> (No. 5 in the table).
- The timing signal is that from display-timing generator 0 or 1 as selected by the DR0D and PG1T bits of DORCR0\*<sup>1</sup> / DORCR\*<sup>2\*3</sup> (No. 3 in the table).
- The planes for superpositioning of data are selected in DS0PR0\*<sup>1</sup> / DS0PR\*<sup>2\*3</sup> (No. 15 in the table).

Take care with register settings because timing signals such as the dot clock, sync signals and so on are freely specifiable, but if the dot clock or other timing signals differ from block to block, a normal display will not be possible.

Table 21.35 Combinations of Blocks

	Output Block																	
	Dot-clock generator 0 (clock)	Dot-clock generator 0 (external SYNC)	Dot-clock generator 1 (clock)	Dot-clock generator 1 (external SYNC)	Display-timing generator 0	Display-timing generator 1	Superposition processor 0	Superposition processor 1	Pin controller (output timing adjustment) 0	Pin controller (output timing adjustment) 1	Planes 1 to 8	Alpha-ratio planes 1 to 2	Display capture 1	Display capture 2	DU0 pins	DU1 pins		
Dot-clock generator 0 (clock)	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	✓	—
Dot-clock generator 0 (external SYNC)	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	✓	—
Dot-clock generator 1 (clock)	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	✓
Dot-clock generator 1 (external SYNC)	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	✓
Display-timing generator 0	✓	✓	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Display-timing generator 1	1	—	1	✓	—	—	—	—	—	—	—	—	—	—	—	—	—	—

 n = 1 to 8.

### 21.4.20 Divided YUV Display

An image that has been divided up into separate Y and UV data for separate storage in memory can be displayed as YUV422 or YUV420 data by using two planes.

**Figure 21.20 Overview of Divided YUV Display Function (Little Endian)**

#### (1) Image Data Format

The following figures show the configuration of YUV422 data divided for separate storage in little endian in memory. The configuration of YUV420 data is the same as that shown in section 21.4.5 (5), YC: YUV420.

The formulae for YC-RGB conversion are the same as those shown in section 21.4.5 (4), YC: YUV422.

##### (a) Y data

##### (b) UV data

## (2) Register Setting Examples

Two planes are used to display the divided YUV data. The methods for specifying Y data in plane 1 and UV data in plane 2 to display the divided YUV data are described below.

- The following is the setting made by the plane n display data control 2 register m (PnDDC2Rm<sup>\*1</sup>).

### YUV422 data

Bit :	7	6	5	4	3	2	1	0
			PnNV21	PnY420			PnDIVU	PnDIVY
Plane 1 (Y data)	–	–	0	0	–	–	0	1
Plane 2 (UV data)	–	–	0	0	–	–	1	0

### YUV420 data

Bit :	7	6	5	4	3	2	1	0
			PnNV21	PnY420			PnDIVU	PnDIVY
Plane 1 (Y data)	–	–	0	0	–	–	0	1
Plane 2 (UV data)	–	–	0/1	1	–	–	1	0

- Set the start address of Y data in the plane 1 display area start address 0 to 2 registers m (P1DSA0Rm<sup>\*1</sup> to P1DSA2Rm<sup>\*1</sup>).
- Set the start address of UV data in the plane 2 display area start address 0 to 2 registers m (P2DSA0Rm<sup>\*1</sup> to P2DSA2Rm<sup>\*1</sup>).
- The same settings should be made in the plane 1 and plane 2 registers of display plane registers other than the registers described above (PnDDC2Rm<sup>\*1</sup>, P1DSA0Rm<sup>\*1</sup> to P1DSA2Rm<sup>\*1</sup>, and P2DSA0Rm<sup>\*1</sup> to P2DSA2Rm<sup>\*1</sup>). Set the PnDDF<sup>\*1</sup> bits in the plane n mode register (PnMRm<sup>\*1</sup>) to B'11.
- Set bit 20 in the display unit system control register n (DSYSRn<sup>\*2</sup>) to 1 if data is stored in big endian in memory.
- Turn on the display of planes 1 and 2, and give plane 2 the next order of priority for processing after plane 1. For details on turning on the display, see section 21.4.2, Display On/Off.

## (3) Combinations of Planes

Display as YUV422 or YUV420 data is obtained by using the combinations of planes listed below. UV data should be on the plane immediately below that for the Y data.

**Table 21.37 Possible Combinations of Planes**

Y Data Obtained by Dividing up YUV	UV Data Obtained by Dividing up YUV
Plane 1	Plane 2
Plane 2	Plane 3
Plane 3	Plane 4
Plane 4	Plane 5
Plane 5	Plane 6
Plane 6	Plane 7
Plane 7	Plane 8
Plane 8	Plane 1

- Notes: 1. m = 0 and 2, suffix "m" is only for RZ/G1H.  
n = 1 to 8.  
2. n = 0 to 2 for RZ/G1H, n = 0 and 1 for RZ/G1M/N/E.

### 21.4.21 Multiple Output Display

The 24-bit data of the DU0/DU2 display digital data (RGB888) can be multiplexed 12 bits each and output.

For a multiple output, set both the MLOS1 bit in display unit extensional function control 6 register m (DEF6Rm<sup>\*4</sup>) and the DCKOINV bit in the external synchronization control register m (ESCRm<sup>\*4</sup>) to 1.[RZ/G1H]

The 24-bit data of the DU0/DU1 display digital data (RGB888) can be multiplexed 12 bits each and output.

For a DU0 multiple output, set both the MLOS0 bit in display unit extensional function control 6 register (DEF6R) and the DCKOINV bit in the external synchronization control register 0 (ESCR0) to 1. For a DU1 multiple output, set both the MLOS1 bit in display unit extensional function control 6 register (DEF6R) and the DCKOINV bit in the external synchronization control register 1(ESCR1) to 1. [RZ/G1M/N/E]

The output dot clock should be set so that its frequency is equal to or smaller than half of the input dot clock frequency. The pin functions for a multiple output display are shown in Tables 21.38a to 21.38c.

Figure 21.21 shows the timing of the output dot clock, display control signal, and display digital data. The display control signal is output in synchronization with the falling edge of the output dot clock. As for display digital data, the Df data (Tables 21.38a to 21.38c) is output in synchronization with the falling edge of the output dot clock and the Dr data (Tables 21.38a to 21.38c) is output in synchronization with the rising edge.

#### 21.4.22 YC Format Display [RZ/G1M/N/E]

In addition to RGB format display, data stored in YC format can be displayed unmodified in YC format. RGB format display data can also be RGB-YC converted and displayed as YC format. Data stored in YC format cannot be superpositioned; however, different planes can be displayed on the different display areas in the divided screen.

In DU0, to display data stored in YC format unmodified in YC format, select YC format rather than RGB format by setting bits 9 and 8 in the display unit extended function control register n (DEFRn\*1). Bits 9 and 8 setting of B'10 selects 16-bit YC format display (non-multiplexed), and a setting of B'11 selects 8-bit YC format display (multiplexed). A setting of B'00 selects RGB format.

In DU0, to use RGB-YC conversion for YC format display, set the RGBYC0 bits in display unit extended function control 5 register (DEF5R). A RGBYC0 setting of B'10 selects 18-bit display (non-multiplexed), and a setting of B'01 selects 10-bit display (multiplexed).

When YC format is displayed by the timing as shown in Figure 21.22 and Figure 21.23, input 2 clocks to DCLKIN and specify division by 2. Also output 2 clocks from DCLKOUT. Both 2 clocks output and division by 2 are specified by settings in the external synchronization control register n (ESCRn\*1). Non-multiplexed YC format can be displayed in Figure 21.22a and Figure 21.22b, this setting is not required.

### 21.4.23 RGB → YC Color Space Conversion Formula [RZ/G1M/N/E]

The formulae for RGB-YC conversion are given below. The underlined coefficients are defined by the settings in the corresponding registers.

$$Y = \underline{YCLRP} \times R + \underline{YCLGP} \times G + \underline{YCLBP} \times B + \underline{YCLAP}$$

$$Cb = \underline{CBCLRP} \times R + \underline{CBCLGP} \times G + \underline{CBCLBP} \times B + \underline{CBCLAP}$$

$$Cr = \underline{CRCLRP} \times R + \underline{CRCLGP} \times G + \underline{CRCLBP} \times B + \underline{CRCLAP}$$

Values to be set for full scale to ITU-R BT.601 conversion are as follows.

$$Y = 0.257 \times R + 0.504 \times G + 0.098 \times B + 16$$

$$Cb = -0.148 \times R - 0.291 \times G + 0.439 \times B + 128$$

$$Cr = 0.439 \times R - 0.368 \times G - 0.071 \times B + 128$$

Values to be set for full scale to full scale conversion are as follows.

$$Y = 0.299 \times R + 0.587 \times G + 0.114 \times B + 0$$

$$Cb = -0.169 \times R - 0.331 \times G + 0.550 \times B + 128$$

$$Cr = 0.500 \times R - 0.419 \times G - 0.081 \times B + 128$$

## 21.5 Display Control

RZ/G1H

RZ/G1N

RZ/G1M

RZ/G1E

### 21.5.1 Display Timing Generation

In the display unit (DU), display timing is generated for the horizontal direction and vertical direction of the display screen. Display timing is set by using display timing generation registers in section 21.3.2. Figure 21.24 shows the display timing in non-interlaced mode. Here, the display screen is defined in terms of the variables of Table 21.40.

**Figure 21.24 Display Timing Generation for Horizontal Direction and Vertical Direction of Display Screen**

**Table 21.40 Variables Defined in Display Screen**

Variables	Contents	Units
hc*1	Horizontal scan period	Dot clock
hsw	Horizontal sync pulse width	Dot clock
xs	From rise of HSYNC to display start position in the horizontal direction of the display screen	Dot clock
xw	Display width per 1 raster of display screen	Dot clock
vc*2	Vertical scan period	Raster line
vsw	Vertical sync pulse width	Raster line
ys	From rise of VSYNC to display start position in the vertical direction of the display screen	Raster line
yw	Vertical display period of display screen	Raster line

Notes: 1. Should be set such that  $hsw + xs + xw < hc$   
 2. Should be set such that  $vsw + ys + yw < vc$

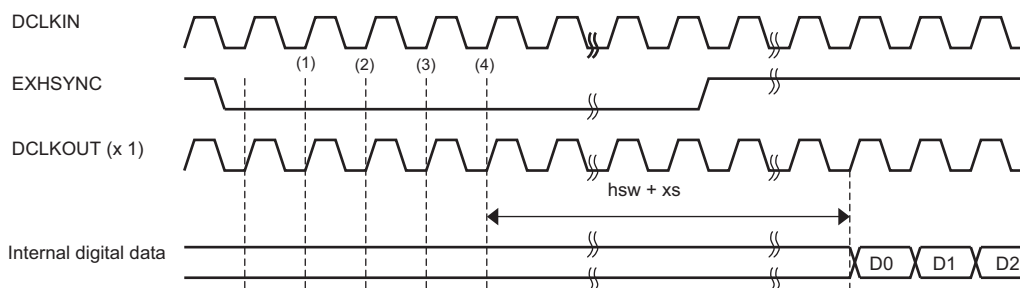

The display timing generation register settings are different depending on the scan method and synchronization method. Hence the value of the display timing generation registers should be set after performing calculations like those indicated in Table 21.41.

**Table 21.41 Correspondence Table of Settings of Display Timing Generation Registers**

Register Name	Bit Name	Synchronization Method	
		Master Mode	TV Sync Mode
Horizontal display start register n (HDSRn)	HDS	$hsw + xs - 19^{*5}$	$hsw + xs - 25^{*2*5}$
Horizontal display end register n (HDERn)	HDE	$hsw + xs - 19^{*5} + xw$	$hsw + xs - 25 + xw^{*2*5}$
Vertical display start register n (VDSRn)	VDS	$ys - 2^{*3}$	$ys - 2^{*3}$
Vertical display end register n (VDERn)	VDE	$ys - 2 + yw$	$ys - 2 + yw$
Horizontal synch width register n (HSWRn)	HSW	$hsw - 1$	$hsw - 1$
Horizontal cycle register n (HCRn)	HC	$hc - 1$	$hc - 1$
Vertical synch point register n (VSPRn)	VSP	$vc - vsw - 1$	$vc - vsw - 1$
Vertical cycle register n (VCRn)	VC	$vc - 1$	$vc - 1$

Notes: n = 0 to 2 for RZ/G1H; n = 0 and 1 for RZ/G1M/N/E

1. In all scan modes, VDS, VDE, VSP, VC settings are in single-field units.
2. The values of HDS and HDE are from the fourth rising edge of DCLKOUT after detection of the falling edge of EXHSYNC through the rising edge of DCLKOUT.

3. VDS should be set to 1 or greater.
4. HC should be set so as to satisfy  $HC > HDE$ .
5. If the function below is used, the following correction value is subtracted from both HDS and HDE in Table 21.41.

- When using the RGB-YC conversion function (RGBYC0 bits in the display unit extensional function control 5 register (DEF5R) are set to 1), 3 should be subtracted. [RZ/G1M/N/E]
- When using the YC-RGB conversion function (YCRGB0 or YCRGB1 bits in the display unit extensional function control 5 register m (DEF5Rm\*) are set to 1), 3 should be subtracted. [RZ/G1H]
- When using the DRC function (DRC0 or DRC1 bits in the display unit extensional function control 5 register (DEF5Rm\*) are set to 1), 3 should be subtracted. [RZ/G1H]

Note: \* m = 0 and 2, suffix "m" is only for RZ/G1H.

### 21.5.2 CSYNC

In master mode, a CSYNC (composite sync) signal is output. EQWRn\* is used to set the low-level pulse width of the CSYNC equivalent pulse. SPWRn\* is used to set the low-level pulse width of the CSYNC serration pulse.

The CSYNC waveform is selected using the CSY bit in DSMRn\*.

Note: \* n = 0 to 2 for RZ/G1H, n = 0 and 1 for RZ/G1M/N/E

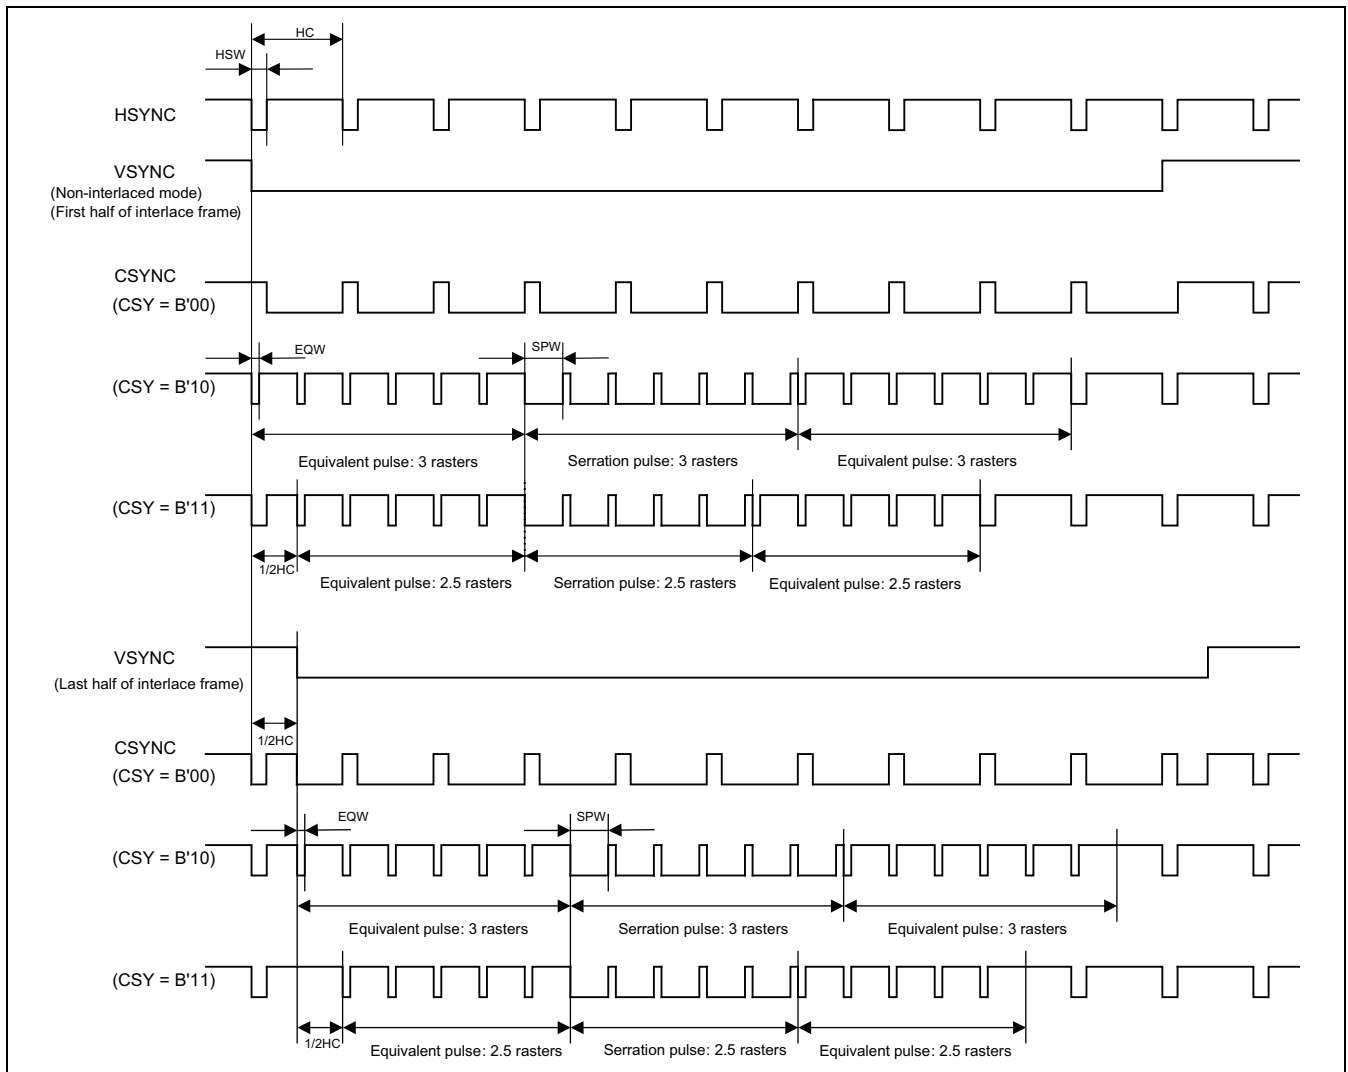

Figure 21.25 CSYNC Timing Chart

### 21.5.3 Scan Method

The scan method can be selected from among non-interlaced mode, interlaced sync mode, and interlaced sync & video mode. The mode is selected using bit 5 and bit 4 in DSYSRn\*.

- Non-interlaced mode  
In this scan method, one frame consists of a single field.
- Interlaced sync mode  
In this scan method, one frame consists of two fields. The two fields are an even field and an odd field, displaying the same data.
- Interlaced sync & video mode  
In this scan method, one frame consists of two fields. The two fields are an even field and an odd field, displaying different data.

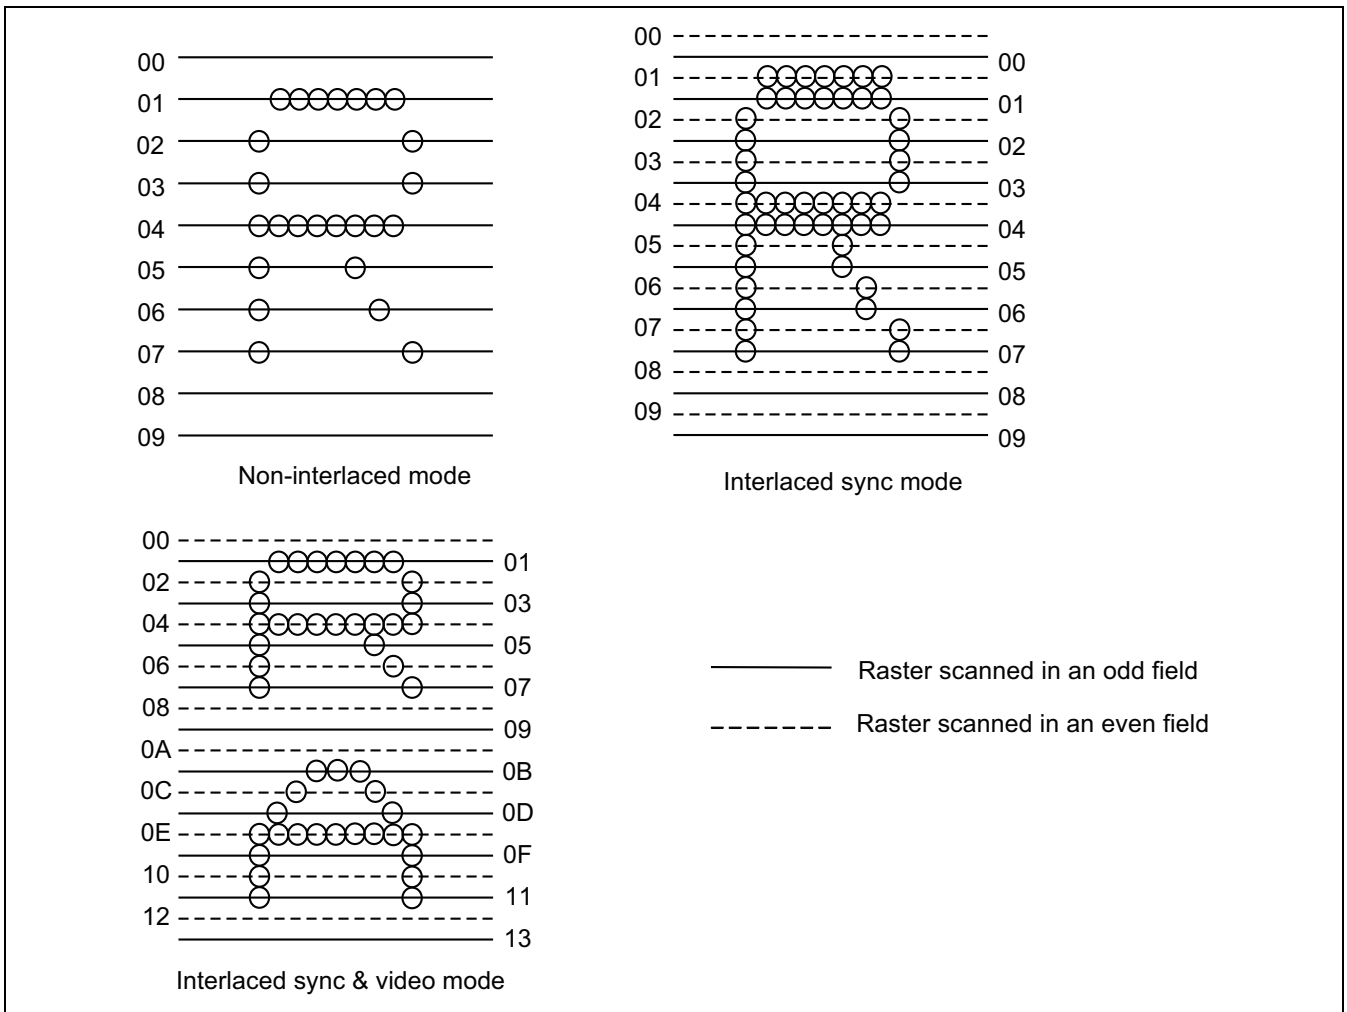

The ODEV bit in DSMRn\* is used to set the display order of fields in interlaced sync mode and in interlaced sync & video mode. When the ODEV bit is 0, the display order for one frame is odd field, then even field; when the ODEV bit is 1, the order for one frame is even field, then odd field.

In master mode, high level is output from the ODDF pin during even field display, and low level is output during odd field display. In TV sync mode, high level is input to the EXODDF pin to cause display of the even field, and low level is input to cause display of the odd field.

Notes: When non-interlaced mode is selected in TV sync mode, the EXODDF pin should be fixed at low level or high level.

\* n = 0 to 2 for RZ/G1H, n = 0 and 1 for RZ/G1M/N/E.

**Figure 21.26 Example of Display in Each Scan Mode**

- Example of vertical scan period  
 Non-interlaced mode: 1/60 second/field, 1/30 second/field  
 Interlaced sync mode: 1/30 second/frame  
 Interlaced sync & video mode: 1/30 second/frame
- Display in non-interlaced method  
 In this method, all lines are displayed at once without providing intervals between input video signals.  
 This input method is for monitors capable of high-resolution display.

Figure 21.27 Display in Non-Interlaced Method

• Display in interlaced method

At every scan period VC of the input video signal, even lines and odd lines are switched and displayed in alternation, and a single screen (one frame) is combined and displayed (with the afterimage of the preceding VC) with a period of 2VC. This is a basic TV input method.

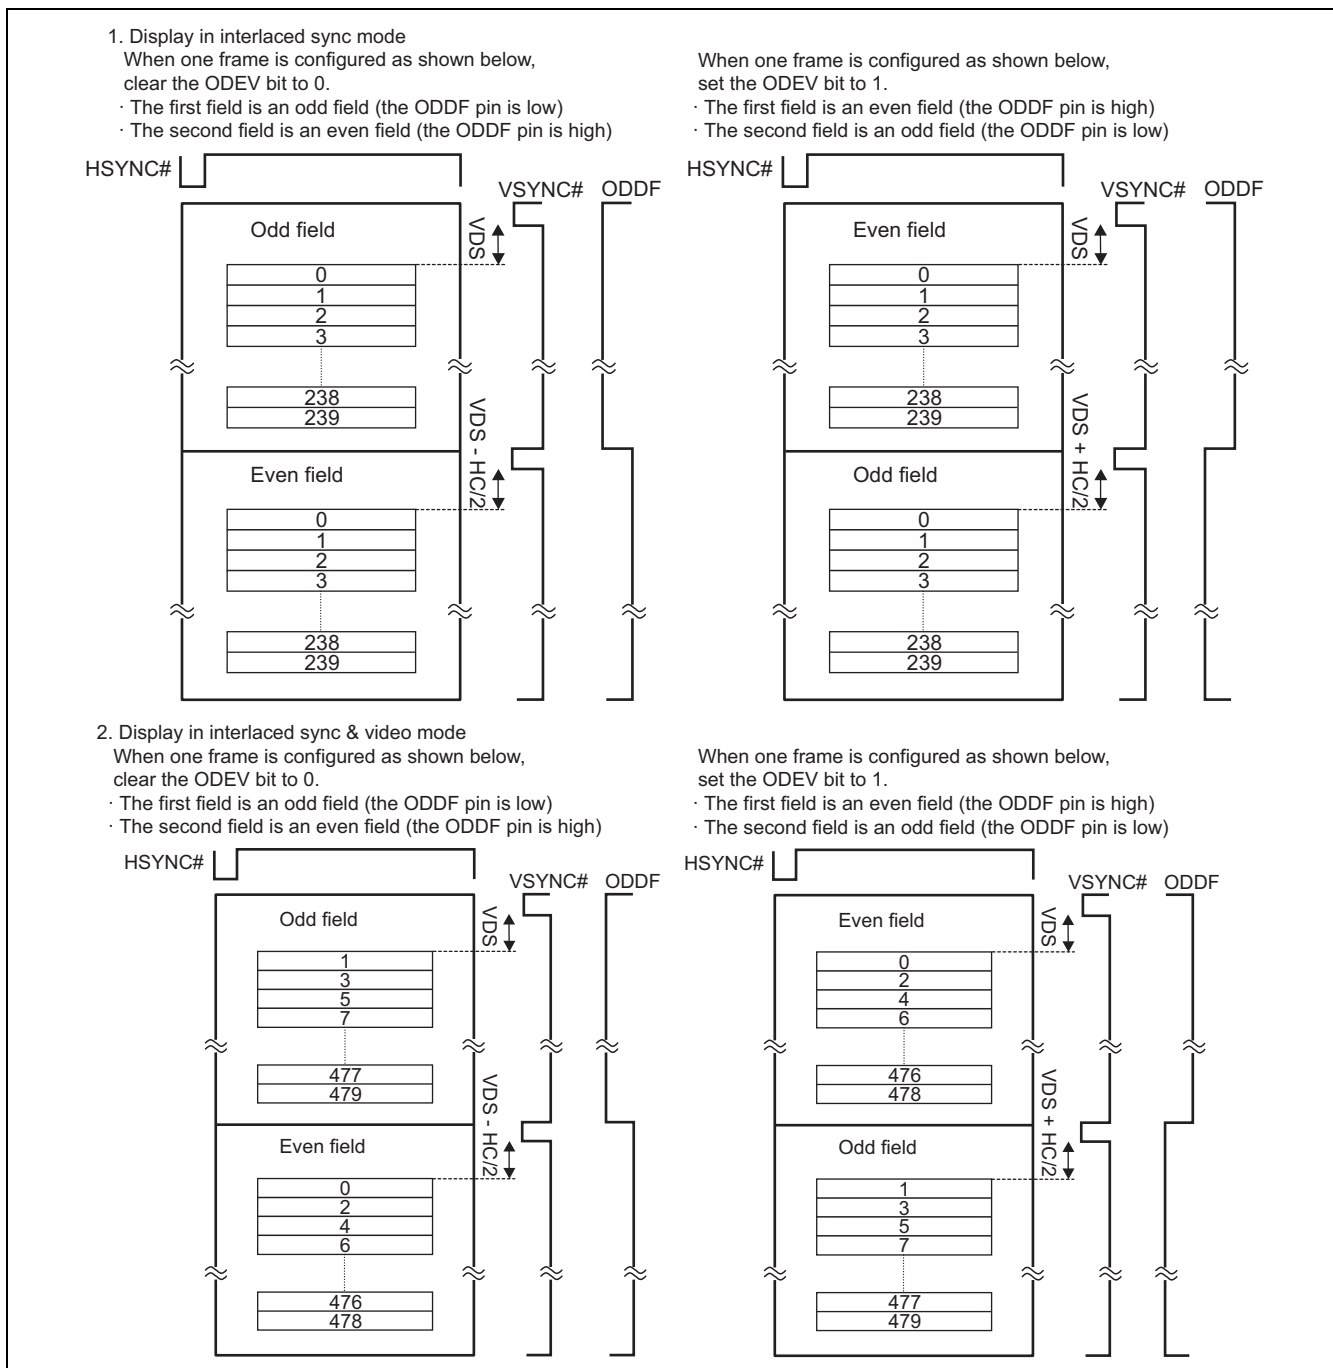

Figure 21.28 Display in Interlaced Method

### 21.5.4 Color Detection

When output display data matches a color set in CDERn\*<sup>1</sup>, high level is output from the CDE pin. The CDEM bit in DSMRn\*<sup>1</sup> can be used to fix the level outside display intervals. Also, the CDEL bit in DSMRn\*<sup>1</sup> can be used to select the polarity of the output level.

When the following display functions are set, the color detection function cannot be used.

- DRC processing performed by setting the DRC0 bits in the display unit extensional function control 5 register m (DEF5Rm\*<sup>2</sup>) [RZ/G1H]
- DRC processing performed by setting the DRC1 bits in the display unit extensional function control 5 register m (DEF5Rm\*<sup>2</sup>) [RZ/G1H]
- YC-RGB conversion performed by setting the YCRGB0 bits in the display unit extensional function control 5 register m (DEF5Rm\*<sup>2</sup>) [RZ/G1H]
- YC-RGB conversion performed by setting the YCRGB1 bits in the display unit extensional function control 5 register m (DEF5Rm\*<sup>2</sup>) [RZ/G1H]
- RGBYC processing performed by setting the RGBYC0 bits in the display unit extensional function control 5 register (DEF5R) [RZ/G1M/N/E]

Notes: 1. n = 0 to 2 for RZ/G1H, n = 0 and 1 for RZ/G1M/N/E.  
2. m = 0 and 2, suffix "m" is only for RZ/G1H.

**Table 21.42 Output Level of the CDE Pin**

CDEL	CDEM	The CDE pin in display intervals		The CDE pin outside display intervals	
		Result of Comparison of Output Display Data and Color Detection Register		Value of Color Detection Register*	
		Same	Different	0	Other than 0
0	B'00	High level	Low level	High level	Low level
0	B'01	High level	Low level	High level	Low level
0	B'10	High level	Low level	Low level	Low level
0	B'11	High level	Low level	High level	High level
1	B'00	Low level	High level	Low level	High level
1	B'01	Low level	High level	Low level	High level
1	B'10	Low level	High level	High level	High level
1	B'11	Low level	High level	Low level	Low level

Note: \* Output display data is 0 outside display intervals.

### 21.5.5 External Sync Control

In TV-sync mode, the display unit (DU) is capable of using an externally input dot clock (clock signal for frequency multiplication: DCLKIN) to generate a dot clock (output dot clock: DCLKOUT) that is in accord with external synchronizing signals (EXHSYNC, EXVSYNC). Supply the externally input dot clock (multiplication clock: DCLKIN) and set the following parameters in ESCRn\*.

**Table 21.43 External Sync Control Parameters**

Variable	Function
ESCRn*/SYNCSEL	Selects the sync signal (EXHSYNC or EXVSYNC) to use in phase matching of the dot clock.
ESCRn*/FRQSEL	Selects the dot-clock division ratio.

1. Use the SYNCSEL bits of ESCRn\* to set the sync timing of the dot clock (output dot clock: DCLKOUT) generated from the internal dot clock.
2. Use the FRQSEL bits of ESCRn\* to set the division ratio for generation of the internal dot clock. The following figure shows the internal dot clock timing where the input dot clock has been synchronized with EXHSYNC and then divided by four.

Note \* n = 0 to 2 for RZ/G1H, n = 0 and 1 for RZ/G1M/N/E.

**Figure 21.29 DCLKOUT Timing Chart where DCLKIN Synchronized with EXHSYNC is divided by Four**

### 21.5.6 Output Signal Timing Adjustment

The display unit (DU) enables selection of output timing, with respect to the output dot clock, of the various output signals (the four sync signals HSYNC, VSYNC, CSYNC, ODDF, as well as DISP, CDE, CLAMP, DE, digital RGB signals). Timing is selected by setting OTARn\*.

Note \* n = 0 to 2 for RZ/G1H, n = 0 and 1 for RZ/G1M/N/E.

**Table 21.44 Output Signal Timing Setting Parameters**

Variable	Description
SYNCA	Sets output timing of the HSYNC, VSYNC, CSYNC, ODDF signal
DISPA	Sets output timing of the DISP signal
CDEA	Sets output timing of the CDE signal
DRGBA	Sets output timing of digital RGB signal
CLAMPA	Sets output timing of the CLAMP signal
DEA	Sets output timing of the DE signal

**Figure 21.30 Adjustable Range of Output Timing**

## 21.6 Notes on Usage

RZ/G1H

RZ/G1N

RZ/G1M

RZ/G1E

### 21.6.1 Module Standby Mode

Module Standby mode, in which supply of the clock signal to the display unit (DU) is stopped, is supported.

Even when the display unit (DU) enters the standby mode, the register values are retained. Do not access the display unit (DU) during periods in standby mode.

### 21.6.2 Transition to Module Standby Mode

1. Set both the DEN and DRES bits in DSYSRm\*<sup>1</sup> to 0 to stop access to the AXI.
2. Test bit 11 in DSSRn\*<sup>2</sup> to confirm the next VBK flag. The setting made in step 1 becomes effective with the timing of VBK and access to AXI is stopped. The value of the display data becomes the value set in DOORn\*<sup>2</sup>  
When DU0, DU1 and DU2 are running, test bit 11 of all of DSSR0, DSSR1 and DSSR2. [RZ/G1H]  
When DU0 and DU1 are running, test bit 11 of both DSSR0 and DSSR1.
3. Stop the clock.
4. When the DRC is running, after step 3, stop the clock of the module to be stopped. [RZ/G1H]

Notes: 1. m = 0 and 2 for RZ/G1H, m = 0 for RZ/G1M/N/E.  
2. n = 0 to 2 for RZ/G1H, n = 0 and 1 for RZ/G1M/N/E.

### 21.6.3 Release from Module Standby Mode and Restarting Display

1. When running the DRC, start the clock of the module to be run. [RZ/G1H]
2. Start the clock.
3. Make settings to turn the display on by setting the DEN and DRES bits in DSYSRm\* to 1 and 0 respectively.

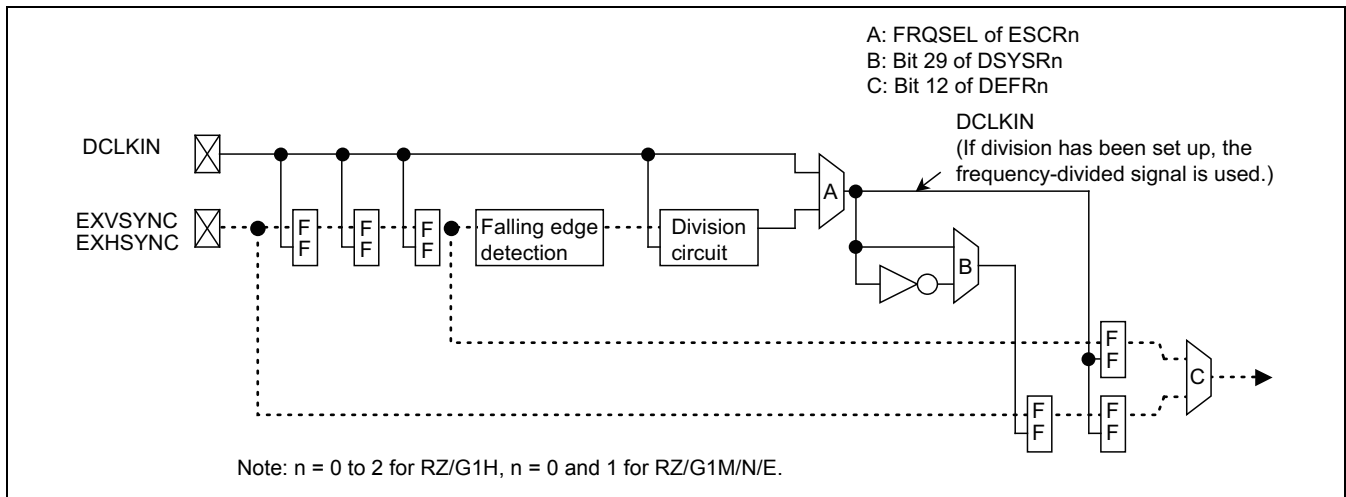

Note: \* 1: m = 0 and 2 for RZ/G1H, m = 0 for RZ/G1M/N/E.

### 21.6.4 Acquisition of External Sync Signal

The following three ways of acquiring the external SYNC signal are available.

- (a) The SYNC signal is acquired on rising edges of DCLKIN (or the frequency-divided clock signal derived from this if division has been set up).
- (b) The SYNC signal is acquired on falling edges of DCLKIN (or the frequency-divided clock signal derived from this if division has been set up).
- (c) Assuming that division has been set up, the SYNC signal that is acquired by the pre-division clock signal is latched on edges of the frequency-divided clock signal.

The electrical characteristics (AC spec.) are only guaranteed for case (a) above. There is no guarantee of electrical characteristics (AC spec.) for cases (b) and (c).

**Figure 21.31 Diagram of Circuit that Generates the Display Timing from an External Sync Signal**

### 21.6.5 Restrictions on Changing the Synchronization of the External SYNC Signal

When electrical characteristics (AC spec.) related to the acquisition of an external signal are not satisfied, ensure an interval of at least two cycles between changes of EXHSYNC or EXVSYNC, i.e. the external SYNC signals.

The frequency-divided dot clock is used as the basis of the cycle period when bit 12 of DEFRn\* is 0. The pre-division dot clock is used when bit 12 is 1.

Note: \* n = 0 to 2 for RZ/G1H, n = 0 and 1 for RZ/G1M/N/E.

### 21.6.6 Note on Register Settings

At the time of a reset, some registers of the DU have fixed initial values but others do not. The initial values of the latter when the power for the LSI is turned on can be either 0 or 1. From the initial state after power is switched on, be sure to set all of the registers in the DU to the desired values before starting synchronization of the display\*<sup>1</sup>.

If turning on the display\*<sup>2</sup>,  $\alpha$  planes\*<sup>3</sup>, or capturing\*<sup>4</sup> is attempted while values in registers are unknown, operation may be incorrect due to access by the DU to areas other than those intended (the DU is capable of access to any area).

- Notes:
- Setting (a) or (b) starts synchronization of the display.
    - The DRES and DEN bits in DSYSRm\*<sup>5</sup> are B'00.
    - The DRES and DEN bits in DSYSRm\*<sup>5</sup> are B'01.
  - Setting (a) or (b) turns the display on.
    - When the DPRS bit in DORCRm\*<sup>6</sup> is 0:  
With setting (b) in note 1, setting any of bits DPE8 to DPE1 in DPPRm\*<sup>6</sup> to 1.
    - When the DPRS bit in DORCRm\*<sup>6</sup> is 1:  
With setting (b) in note 1, setting bits S0S8 to S0S1 in DS0PRm\*<sup>6</sup> or bits S1S8 to S1S1 in DS1PR to any value from B'0001 to B'1000.
  - $\alpha$  planes are turned on by the combination of setting (b) in note 1 and any of bits AP2E or AP1E in DAPCRm\*<sup>6</sup> being set to 1.
  - Capturing is turned on by the combination of setting (b) in note 1 and the DC2E or DCE bit in DCPCRm\*<sup>6</sup> being set to 1.
  - m = 0 and 2 for RZ/G1H, m = 0 for RZ/G1M/N/E.
  - m = 0 and 2 for RZ/G1H, suffix "m" is only for RZ/G1H.

## 22. LVDS Interface

RZ/G1H	RZ/G1N
RZ/G1M	RZ/G1E

### 22.1 Overview

The LVDS (low voltage differential signaling) module converts an RGB signal output by the DU module to the LVDS format and outputs those signals.

The LVDS interface supports 8 output data formats with the conversion formats selected by register settings. The output control signals can also be selected freely.

#### 22.1.1 Features

This module has the following features.

- Output pins: Five differential output pairs (4 data and 1 clock) that conform to the TIA/EIA-644 standard.
- Operating frequency: A maximum dot clock frequency of 31 to 148.5 MHz
- Supports eight output data formats

#### 22.1.2 Block Diagram

Figures 22.1a and 22.1b show the block diagrams of the LVDS module.

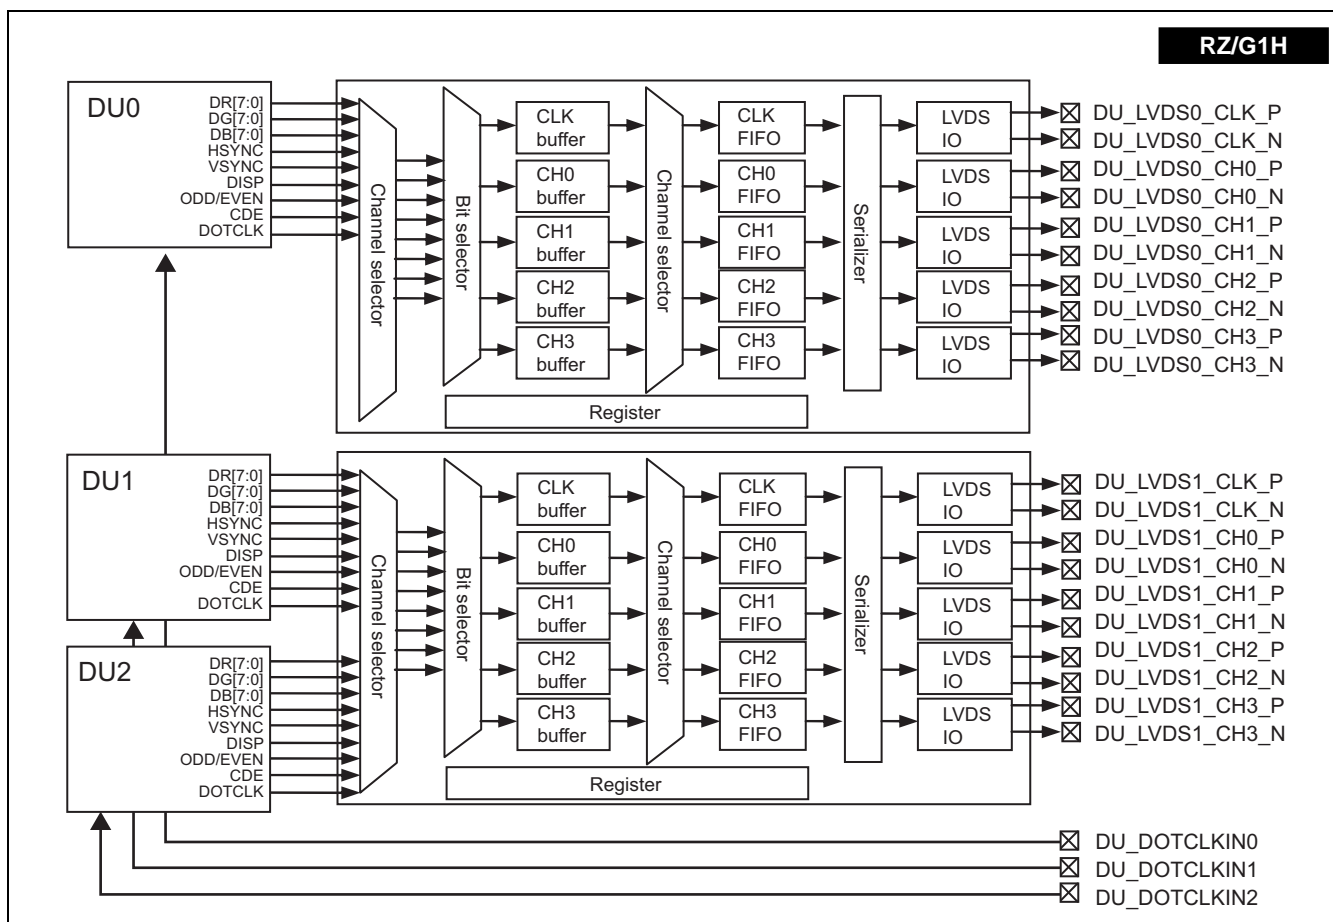

Figure 22.1a LVDS Block Diagram [RZ/G1H]

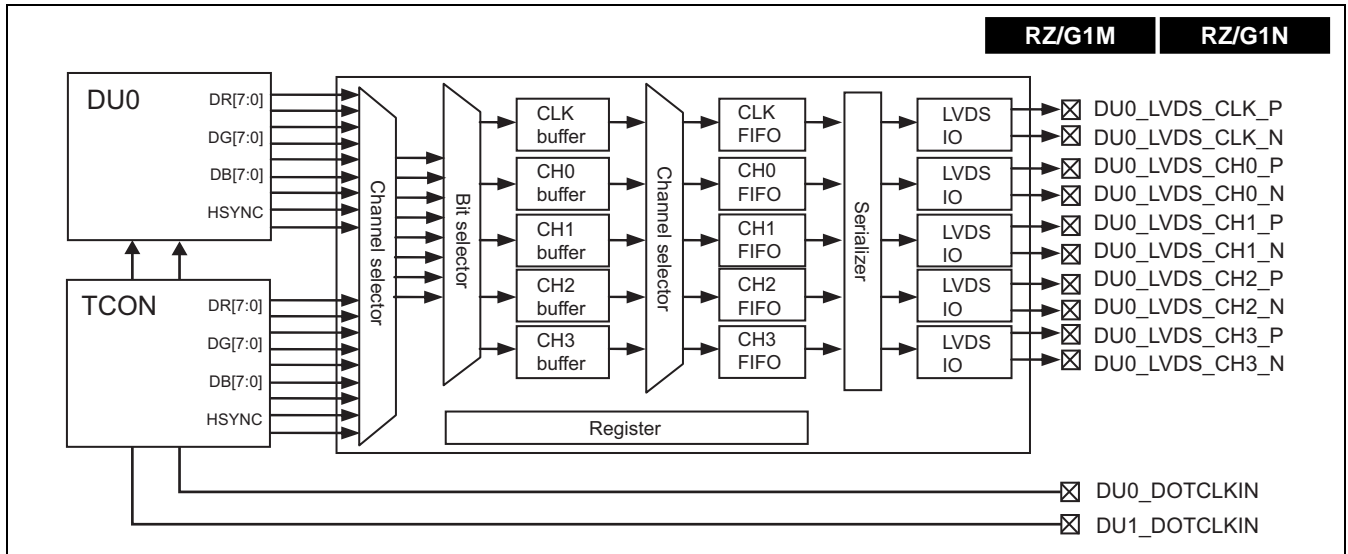

Figure 22.1b LVDS Block Diagram [RZ/G1M, RZ/G1N]

### 22.1.3 Input/Output Pins

**Table 22.1 Pin Configuration**

Pin Name	I/O	Description
DU_LVDS0_CLK_P [RZ/G1H] DU0_LVDS_CLK_P [RZ/G1M, RZ/G1N]	Output	LVDS differential clock (pos)
DU_LVDS0_CLK_N [RZ/G1H] DU0_LVDS_CLK_N [RZ/G1M, RZ/G1N]	Output	LVDS differential clock (neg)
DU_LVDS0_CH0_P [RZ/G1H] DU0_LVDS_CH0_P [RZ/G1M, RZ/G1N]	Output	LVDS differential Ch0 data (pos)
DU_LVDS0_CH0_N [RZ/G1H] DU0_LVDS_CH0_N [RZ/G1M, RZ/G1N]	Output	LVDS differential Ch0 data (neg)
DU_LVDS0_CH1_P [RZ/G1H] DU0_LVDS_CH1_P [RZ/G1M, RZ/G1N]	Output	LVDS differential Ch1 data (pos)
DU_LVDS0_CH1_N [RZ/G1H] DU0_LVDS_CH1_N [RZ/G1M, RZ/G1N]	Output	LVDS differential Ch1 data (neg)
DU_LVDS0_CH2_P [RZ/G1H] DU0_LVDS_CH2_P [RZ/G1M, RZ/G1N]	Output	LVDS differential Ch2 data (pos)
DU_LVDS0_CH2_N [RZ/G1H] DU0_LVDS_CH2_N [RZ/G1M, RZ/G1N]	Output	LVDS differential Ch2 data (neg)
DU_LVDS0_CH3_P [RZ/G1H] DU0_LVDS_CH3_P [RZ/G1M, RZ/G1N]	Output	LVDS differential Ch3 data (pos)
DU_LVDS0_CH3_N [RZ/G1H] DU0_LVDS_CH3_N [RZ/G1M, RZ/G1N]	Output	LVDS differential Ch3 data (neg)
DU_LVDS1_CLK_P [RZ/G1H]	Output	LVDS differential clock (pos)
DU_LVDS1_CLK_N [RZ/G1H]	Output	LVDS differential clock (neg)
DU_LVDS1_CH0_P [RZ/G1H]	Output	LVDS differential Ch0 data (pos)
DU_LVDS1_CH0_N [RZ/G1H]	Output	LVDS differential Ch0 data (neg)
DU_LVDS1_CH1_P [RZ/G1H]	Output	LVDS differential Ch1 data (pos)
DU_LVDS1_CH1_N [RZ/G1H]	Output	LVDS differential Ch1 data (neg)
DU_LVDS1_CH2_P [RZ/G1H]	Output	LVDS differential Ch2 data (pos)
DU_LVDS1_CH2_N [RZ/G1H]	Output	LVDS differential Ch2 data (neg)
DU_LVDS1_CH3_P [RZ/G1H]	Output	LVDS differential Ch3 data (pos)
DU_LVDS1_CH3_N [RZ/G1H]	Output	LVDS differential Ch3 data (neg)
DU_DOTCLKIN0 [RZ/G1H] DU0_DOTCLKIN [RZ/G1M, RZ/G1N]	Input	LVDS Dotclk input (31 to 148.5 MHz)*
DU_DOTCLKIN1 [RZ/G1H] DU1_DOTCLKIN [RZ/G1M, RZ/G1N]	Input	LVDS Dotclk input (31 to 148.5 MHz)*
DU_DOTCLKIN2 [RZ/G1H]	Input	LVDS Dotclk input (31 to 148.5 MHz)*

Note: \* Either an internal clock or the LVDS\_DOTCLKIN clock can be used as the LVDS Dotclk. The DU register is used to select the clock source and the clock divisor. See section 22.3.4, Dotclk Settings, for details.

The state of the LVDS pin is determined by the LVDCR register.

**Table 22.2 Pin State**

Bit Name		Pin State	Notes
LVRES	LVEN		
0	0	X (Irrelevant (L or H))	Set at reset and as the initial value.
0	1	Hi-Z (High Impedance)	When the display is off.
1	0	L (DU_LVDS_xxx_P), H (DU_LVDS_xxx_N)	Operation is not guaranteed.
1	1	Output	During normal operation.

## 22.2 Register Description

Table 22.3 lists the register configuration. Only use the longword access size to access these registers. Operation is not guaranteed if any access size other than longword is used to access these registers.

**Table 22.3 Register Configuration**

Name	Abbreviation	R/W	LVDS0 Address	LVDS1 Address [Only RZ/G1H]	Access Size	RZ/G Series Products

## 22.3 Operation

RZ/G1H	RZ/G1N
RZ/G1M	RZ/G1E

The LVDS module converts the RGB signals output by DU to the LVDS format and outputs those signals. Since the output data format can be selected by register settings, this module can convert to any of the LVDS formats. The output data format is determined by (1) the mode selection, (2) the Ctrl signal selection, and (3) the CH selection.

The registers concerned with the output data format must be set before the LVDS module is started and must not be changed during module operation. (See section 22.3.5, Setting Procedure, for details.)

### 22.3.1 Mode Selection

The mode is selected by the LDMD bits in the LVDS control register 0. Figure 22.2 shows the modes that can be set.

Here, R0 to R7, G0 to G7, and B0 to B7 are the RGB signals and Ctrl0 to Ctrl3 are control signals (such as HSYNC and VSYNC). The Ctrl signals can be set by the CTR control register.

CH0, CH1, CH2, and CH3 are buffers that hold data temporarily. The default is for the CH0, CH1, CH2, and CH3 data to be output directly without change to DU\_LVDS0/1\_CH0\_P/N, DU\_LVDS0/1\_CH1\_P/N, DU\_LVDS0/1\_CH2\_P/N, and DU\_LVDS0/1\_CH3\_P/N. The CH assignment can be switched with the CH control register settings.

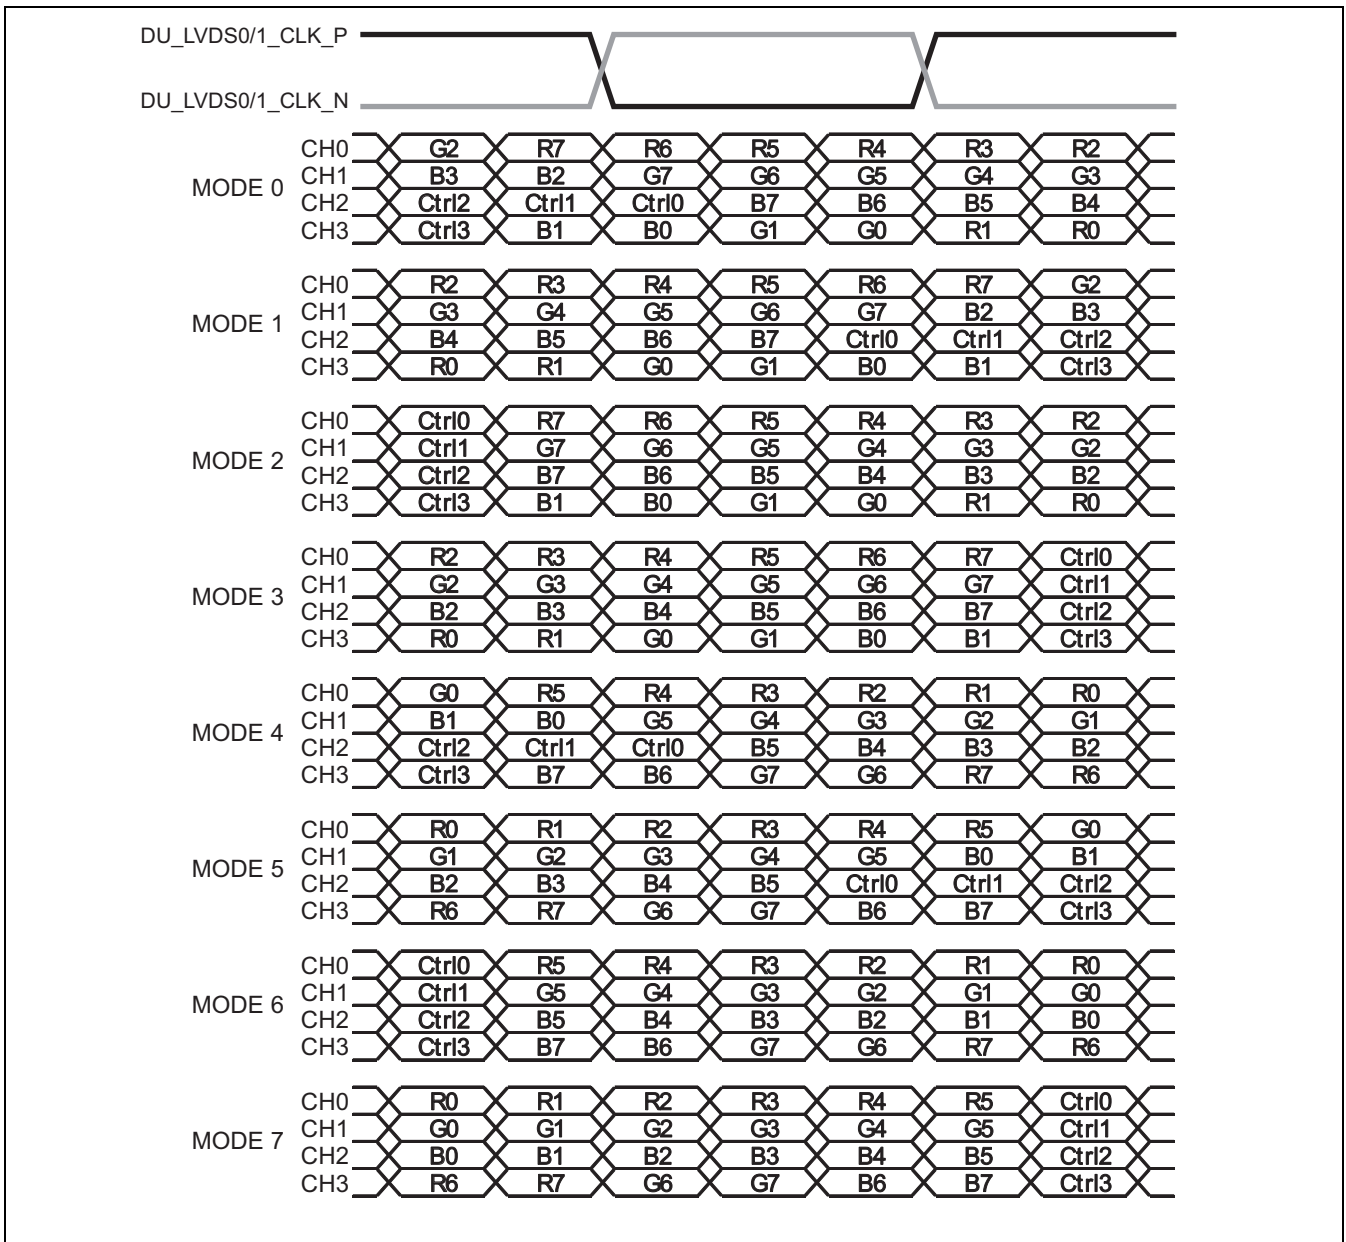

Figure 22.2 Output Data Format (1)

Figure 22.3 Output Data Formats (2)

### 22.3.2 Ctrl Signal Selection

The two stage settings shown below are required to select the Ctrl signals.

#### (1) DU Output Signal Selection

The DU output ports are multiplexed. The signals that you want to output are set up with the corresponding register. The specified signals are input to the LVDS module ports.

#### (2) LVDS Port Selection

The LVDS ports used to output to the Ctrl signals are selected with the CTR control register (LVDCTRCR). This results in the signals input to the LVDS ports being output as Ctrl signals.

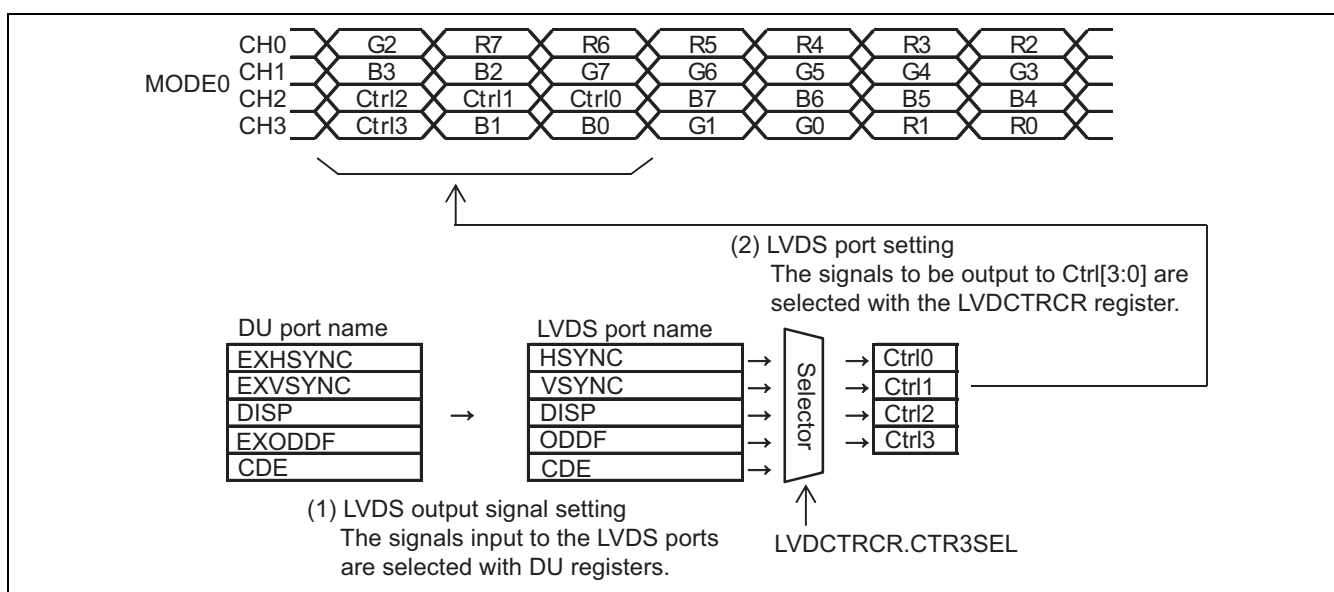

Figure 22.4 Ctrl Signal Selection

Set the desired Ctrl signal characteristics with the DU registers.

For example, to reverse the polarity of the HSYNC signal, the polarity must be set with DU register settings. (The LVDS module only converts the signals output from DU to the LVDS format.)

An example of Ctrl signal settings is shown below.

1. Ctrl0 = HSYNC, Ctrl1 = VSYNC, and Ctrl2 = DISP

Set the DU registers so that HSYNC, VSYNC, and DISP are output.

Then set the CTR control register (LVDCTRCR) so that CTR0SEL = B'000, CTR1SEL = B'000, and CTR2SEL = B'000.

2. Ctrl0 = CSYNC, Ctrl1 = ODDF, and Ctrl2 = CDE

Set the DU registers so that CSYNC, ODDF, and CDE are output.

Then set the LVDS register (LVDCSCR) so that CTR0SEL = B'000, CTR1SEL = B'010, and CTR2SEL = B'010.

(Note that since CSYNC can also be output from other ports, CTR0SEL must be set to match the port from which DU outputs CSYNC.)

### 22.3.3 CH Selection

The LVDS module stores the RGB signal data in CH0, CH1, CH2, and CH3 according to the mode selection and Ctrl signal selection registers.

The CH0, CH1, CH2, and CH3 data is then stored in the CH0, CH1, CH2, and CH3 FIFOs according to the CH selection register setting. The data stored in the CH0, CH1, CH2, and CH3 FIFOs is output from the external pins after passing through the LVDS buffers.

### 22.3.4 Dotclk Settings

The LVDS module Dotclk frequency is determined by the clock source selected and the divisor settings. This section describes how this frequency is set.

The individual settings are made with the DU (Display Unit) and PFC (Pin Function Controller) registers. Refer to the corresponding sections for details on the registers, notes, and other information on these settings.

- Clock source selection

The clock source can be selected to be either the internal clock (clkp) or an external input (DU\_DOTCLKIN0, DU\_DOTCLKIN1 or DU\_DOTCLKIN2\*).

This is set with the DCLK SEL bit in the DU external sync control register n (ESCRn (n = 0, 1, 2\*)).

When an external input (DU[01]\_DOTCLKIN, DU\_DOTCLKIN2\*) is used, set the DU[01]\_DOTCLKIN function in the PFC GPIO peripheral function selection (GPSR). See the section on PFC pin multiplexing settings for details.)

- Divisor setting

This setting specifies the divisor applied to the clock source.

This is set with the FRQSEL field in the DU external sync control register n (ESCRn (n = 0, 1, 2\*)).

Note: \* Only RZ/G1H

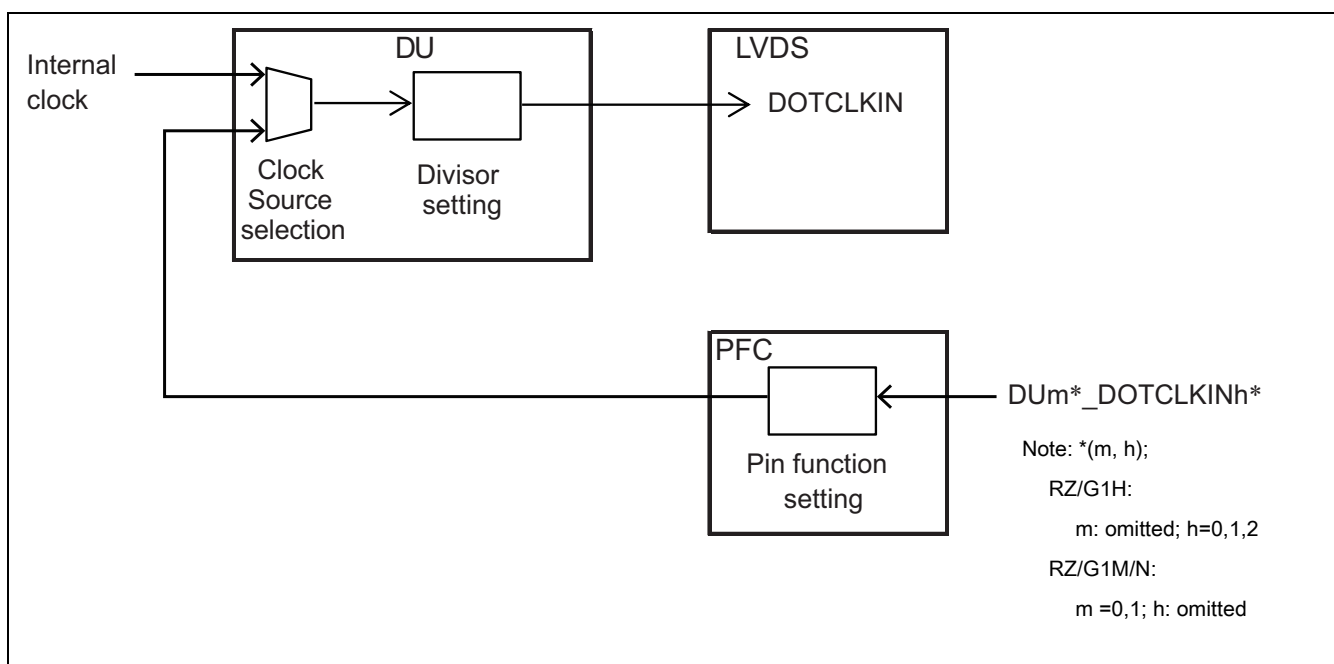

Figure 22.5 Dotclk Settings

### 22.3.5 Setting Procedure

The procedure for using the LVDS module is shown below.

#### Startup Procedure

1. Clear the DU and LDVS module standby states using CPG: MSTPCR.\*<sup>1</sup>
2. Set the DU register.\*<sup>2</sup>
3. Set the LVDS registers other than LVDCR0.PLLON, BEN, LVEN, LVRES and LVDCR1.CHnSTBY.\*<sup>3</sup>
4. Set LVDCR1.CHnSTBY to B'11 to turn on the LVDS IO.
5. Set LVDCR0.BEN and LVEN to 1 to enable the LVDS logic.
6. Set LVDCR0.PLLON to 1 to turn on the PLL.
7. When all of the following conditions have been met, set LVDCR.LVRES to 1.
  - At least 100  $\mu$ s has elapsed since LVDCR0.PLLON was set to 1.
8. Signals will be output from the LVDS pins after LVDCR0.LVRES is set to 1.

Notes: 1. For both the DU and LVDS modules, the initial state is the module standby state. When starting the module immediately after a reset, the module standby state must be cleared.

2. Here, it is possible to proceed as long as the Dotclk signal is output. (The LVDS PLL must be started.) Other items may be set while waiting for the conditions of step 6 to be met.

3. This refers to settings other than those that are concerned with LVDS startup. These items may be set while waiting for the conditions of step 6 to be met.

#### Turning the Display On or Off

##### Display Off

1. Set LVDCR0.LVRES to 0 to turn the display off.
2. Set LVDCR0.PLLON to 0 to turn the LVDS PLL circuit off.
3. Set LVDCR0.BEN and LVEN to 0 to disable the LVDS logic.
4. Set LVDCR1.CHnSTBY to B'00 to turn off the LVDS IO.
5. Set CPG: SRCR\* to 1 to reset LVDS module.

##### Display On

6. Set CPG: SRSTCLR\* to 1 to clear reset of LVDS module.
7. Re-perform the above procedure [Startup Procedure]

## 22.4 Usage Notes

RZ/G1H

RZ/G1N

RZ/G1M

RZ/G1E

The following notes must be observed when using the LVDS module.

Incorrect operation and damage to the device itself may occur if these notes are not followed.

- Since the LVDS module includes logic that operates from the dot clock (Dotclk) signal output by the DU module, incorrect operation may occur if the DU registers are not set appropriately. Also, do not change any DU register values during LVDS operation. (If Dotclk output is not stable, the LVDS PLL is unlocked, and thus operation cannot be guaranteed.) There are two DU registers related to Dotclk: Display unit SYStem control Register n (DSYSRn, n = 0, 1, 2\*) and External Synchronization Control Register n (ESCRn, n = 0, 1, 2\*). These registers must not be changed during LVDS operation.
- Set the Dotclk signal input to the LVDS module to a frequency within the LVDS module's guaranteed operating range (31 to 148.5 MHz).
- Application systems should be implemented in a failsafe manner, such as by connecting the LVDS outputs to a failsafe receiver or by connecting terminators, so that no problems in or damage to the application can occur if the LVDS pins become unstable (for example, going to the high-impedance state or the differential outputs going to the same level).

Note: \* Only RZ/G1H

## 22.5 Notes on Board Design

### 22.5.1 Notes on Using the PLL Oscillator Circuit

Isolate the VDD-LVDSPLL and VSS-LVDSPLL levels from other VDD and VSS levels at the board power supply sources. Also, insert the resistor RCB and the bypass capacitor CB in the power supply circuit near these pins.

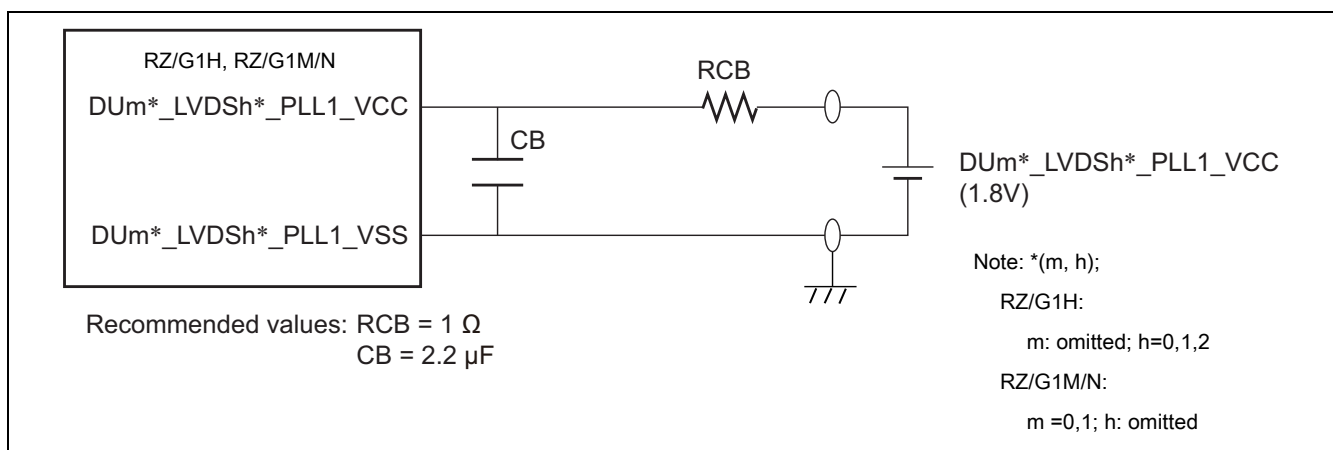

Figure 22.6 Notes on Using the PLL Oscillator Circuit

## 23. Video Input Module (VIN)

RZ/G1H

RZ/G1N

RZ/G1M

RZ/G1E

### 23.1 Overview

The video input module (hereinafter abbreviated as VIN) is a video capture module that stores in external memory YCbCr-422 data through the ITU-R BT.601, ITU-R BT.656, or ITU-R BT.709 interface and RGB data through the ITU-R BT.601 or ITU-R BT.709 interface.

The module has up to six video channels that can independently control the capture of data into a capture area of up to  $2048 \times 2048$  pixels. It can also provide vertical and horizontal scaling of the data by up to three and two times, respectively.

For captured video data, the VIN provides a color space conversion function from YCbCr-422 to RGB, a format conversion function from RGB to ARGB.

As the VIN internally generates a field signal, it can capture progressive data.

- Notes:
1. The maximum frequency of the video clock is 100 MHz when bit 31 (FAST) in the main control register is set to support the 100 MHz clock input, except during vertical or horizontal scaling up.
  2. When the ITU-R BT.709 interface is in use, the maximum frequency of the video clock is 74.5 MHz.
  3. The number of video input channels for each product is as follows:
    - RZ/G1H: 4 channels
    - RZ/G1M/N: 3 channels
    - RZ/G1E: 2 channels

### 23.1.1 Features

#### (1) Video Channels 0 and 1 (RZ/G1H, M/N) and Video Channel 0 (RZ/G1E)

The following input interfaces can be selected for these channels.

**Table 23.1 Input Interface for Video Channels 0 and 1 for RZ/G1H, M/N, Channel 0 for RZ/G1E**

Interface	Data Width	Data Type	RZ/G Series Products			
			RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
ITU-R BT.601/BT.709*1,*3	8/10/12 bits	YCbCr-422 data (UYVY format)	√	√	√	√
ITU-R BT.601/BT.709	4/8 bits	YCbCr-422 data (UYVY format) Double-edge capture mode	√	—	—	—
ITU-R BT.601/BT.709*3/ BT.1358*2	16/20/24 bits	YCbCr-422 data (8/10/12 bits (Y) + 8/10/12 bits (CbCr) format)	√	√	√	√
ITU-R BT.656*1	8/10/12 bits	YCbCr-422 data (UYVY format)	√	√	√	√
ITU-R BT.656	4/8 bits	YCbCr-422 data (UYVY format) Double-edge capture mode	√	—	—	—
ITU-R BT.601/BT.709*3	18 bits	RGB-666 data	√	√	√	√
ITU-R BT.601/BT.709*3	12 bits	RGB-888 data Double-edge capture mode	√	—	—	—
ITU-R BT.601/BT.709*3	24 bits	RGB-888 data	√	√	√	√

- Notes:
1. Disable the XY scaling settings when using the 10/12-bit YCbCr-422 format in the ITU-R BT.601, BT.709, or BT.656 interface (only the 100% scaling is enabled).
  2. Disable the XY scaling settings when using the 20/24-bit YCbCr-422 format in the ITU-R BT.601, BT.709, or BT.1358 interface (only the 100% scaling is enabled).
  3. When the ITU-R BT.709 interface is in use, the maximum frequency of the video clock is 74.5 MHz.
  4. RZ/G1E channel 0 (excluding RZ/G1E channel 1).

**(2) Video Channel 2 (RZ/G1H, M/N), Channel 1(RZ/G1E)**

The following input interfaces can be selected for this channel.

**Table 23.2 Input Interface for Video Channel 2 for RZ/G1H, M/N, Channel 1 for RZ/G1E**

Interface	Data Width	Data Type	RZ/G Series Products			
			RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
ITU-R BT.601*1/BT.709*2	8 bits	YCbCr-422 data (UYVY format)	√	√	√	—
	8/10/12 bits		—	—	—	√
ITU-R BT.601/BT.709*2	4/8 bits	YCbCr-422 data (UYVY format) Double-edge capture mode	√	—	—	—
ITU-R BT.601/BT.709*2/ BT.1358	16 bits	YCbCr-422 data (8 bits (Y) + 8 bits (CbCr) format)	√	—	—	—
ITU-R BT.656*1	8 bits	YCbCr-422 data (UYVY format)	√	√	√	—
	8/10/12 bits		—	—	—	√
ITU-R BT.656	4/8 bits	YCbCr-422 data (UYVY format) Double-edge capture mode	√	—	—	—
ITU-R BT.601/BT.709*2	18 bits	RGB-666 data	√	—	—	—
ITU-R BT.601/BT.709*2	24 bits	RGB-888 data	√	—	—	—

Notes: 1. Disable the XY scaling settings when using the 10/12-bit YCbCr-422 format in the ITU-R BT.601, BT.709, or BT.656 interface. (Only the 100% scaling is enabled.)  
2. When the ITU-R BT.709 interface is in use, the maximum frequency of the video clock is 74.5 MHz.

**(3) Video Channel 3 (RZ/G1H)**

The following input interfaces can be selected for this channel.

**Table 23.3 Input Interface for Video Channel 3 for RZ/G1H**

Interface	Data Width	Data Type	RZ/G Series Products			
			RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
ITU-R BT.601/BT.709*1, *2	8 bits	YCbCr-422 data (UYVY format)	√	—	—	—
ITU-R BT.656*1	8 bits	YCbCr-422 data (UYVY format)	√	—	—	—

Notes: 1. Disable the XY scaling settings when using the 10/12-bit YCbCr-422 format in the ITU-R BT.601, BT.709, or BT.656 interface. (Only the 100% scaling is enabled.)  
2. When the ITU-R BT.709 interface is in use, the maximum frequency of the video clock is 74.5 MHz.

#### (4) Internal Sync Signal Generation

For video data capturing through the ITU-R BT.601 or ITU-R BT.709 interface, the field signal can be internally generated even if the input sync signals stops (In video data capture through the ITU-R BT.656 interface, only the field signal is generated).

#### (5) Capture Mode

The following four modes can be selected to capture the interlace images. In addition, single frame capture or continuous frame capture mode can be selected.

Triple-buffering control is provided in accordance with the captured field image and frame image to coordinate with the video capture mode of the display module.

- Odd-field capture mode
- Even-/odd-field capture mode
- Even-field capture mode
- Full interlace capture mode

#### (6) Vertical and Horizontal Scaling

The image can be scaled up and down up to three times in the vertical and two times in the horizontal directions.

#### (7) Size Clipping

The VIN has two clipping circuits, which independently handle images with up to  $2048 \times 2048$  pixels. Any capture size within this limit can be specified before or after scaling.

#### (8) Color Space Conversion

Color space conversion can be performed from YC to RGB or from RGB to YC. Desired conversion coefficients can be specified through registers to adjust colors.

#### (9) Lookup Table (LUT) Density Conversion

The lookup table (LUT) density can be converted from 10 bits to 8 bits for each pixel according to the color space conversion result.

Note: When the density conversion function is not used, the upper 8 bits of data are output.

#### (10) Image Data Format Conversion

To the density-converted YCbCr444 or RGB888 image data, the following data format conversions are available:

- YCbCr image data
  - Y/Cb/Cr 8-bit multiplex conversion
  - YCbCr444 → YC separation (separated into Y and CbCr components.)
  - YCbCr444 → Y component extraction
- RGB image data
  - RGB-888 → 32 bits/pixel conversion
  - RGB-888 → RGB-565 (16 bits/pixel) conversion
  - RGB-888 → ARGB-1555 (16 bits/pixel) conversion
  - RGB-888 → ARGB-888 (32 bits/pixel) conversion

Note: The lookup table is common to the YCbCr and RGB formats.

#### (11) Local Video Interface Output

By using the local video interface output control function, operation can be linked with the IMR-LSX2.

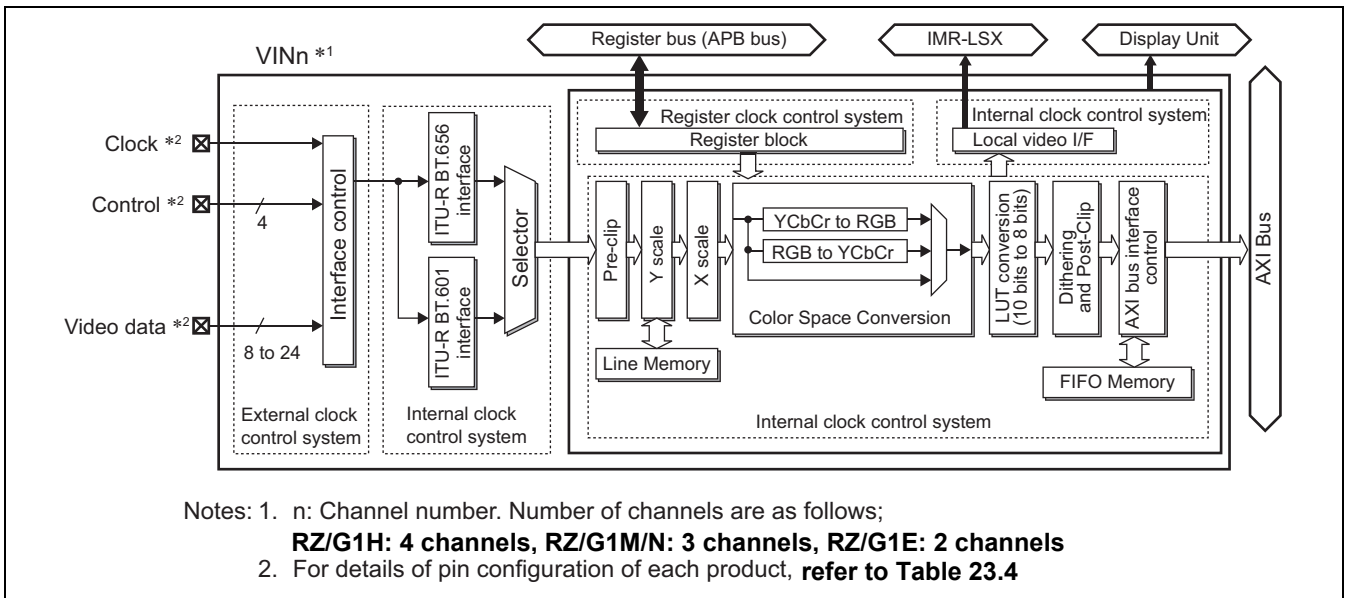

- Notes: 1. The distortion correction or scaling processing should be implemented with the IMR-LSX2 module.  
 2. Post-clipping processing cannot be provided for the image data output from the local video interface.

**(12) Memory Output Data Format**

Format-converted image data can be transferred to the memory. The following shows the available formats of the data stored.

- YCbCr image data
  - Y/Cb/Cr, 8-bit multiplexed
  - YC separation, YCbCr422, Y, 8-bit Cb/Cr, 8-bit multiplexed
  - YC separation, YCbCr422, Y, 10-bit Cb/Cr, 8-bit multiplexed
  - YC separation, YCbCr422, Y, 12-bit Cb/Cr, 8-bit multiplexed
  - YC separation, Y data, 8-bit
  - YC separation, Y data, 10-bit
  - YC separation, Y data, 12-bit
- RGB image data
  - RGB-565 (16 bits/pixel)
  - ARGB-1555 (16 bits/pixel)
  - RGB-888 (32 bits/pixel)
  - ARGB-8888 (32 bits/pixel)

VIN2 horizontal sync signal (control)	VI2_HSYNC#	Input	Horizontal sync signal in the ITU-R BT.601, ITU-R BT.1358 (excluding RZ/G1M/N channel 2), or ITU-R BT.709 interface Fix this pin high or low when the pin is not used.	√	√	√	—
VIN2 data enable (control)	VI2_CLKENB	Input	Data enable signal in the ITU-R BT.601, ITU-R BT.1358 (excluding RZ/G1M/N channel 2), or ITU-R BT.709 interface Fix this pin high or low when the pin is not used. If the signal is not present in the ITU-R BT.601, ITU-R BT.1358, or ITU-R BT.709 interface, connect the pin to a horizontal sync signal.	√	√	√	—
VIN2 video data (video data)	VI2_R7 to VI2_R0 VI2_G7 to VI2_G0 VI2_B7 to VI2_B0	Input	Data signals in the ITU-R BT.601, ITU-R BT.656, ITU-R BT.1358 (excluding RZ/G1M/N channel 2), or ITU-R BT.709 interface Fix these pins high or low respectively when these pins are not used in whole or in part.	√	√	√	—
VIN3 video clock (clock)	VI3_CLK	Input	External video clock in the ITU-R BT.601, ITU-R BT.656, or ITU-R BT.709 interface	√	—	—	—

Pin Name	Function	I/O	Description	RZ/G Series Products			
				RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
VIN3 field signal (control)	VI3_FIELD	Input	Field signal in the ITU-R BT.601 or ITU-R BT.709 interface Fix this pin high or low when the pin is not used.	√	—	—	—
VIN3 vertical sync signal (control)	VI3_VSYNC#	Input	Vertical sync signal in the ITU-R BT.601 or ITU-R BT.709 interface Fix this pin high or low when the pin is not used.	√	—	—	—
VIN3 horizontal sync signal (control)	VI3_HSYNC#	Input	Horizontal sync signal in the ITU-R BT.601 or ITU-R BT.709 interface Fix this pin high or low when the pin is not used.	√	—	—	—
VIN3 data enable (control)	VI3_CLKENB	Input	Data enable signal in the ITU-R BT.601 or ITU-R BT.709 interface Fix this pin high or low when the pin is not used. If the signal is not present in the ITU-R BT.601 or ITU-R BT.709 interface, connect the pin to a horizontal sync signal.	√	—	—	—
VIN3 video data (video data)	VI3_DATA7 to VI3_DATA0	Input	Data signals in the ITU-R BT.601, ITU-R BT.656, or ITU-R BT.709 interface Fix these pins high or low respectively when these pins are not used in whole or in part.	√	—	—	—

### 23.1.4 Register Configuration

Tables 23.9 (1) through 23.9 (4) show the VIN register configuration for each channel.

Notes: Do not write to any addresses other than listed below. Operations cannot be guaranteed if writing is attempted. Values read from addresses other than those listed below are undefined.

\* For the internal update mode, refer to the description of the VUP bit in the main control register (VnMC).

#### (1) Channel 0

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

All registers of channel 0 are the same for RZ/G1H, M/N and E, however, some bit function may not be supported by products.

**Table 23.9 (1) VIN Registers**

#### Channel 0 (RZ/G1H, M/N and E)

Channel	Name	Symbol	R/W	Address	Initial Value	Access Size	Internal Update Mode Support*
0	Video 0 main control register	V0MC	R/W	H'E6EF0000	H'00000000	32	Δ
	Video 0 module status register	V0MS	R	H'E6EF0004	H'00000018	32	—
	Video 0 frame capture register	V0FC	R/W	H'E6EF0008	H'00000000	32	—

## 23.2 Register Descriptions

RZ/G1H	RZ/G1N
RZ/G1M	RZ/G1E

[Legend]

—: Reserved. The write value should always be 0.

Initial value: Register value after a reset

R/W: Readable/writable. The written value can be read.

R: Read-only. The write value should always be 0.

Vn: Video Channel n

### 23.2.1 Video n Main Control Register (VnMC)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√*	√	√	√

Notes: Availability of channels:

n = 0 to 3 (RZ/G1H), 0 to 2 (RZ/G1M/N), 0 and 1 (RZ/G1E)

\* For RZ/G1H, special function (bit 25) is available.

Bit	Bit Name	Initial Value	R/W	Description																	
31	FAST	0	R/W	High-Speed Video Clock Support Mode Set this bit to 1 to input 100-MHz video clock. 0: 100-MHz video clock input is not supported. 1: 100-MHz video clock input is supported. Note: Do not perform vertical or horizontal scaling up when this bit is 1.																	
30	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.																	
29, 28	CLP[1:0]	00	R/W	Pixel Data Clipping When the input image data is in the YCbCr format, these bits specify the data clip value for clipping the YCbCr-RGB color conversion input data to the nominal range prescribed in the ITU-R BT.601 standard. <table border="1"> <thead> <tr> <th>CLP</th> <th>Luminance</th> <th>Color Difference</th> <th>Initial value</th> </tr> </thead> <tbody> <tr> <td>00</td> <td>No clipping</td> <td>16 or a smaller value is clipped to 16. 240 or a greater value is clipped to 240.</td> <td rowspan="4">Initial value</td> </tr> <tr> <td>01</td> <td>16 or a smaller value is clipped to 16. 240 or a greater value is clipped to 240.</td> <td>16 or a smaller value is clipped to 16. 240 or a greater value is clipped to 240.</td> </tr> <tr> <td>10</td> <td>No clipping</td> <td>16 or a smaller value is clipped to 128. 240 or a greater value is clipped to 128.</td> </tr> <tr> <td>11</td> <td>No clipping</td> <td>No clipping</td> </tr> </tbody> </table> Note: These bits support the internal update mode.	CLP	Luminance	Color Difference	Initial value	00	No clipping	16 or a smaller value is clipped to 16. 240 or a greater value is clipped to 240.	Initial value	01	16 or a smaller value is clipped to 16. 240 or a greater value is clipped to 240.	16 or a smaller value is clipped to 16. 240 or a greater value is clipped to 240.	10	No clipping	16 or a smaller value is clipped to 128. 240 or a greater value is clipped to 128.	11	No clipping	No clipping
CLP	Luminance	Color Difference	Initial value																		
00	No clipping	16 or a smaller value is clipped to 16. 240 or a greater value is clipped to 240.	Initial value																		
01	16 or a smaller value is clipped to 16. 240 or a greater value is clipped to 240.	16 or a smaller value is clipped to 16. 240 or a greater value is clipped to 240.																			
10	No clipping	16 or a smaller value is clipped to 128. 240 or a greater value is clipped to 128.																			
11	No clipping	No clipping																			
27, 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.																	

Bit	Bit Name	Initial Value	R/W	Description
25	RIS/—	0	R/W	<p>RGB/YCbCr Interface Select [RZ/G1H]</p> <p>This bit chooses capturing method of the video clock.</p> <p>0: Sync data are captured on rising edges of the video clock signal.</p> <p>1: Sync data are captured on rising and falling edges of the video clock signal.</p> <hr/> <p>Reserved [RZ/G1M/N, E]</p> <p>This bit is always read as 0. The write value should always be 0.</p>
24 to 22	—	All 0	R	<p>Reserved</p> <p>These bits are always read as 0. The write value should always be 0.</p>
21	FOC	0	R/W	<p>Field Order Control</p> <p>This bit controls the field order for full interlace capturing.</p> <p>0: Top field = Odd field (field 1)</p> <p>1: Top field = Even field (field 2)</p> <p>Note: This bit supports the internal update mode.</p>
20	LUTE	0	R/W	<p>Lookup Table Enable</p> <p>This bit enables lookup table conversion from 10 bits to 8 bits.</p> <p>0: LUT is not used.</p> <p>1: LUT is used.</p> <p>Notes: 1. To perform LUT conversion, the conversion table should be set with VnLUTP and VnLUTD.</p> <p>2. This bit supports the internal update mode.</p>
19	YCAL	0	R/W	<p>YCbCr-422 Input Data Alignment</p> <p>This bit controls data alignment for YCbCr-422 input.</p> <p>0: When the multiplexed CbCr interface is set, capturing is performed with Y in the upper bits and CbCr in the lower bits.</p> <p>1: When the multiplexed CbCr interface is set, capturing is performed with CbCr in the upper bits and Y in the lower bits.</p>
18 to 16	INF[2:0]	000	R/W	<p>Input Interface Format</p> <p>These bits specify the image format input to the VIN.</p> <p>000: ITU-R BT.656 8-bit YCbCr-422 or ITU-R BT.656 8-bit YCbCr422 4-bit input*<sup>1</sup></p> <p>001: ITU-R BT.601/BT.709 8-bit YCbCr-422 or ITU-R BT.601/BT.709 8-bit YCbCr422 4-bit input *<sup>1</sup></p> <p>010: ITU-R BT.656 10/12-bit YCbCr-422*<sup>1</sup></p> <p>011: ITU-R BT.601/BT.709 10/12-bit YCbCr-422*<sup>1</sup></p> <p>100: Setting prohibited</p> <p>101: ITU-R BT.601/BT.1358 16-bit YCbCr-422 or ITU-R BT.601/BT.709/BT.656 8-bit YCbCr422 8-bit input*<sup>1</sup></p> <p>110: ITU-R BT.601/BT.709 24-bit RGB-888*<sup>1</sup></p> <p>111: ITU-R BT.601/BT.709 18-bit RGB-666 or ITU-R BT.601/BT.709 RGB-888 12-bit input*<sup>1</sup></p>

Bit	Bit Name	Initial Value	R/W	Description
15, 14	DC[1:0]	00	R/W	<p>Dithering Mode Control</p> <p>These bits select the dithering mode for conversion from RGB888 to RGB565/ARGB1565.</p> <p>00: Dithering with cumulative addition  01: Ordered dithering  10: Setting prohibited  11: Setting prohibited</p>
13, 12	EXINF[1:0]	00	R/W	<p>Extension Interface Select</p> <p>00: Data extension is not performed  01: Combined with the INF setting, 8-bit data extension is performed.  10: Combined with the INF setting, 10-bit data extension is performed.  11: Combined with the INF setting, 12-bit data extension is performed.</p>
11	—	0	R	<p>Reserved</p> <p>This bit is always read as 0. The write value should always be 0.</p>
10	VUP	0	R/W	<p>VIN Register Update Control</p> <p>This bit specifies the internal register update timing after register writing. See the list of registers for applicable registers.</p> <p>0: The register contents are updated immediately after register writing.  1: The register contents are updated after a valid field is detected in the ITU-R BT.601 data or the field (F) bit changes in the ITU-R BT.656 data.</p>
9 to 7	—	All 0	R	<p>Reserved</p> <p>These bits are always read as 0. The write value should always be 0.</p>
6	EN	0	R/W	<p>Endian Type</p> <p>This bit specifies the endian type for data to be output to external memory.</p> <p>0: Image data is packed and allocated in little endian.  1: Image data is packed and allocated in big endian.</p> <p>Note: When allocating the YCbCr422 (UYVY format) data in big endian, be sure to set the BPSM bit in VnDMR to 1.</p>
5	EC	0	R/W	<p>Error Correction Control</p> <p>This bit specifies whether error correction with the parity bit is performed on the ITU-R BT.656 input.</p> <p>0: Error correction is not performed on the ITU-R BT.656 input.  1: Error correction with the parity bit is performed on the ITU-R BT.656 input.</p> <p>Error correction must not be performed in the following cases:</p> <ul style="list-style-type: none"> <li>• When data is captured in the ITU-R BT.601 interface</li> <li>• When input data does not meet the standard of the ITU-R BT.656 parity bit</li> </ul>

Bit	Bit Name	Initial Value	R/W	Description
4, 3	IM[1:0]	00	R/W	<p>Interlace Mode</p> <p>These bits specify the capture mode. Do not modify this setting during capture operation.</p> <p>00: Odd-field (field 1) capture mode Handles only odd fields as frames and stores them in external memory.</p> <p>01: Odd-/even-field capture mode Handles odd and even fields as separate frames and stores them in external memory. This mode is available only in continuous frame capture mode.</p> <p>10: Even-field (field 2) capture mode Handles only even fields as frames and stores them in external memory.</p> <p>11: Full interlace mode Handles combinations of odd and even fields as single frames and stores them in external memory.</p>
2	—	0	R	<p>Reserved</p> <p>This bit is always read as 0. The write value should always be 0.</p>
1	BPS	0	R/W	<p>Color Space Conversion Bypass Mode</p> <p>0: The input YCbCr data is converted into the RGB color space and RGB data is converted into the YCbCr color space*<sup>2</sup>.</p> <p>1: Color space conversion is not performed.</p> <p>Note: YCbCr→RGB or RGB→YCbCr conversion is performed with the coefficients specified by the YC-RGB conversion coefficient register or RGB-YC coefficient register.</p>
0	ME	0	R/W	<p>Module Enable</p> <p>This is the enable bit for the VIN. Set this bit before setting the Frame Capture (VnFC) register.</p> <p>0: The module operation is stopped.</p> <p>1: The module operation is enabled. *<sup>3</sup></p>

- Notes:
1. Table 23.10 shows the combinations of interfaces which can be set by the input interface format (the INF bits in VnMC) and extension interface select (the EXINF bit in VnMC). Do not make the other settings.
  2. Table 23.11 shows the image data which can be converted according to the color space conversion bypass mode settings (set by the BPS bit in VnMC).
  3. To stop capturing operation, only set the ME bit to 0. Do not change the other bit settings.

**Table 23.10 Capture Interface Settings**

Interface		VnMC/EXINF	VnMC/RIS*	VnMC/INF

### 23.2.2 Video n Module Status Register (VnMS)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Note: Availability of channels:

n = 0 to 3 (RZ/G1H), 0 to 2 (RZ/G1M/N), 0 and 1 (RZ/G1E)

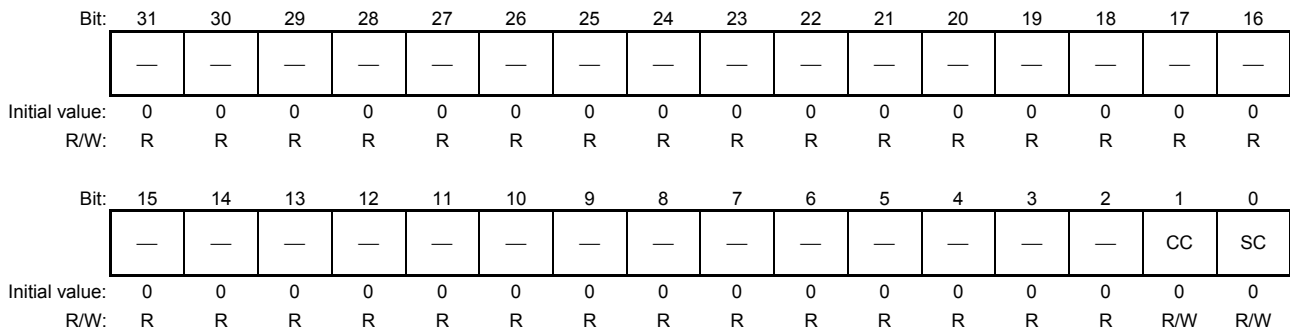

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	FBS[1:0]	FS	AV	CA	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	1	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4, 3	FBS[1:0]	11	R	Frame Buffer Status These bits show the frame buffer status. 00: The latest valid frame buffer has the base address defined by the memory base 1 register. 01: The latest valid frame buffer has the base address defined by the memory base 2 register. 10: The latest valid frame buffer has the base address defined by the memory base 3 register. 11: There is no valid frame buffer.
2	FS	0	R	Field Status This bit shows the type of the current capture field. 0: The current field is an odd field (field 1). 1: The current field is an even field (field 2).
1	AV	0	R	Active Video Status This bit shows whether the current field is in the active video area defined by the pre-clipping register. 0: The current field is not in the active video area. 1: The current field is in the active video area. Note: This bit will be 0 if no input data is captured.
0	CA	0	R	Video Capture Active Status This bit shows the current video capture operation status. This bit is updated by the captured field signal. 0: Video capture is not operating. 1: Video capture is operating. Note: In field capture mode, this bit is set to 1 even for the field that does not capture data.

**23.2.3 Video n Frame Capture Register (VnFC)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Note: Availability of channels:  
 n = 0 to 3 (RZ/G1H), 0 to 2 (RZ/G1M/N), 0 and 1 (RZ/G1E)

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	CC	0	R/W	Continuous Frame Capture Mode  This bit specifies the continuous frame capture mode. In this mode, the first capture frame is written into the memory address specified by the memory base 1 (VnMB1) register. After that, the capture operation is repeated in the order of MB2, MB3, MB1, MB2, and such.  Writing 0 into this bit during continuous capture operation will immediately terminate the capture operation if the current frame is completed or it has not been captured.  0: The continuous frame capture mode is not set. 1: The continuous frame capture mode is set.
0	SC	0	R/W	Single Frame Capture Mode  This bit specifies the single frame capture mode. In this mode, the capture frame is written into the memory address specified by the memory base 1 (VnMB1) register.  Immediately after this bit is set to 1, the frame buffer status (FBS) bits in MS are initialized and the SC bit is also cleared to 0.  0: The single frame capture mode is not set. 1: The single frame capture mode is set.  Note: Do not set this bit to 1 when the interlace mode (IM) bits in the main control register (VnMC) are set to 01 (odd-/even-field capture mode).

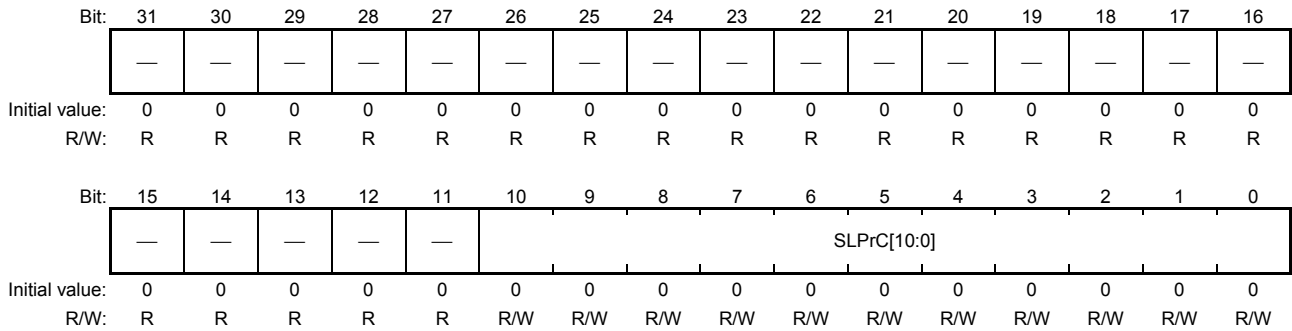

Note: Do not specify the single frame capture mode and continuous frame capture mode at the same time.

**23.2.4 Video n Start Line Pre-Clip Register (VnSLPrC)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Note: Availability of channels:

n = 0 to 3 (RZ/G1H), 0 to 2 (RZ/G1M/N), 0 and 1 (RZ/G1E)

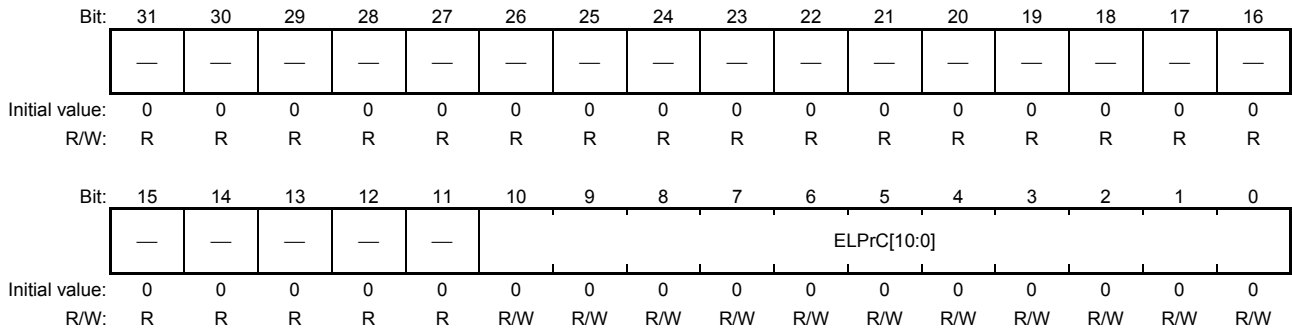

Bit	Bit Name	Initial Value	R/W	Description
31 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SLPrC[10:0]	H'000	R/W	Start Line Pre-Clip These bits specify the (pre-clipping start line – 1) value in line units. This value is used before scaling. Specify a value in the range from 0 to 2046 so that the number of lines after pre-clipping will be 2 or more. (The value of 0 indicates the first valid line.)

**23.2.5 Video n End Line Pre-Clip Register (VnELPrC)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Note: Availability of channels:

n = 0 to 3 (RZ/G1H), 0 to 2 (RZ/G1M/N), 0 and 1 (RZ/G1E)

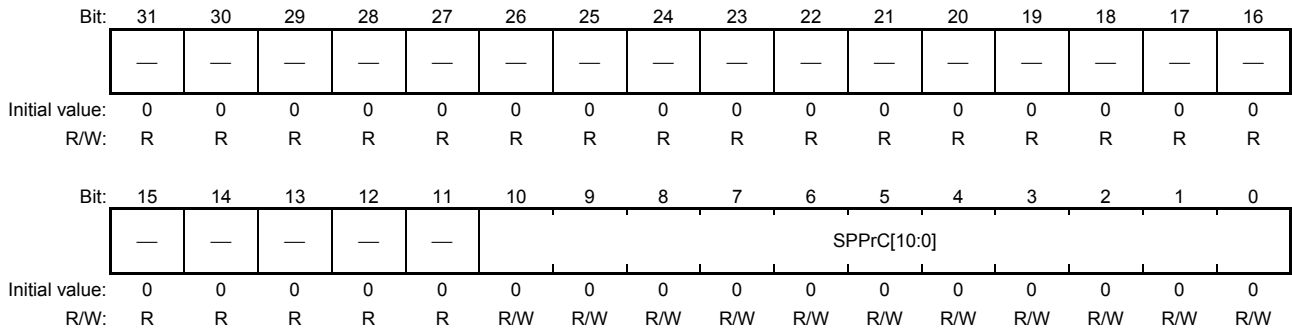

Bit	Bit Name	Initial Value	R/W	Description
31 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	ELPrC[10:0]	H'000	R/W	End Line Pre-Clip These bits specify the (pre-clipping end line – 1) value in line units. This value is used before scaling. Specify a value in the range from 1 to 2047 so that the number of lines after pre-clipping will be 2 or more.

**23.2.6 Video n Start Pixel Pre-Clip Register (VnSPPrC)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Note: Availability of channels:

n = 0 to 3 (RZ/G1H), 0 to 2 (RZ/G1M/N), 0 and 1 (RZ/G1E)

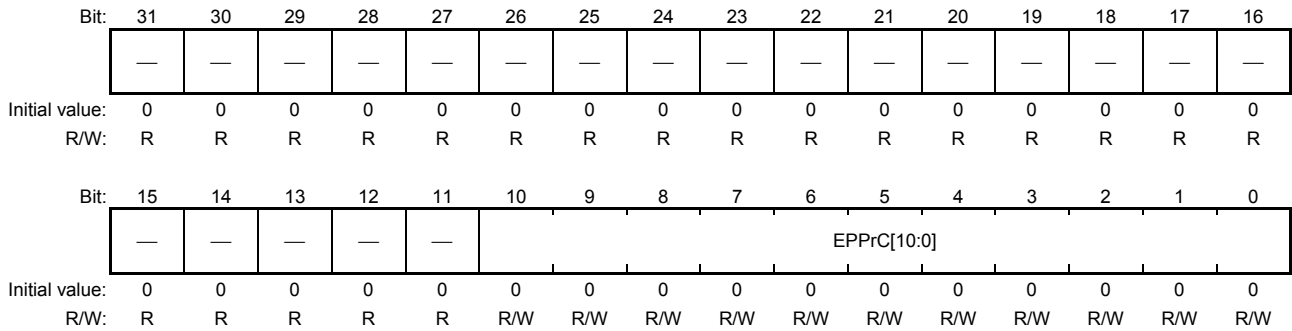

Bit	Bit Name	Initial Value	R/W	Description
31 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SPPrC[10:0]	H'000	R/W	Start Pixel Pre-Clip These bits specify the (pre-clipping start pixel – 1) value in pixel units. This value is used before scaling. Specify a value in the range from 0 to 2042 so that the number of pixels after pre-clipping will be an even number than 6. Notes: 1. When SPPrC is set to 0x0, the first valid pixel is specified. 2. Specify an even number. 3. The capacity of the internal buffer is limited, so if the horizontal scaling up function is in use, the value here should be such that EPPrC – SPPrC is no greater than 2048 pixels.

**23.2.7 Video n End Pixel Pre-Clip Register (VnEPPrC)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Note: Availability of channels:

n = 0 to 3 (RZ/G1H), 0 to 2 (RZ/G1M/N), 0 and 1 (RZ/G1E)

Bit	Bit Name	Initial Value	R/W	Description
31 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	EPPrC[10:0]	H'000	R/W	End Pixel Pre-Clip These bits specify the (pre-clipping end pixel – 1) value in pixel units. This value is used before scaling. Specify a value in the range from 5 to 2047 so that the number of pixels after pre-clipping will be an even number than 6. Notes: 1. Set this bit so that the (EPPrC – SPPrC) value is an odd number. 2. The capacity of the internal buffer is limited, so if the horizontal scaling up function is in use, the value here should be such that EPPrC – SPPrC is no greater than 2048 pixels.

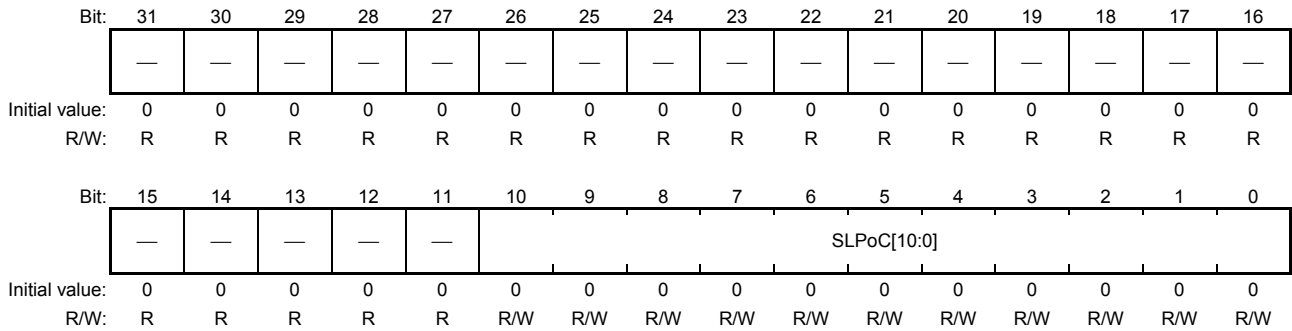

**23.2.8 Video n Start Line Post-Clip Register (VnSLPoC)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Note: Availability of channels:

n = 0 to 3 (RZ/G1H), 0 to 2 (RZ/G1M/N), 0 and 1 (RZ/G1E)

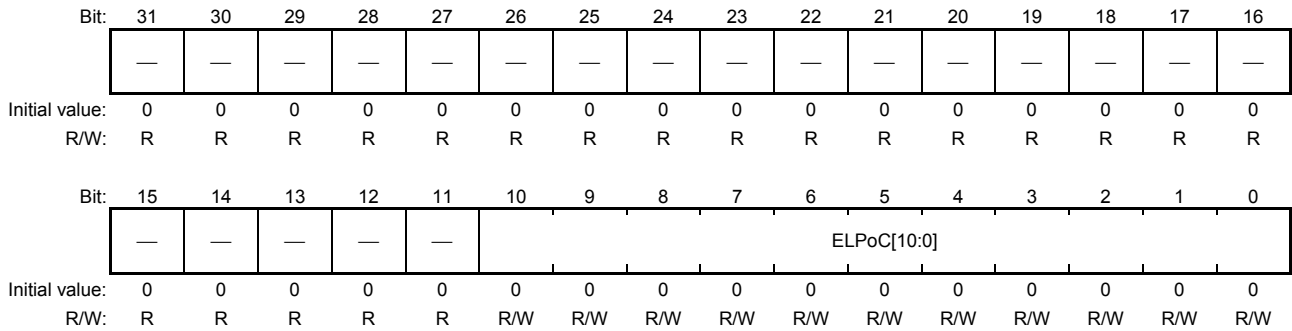

Bit	Bit Name	Initial Value	R/W	Description
31 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SLPoC[10:0]	H'000	R/W	Start Line Post-Clip These bits specify the (post-clipping start line – 1) value in line units. This value is used after scaling. Specify a value in the range from 0 to 2046 so that the number of lines after post-clipping will be 2 or more. (The value of 0 indicates the start line after scaling.)

**23.2.9 Video n End Line Post-Clip Register (VnELPoC)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Note: Availability of channels:

n = 0 to 3 (RZ/G1H), 0 to 2 (RZ/G1M/N), 0 and 1 (RZ/G1E)

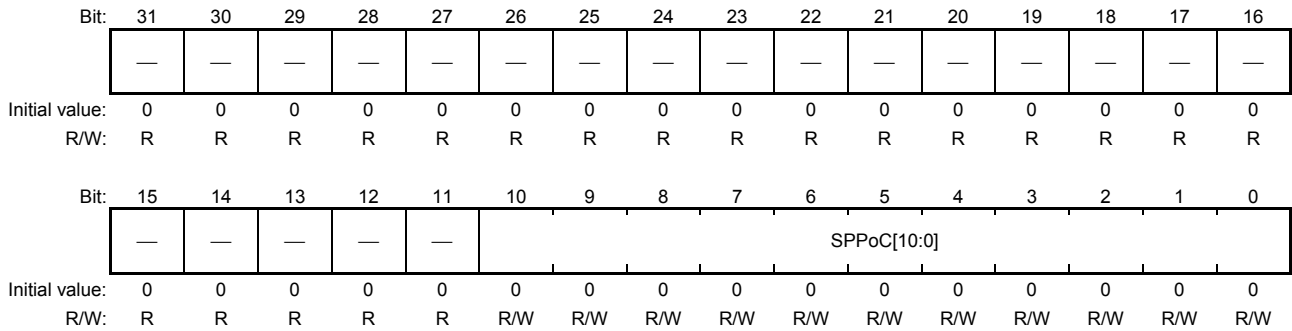

Bit	Bit Name	Initial Value	R/W	Description
31 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	ELPoC[10:0]	H'000	R/W	End Line Post-Clip These bits specify the (post-clipping end line – 1) value in line units. This value is used after scaling. Specify a value in the range from 1 to 2047 so that the number of lines after post-clipping will be 2 or more.

**23.2.10 Video n Start Pixel Post-Clip Register (VnSPPoC)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Note: Availability of channels:

n = 0 to 3 (RZ/G1H), 0 to 2 (RZ/G1M/N), 0 and 1 (RZ/G1E)

Bit	Bit Name	Initial Value	R/W	Description
31 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SPPoC[10:0]	H'000	R/W	Start Pixel Post-Clip These bits specify the (post-clipping start pixel – 1) value in pixel units. This value is used after scaling. Specify a value in the range from 0 to 2042 so that the number of pixels after post-clipping will be 5 or more.

### 23.2.11 Video n End Pixel Post-Clip Register (VnEPPoC)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Note: Availability of channels:

n = 0 to 3 (RZ/G1H), 0 to 2 (RZ/G1M/N), 0 and 1 (RZ/G1E)

Bit	Bit Name	Initial Value	R/W	Description
31 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	EPPoC[10:0]	H'000	R/W	End Pixel Post-Clip These bits specify the (post-clipping end pixel – 1) value in pixel units. This value is used after scaling. Specify a value in the range from 5 to 2047 so that the number of pixels after post-clipping will be 5 or more.

Note: When the output format is YCbCr-422, even if the settings produce a post-clipping size in pixels that is an odd number, the output to memory will be in even pixel units. Note that if the clipping values specify an odd size (i.e. if EPPoC – SPPoC is odd), one will be added to round the value up to an even number.

Example: When SPPoC is set to 0 and EPPoC is set to 62:

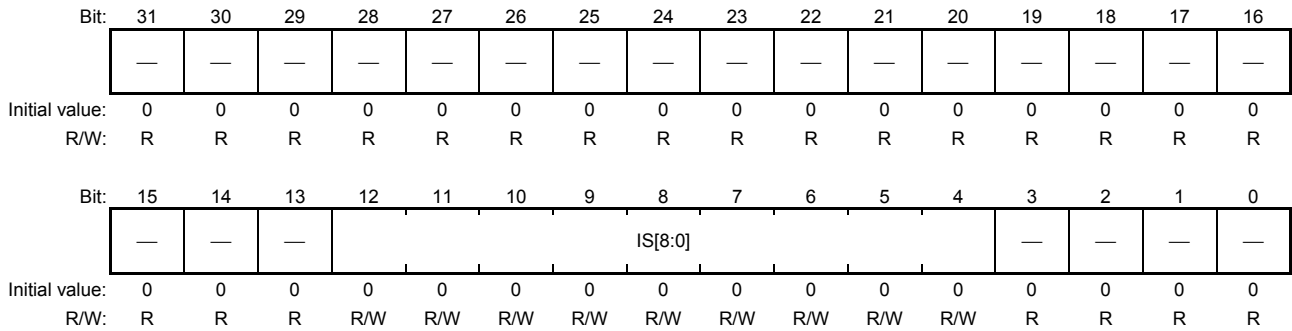

The actual processing is done for 64 pixels.  
 62 - 0 = 62 (63 pixels)  
 63 pixels + 1 = 64 pixels

**23.2.12 Video n Image Stride Register (VnIS)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Note: Availability of channels:

n = 0 to 3 (RZ/G1H), 0 to 2 (RZ/G1M/N), 0 and 1 (RZ/G1E)

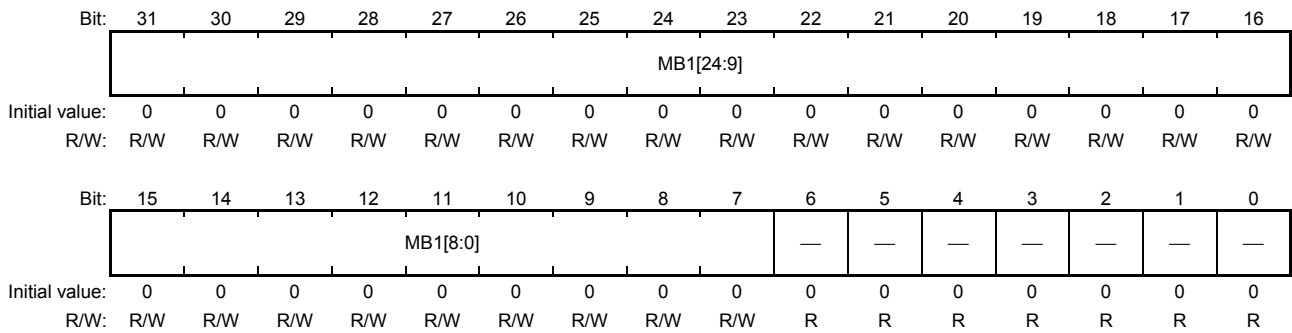

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12 to 4	IS[8:0]	H'000	R/W	Image Stride These bits specify the width of the transfer destination memory. Specify a value no less than the post-clipping width (EPPoC - SPPoC) and aligned with a 32-byte boundary (i.e. bit 4 should be specified as 0). For 16 bits/pixel data, word addresses are generated. For 8 bits/pixel data in YC separation mode, byte addresses are generated.
3 to 0	—	All 0	R	Reserved bits that indicate the lower-order four bits of the image stride. These bits are always read as 0. The write value should always be 0.

**23.2.13 Video n Memory Base 1 Register (VnMB1)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Note: Availability of channels:

n = 0 to 3 (RZ/G1H), 0 to 2 (RZ/G1M/N), 0 and 1 (RZ/G1E)

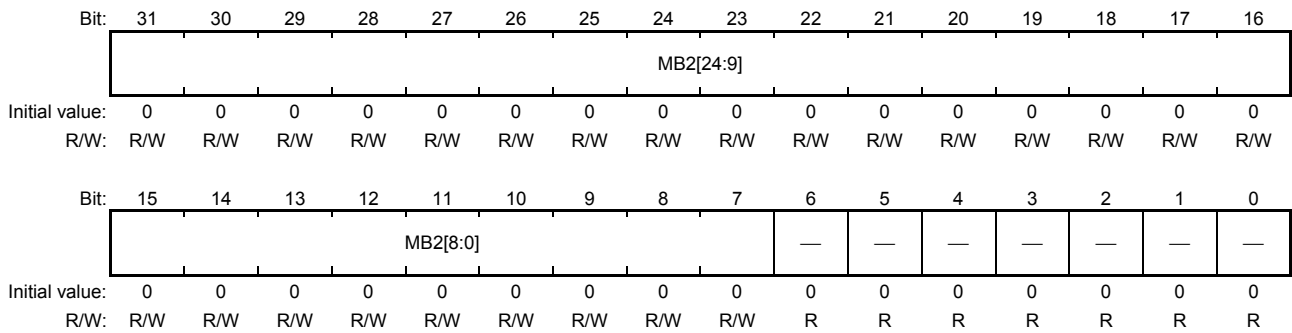

Bit	Bit Name	Initial Value	R/W	Description
31 to 7	MB1[24:0]	H'0000000	R/W	<p>Memory Base Address 1</p> <p>These bits specify the transfer start address in frame buffer 1. Specify a value for physical address bits [31:7] in units of 128 bytes.</p> <p>If the module is in continuous frame capture mode, this value is used as the MB1 address in the following capture sequence: MB1 → MB2 → MB3 → MB1 → MB2 → MB3.</p> <p>In single frame capture mode, this value is used as the capture address.</p> <p>Specify a memory address taking into account the image size so that the image data does not exceed an area boundary on the address map.</p>
6 to 0	—	All 0	R	<p>Reserved bits that indicate the lower-order seven bits of memory base address 1 (a multiple of 128 bytes).</p> <p>These bits are always read as 0. The write value should always be 0.</p>

**23.2.14 Video n Memory Base 2 Register (VnMB2)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Note: Availability of channels:

n = 0 to 3 (RZ/G1H), 0 to 2 (RZ/G1M/N), 0 and 1 (RZ/G1E)

Bit	Bit Name	Initial Value	R/W	Description
31 to 7	MB2[24:0]	H'0000000	R/W	<p>Memory Base Address 2</p> <p>These bits specify the transfer start address in frame buffer 2. Specify a value for physical address bits [31:7] in units of 128 bytes.</p> <p>If the module is in continuous frame capture mode, this value is used as the MB2 address in the following capture sequence: MB1 → MB2 → MB3 → MB1 → MB2 → MB3.</p> <p>Specify a memory address taking into account the image size so that the image data does not exceed an area boundary on the address map.</p>
6 to 0	—	All 0	R	<p>Reserved bits that indicate the lower-order seven bits of memory base address 2 (a multiple of 128 bytes).</p> <p>These bits are always read as 0. The write value should always be 0.</p>

R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	FIS2	0	R/W	<p>Field Interrupt Status 2</p> <p>This bit shows that the field has changed. This bit is set to 1 when a valid field is detected in the ITU-R BT.601 interface or the F bit defined in ITU-R BT.656 changes. After being set to 1, this bit is cleared to 0 by writing 1.</p> <p>Note: This bit is set to 1 irrespective of whether or not capture is taking place. Be sure to clear this bit to 0 before using it.</p>
30 to 18	—	All 0	R	<p>Reserved</p> <p>These bits are always read as 0. The write value should always be 0.</p>
17	VFS	0	R/W	<p>VSYNC Falling Edge Detect Interrupt Status</p> <p>This bit shows that a VSYNC falling edge has been detected in the ITU-R BT.601 input. After being set to 1, this bit is cleared to 0 by writing 1.</p> <p>Note: This bit is set to 1 irrespective of whether or not capture is taking place. Be sure to clear this bit to 0 before using it.</p>
16	VRS	0	R/W	<p>VSYNC Rising Edge Detect Interrupt Status</p> <p>This bit shows that a VSYNC rising edge has been detected in the ITU-R BT.601 input. After being set to 1, this bit is cleared to 0 by writing 1.</p> <p>Note: This bit is set to 1 irrespective of whether or not capture is taking place. Be sure to clear this bit to 0 before using it.</p>
15 to 5	—	All 0	R	<p>Reserved</p> <p>These bits are always read as 0. The write value should always be 0.</p>
4	FIS	0	R/W	<p>Field Interrupt Status</p> <p>This bit shows that a field has been captured in the active capture operation.</p> <p>This bit is set to 1 when a valid field is detected in the ITU-R BT.601 interface or the F bit defined in ITU-R BT.656 changes. After being set to 1, this bit is cleared to 0 by writing 1.</p>

Bit	Bit Name	Initial Value	R/W	Description
3	CES	0	R/W	<p>Correction Error Interrupt Status</p> <p>This bit shows that the timing reference code in the active capture operation has an error involving at least two bits. After being set to 1, this bit is cleared to 0 by writing 1.</p> <p>This bit is set to 1 if the EC bit in VnMC is enabled and the timing reference code has an error involving at least two bits. If a 1-bit error occurs when the EC bit is enabled, this bit is not set to 1.</p>
2	SIS	0	R/W	<p>Scanline Interrupt Status</p> <p>This bit shows that the number of lines specified by VnSI has been reached in the active capture operation. After being set to 1, this bit is cleared to 0 by writing 1.</p> <p>This bit is set to 1 at the next line start timing after the value in the VnLC register matches the VnSI register setting. This timing is shown in Figure 23.2, Scanline Interrupt Status Generation Timing.</p>
1	EFS	0	R/W	<p>End of Frame Interrupt Status</p> <p>This bit shows that the last frame has been reached in the active capture operation. This bit is set to 1 at the end of even field (field 2). After being set to 1, this bit is cleared to 0 by writing 1.</p>
0	FOS	0	R/W	<p>FIFO Overflow Interrupt Status</p> <p>This bit shows that the FIFO has overflowed in the active capture operation. After being set to 1, this bit is cleared to 0 by writing 1.</p> <p>If the FIFO overflows, the FIFO data is overwritten by the pixel data captured after the overflow, and the resultant data is sent to the frame buffer.</p>

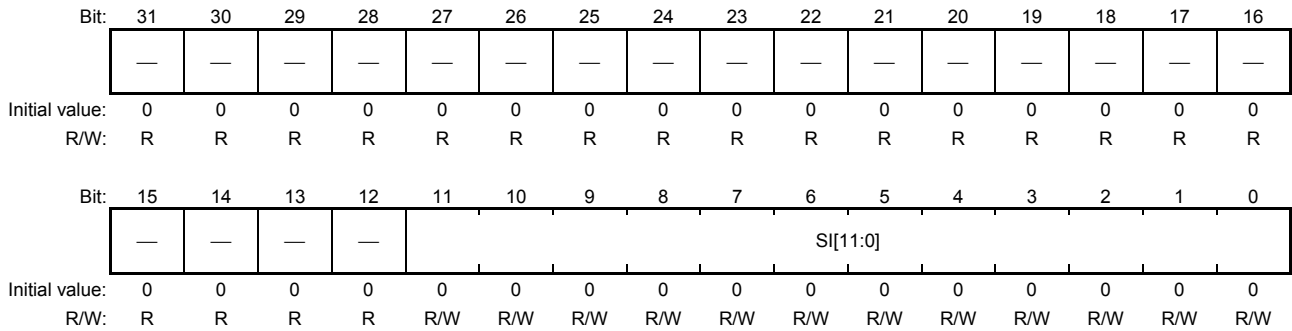

**Figure 23.2 Scanline Interrupt Status Generation Timing**

**23.2.19 Video n Scanline Interrupt Register (VnSI)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Note: Availability of channels:

n = 0 to 3 (RZ/G1H), 0 to 2 (RZ/G1M/N), 0 and 1 (RZ/G1E)

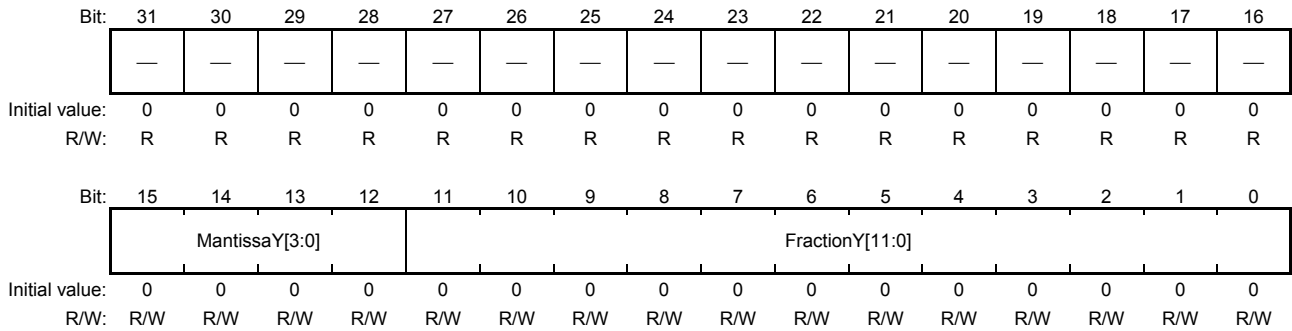

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 0	SI[11:0]	All 0	R/W	Scanline Interrupt Setting These bits specify a value to be compared with the VnLC register value in each field while the SIE bit in the VnIE register is set to 1. When this value matches the VnLC register value, an interrupt signal is asserted.

**23.2.20 Video n Y Scale Register (VnYS)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Note: Availability of channels:

n = 0 to 3 (RZ/G1H), 0 to 2 (RZ/G1M/N), 0 and 1 (RZ/G1E)

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 12	MantissaY [3:0]	H'0	R/W	The scaling ratio in the Y direction should be specified through MantissaY and FractionY. This register specifies the value of (number of lines output to memory per field) / (number of capture lines per field) and it is calculated from MantissaY and FractionY by the following equation. $Y \text{ scaling} = 4096 / (4096 \times \text{MantissaY} + \text{FractionY})$ For example, to obtain a Y scaling ratio of 1/2, specify MantissaY = H'2 and FractionY = H'000. Note that the maximum scaling-up ratio is $\times 3$ . When both MantissaY and FractionY are set to 0, the scaling function is disabled. To specify a scaling ratio of $\times 1$ , disabling of the scaling function is recommended.
11 to 0	FractionY [11:0]	H'000	R/W	

- Notes:
- Do not make the scaling-up setting when the FAST bit in MC is set to enable the applicable function.
  - Disable the scaling function when using the 10/12-bit YCbCr-422 format in the ITU-R BT.601, BT.709, or BT656 interface or the 20/24-bit YCbCr-422 format in the ITU-R BT.1358 interface.
  - The minimum scaling-down ratio is:  
Mantissa[3:0] = H'E, Fraction[11:0] = H'FFF

**23.2.21 Video n X Scale Register (VnXS)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Note: Availability of channels:

n = 0 to 3 (RZ/G1H), 0 to 2 (RZ/G1M/N), 0 and 1 (RZ/G1E)

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 12	MantissaX [3:0]	H'0	R/W	The scaling ratio in the X direction should be specified through MantissaX and FractionX. This register specifies the value of (number of pixels output to memory per line) / (number of input pixels per line) and it is calculated from MantissaX and FractionX by the following equation. $X \text{ scaling} = 4096 / (4096 \times \text{MantissaX} + \text{FractionX})$ As the multiphase filter specified by the coefficient set CmA (m = 1 to 8) registers are used for scaling, be sure to specify the coefficient set registers for scaling. Note that the maximum scaling-up ratio is $\times 2$ . When both MantissaX and FractionX are set to 0, the scaling function is disabled. To specify a scaling ratio of $\times 1$ , set both the mantissaX and fractionX to 0. Typical examples of this register setting and scaling ratio for 720 input pixels are shown in Table 23.12.
11 to 0	FractionX [11:0]	H'000	R/W	

- Notes: 1. Do not make the scaling-up setting when the FAST bit in MC is set to enable the applicable function.  
2. Disable the scaling function when using the 10/12-bit YCbCr-422 format in the ITU-R BT.601, BT.709, or BT656 interface or the 20/24-bit YCbCr-422 format in the ITU-R BT.1358 interface.

**Table 23.12 Examples of Scaling Setting (Input Pixels: 720 Pixels)**

Output Pixels	Scaling Ratio	Setting
680	0.943	H'10F8
800	1.111	H'0E68
854	1.185	H'0D80

### 23.2.22 Video n Data Mode Register (VnDMR)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Notes: Availability of channels:

n = 0 to 3 (RZ/G1H), 0 to 2 (RZ/G1M/N), 0 and 1 (RZ/G1E)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R	R	R	R/W	R	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	A8BIT[7:0]	H'00	R/W	Alpha 8 These bits set the alpha value for the ARGB8888 format output.
23 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	EVA	0	R/W	Even Field Address Offset This bit specifies the address offset of the even field (field 2) in memory in odd-/even-field capture mode. 0: Data are stored from the base address in external memory. 1: Data are stored from the base address plus the memory width in external memory.
15	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
14 to 12	YMODE[2:0]	000	R/W	YC Data Transfer Mode These bits specify the transfer method of Y/CbCr when the data conversion mode (DTMD) is 10 (YC separation). 000: Both Y and CbCr data are transferred to memory 001: Only Y data is transferred to memory as 8-bit data 010: 10-bit Y data is converted to 16-bit data and both Y and CbCr data are transferred to memory. 011: 10-bit Y data is converted to 16-bit data and only Y data is transferred to memory. 100: 12-bit Y data is converted to 16-bit data and both Y and CbCr data are transferred to memory. 101: 12-bit Y data is converted to 16-bit data and only Y data is transferred to memory. 110: Setting prohibited 111: Setting prohibited
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
8	EXRGB	0	R/W	Extension RGB Conversion Mode 0: RGB data extension processing is not performed. 1: Data is extended to 32-bit RGB conversion when DTMD[1:0] is set to 00 or 01 as the data conversion mode.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	BPSM	0	R/W	Output Data Byte Swap Mode 0: Bytes are not swapped in output data. 1: Bytes are swapped in output data. Note: When YCbCr-422 data is output in big endian, data is transferred in the YUYV format in most cases. To transfer data in the UYVY format, set this bit to 1.
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2	ABIT	0	R/W	Alpha Bit This bit specifies the alpha value for data in ARGB-1555 output mode. 0: The alpha value is set to 0. 1: The alpha value is set to 1.
1, 0	DTMD[1:0]	00	R/W	Data Conversion Mode These bits set the format for storing RGB888 or YCbCr444 data after LUT conversion, in the external memory. *1 00: Data is not converted. 01: RGB is converted to ARGB before output. 10: YC is separated before output. *2 11: Setting prohibited.

Notes: 1. The data conversion modes that can be set are shown in Table 23.12. Do not set any other mode that is not listed in the table. RGB and YCbCr data after LUT conversion should be set as shown in Tables 23.10 and 23.11.

2. Do not set for any other data format except for YCbCr422; set YC separation only for YCbCr data format.

**Table 23.13 Data Conversion Settings**

## • RGB Data Conversion Modes

Format of Data Stored in Memory	VnDMR/ YMODE[2:0]	VnDMR/ EXRGB	VnDMR/ DTMD[1:0]	Remarks
RGB-565 (16 bits/pixel) format	000	0	00	
RGB-888 (32 bits/pixel) format	000	1	00	
ARGB-1555 (16 bits/pixel) format	000	0	01	The alpha bit is set with the ABIT bit in VnDMR.
ARGB-8888 (32 bits/pixel) format	000	1	01	The alpha bit is set with the A8BIT bit in VnDMR.

## • YCbCr Data Conversion Modes

Format of Data Stored in Memory	VnDMR/ YMODE[2:0]	VnDMR/ EXRGB	VnDMR/ DTMD[1:0]	Remarks
YCbCr-422 ( 8 bits) transfer	000	0	00	Set the BPSM bit in VnDMR to 1 to transfer in UYVY format in big endian.
Y (8 bits)/CbCr separation transfer	000	0	10	CbCr transfer destination is determined by the VnUVAOF register setting.
Y (8 bits) transfer	001	0	10	
Y (16 bits)/CbCr separation transfer	010/100	0	10	CbCr transfer destination is determined by the VnUVAOF register setting.
Y (16 bits) transfer	011/101	0	10	

Notes: If any combination of values not listed above is specified, correct operation is not guaranteed.

**23.2.24 Video n UV Address Offset Register (VnUVAOF)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Note: Availability of channels:

n = 0 to 3 (RZ/G1H), 0 to 2 (RZ/G1M/N), 0 and 1 (RZ/G1E)

Bit	Bit Name	Initial Value	R/W	Description
31 to 7	UVAOF[24:0]	All 0	R/W	<p>UV Data Address Offset</p> <p>These bits specify the transfer offset address for the YC separation YCbCr-422 UV data.</p> <p>Specify bits 31 to 7 of the physical address in 128-byte units.</p> <p>Note: The specified address should be equal to or greater than the Y transfer size. Otherwise, the overwriting of Y data occurs.</p>
6 to 0	—	All 0	R	<p>Reserved bits that indicate the 128-byte boundary of the UVAOF value.</p> <p>These bits are always read as 0. The write value should always be 0.</p>

### 23.2.25 YC-RGB Conversion Coefficient Registers

YC→RGB color space conversion is performed with the following formula. Each of the coefficients can be set through the registers. Here, if 8-bit data format is set, the coefficient registers set with the YMUL, CSUB, and YSUB bits in the VnCSCC1 register, RCRMU and GCRMUL bits in the VnCSCC2 register and GCBMUL and BCBMUL bits in the VnCSCC3 register are used to convert the color space. When 10-bit/12-bit data format is set, the YMUL2 bit in the VnCSCE1 register, CSUB2 and YSUB2 bits in the VnCSCE2 register, RCRMUL2 and GCRMUL2 bits in the VnCSCE3 register, GCBMUL2 and BCBMUL2 bits in the VnCSCE4 register are used in color space conversion.

$$\begin{aligned}
 R &= \begin{pmatrix} VnCSCC1/ \\ YMUL[9:0] \\ or \\ VnCSCE1/ \\ YMUL2[13:0] \end{pmatrix} \times (Y - \begin{pmatrix} VnCSCC1/ \\ YSUB[7:0] \\ or \\ VnCSCE1/ \\ YSUB2[11:0] \end{pmatrix}) + \begin{pmatrix} VnCSCC2/ \\ RCRMUL[9:0] \\ or \\ VnCSCE3/ \\ RCRMUL2[13:0] \end{pmatrix} \times (Cr - \begin{pmatrix} VnCSCC1/ \\ CSUB[7:0] \\ or \\ VnCSCE1/ \\ CSUB2[11:0] \end{pmatrix}) \\
 G &= \begin{pmatrix} VnCSCC1/ \\ YMUL[9:0] \\ or \\ VnCSCE1/ \\ YMUL2[13:0] \end{pmatrix} \times (Y - \begin{pmatrix} VnCSCC1/ \\ YSUB[7:0] \\ or \\ VnCSCE1/ \\ YSUB2[11:0] \end{pmatrix}) - \begin{pmatrix} VnCSCC2/ \\ GCRMUL[9:0] \\ or \\ VnCSCE3/ \\ GCRMUL2[13:0] \end{pmatrix} \times (Cr - \begin{pmatrix} VnCSCC1/ \\ CSUB[7:0] \\ or \\ VnCSCE1/ \\ CSUB2[11:0] \end{pmatrix}) - \begin{pmatrix} VnCSCC3/ \\ GCBMUL[9:0] \\ or \\ VnCSCE4/ \\ GCBMUL2[13:0] \end{pmatrix} \times (Cb - \begin{pmatrix} VnCSCC1/ \\ CSUB[7:0] \\ or \\ VnCSCE1/ \\ CSUB2[11:0] \end{pmatrix}) \\
 B &= \begin{pmatrix} VnCSCC1/ \\ YMUL[9:0] \\ or \\ VnCSCE1/ \\ YMUL2[13:0] \end{pmatrix} \times (Y - \begin{pmatrix} VnCSCC1/ \\ YSUB[7:0] \\ or \\ VnCSCE1/ \\ YSUB2[11:0] \end{pmatrix}) + \begin{pmatrix} VnCSCC3/ \\ BCBMUL[9:0] \\ or \\ VnCSCE4/ \\ BCBMUL2[13:0] \end{pmatrix} \times (Cb - \begin{pmatrix} VnCSCC1/ \\ CSUB[7:0] \\ or \\ VnCSCE1/ \\ CSUB2[11:0] \end{pmatrix})
 \end{aligned}$$

Note: Set the coefficients for ITU-R BT.601 (8 bits) as the initial value.

$$R = 1.164 \times (Y - 16) + 1.596 \times (Cr - 128)$$

$$G = 1.164 \times (Y - 16) - 0.813 \times (Cr - 128) - 0.392 \times (Cb - 128)$$

$$B = 1.164 \times (Y - 16) + 2.017 \times (Cb - 128)$$

13 to 0	BCBMUL2[13:0]	H'2045	R/W	Cb Multiplication Coefficient 2 for B Calculation These bits specify the Cb multiplication coefficient for the B data calculation equation in YCbCr-444→RGB-101010/RGB121212 color space conversion. (Initial value: 2.017) Specify an unsigned 14-bit integer obtained by multiplying the desired coefficient value by 4096.

### 23.2.26 Video n Coefficient Set Registers

The coefficient set registers specify the coefficients used for calculation of X scaling specified in XS. The X scaling function processes input pixels with 8-step resolution and generates scaled pixels by using nine calculation coefficients (nine taps) around the determined pixel.

The following is an overview of nine tap coefficients. The MSB of each coefficient is a sign bit.

**Table 23.14 Bit Count for Tap Coefficients**

Register Name (m = 1 to 8)	CmA			CmC			CmB		
Nine tap coefficients	L1	L2	L3	L4	M	R4	R3	R2	R1
Bit width	10	10	10	10	10	10	10	10	10

19 to 10	R2[9:0]	H'000	R/W	R2 coefficient
9 to 0	R3[9:0]	H'000	R/W	R3 coefficient

**23.2.26.3 Video n Coefficient Set CmC Register (VnCmC) (m = 1 to 8)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Note: Availability of channels:

n = 0 to 3 (RZ/G1H), 0 to 2 (RZ/G1M/N), 0 and 1 (RZ/G1E)

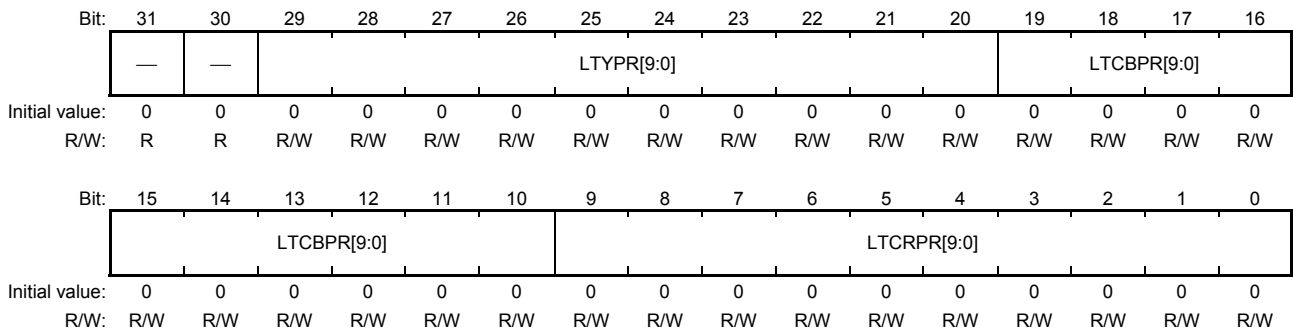

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
29 to 20	R4[9:0]	H'000	R/W	R4 coefficient
19 to 10	L4[9:0]	H'000	R/W	L4 coefficient
9 to 0	M[9:0]	H'000	R/W	M coefficient

**23.2.27 Video n Lookup Table Pointer (VnLUTP)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Note: Availability of channels:  
 n = 0 to 2 (RZ/G1H), 0 and 1 (RZ/G1M/N), 0 and 1 (RZ/G1E)

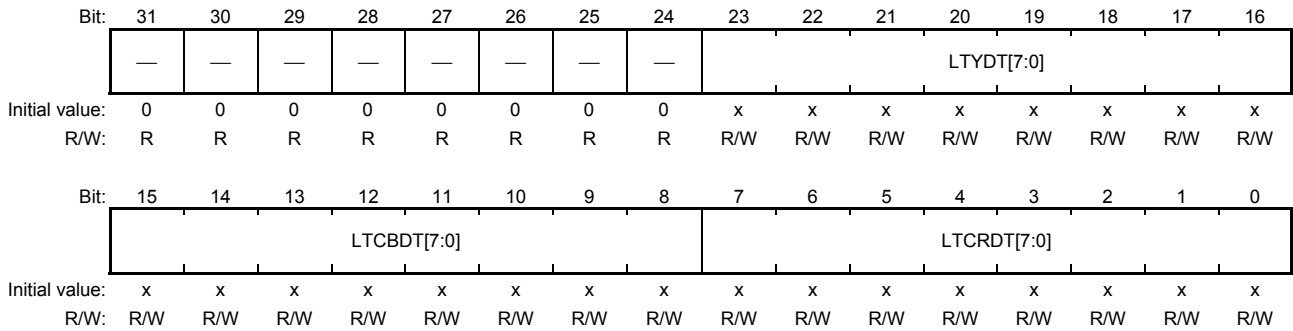

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
29 to 20	LTYPR[9:0]	All 0	R/W	Lookup Table Y Pointer These bits set the LUT pointer to Y and R data after color space conversion.
19 to 10	LTCBPR[9:0]	All 0	R/W	Lookup Table Cb Pointer These bits set the LUT pointer to Cb and G data after color space conversion.
9 to 0	LTCRPR[9:0]	All 0	R/W	Lookup Table Cr Pointer These bits set the LUT pointer to Cr and G data after color space conversion.

Note: Set the LUT pointer to the upper 10 bits of the 12-bit data for the color space conversion result.  
 The access pointer to the LUT will be automatically incremented by writing to the VnLUTD register.  
 There will be no automatic increment at read access.

**23.2.28 Video n Lookup Table Data Register (VnLUTD)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Note: Availability of channels:  
 n = 0 to 2 (RZ/G1H), 0 and 1 (RZ/G1M/N), 0 and 1 (RZ/G1E)

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	LTYDT[7:0]	H'x	R/W	Lookup Table Y Data These bits set the LUT conversion data for Y and R data after color space conversion.
15 to 8	LTCBDT[7:0]	H'x	R/W	Lookup Table Cb Data These bits set the LUT conversion data for Cb and G data after color space conversion.
7 to 0	LTCRDT[7:0]	H'x	R/W	Lookup Table Cr Data These bits set the LUT conversion data for Cr and B data after color space conversion.

Note: The 8-bit data after LUT conversion is subjected to upper shift to carry out capture control as 12-bit data.  
 As for reading from the VnLUTD register, the data read the second time, including dummy read, after the VnLUTP register has been set is valid.

### 23.2.29 RGB-YC Conversion Coefficient Registers

Color space conversion from RGB to YC is done with the following formula. Each of the coefficients can be set with the registers.

$$\begin{aligned}
 Y &= YCLRP \times R + YCLGP \times G + YCLBP \times B + YCLAP \\
 Cb &= CBCLRP \times R + CBCLGP \times G + CBCLBP \times B + CBCLAP \\
 Cr &= YCLRP \times R + YCLGP \times G + YCLBP \times B + YCLAP
 \end{aligned}$$

Note: Set the coefficients for ITU-R BT.601 (8 bits) as the initial value.

$$\begin{aligned}
 Y &= 0.257 \times R + 0.504 \times G + 0.098 \times B + 16 \\
 Cb &= -0.148 \times R - 0.291 \times G + 0.439 \times B + 128 \\
 Cr &= 0.439 \times R - 0.368 \times G - 0.071 \times B + 128
 \end{aligned}$$

## 23.3 Operation

RZ/G1H

RZ/G1N

RZ/G1M

RZ/G1E

### 23.3.1 Input Interface

The VIN captures video data in the ITU-R BT.601, ITU-R BT.656, ITU-R BT.1358, or ITU-R BT.709 interface and stores it in external memory. The module has four input-interface channels. The interface and data format can be set as desired for each video channel.

The following tables show the interface and data format supported in each product and its channels.

Note: When the ITU-R BT.709 interface is in use, the maximum frequency of the video clock is 74.5 MHz.

**Table 23.15 Video Channels and Supported Interfaces (RZ/G1H)**

				Channel 0	Channel 1	Channel 2	Channel 3
Input interface	ITU-R BT.656	YCbCr-422	8 bits	Supported	Supported	Supported	Supported

**(1) Multiplexed YCbCr-422 Data Format in ITU-R BT.601 Interface**

Data in the multiplexed YCbCr-422 format is a UYVY format (U0Y0V0Y1 format) YCbCr data. The Y, Cb, Cr image data is captured at the rising edges of the input video clock signal.

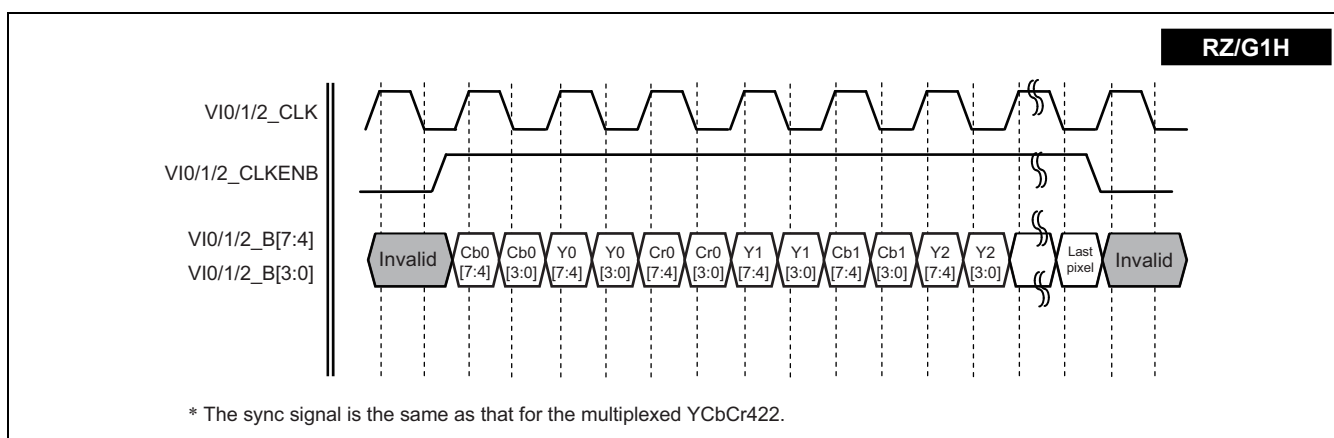

**Figure 23.4 Multiplexed YCbCr-422 Data Format (Example of RZ/G1H)**

**(2) Multiplexed YCbCr-422 (4 Bits) Data Format in ITU-R BT.601 Interface (RZ/G1H only)**

Data in the multiplexed YCbCr-422 format is a UYVY format (U0Y0V0Y1 format) YCbCr data. The Y, Cb, Cr image data is captured at the rising and falling edges of the input video clock signal.

When data are captured via this interface, the RIS bit in the main control register (VnMC) should be set to 1.

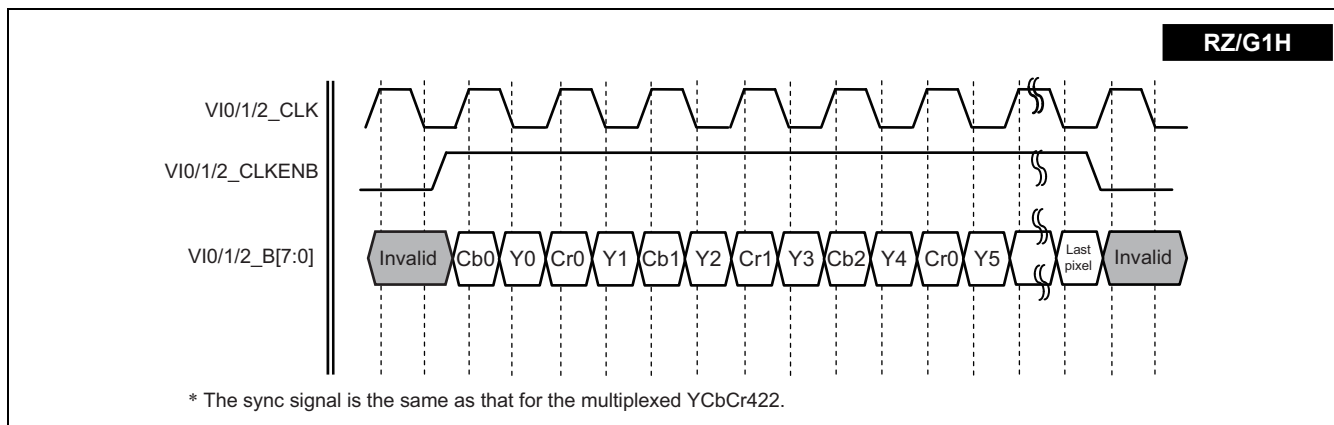

**Figure 23.5 Multiplexed YCbCr-422 (4 Bits) Data Format [RZ/G1H]**

**(3) Multiplexed YCbCr-422 (8 Bits) Data Format in ITU-R BT.601 Interface (RZ/G1H only)**

Data in the multiplexed YCbCr-422 format is a UYVY format (U0Y0V0Y1 format) YCbCr data. The Cb, Cr image data is captured at the rising edges of the input video clock signal and the Y image data is captured at the falling edges of the input video clock signal.

When data are captured via this interface, the RIS bit in the main control register (VnMC) should be set to 1.

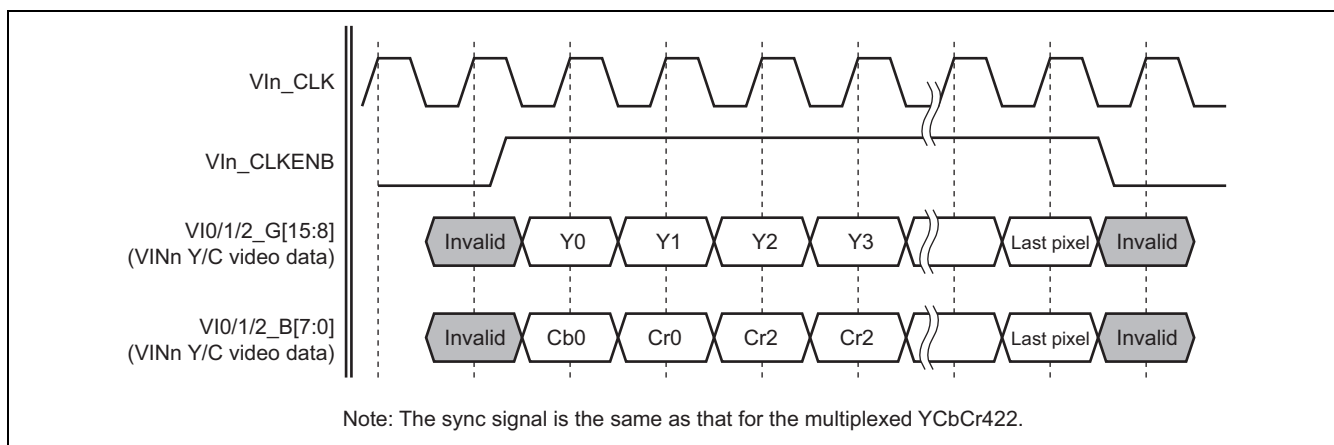

**Figure 23.6 Multiplexed YCbCr-422 (8 Bits) Data Format [RZ/G1H]**

**(4) CbCr Multiplexed YCbCr-422 Data Format in ITU-R BT.601/1358 Interface**

Data in the CbCr multiplexed YCbCr-422 format is YCbCr data with only the CbCr data being multiplexed. The Y and CbCr image data are captured at the rising edges of the input video clock signal.

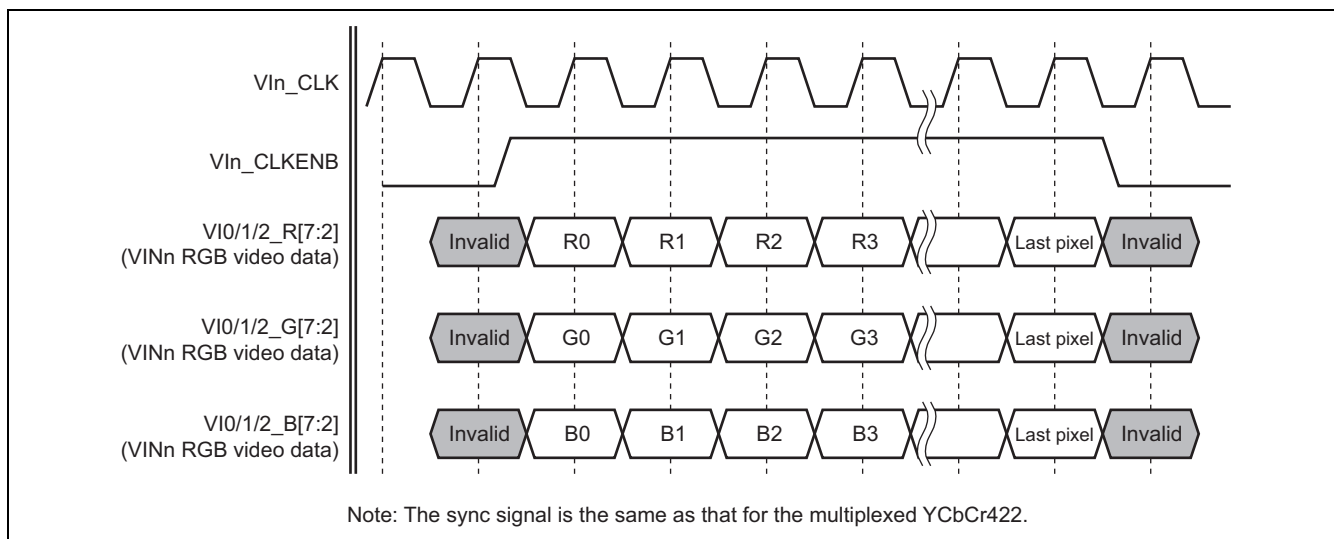

Setting the YCAL bit in VnMC to 1 enables the capturing of image data with CbCr data in the upper bits and Y data in the lower bits.

**Figure 23.7 CbCr Multiplexed YCbCr-422 Data Format (Y Data in Upper Bits) (Example of RZ/G1H)**

**(5) RGB-666 Data Format in ITU-R BT.601 Interface**

This data format can be used for the color conversion space in the RGB=4:4:4 format defined in the ITU-R BT.601 standard. The R, G, B image data are captured at the rising edges of the input video clock signal.

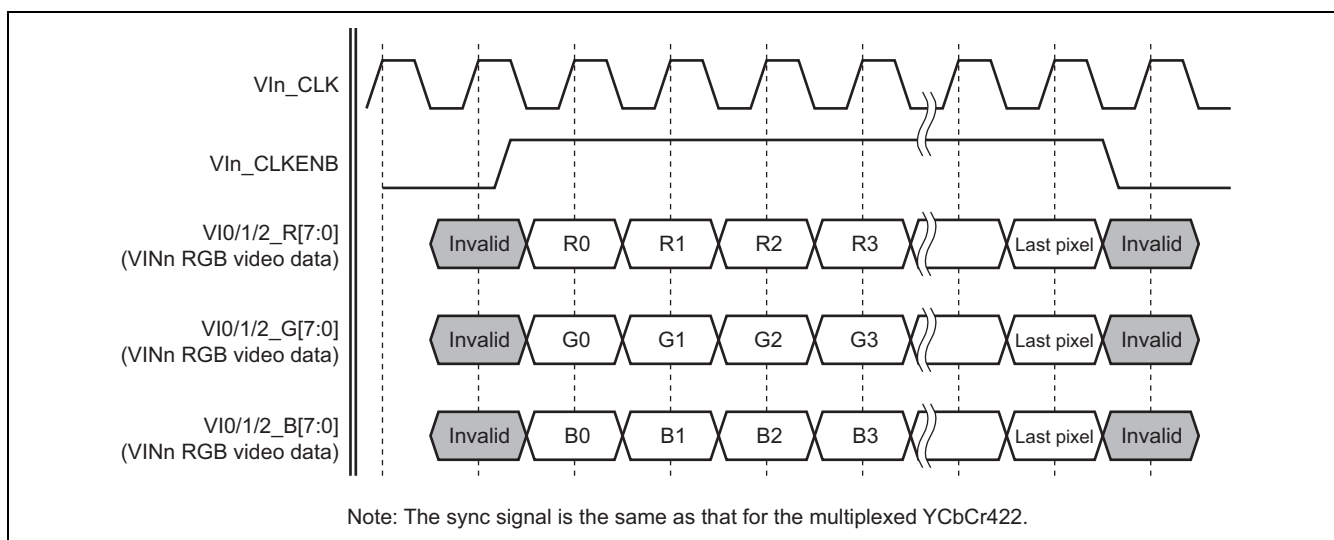

**Figure 23.8 RGB-666 Data Format (Example of RZ/G1H)**

**(6) RGB-888 (24 bits) Data Format in ITU-R BT.601 Interface**

This data format can be used for the color conversion space in the RGB=4:4:4 format defined in the ITU-R BT.601. The R, G, B image data are captured at the rising edges of the input video clock signal.

For the RZ/G1H, when data are captured via this interface, the RIS bit in the main control register (VnMC) should be set to 0.

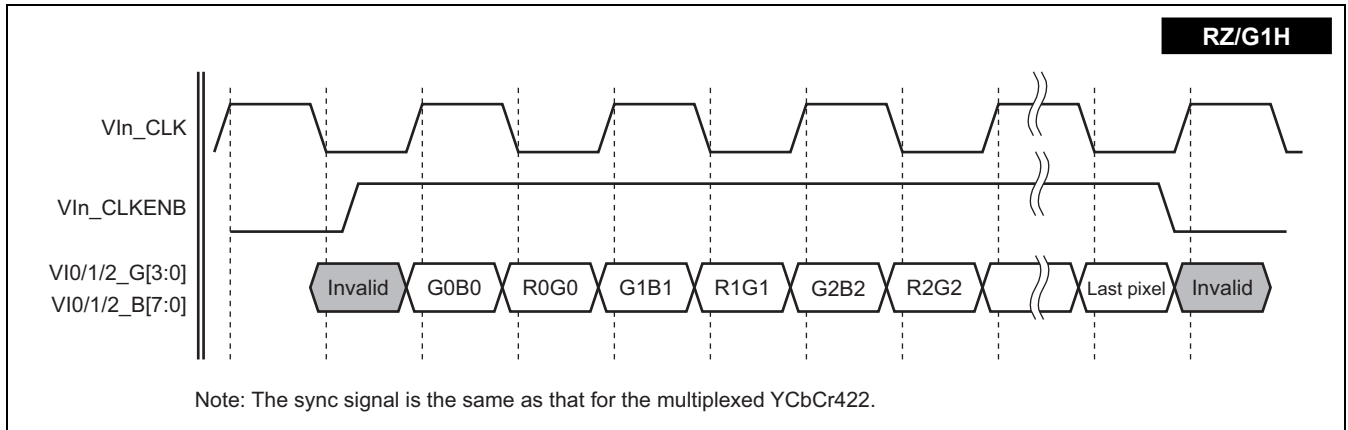

**Figure 23.9 RGB-888 (24 Bits) Data Format (Example of RZ/G1H)**

**(7) RGB-888 (12 bits) Data Format in ITU-R BT.601 Interface (RZ/G1H only)**

This data format can be used for the color conversion space in the RGB=4:4:4 format defined in the ITU-R BT.601. The R, G, B image data are captured at the rising and falling edges of the input video clock signal.

When data are captured via this interface, the RIS bit in the main control register (VnMC) should be set to 1.

**Figure 23.10 RGB-888 (12 Bits) Data Format (RZ/G1H Only)**

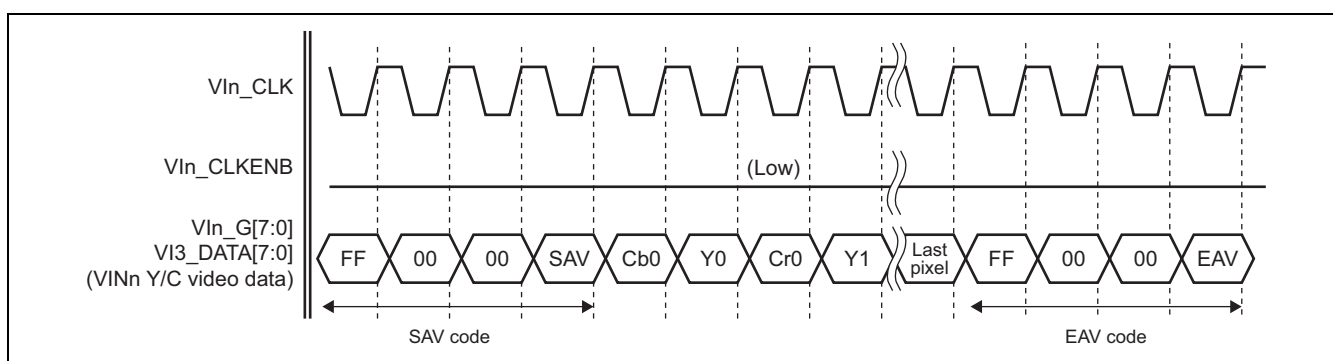

**(8) Multiplexed YCbCr-422 Data Format in ITU-R BT.656 Interface**

In the ITU-R BT.656 interface, active data between the start of active video (SAV) and the end of active video (EAV) indicated with the timing reference code is captured.

**Table 23.18 Video Timing Reference Code**

VINn Image Data			First Word	Second Word	Third Word	Fourth Word (XY)	
12 bits	10 bits	8 bits					
VIn_G[3]	VIn_G[1]	VIn_B[7]	1	0	0	1	
VIn_G[2]	VIn_G[0]	VIn_B[6]	1	0	0	F	0: Field 1 1: Field 2
VIn_G[1]	VIn_B[7]	VIn_B[5]	1	0	0	V	0: elsewhere 1: Field Blanking
VIn_G[0]	VIn_B[6]	VIn_B[4]	1	0	0	H	0: SAV 1: EAV
VIn_B[7]	VIn_B[5]	VIn_B[3]	1	0	0	P3	Protection bit 3
VIn_B[6]	VIn_B[4]	VIn_B[2]	1	0	0	P2	Protection bit 2
VIn_B[5]	VIn_B[3]	VIn_B[1]	1	0	0	P1	Protection bit 1
VIn_B[4]	VIn_B[2]	VIn_B[0]	1	0	0	P0	Protection bit 0
VIn_B[3]	VIn_B[1]	—	1	0	0	0	
VIn_B[2]	VIn_B[0]	—	1	0	0	0	
VIn_B[1]	—	—	1	0	0	0	
VIn_B[0]	—	—	1	0	0	0	

Active data is available with the multiplexed YCbCr-422 data format in the UYVY (U0Y0V0Y1) format. In this interface, timing reference and Y, Cb, Cr image data are captured at the rising edges of the input clock signal.

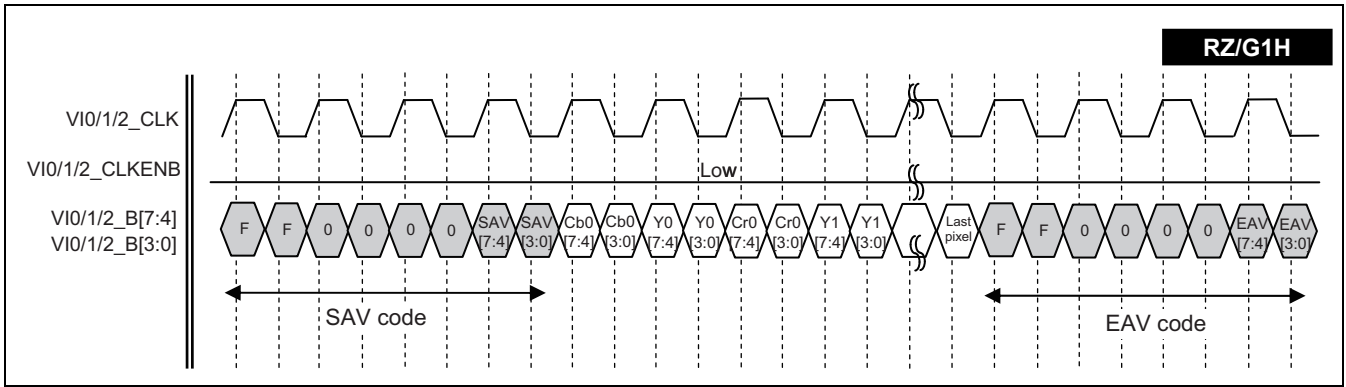

**Figure 23.11 Multiplexed YCbCr-422 Data Format (Example of RZ/G1H)**

Capturing is controlled based on field information. Therefore, the field signal and timing reference codes should be correct.

**(9) Multiplexed YCbCr-422 (4 Bits) Data Format in ITU-R BT.656 Interface (RZ/G1H only)**

Active data is available with the multiplexed YCbCr-422 data format in the UYVY (U0Y0V0Y1) format. In this interface, timing reference and Y, Cb, Cr image data are captured at the rising and falling edges of the input clock signal.

When data are captured via this interface, the RIS bit in the main control register (VnMC) should be set to 1.

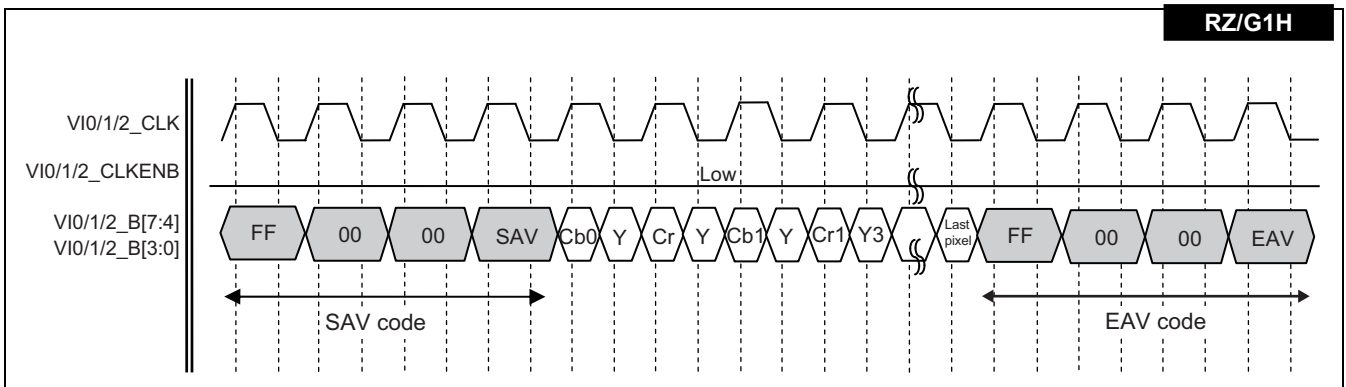

**Figure 23.12 Multiplexed YCbCr-422 (4 Bits) Data Format [RZ/G1H]**

Capturing is controlled based on field information. Therefore, the field signal and timing reference codes should be correct.

**(10) Multiplexed YCbCr-422 (8 Bits) Data Format in ITU-R BT.656 Interface (RZ/G1H only)**

Active data is available with the multiplexed YCbCr-422 data format in the UYVY (U0Y0V0Y1) format. In this interface, timing reference and Cb, Cr image data are captured at the rising and falling edges of the input clock signal, and timing reference and Y image data are captured at the falling edges.

When data are captured via this interface, the RIS bit in the main control register (VnMC) should be set to 1.

**Figure 23.13 Multiplexed YCbCr-422 (8 Bits) Data Format [RZ/G1H]**

Capturing is controlled based on field information. Therefore, the field signal and timing reference codes should be correct.

The same timing reference codes should be input for the rising and falling edges.

**23.3.2 Error Correction**

At the time of capturing with ITU-R BT.656, the VIN allows errors to be corrected with the timing reference code (SAV/EAV). The timing reference code (SAV/EAV) of ITU-R BT.656 has four protection bits, which can be used to correct only one-bit errors in the interface.

If the VIN cannot correct errors while the CEE bit in the interrupt enable register (VnIE) has been set to 1, an interrupt signal is generated as soon as the CES bit in the interrupt status (VnINTS) register is set. Note that no interrupt signal is generated if errors can be corrected.

### 23.3.3 Capture Mode

With the VIN, either of the single frame capture mode or continuous frame capture mode can be selected.

Specifying the capture field in IM bits of the main control (VnMC) register and then setting the SC bit in the frame capture (VnFC) register to 1 provides single frame capture mode. In this mode, the current frame is captured when the SC bit write timing (current scanline position) is smaller than the value of the start line pre-clip (VnSLPrC) register, or the next frame is captured in other cases. The capture data is transferred to the memory address that is set in the memory base 1 (VnMB1) register.

Specifying the capture field in IM bits of VnMC and then setting the CC bit of VnFC to 1 provides continuous frame capture mode, in which capture data is sequentially transferred to the addresses that are set in MB1 to MB3. In this case, the latest captured frame ID is shown in the FBS bits in the module status (VnMS) register.

When the IM bits in VnMC are set to the full interlace mode, data in the capture start field is stored in every other line in the memory as the odd field (field 1) data and then data in the next field is stored as the even field (field 2) between the written lines so that the top and bottom field lines alternate with each other for interlace composition. The capture start field (top field) can be changed through the FOC bit in VnMC.

The following is a schematic diagram of capturing in full interlace mode when the odd field (field 1) is selected as the top field, the memory width is set to H'200, and VnMB1 is set to H'0000.

**Figure 23.14 Example of Capturing Full Interlace**

The VIN starts capture operation after detecting a frame signal switching in the ITU-R BT.601 or 656 interface. When capturing progressive data, in which the field signal does not change, use the internal field signal generation function to toggle the internal field signal.

### 23.3.4 Size Clipping

Image data that has been captured is pre-clipped according to the settings of the following registers: start line pre-clip (VnSLPrC), end line pre-clip (VnELPrC), start pixel pre-clip (VnSPPrC), and end pixel pre-clip (VnEPPrC).

After the horizontal and vertical scaling, post-clipping takes place according to the settings of the following registers: start line post-clip (VnSLPoC), end line post-clip (VnELPoC), start pixel post-clip (VnSPPoC), and end pixel post-clip (VnEPPoC). The following shows an example of size clipping.

**Figure 23.15 Example of Clipping**

For all the post-clipped lines, the lengths of individual lines written into the memory are defined by the image stride (VnIS) register. The setting can be larger than the post-clipped frame width, but cannot be smaller than the width. The VnIS register must be filled with a value larger than the horizontal post-clipping width. The input field in the above figure shows an effective image area from the video decoder; the VIN does not allow anything exceeding the image area to be captured.

Note: Each of the following registers specifies a distance from the starting point in the effective image area: start line pre-clip (VnSLPrC), end line pre-clip (VnELPrC), start pixel pre-clip (VnSPPrC), and end pixel pre-clip (VnEPPrC). Specifically, in ITU-R BT.601, the distance is from the starting point of Vin\_CLKENB (data enable); in ITU-R BT.656, the distance is from the SAV (start of active video) signal.

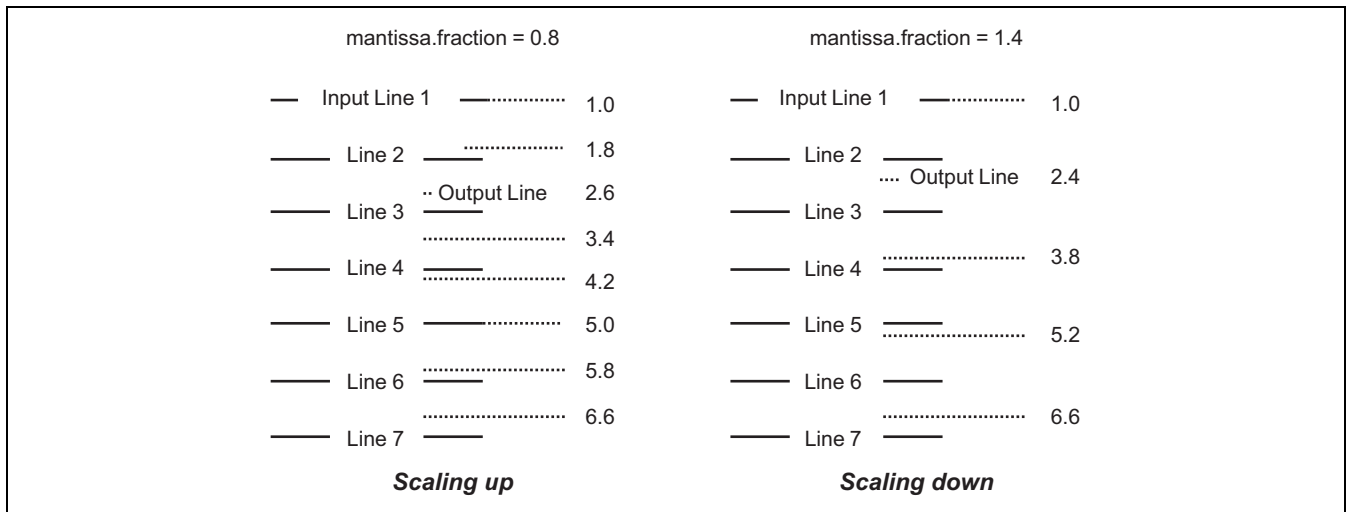

### 23.3.5 Vertical Scaling

The vertical scaling function in the VIN creates lines by scaling up or down in the vertical direction through interpolation between two points in the neighborhood of captured lines. With the combinations of mantissaY and fractionY in the Y scaling (VnYS) register, the vertical scaling creates new lines by selecting line positions from captured lines.

The Y scaling function is disabled if mantissaY and fractionY are both cleared to 0 in VnYS.

Scaling down is implemented by creating fewer lines than captured lines. Examples of scaling up and down are shown in the following figure.

Note: When vertical scaling up is specified in full interlace capture mode, the scaling-up processing is applied separately to each field before full interlace composition on memory. Accordingly, the top and bottom field lines are inverted in some cases depending on the scaling ratio. Be sure to evaluate the scaled image quality before practical application.

**Figure 23.16 Examples of Scaling Up and Down in Vertical Direction**

The number of lines created by the vertical scaling block is expressed by the following equation:

$$N_y = \begin{cases} \frac{4096 \times (ELPrC - SLPrC)}{4096 \times MantissaY + FractionY} - 1, & \text{when } \{4096 \times (ELPrC - SLPrC)\} \% (4096 \times MantissaY + FractionY) = 0 \\ Int \left( \frac{4096 \times (ELPrC - SLPrC)}{4096 \times MantissaY + FractionY} \right), & \text{otherwise} \end{cases}$$

where:

ELPrC is the value in the end line pre-clip (VnELPrC) register.  
 SLPrC is the value in the start line pre-clip (VnSLPrC) register.  
 MantissaY and FractionY are the values in VnYS.

### 23.3.6 Horizontal Scaling

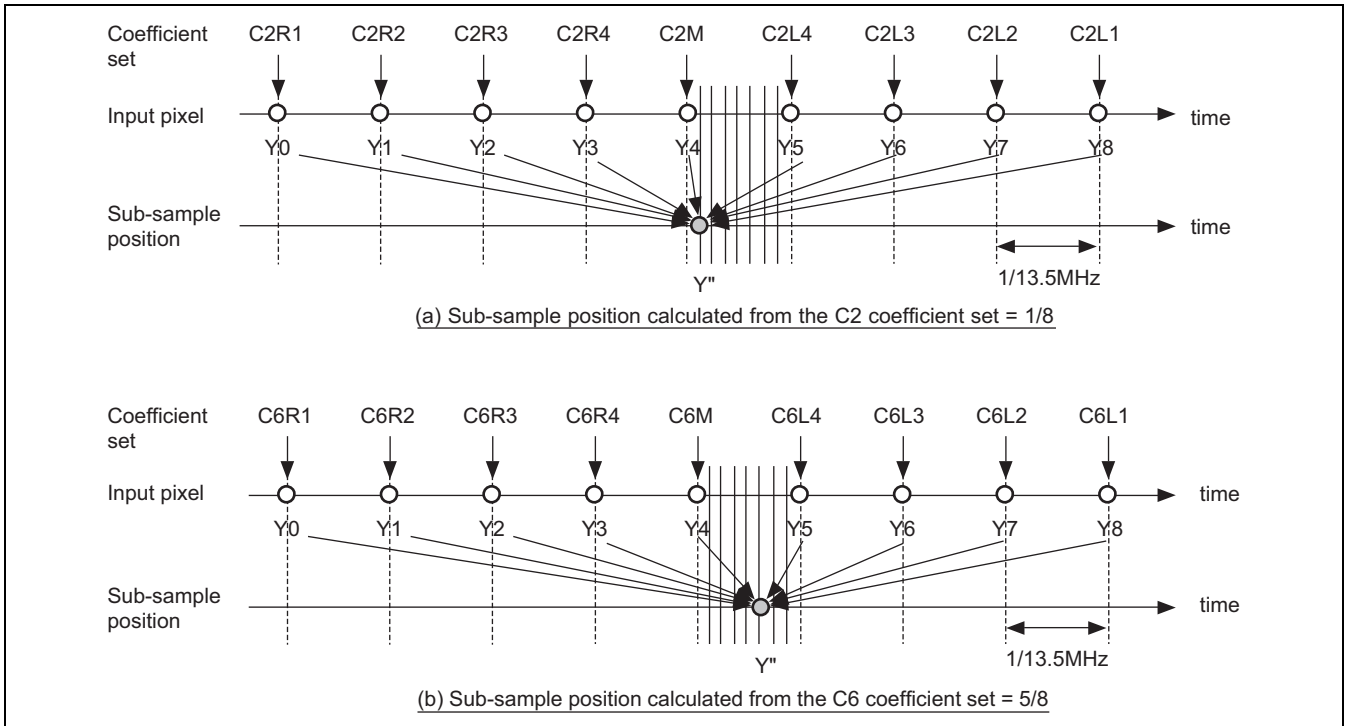

Using a 9-tap multiphase filter, the VIN creates pixels by scaling down in the horizontal direction. The horizontal scaling-up doubles the number of input pixels captured and provides the function of expansion of up to two-fold by the scaling-down in the 9-tap multiphase filter. The horizontal scaling, which is set through combinations of mantissaX and fractionX in the X scale (VnXS) register, determines the position of new pixels with a poly-phase filter. The selected coefficient, which is one of the eight coefficients, is determined by the position of output pixels.

In the example shown below, mantissaX and fractionX are set at 1.2. In this case, coefficient set C2 is selected.

**Figure 23.17 Pixel Position and Coefficient Set**

The following figure shows an example in which different coefficient sets are used for different output pixel positions. Nine coefficient sets are assigned to each. A total of 72 coefficients are used in the horizontal scaling. Each of the coefficients in these sets has a width of 10 bits, where the MSB serves as the sign bit. By setting the same coefficients into the entire eight coefficient set registers, the horizontal scaling allows the use of a multiphase filter just like a single-phase filter.

**Figure 23.18 Example of Coefficients in Selected Coefficient Set**

This scaling mechanism requires different coefficient values dependent on the scaling ratio. Here is an example of coefficient sets to be selected. The coefficients,  $C_{mM}$ ,  $C_{mLi}$ , and  $C_{mRi}$  ( $m = 1, 2, 3, \dots, 8$ ;  $i = 1, 2, 3, \text{ and } 4$ ), are determined by the following equations:

$$C_{nM} = \beta \times h(-(n-1))$$

$$C_{nRi} = \beta \times h(-(n-1) - 8(5-i))$$

$$C_{nLi} = \beta \times h(-(n-1) + 8(5-i))$$

$$h(t) = \frac{\sin\left(\frac{\pi t}{T}\right)}{\frac{\pi t}{T}} \times \frac{\cos\left(\frac{\alpha \pi t}{T}\right)}{1 - \frac{4\alpha^2 t^2}{T^2}}$$

$$T = 8 \times \text{MantissaX} + \text{FractionX} \text{ [11:9]}$$

Mantissa X and Fraction X are the values in VnXS.

The parameter  $\beta$  is a standardized one. In the equation,  $h(t)$  follows the cosine characteristic and is executed with a 9-tap filter if the value of  $\alpha$  is in the  $0 < \alpha \leq 1$  range.

Obtaining dependable scale images requires you to use and meet the following equation in which all the coefficient sets are standardized.

This must be executed with the inherent  $\beta$  value that has been selected from the equation above.

$$C_{nM} + \sum_{i=1}^4 C_{nRi} + \sum_{i=1}^4 C_{nLi} = 512$$

The number of pixels created by the horizontal scaling block is calculated by the following equation.

$$N_x = \text{Int} \left( \frac{4096 \times (EPPrC - SPPrC)}{4096 \times \text{MantissaX} + \text{FractionX}} \right) + 1$$

where:

EPPrC is the value in the end pixel pre-clip (VnEPPrC) register.

SPPrC is the value in the start pixel pre-clip (VnSPPrC) register.

Mantissa X and Fraction X are the values in VnXS.

### 23.3.7 Color Conversion Function

#### (1) YC-RGB Color Conversion

When the data input format is YCbCr, set the BPS bit in the VnMC register to 0 to convert YCbCr data to RGB data. If an 8-bit data format is used for the capture interface, the color conversion is carried out according to the matrix coefficients set in the VnCSCC1, VnCSCC2, and VnCSCC3 registers. Otherwise, it is carried out according to the matrix coefficients set in the VnCSCE1, VnCSCE2, VnCSCE3, and VnCSCE4 registers. All of the input YCbCr data is extended to 12-bit data before carrying out color conversion.

Here, if the BPS bit in VnMC is set to 1, the data is stored in memory as it is in YCbCr format.

$$\begin{aligned}
 R &= \begin{pmatrix} VnCSCC1/ \\ YMUL[9:0] \\ or \\ VnCSCE1/ \\ YMUL2[13:0] \end{pmatrix} \times (Y - \begin{pmatrix} VnCSCC1/ \\ YSUB[7:0] \\ or \\ VnCSCE1/ \\ YSUB2[11:0] \end{pmatrix}) + \begin{pmatrix} VnCSCC2/ \\ RCRMUL[9:0] \\ or \\ VnCSCE3/ \\ RCRMUL2[13:0] \end{pmatrix} \times (Cr - \begin{pmatrix} VnCSCC1/ \\ CSUB[7:0] \\ or \\ VnCSCE1/ \\ CSUB2[11:0] \end{pmatrix}) \\
 G &= \begin{pmatrix} VnCSCC1/ \\ YMUL[9:0] \\ or \\ VnCSCE1/ \\ YMUL2[13:0] \end{pmatrix} \times (Y - \begin{pmatrix} VnCSCC1/ \\ YSUB[7:0] \\ or \\ VnCSCE1/ \\ YSUB2[11:0] \end{pmatrix}) - \begin{pmatrix} VnCSCC2/ \\ GCRMUL[9:0] \\ or \\ VnCSCE3/ \\ GCRMUL2[13:0] \end{pmatrix} \times (Cr - \begin{pmatrix} VnCSCC1/ \\ CSUB[7:0] \\ or \\ VnCSCE1/ \\ CSUB2[11:0] \end{pmatrix}) - \begin{pmatrix} VnCSCC3/ \\ GCBMUL[9:0] \\ or \\ VnCSCE4/ \\ GCBMUL2[13:0] \end{pmatrix} \times (Cb - \begin{pmatrix} VnCSCC1/ \\ CSUB[7:0] \\ or \\ VnCSCE1/ \\ CSUB2[11:0] \end{pmatrix}) \\
 B &= \begin{pmatrix} VnCSCC1/ \\ YMUL[9:0] \\ or \\ VnCSCE1/ \\ YMUL2[13:0] \end{pmatrix} \times (Y - \begin{pmatrix} VnCSCC1/ \\ YSUB[7:0] \\ or \\ VnCSCE1/ \\ YSUB2[11:0] \end{pmatrix}) + \begin{pmatrix} VnCSCC3/ \\ BCBMUL[9:0] \\ or \\ VnCSCE4/ \\ BCBMUL2[13:0] \end{pmatrix} \times (Cb - \begin{pmatrix} VnCSCC1/ \\ CSUB[7:0] \\ or \\ VnCSCE1/ \\ CSUB2[11:0] \end{pmatrix})
 \end{aligned}$$

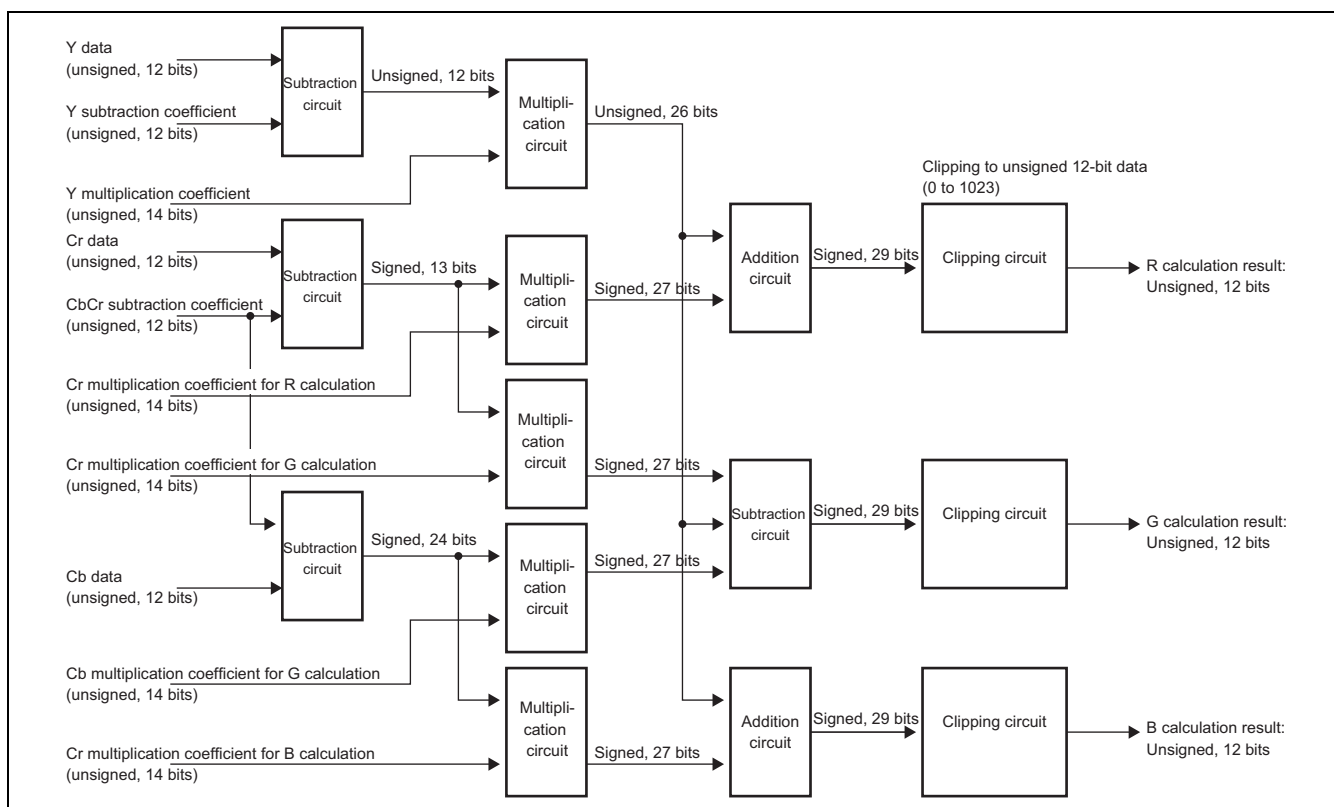

Figure 23.19 YCbCr→RGB Calculation Circuit Configuration

Examples of color space that can be set in YC-RGB conversion coefficient registers are shown below. See the register descriptions for details of the coefficients.

**Table 23.19 Examples of YC-RGB Conversion Coefficient Register Settings**

YC-RGB Conversion Coefficient	YMUL	YSUB	CSUB	RCRMUL	GCRMUL	GCBMUL	BCBMUL
ITU-R BT.601 (initial value) 16 ≤ Y ≤ 235, 16 ≤ Cb, Cr ≤ 240	1.164	16	128	1.596	0.813	0.392	2.017
Luminance expansion example 1 ≤ Y ≤ 254, 16 ≤ Cb, Cr ≤ 240	1.008	1	128	1.596	0.392	0.813	2.017

Specify an integer in each addition coefficient bit field. For each multiplication coefficient, specify a value obtained by multiplying the desired coefficient value by 256.

Example: When the desired multiplication coefficient is 1.164

$$1.164 \times 256 = 297 \text{ (set value: B'0100101001)}$$

- Notes:
1. In order to process the data outside the range prescribed by the ITU-R BT.601 standard, set the CLP[1:0] bits in VnMC to 11. The data is clipped to the specified value before color space conversion.
  2. The YC-RGB color conversion data is unconditionally rounded to the  $0 \leq R, G, B \leq 255$  range.

## (2) RGB-YC Color Conversion

When the data input format is RGB, set the BPS bit in VnMC to 0 for color conversion of RGB data into YCbCr data format. Color conversion from RGB to YCbCr is done according to the matrix coefficients set in RGB-YC conversion coefficient registers (VnYCCR1-VnYCCR3/VnCBCCR1-VnCBCCR3/VnCRCCR1-VnCRCCR3). All of the input RGB data is extended to 12-bit data before color conversion.

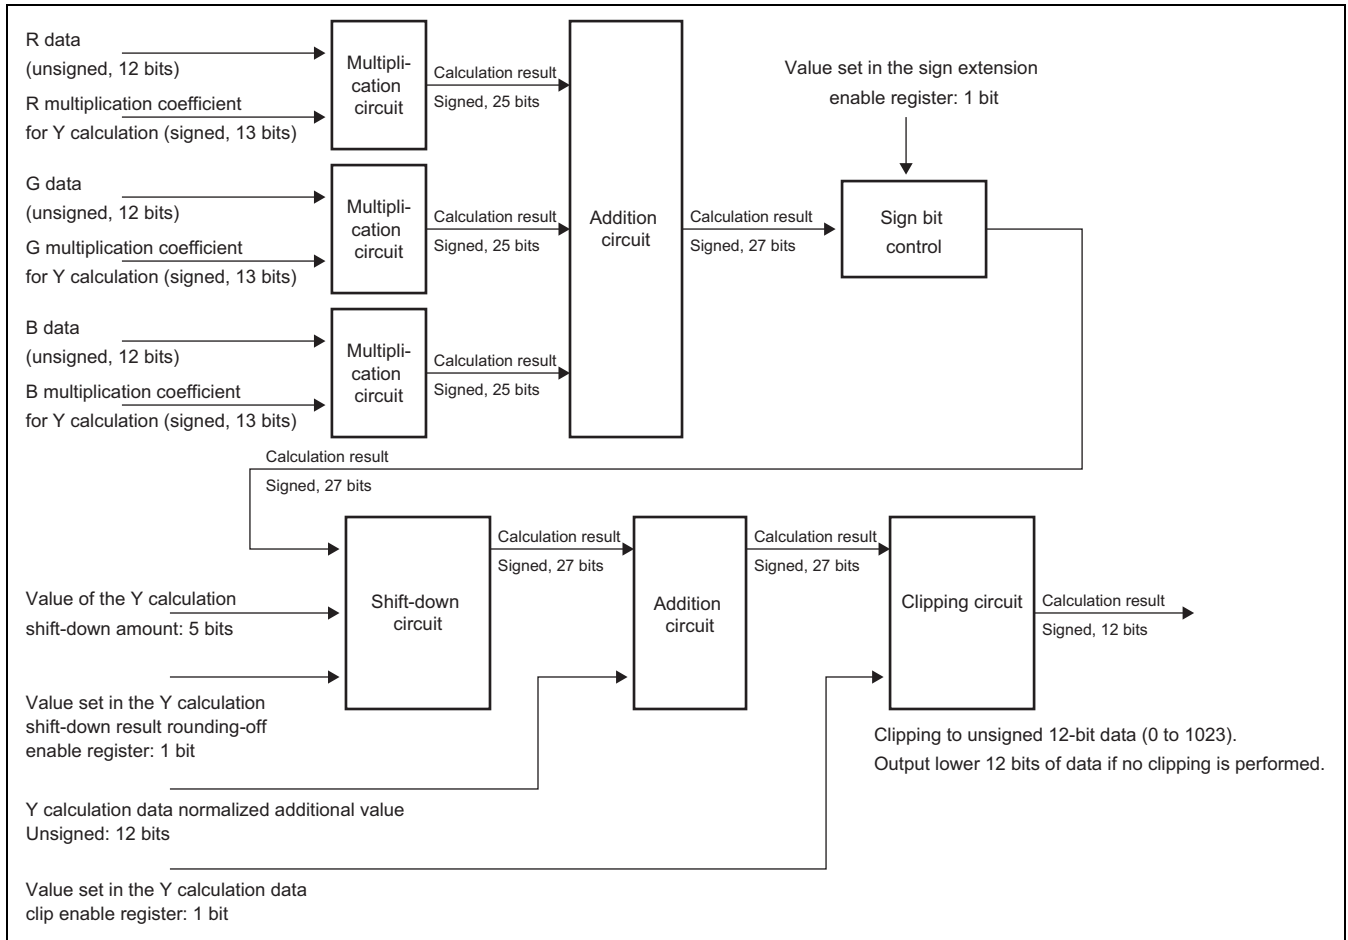

If 1 is set to the BPS bit in VnMC, the data will be stored in the memory as it is in RGB format.

$$\begin{aligned}
 Y &= (( YCLRP \times R + YCLGP \times G + YCLGP \times B) \times 2^{YCLSFT}) + YCALP \\
 Cb &= (( CBCLRP \times R + CBCLGP \times G + CBCLGP \times B) \times 2^{CBCLSFT}) + CBCALP \\
 Cr &= (( CRCLRP \times R + CRCLGP \times G + CRCLGP \times B) \times 2^{CRCLSFT}) + CRCALP
 \end{aligned}$$

The following data rounding functions of RGB-YCbCr color conversion function can be independently set to each pixel. The circuit configuration of Y data is given below.

**Table 23.20 Data Rounding Functions of RGB-YC Color Conversion Function**

Function	Symbol	Description
Sign extension enable	YEXPEN	Enables/disables signed bits of the matrix multiplication result.
Multiplication result shift down amount	YCLSFT[4:0]	Amount of shift down in the matrix multiplication result
Rounding off enable	YCLHEN	Enables/disables rounding off to the shift down amount.
Clipping enable	YLCEN	Enables/disables data rounding process between 0 to 1023 of the output data.

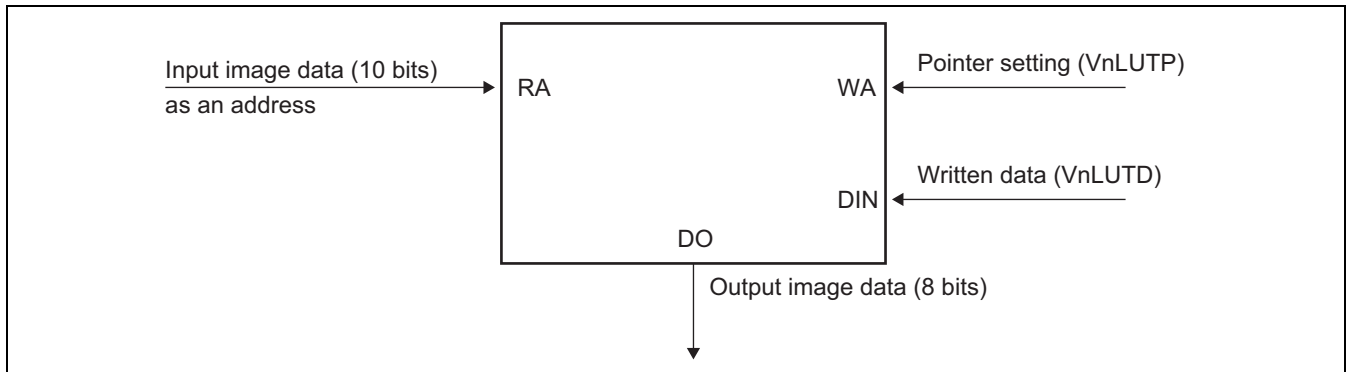

**Figure 23.20 Y Data Circuit Configuration of RGB → YCbCr Color Conversion Function**

### 23.3.8 Image Data Format Conversion Functions

#### (1) Lookup Table (LUT) Density Conversion Function

Set the LUTE bit in VnMC to 1 to enable table conversion of each pixel data of Y, Cb, Cr and R, G, B data after color conversion.

**Figure 23.21 Lookup Table**

#### Pointer Access:

The pointer is incremented every time a write access to the VnLUTD register is made.

The incremented data is read when the VnLUTP register is read. Since data is not incremented at read access, the pointer should be set just before reading.

The procedure given below must be followed to access the lookup table.

The lookup table cannot be accessed from the CPU during the conversion process.

(For write/read access to the LUT from the CPU, the LUTE bit in VnMC should be 0.)

#### Write access:

1. Write the access destination address in VnLUTP.
2. Write the data in VnLUTD.  
Thereby the data will be reflected in the lookup table.  
Also the pointer will automatically increase by 1.
3. Writing to VnLUTD will consecutively update the lookup table.

#### Read Access:

1. Write the access destination address in VnLUTP.
2. Read VnLUTD. This is dummy read; thus the read data needs to be discarded.
3. Read VnLUTD. This reading allows the address data written in VnLUTP to be acquired.

#### [Notes on Using the Lookup Table]

1. Set the lookup table only after capture operation has stopped.
2. Rewrite all before using the lookup table.
3. Data set to the lookup table should be within the range compatible to the input bit width.

**(2) YCbCr444→YC Separation Function**

When transferring YCbCr data to memory, Y data and CbCr data can be separated and transferred to different address spaces.

To perform YCbCr separation transfer, set the DTMD[1:0] bits in the VnDMR register to B'10. In this case, the Y data will be transferred to the address set in the memory base address register and CbCr data will be transferred to the address obtained by adding the value set in the VnUVAOF register to the memory base address register.

If the YMODE[2:0] bits in the VnDMR register are set, only Y data will be transferred to memory and CbCr data is not transferred to memory.

**Figure 23.22 Y/Cb/Cr Separation in Big Endian**

**(3) Dithering Function**

Dithering is performed when the internal RGB-888 format after color space conversion is converted to the RGB-565 or RGB-1555 format. The dithering mode can be selected with the DC[1:0] bits in VnMC.

**(a) Dithering with Cumulative Addition**

Set the DC[1:0] bits in VnMC to B'00 to perform dithering using the cumulative addition method in horizontal pixel units.

$$R_n [7:3] \leq (R_x[7:0] + R_{n-1}[2:0]) \gg 3$$

$$G_n [7:2] \leq (G_x[7:0] + G_{n-1}[1:0]) \gg 2$$

$$B_n [7:3] \leq (B_x[7:0] + B_{n-1}[2:0]) \gg 3$$

Where:

( $R_n, G_n, B_n$ ) = Output RGB-565 pixel

( $R_x, G_x, B_x$ ) = Input RGB-888 pixel

( $R_{n-1}, G_{n-1}, B_{n-1}$ ) = Pseudo random error (LSB of the cumulative error)

**(b) Ordered Dithering**
