Set the DC[1:0] bits in VnMC to B'01 to perform dithering using the ordered dithering method.

$$R_n [7:3] \leq (R_x[7:0] + D_{42_{xy}}) \gg 3$$

$$G_n [7:2] \leq (G_x[7:0] + D_{22_{xy}}) \gg 2$$

$$B_n [7:3] \leq (B_x[7:0] + D_{42_{xy}}) \gg 3$$

Where:

( $R_n$ ,  $G_n$ ,  $B_n$ ) = Output RGB-565 pixel

( $R_x$ ,  $G_x$ ,  $B_x$ ) = Input RGB-888 pixel

( $D_{22_{xy}}$ ,  $D_{42_{xy}}$ ) = Input x, y coordinate dithering matrix result

$$D_{22} = \begin{bmatrix} 0 & 3 \\ 2 & 1 \end{bmatrix}, D_{42} = \begin{bmatrix} 0 & 3 & 4 & 7 \\ 2 & 1 & 6 & 5 \end{bmatrix}$$

### 23.3.9 Internal Field Signal Generation

As the video input module controls capture of data in interlaced mode, correct capture control is not achieved if the external field signal level does not change.

Through the internal field signal generation function, the VIN can control the capture field signal even when the input field signal does not change, such as during progressive data capturing. The following settings can be made for the internal field generation function through the FTEV and FTEH bits in the data mode register 2 (VnDMR2).

- VSYNC field toggle mode (FTEV = 1 in VnDMR2)

When this setting is made, the VSYNC field toggle mode is entered for capture field signal control if the input field signal does not change for the VSYNC cycles specified by the VLV bits in VnDMR2. The toggle mode is canceled when a change in the external field signal level is detected (the capture operation is controlled according to the input field signal).
- HSYNC field toggle counter (FTEH = 1 in VnDMR2)

This counter counts the capture active lines. If the external field signal does not change until the count reaches the HLV setting in VnDMR2, the capture field signal is controlled.

Notes: 1. Do not set both the FTEV and FTEH bits in VnDMR2 at the same time.  
 2. Immediately after cancellation of the toggle mode, capture control is skipped for one VSYNC cycle in some cases depending on the input field signal state.

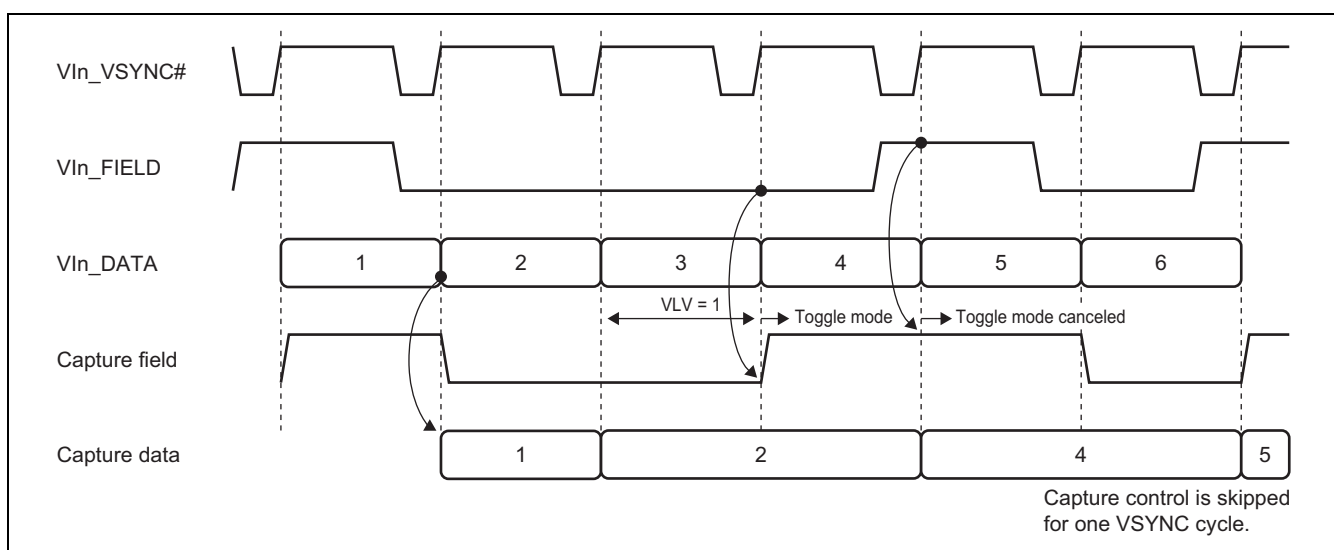

Figure 23.23 Overview and Notes of VSYNC Field Toggle Mode

### 23.3.10 Local Video Interface Output

A local video interface can be provided for each video channel to transfer captured data of the video channels to the IMR-LSX2 module.

- If distortion correction and scaling process are performed, use the IMR-LSX2 module.
- Post-clipping cannot be performed for image data output from a local video interface.

### 23.3.11 Output Data Format

The VIN can output image data in the following formats. The figures in this section assume that data is stored in unified memory in little endian.

#### (1) YC: YCbCr-422, 8 bits

The 8-bit YUV image data in the YC (YCbCr) = 4:2:2 format is shown below. YC data can be switched between the UYVY format and YUYV format through the BPSM bit in VnDMR.

- BPSM = 0 in VnDMR: UYVY format

8-bit YCbCr-422 data (UYVY format)

D63 to D48	63	56	55	48
Image data 3 and 4	Y3[7:0]		Cr2[7:0]	
D47 to D32	47	40	39	32
Image data 3 and 4	Y2[7:0]		Cb2[7:0]	
D31 to D16	31	24	23	16
Image data 1 and 2	Y1[7:0]		Cr0[7:0]	
D15 to D0	15	8	7	0
Image data 1 and 2	Y0[7:0]		Cb0[7:0]	

- BPSM = 1 in VnDMR: YUYV format

8-bit YCbCr-422 data (YUYV format)

D63 to D48	63	56	55	48
Image data 3 and 4	Cr2[7:0]		Y3[7:0]	
D47 to D32	47	40	39	32
Image data 3 and 4	Cb2[7:0]		Y2[7:0]	
D31 to D16	31	24	23	16
Image data 1 and 2	Cr0[7:0]		Y1[7:0]	
D15 to D0	15	8	7	0
Image data 1 and 2	Cb0[7:0]		Y0[7:0]	

**(2) YC: YC Separation YCbCr-422, 8 bits**

This is 8-bit YUV image data in the YC separated YC (YCbCr) = 4:2:2 format. UV data is supported by the NV12 format only.

If the YMODE[2:0] bits in the data mode register (VnDMR) are set to B'000 or B'001, setting the DTMD[1:0] bits in VnDMR to B'10 changes the format to 4:2:2 and transfers the UV data to an address which is specified by the addition of the value set in the UV address offset register (VnUVAOF) to the Memory Base. If the YMODE[2:0] bits in VnDMR are set to B'001, only Y data can be transferred and UV data cannot be transferred.

## Y data

D31 to D16	31	24	23	16
Image data 3 and 4	Y3[7:0]		Y2[7:0]	

D15 to D0	15	8	7	0
Image data 1 and 2	Y1[7:0]		Y0[7:0]	

## Cb, Cr data

D31 to D16	31	24	23	16
Image data 3 and 4	Cr2[7:0]		Cb2[7:0]	

D15 to D0	15	8	7	0
Image data 1 and 2	Cr0[7:0]		Cb0[7:0]	

**(3) YC: YC Separation YCbCr-422, 10 bits**

This is 10-bit YUV image data in the YC separated YC (YCbCr) = 4:2:2 format. UV data is supported by the NV12 format only.

If the YMODE[2:0] bits in the data mode register (VnDMR) are set to B'010 or B'011, setting the DTMD[1:0] bits in VnDMR to B'10 converts 10-bit Y data to 16-bit and changes the format to 4:2:2. UV data is transferred to the address obtained by adding the value set in the UV address offset register (VnUVAOF) to Memory Base. If the YMODE[2:0] bits in VnDMR are set to B'011, only Y data can be transferred and UV data cannot be transferred.

- Notes: 1. A word address is output for Y data according to the VnIS register setting.  
2. A byte address is output for CbCr data according to the VnIS register setting.

## Y data

D31 to D16	31	26	25	16
Image data 3 and 4	0	0	0	0
	0	0	0	0
				Y1[9:0]

D15 to D0	15	10	9	0
Image data 1 and 2	0	0	0	0
	0	0	0	0
				Y0[9:0]

## Cb, Cr data

D31 to D16	31	24	23	16
Image data 3 and 4	Cb2[7:0]			
	Cr2[7:0]			

D15 to D0	15	8	7	0
Image data 1 and 2	Cb0[7:0]			
	Cr0[7:0]			

**(4) YC: YC Separation YCbCr-422, 12 bits**

This is 12-bit YUV image data in the YC separated YC (YCbCr) = 4:2:2 format. UV data is supported by the NV12 format only.

If the YMODE[2:0] bits in the data mode register (VnDMR) are set to B'100 or B'101, setting the DTMD[1:0] bits in VnDMR to B'10 converts 12-bit Y data to 16-bit and changes the format to 4:2:2. UV data is transferred to the address obtained by adding the value set in the UV address offset register (VnUVAOF) to Memory Base. If the YMODE[2:0] bits in VnDMR are set to B'101, only Y data can be transferred and UV data cannot be transferred.

- Notes: 1. A word address is output for Y data according to the VnIS register setting.  
2. A byte address is output for CbCr data according to the VnIS register setting.

Y data

D31 to D16	31	28	27	16	
Image data 3 and 4	0	0	0	0	Y1[11:0]

D15 to D0	15	12	11	0	
Image data 1 and 2	0	0	0	0	Y0[11:0]

Cb, Cr data

D31 to D16	31	24	23	16	
Image data 3 and 4	Cr2[7:0]			Cb2[7:0]	

D15 to D0	15	8	7	0	
Image data 1 and 2	Cr0[7:0]			Cb0[7:0]	

**(5) 16 Bits/Pixel: RGB-565**

The RGB levels are expressed through 5 bits for R, 6 bits for G, and 5 bits for B.

16 bits/pixel data (RGB data) format

D15 to D0	15	11	10	5	4	0
Image data	R[4:0]			G[5:0]		B[4:0]

**(6) 16 Bits/Pixel: ARGB-1555**

The ARGB levels are expressed through 1 bit for A, 5 bits for R, 5 bits for G, and 5 bits for B. For data conversion to ARGB-1555, the lowest bit of the G data in RGB-565 data is truncated, and the A value specified through the register is added.

Set the DTMD[1:0] bits in the data mode register (VnDMR) to B'01 to specify conversion to ARGB-1555, and specify the A value in the ABIT bit in VnDMR.

16 bits/pixel data (ARGB data) format

D15 to D0	15	14	10	9	5	4	0
Image data	A	R[4:0]			G[4:0]		B[4:0]

**(7) 32 Bits/Pixel: RGB-888**

The RGB levels are expressed through 8 bits for R, 8 bits for G, and 8 bits for B. Bits 31 to 24 are fixed to 0.

32 bits/pixel data (RGB data) format

**(8) 32 Bits/Pixel: ARGB-8888**

The ARGB levels are expressed through 8 bits for A, 8 bits for R, 8 bits for G, and 8 bits for B. The A value specified by the A8BIT[7:0] bits in VnDMR is set in bits 31 to 24.

32 bits/pixel data (ARGB data) format

### 23.3.12 Endian Conversion

The VIN stores captured data in memory in little endian with the initial settings. Set the EN bit in the main control register (VnMC) to 1 to convert data into big endian before storing in memory.

Endian conversion in word units is controlled through the EN bit in VnMC, and swapping in byte units is controlled through the BPSM bit in the data mode register (VnDMR). For conversion to big endian, specify the BPSM bit as shown in the following table according to the data format specified through the DTMD bits in VnDMR and BPS bit in VnMC.

**Table 23.21 Endian Conversion Unit**

Data Format	BPS in VnMC	DTMD[1:0] in VnDMR	EXRGB in VnDMR	BPSM in VnDMR	Endian Conversion Unit
RGB-565	0	00	0	0	Word units
RGB-888	0	00	1	0	Longword units
YCbCr-422	1	00	0	1	Byte units
ARGB-1555	0	01	0	0	Word units
ARGB-8888	0	01	1	0	Longword units
YC	1	10	0	0	Byte units

The following figures show endian conversions in byte, word, and longword units.

Endian conversion in byte units:

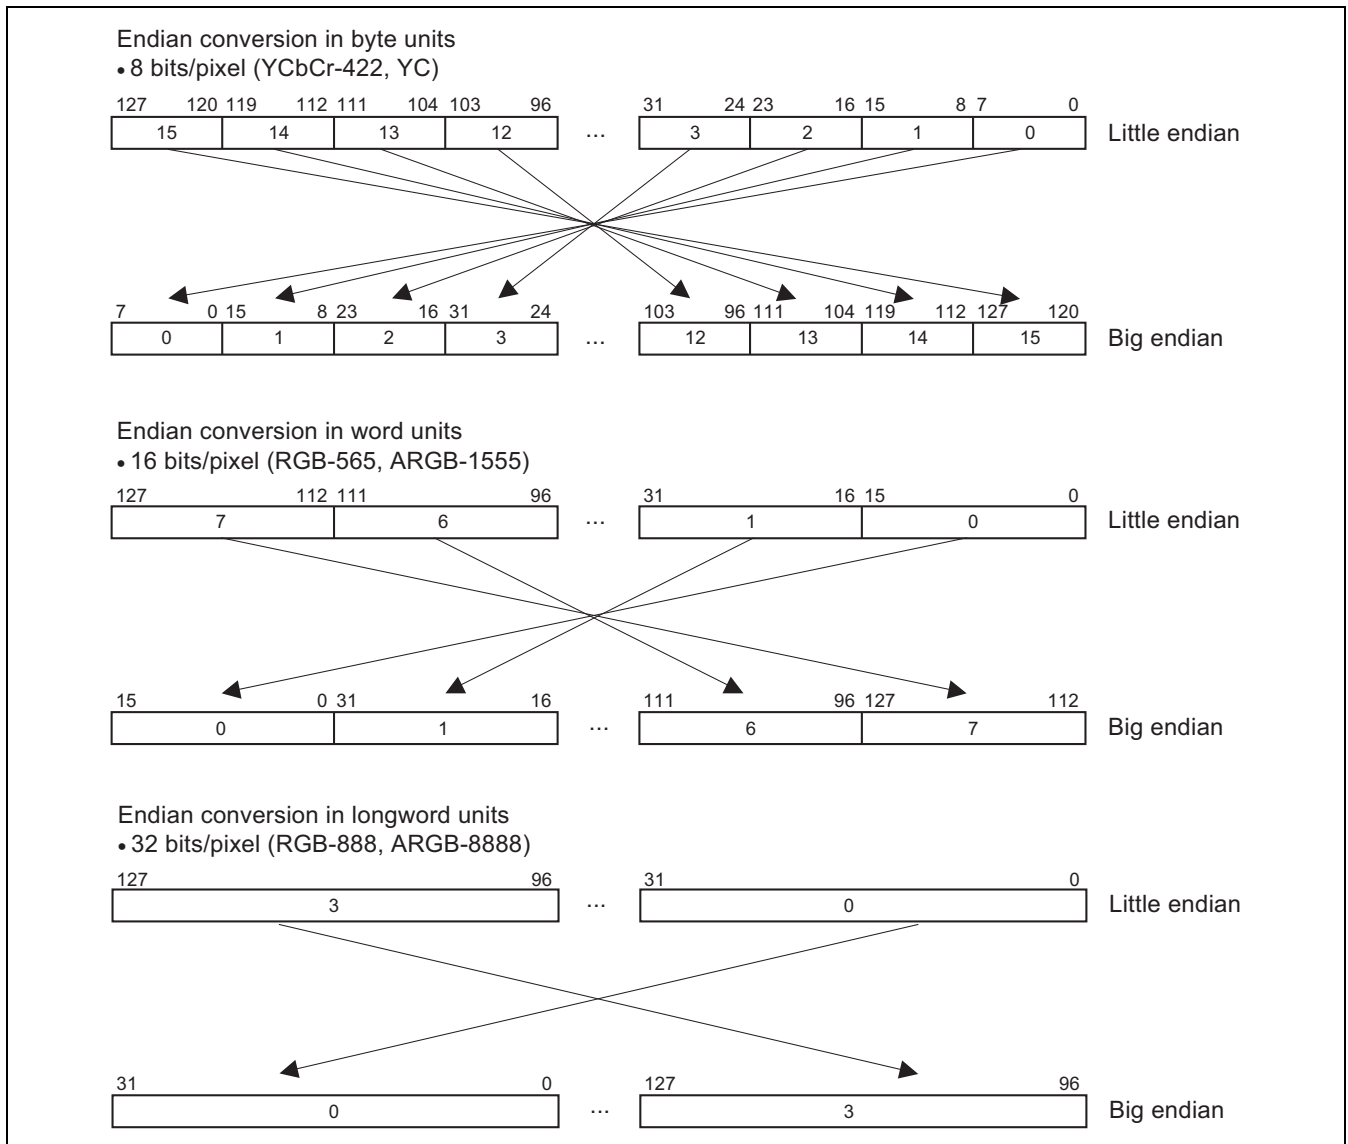

Figure 23.24 Data Alignment Conversion from Little Endian to Big Endian

## 23.4 Usage Notes

### 23.4.1 Module Standby Mode

The LSI supports module standby mode in which clock supply to the VIN is stopped. The video input module should not be accessed during module standby mode.

### 23.4.2 Transition to Module Standby Mode

1. Clear the module enable (ME) bit in the main control register (VnMC) and the continuous frame capture (CC) bit and the single frame capture (SC) bit in the frame capture register (VnFC) to 0 to stop the video input module.
2. Confirm that the capture active (CA) bit in the module status register (VnMS) is cleared to 0.
3. Stop the clock supply.

### 23.4.3 Cancellation of Module Standby Mode and Restarting of Video Input Module

1. Start the clock supply.
2. Set the module enable (ME) bit in the main control register (VnMC) to 1 to start the video input module.
3. Set the continuous frame capture (CC) bit or the single frame capture (SC) bit in the frame capture register (VnFC) to 1.

### 23.4.4 Limitations on Usage

The VIN does not operate correctly in some cases depending on the usage. The following shows cases that require attention.

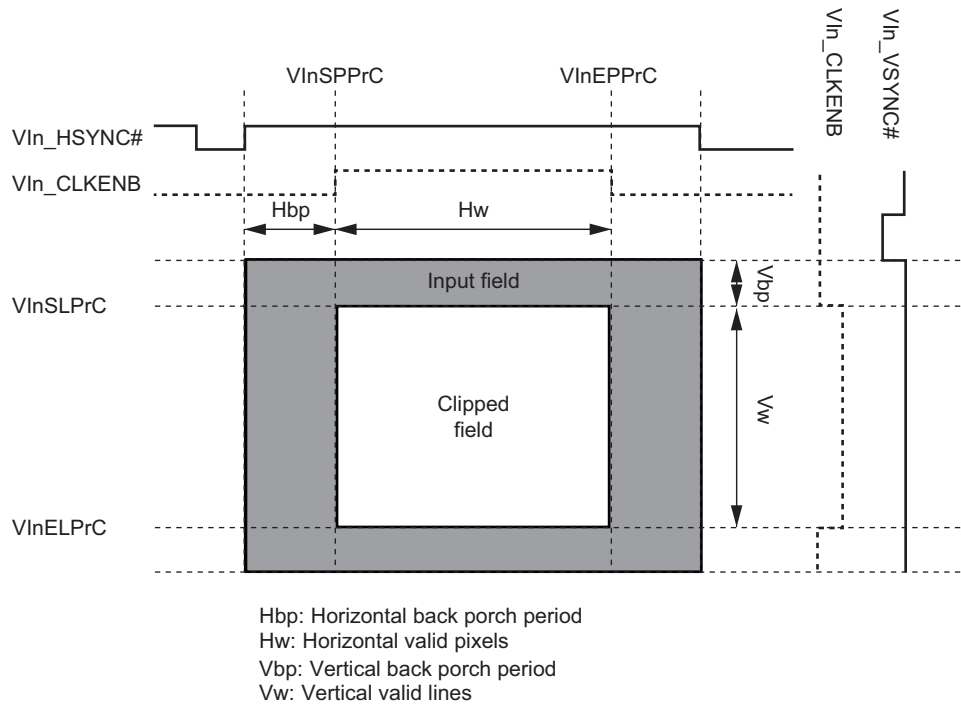

**Table 23.22 Limitations on Usage**

Item	Description	Upper limits on video-clock frequency for this module as a stand-alone unit						
		Horizontal Scaling Ratio XS	VnMC. FAST Mode	Vertical Scaling Ratio YS				
				0.0 ≤ YS ≤ 1.0	1.0 < YS ≤ 2.0	2.0 < YS ≤ 3.0		
Limits on input video clock	The upper limit on frequency of the input video clock varies with the clock mode, capture interface and scaling ratio. The upper limits on frequency of the video clock for this module as a stand-alone unit are shown below. Usage of other modules may make reaching the upper limits impossible. Fully evaluate performance before deciding on the settings for the input video clock, particularly if you are using magnification.	ITU-R BT.601, YCbCr-422, 8 bits	0.0 ≤ XS ≤ 1.0	1	100 MHz	Setting prohibited	Setting prohibited	
				0	80 MHz	80 MHz	80 MHz	
		ITU-R BT.656, YCbCr-422, 8 bits	1.0 < XS ≤ 2.0	1	Setting prohibited	Setting prohibited	Setting prohibited	
				0	70 MHz	70 MHz	50 MHz	
		ITU-R BT.1358, YCbCr-422, 16 bits	0.0 ≤ XS ≤ 1.0	1	100 MHz	Setting prohibited	Setting prohibited	
				0	60 MHz	60 MHz	60 MHz	
		ITU-R BT.601, RGB-888, 12 bits	0.0 ≤ XS ≤ 1.0	1	100 MHz	Setting prohibited	Setting prohibited	
				0	80 MHz	80 MHz	60 MHz	
		ITU-R BT.601, RGB-666, 18 bits	1.0 < XS ≤ 2.0	1	Setting prohibited	Setting prohibited	Setting prohibited	
				0	20 MHz	20 MHz	20 MHz	
		ITU-R BT.601, RGB-888, 24 bits	1.0 < XS ≤ 2.0	1	Setting prohibited	Setting prohibited	Setting prohibited	
				0	20 MHz	20 MHz	20 MHz	
		ITU-R BT.709 interface	When the ITU-R BT.709 interface is in use, the maximum frequency of the video clock is 74.5 MHz.					
		Capture in progressive mode	Use the internal field signal generation function in combination with an input interface in progressive mode.					
Limitation on register update	If a register is updated during capture, data captured immediately after the register update cannot be guaranteed. To update a register which supports the internal update mode as shown in Table 23.9, VIN Registers, specify an internal update for VIN registers by using the MC/VUP bit. To update other registers, stop capture operation and then update them.							
Field capture mode image quality	Images of odd-numbered, odd/even-numbered and even-numbered fields, captured by VnMC/IM interlace mode bit settings, contain every other line from the input interlace images. Therefore, note that the horizontal resolution for video display is in units of fields.							
Full interlace mode image quality	In full interlace composition mode, horizontal stripe noise (such as combing noise) is generated in composite images as fields based on different timelines are combined in memory due to the interlacing method.							
Limitation on vertical scaling	For vertical scaling and full interlace composition, the capture lines are inverted in some cases depending on the scaling ratio because the scaling processing is applied before interlace composition in memory. Be sure to evaluate the image quality before practical application.							
Interrupt event timing	Interrupt event asserted by this module indicates the time when an interrupt event occurs in VIN, not the time when the transfer of capture data to memory is completed.							

Item	Description
Pixel post-clip setting	When the output format is YCbCr-422, after pixel post-clip setting is performed for the clipping data, this data is transferred in YCbCr-422 data format to memory. Therefore, if the EPPoC-SPPoC clipping size is an odd number, it is normalized to an even size which is the sum of that odd number and 1.
Coefficient settings for color space conversion	Specify appropriate values in the color space change coefficient 1 to 3 registers (VnCSCC1 to VnCSCC3) to keep the RGB image data within the range $0 \leq R', G', B' \leq 255$ . After calculation for color space conversion, minus pixel data is normalized to 0 and pixel data more than or equal to 255 is normalized to 255.
Scaling up	When horizontal and vertical scaling up is specified, the amount of memory transfer becomes greater with an increase in traffic. Note the amount of traffic on the entire system when using the scaling-up function because the overall transfer efficiency of the system might degrade due to the increased use of the internal buses.
YC Restrictions on YC separation function	Set the offset register that stores UV data (VnUVAOF) such that the storage areas of Y and UV data are not the same. If the same storage area is set for both data, Y data will be overwritten. It is not allowed to set the YC separate transfer or Y transfer with the vertical scaling-up.
RGB-888→RGB-565 conversion function	In the dithering process by cumulative addition, if the same color is captured as in blue back image, periodic noise may be generated by the cumulative addition process (carried by addition). In this case, set the DC[1:0] bits in VnMC to the ordered dithering.
Video display operation	This module performs capture control based on the external input synchronization signal. Note that it is not synchronous to the timing of frame update set in the Display Unit and thus video display in sync with the capture frame is disabled.  Scaling-up/down process of video capture data via the local video IF can be implemented in conjunction with the IMR-LSX2 module. The following should be noted:  Post-clipping of video capture data is not possible.  Set memory storage data format of this module to YCbCr.  *For data format after LUT conversion, see Table 23.10, Capture Interface Settings, and Table 23.11, Captured Data Formats.  The IMR-LSX2 data is processed based on the synchronization signal from this module. Accordingly, if the scaling-up process is performed on high-definition video input, take the data traffic, memory transfer time and input synchronization signal timing into consideration before using it.  For operation in conjunction with other modules, memory data transfer is performed in the respective modules. If the amount of memory transfer is increased, the internal bus usage is raised, possibly reducing the transfer efficiency of the entire system. For this reason, the amount of traffic for the entire system should be considered in advance.

**Item Description**

The maximum size that can be captured when the HSYNC signal is connected to the VIn\_CLKENB pin (including the case where the CHS bit of the VnDMR2 register is set to 1).

Capture area when the HSYNC signal is connected to the VIn\_CLKENB pin

When the ITU-R BT.601/709/1358 interface is in use, so the HSYNC signal is connected to the VIn\_CLKENB pin (including the case where the CHS bit of the VnDMR2 register is set to 1), the VIN also captures data during the horizontal and vertical back porch periods (Hbp and Vbp). Thus, capturing only the valid data is required by setting the clipping registers as shown below.

- VnSLPrC (start line pre-clip register) = vertical back porch period (Vbp)
- VnELPrC (end line pre-clip register) = vertical back porch period (Vbp) + number of valid lines (Vw) - 1
- VnSPPrC (start pixel pre-clip register) = horizontal back porch period (Hbp)
- VnEPPrC (end pixel pre-clip register) = horizontal back porch period (Hbp) + number of valid pixels (Hw) - 1

The maximum number of lines and pixels that can be captured at this time is as shown below. When this size is exceeded, use the VIN with the data enable signal connected to the VIn\_CLKENB pin.

- The maximum number of lines that can be captured = 2048 (the maximum value of the clipping register) - vertical back porch period (Vbp)
- The maximum number of pixels that can be captured = 2048 (the maximum value of the clipping register) - horizontal back porch period (Hbp)

## 23.5 Supplementary Information

### 23.5.1 Example of Coefficient Set Register Settings for Horizontal Scaling

Table 23.23 shows the example of coefficient set register settings for horizontal (X) scaling (Recommended values).

**Table 23.23 Coefficient Set Register Settings**

- $\alpha = 0.6$  and X Scale (XS) = H'0000 1600

n	CmA	CmB	CmC
1	H'0000 0BDD	H'0000 0BDD	H'0651 9578
2	H'3FF0 07DA	H'0000 0BE3	H'03C2 4973

## 26. VCP3

RZ/G1H

RZ/G1N

RZ/G1M

RZ/G1E

### 26.1 Overview

The VCP3 is a multi-codec module which provides encoding and decoding capabilities on the basis of multiple video coding schemes, e.g., H.264/AVC, MPEG-4, MPEG-2 and VC-1. This module is a multi codec that processes the frame or each field by controlling software for VCP3 executed on host CPU.

#### 26.1.1 Features

The VCP3 has the following excellent features.

- Support for multiple codecs
  - H.264/MPEG-4 AVC HP (High Profile) and MVC SHP (Stereo High Profile) encoding and decoding
  - H.262/MPEG-2 MP (Main Profile) decoding
  - MPEG-4 ASP (Advanced Simple Profile) decoding
  - VC-1 SP/MP/AP (Simple, Main, Advanced Profile) decoding
  - H.263 Baseline and decoding
  - AVS Jizhun Profile decoding
  - VP8 decoding Support for HDTV resolutions
  - 1,920 pixels × 1,080 lines @ 60 frames/second
- Number of channels
  - Two channels in the RZ/G1H
  - One channel in the RZ/G1M, RZ/G1N, and RZ/G1E
- Data handling on a picture-by-picture basis
  - Encode/decode data one picture (frame or field) at a time.
- High picture quality
  - Support the H.264 high-efficiency coding tools (CABAC, 8 × 8 frequency conversion, and quantization matrix).
  - High-efficiency motion vector detection by a combination of discrete search and trace search
  - Highly efficient real-time intra-prediction by Prediction from Original Image (POI)
  - Optimal-mode selection by Rate-Distortion (RD) cost evaluation
  - Picture quality control based on activity analysis results which match visual models
- Dedicated cache memory for VCP3 is integrated on this LSI. (64 Kbytes)

**Table 26.1 Main Function of VCP3**

Item	Description
Encoding standard supported	<ul style="list-style-type: none"> <li>H.264/AVC High Profile@Level 4.2, Main Profile@Level 4.2, Baseline Profile@Level 3</li> <li>H.264/MVC Stereo High Profile@Level 4.1</li> </ul>
Decoding standard supported	<ul style="list-style-type: none"> <li>H.264/AVC High Profile@Level 4.2, Main Profile@Level 4.2, Baseline Profile@Level 3, Constrained Baseline Profile@Level 4.2 H.264/MVC (Error resilience tools (ASO, FMO, and RS) are not supported.) Stereo High Profile@Level 4.1</li> <li>MPEG-2 Main Profile@High Level</li> <li>MPEG-4 Advanced Simple Profile3@Level 5 (GMC and QMC are not supported), Simple Profile@Level 6</li> <li>VC-1 Simple Profile@Medium Level, Main Profile@High Level, Advanced Profile@Level 3</li> <li>H.263 Baseline@Level 40</li> <li>VP8</li> <li>AVS Jizhun Profile@Level 6.2 (picture format 4:2:0 only)</li> </ul>
Maximum throughput	1,920 × 1,080p, 60 frame In VP8 decoding, the maximum ratio of non-display frame is once every five frames.
Maximum bit rate	80 Mbps (40 Mbps × 2 ch). For MPEG-4 Data Partition, and VP8, the maximum bit rate is 60 (30 Mbps × 2 ch).
Picture size supported	Minimum: Horizontal 80 pixels × Vertical 80 lines (except for H.263), 128 pixels × Vertical 96 lines (H.263) Maximum: Horizontal 1,920 pixels × Vertical 1,088 lines Horizontal size is a multiple of 2 pixels, and vertical size is a multiple of 2 lines. 1,080 × 1,920 and 1,088 × 1,920 are supported.
Color format	YCbCr 4:2:0 format NV12, NV21, YV12 and IYUV are supported.
Bit stream format	Video elementary stream. Table 26.2 shows the range of data which can be encoded and decoded. Function to add/remove the emulation prevention byte in the H.264 VCL-NAL unit. (VCL (Video Coding Layer), NAL (Network Abstraction Layer)) Function to remove the emulation prevention byte in the VC-1 AP bit stream data unit. Function to remove the emulation prevention bit for AVS.
Picture structure	Frame structure and field structure

Item	Description
Motion detection	Motion search accuracy: 1/4 pixels (1/2 pixels for MPEG-2, MPEG-4, and H.263) Motion search range: 1. frame reference Horizontal $\pm$ 64 pixels, Vertical $\pm$ 32 lines 2. frame references (Wide side) Horizontal $\pm$ 48 pixels, Vertical $\pm$ 24 lines (Narrow side) Horizontal $\pm$ 32 pixels, Vertical $\pm$ 16 lines

**Table 26.2 Data Format Handled by the VCP3**

Standard	Encoding Range	Decoding Range
MPEG-4	Not supported	Video packet header/Motion shape texture and subsequent data
H.264	Slice header and subsequent data	Slice header and subsequent data (Except for first slice header in a picture)
H.263	Not supported	Macroblock and subsequent data
MPEG-2	Not supported	Picture data and subsequent data
MPEG-1	Not supported	Picture data and subsequent data
VC-1	Not supported	Slice data and subsequent data
AVS	Not supported	Picture data and subsequent data
VP8	Not supported	Frame header and subsequent data

## 26A. Video Processing Unit Cache (VPC)

RZ/G1H

RZ/G1N

RZ/G1M

RZ/G1E

### 26A.1 Overview

This LSI incorporates cache memory exclusively for use in image reference by the VCP3. This can reduce the amount of bus access for decoding.

#### 26A.1.1 Features

The video processing unit cache (VPC) has the following features.

- 64-Kbyte cache
- Eight-way set-associative cache
- Line size: 64 or 128 bytes
- Number of entries: 128 entry/way (64-byte line size) or 64 entry/way (128-byte line size)
- Exclusively for reading
- FIFO (first-in first-out) replacement algorithm

Initial value:	0	0	0	0	1	0	1	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved The write value should always be 0.
28	F64	0	R/W	64 Byte/Line Cache Mode When this bit is set to 1, the cache is configured as 64 bytes per line mode. 128 bytes per line mode is selected as initial value setting. On this product, this bit should be set to 1.
27 to 13	—	All 0	R	Reserved The write value should always be 0.
12	LWSWAP	0	R/W	Longword Swap 0: No longword swap 1: Longword swap When 8-, 16-, or 32-byte access is made with this bit set to 1, the read data is swapped in longwords.
11 to 8	—	H'A	R	Reserved Modifying these bits may affect the performance; usually leave the initial value unmodified.
7 to 4	—	H'8	R	Reserved Modifying these bits may affect the performance; usually leave the initial value unmodified.
3, 2	STRIDE	00	R/W	VPC Stride Setting These bits set the stride for VPC operation. 00: 256-byte stride mode 01: 512-byte stride mode 10: 1024-byte stride mode 11: 2048-byte stride mode The VPC access hit ratio depends on this setting; set these bits appropriately for the size to be processed. Note: XY mode case by setting VPCCFG.MODE to 1. Be sure the stride size of VCP3 is same as this setting.

Bit	Bit Name	Initial Value	R/W	Description
1	CLR	0	R/W	<p>VPC Clear</p> <p>Clears the VPC state.</p> <p>0: VPC operates normally.</p> <p>1: VPC is cleared.</p> <p>Before modifying the VPC stride setting, write 1 to this bit to clear the VPC.</p> <p>After the VPC is cleared by writing 1 to this bit, this bit automatically returns to 0.</p>
0	ENB	0	R/W	<p>VPC Enable</p> <p>Enables the VPC.</p> <p>0: Disables the VPC</p> <p>1: Enables the VPC</p> <p>Set this bit to 1 to use the VPC.</p> <p>Do not modify this bit during VCP3 operation; otherwise, correct operation cannot be guaranteed. (Modify this bit after checking the VPCSTS register.)</p>

## 26A.3 Operation

RZ/G1H

RZ/G1N

RZ/G1M

RZ/G1E

### 26A.3.1 Initialization

When using the VPC, before accessing the VPC from the VCP3, be sure to make the necessary settings as described in 1 to 4 below.

1. Set the stride and cache line size.
  - Set the stride appropriate for the image size to be processed. (Set as same stride size as VCP3 stride size)
  - The stride can be set using bits 3 and 2 in the VPCCTL register.
  - Set the cache line size to 64 byte / line by setting bit 29 in VPCCTL register to 1.
2. Set the VPC mode
  - Set the VPC mode by setting VPCCFG.MODE.
  - VPCCFG.MODE = 0
    - Set H'0000 0000 to VPCnXY register. (n: 0, 1)
    - Set bits[11:8] in S3CTRL.XYMODECONF to H'F.
  - VPCCFG.MODE = 1
    - Set bits [11:8] in S3CTRL.XYMODECONF to H'F
3. Set the tile size
  - Set appropriate tile size in the VPCCFG register
  - The tile size can be set using bit 21 to 16 and bit 7 to 2 for Chroma data and Luminance data respectively.
3. Clear the VPC.
  - Clear the VPC after confirming that bit 0 in the VPCSTS register is 1.
  - The VPC can be cleared by writing 1 to bit 1 in the VPCCTL register.
4. Enable the VPC.
  - Enable the VPC after confirming that bit 0 in the VPCSTS register is 1.
  - The VPC can be enabled by writing 1 to bit 0 in the VPCCTL register.

### 26A.3.2 Clearing VPC at the Beginning of a Frame

Before accessing the beginning of a frame, clear the VPC following steps 1 and 2 below.

1. Check the status.
  - Confirm that bit 0 in the VPCSTS register is 1.
2. Clear the VPC.
  - Clear the VPC by writing 1 to bit 1 in the VPCCTL register.

## 26A.4 Usage Notes

RZ/G1H

RZ/G1N

RZ/G1M

RZ/G1E

### 26A.4.1 Coherency

At the beginning of a frame, be sure to clear the VPC according to the procedure given in section 26A.3.2, Clearing VPC at the Beginning of a Frame.

### 26A.4.2 Tile Size

Appropriate tile size for this LSI: 128 × 32

# 27. Fine Display Processor (FDP1)

RZ/G1H	RZ/G1N
RZ/G1M	RZ/G1E

## 27.1 Functional Description

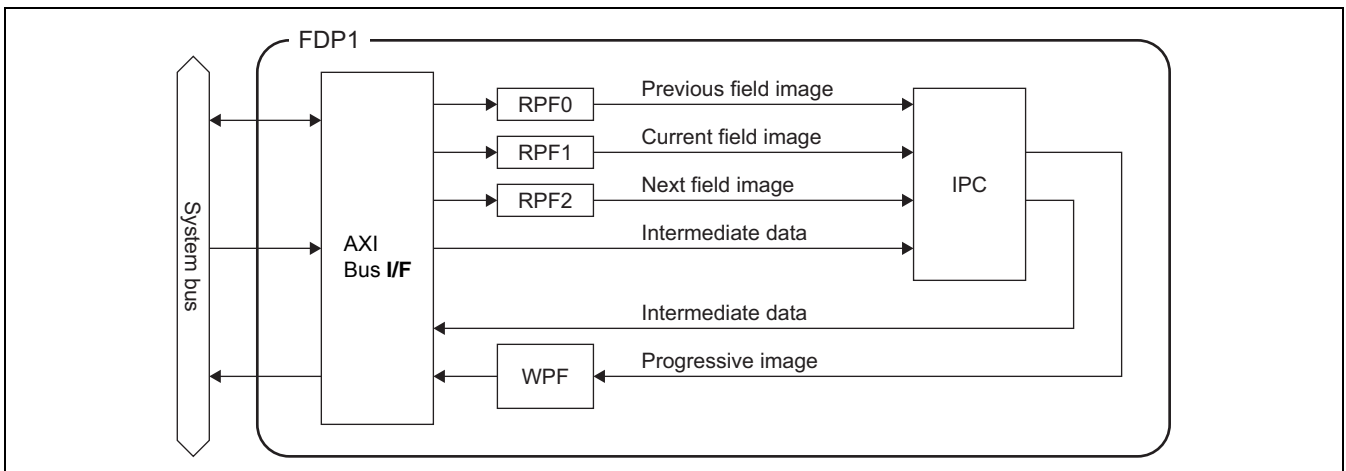

### 27.1.1 Overview

The FDP1 is the de-interlacing module which converts the interlaced video to progressive video. The RZ/G1H provides three channels. The RZ/G1M and RZ/G1N provide two channels and the RZ/G1E provides one channel. This module has the following features.

1. Supports various data formats
  - Input: YCbCr444/422/420
  - Output : YCbCr444/422/420 and RGB/αRGB
2. Full HD video processing performance
  - Can handle conversion from full HD 60i to 60p in operation at 266 MHz.
3. High image-quality de-interlacing algorithm (based only on the luma component)
  - Motion adaptive de-interlacing
  - Accurate still detection
  - Diagonal line interpolation (DLI)

### 27.1.2 FDP1 Architecture

Figure 27.1 shows the block diagram of the FDP1. In this figure, only the luma images are used in processing the images for the previous and next fields.

**Figure 27.1 FDP1 Block Diagram**

The following gives an overview of each block function shown in Figure 27.1. The operation of these functions is determined by the register setting explained in section 27.3. Refer to section 27.3 for the relationship between the register setting and the functional behavior.

**(1) ABI (AXI Bus Interface)**

The FDP1 applies processing to the image data stored in the external memory and writes the resultant data back to the external memory. The data transfer between the external memory and FDP1 necessary for this operation is done by the ABI, which works as the bus master, according to the register settings. The ABI executes this data transfer between the external memory and FDP1.

**(2) RPF (Read Pixel Formatter)**

The RPF reads image data from the external memory through the ABI, unpacks data according to the specified format, and outputs the resultant data to the IPC. The input format unpacking unit expands the image data input from the ABI into the image format for internal processing.

The FDP1 provides three RPF modules (RPF0 to RPF2). RPF0 reads the previous field, RPF1 reads the current field and RPF2 reads the next field for processing de-interlacing operation.

**(3) IPC (Interlace to Progressive Converter)**

The IPC is the de-interlacing module which reads the field image through RPF<sub>n</sub> and writes back the progressive image to the external memory through WPF. The IPC uses the motion adaptive algorithm which enhances the image resolution of still pixels compared with conventional 2D de-interlacing.

Note: Only the luma component is used in the motion adaptive algorithm. The chroma components are still used in conventional 2D de-interlacing.

**(4) WPF (Write Pixel Formatter)**

The WPF is an output module that receives image data from the IPC, converts the color space, number of colors, and format of the data, and outputs the results of FDP1 image processing to external memory through the ABI. The WPF is mainly configured from a color space converter and an output format converter (the packing unit).

The color space converter converts the color space between RGB and YCbCr, and the packing unit converts the format into the picture plane storing format. The FDP1 provides one WPF.

## 27.2 Function List

Table 27.1 shows a functional overview of the FDP1 module.

**Table 27.1 Function List**

<b>Read Pixel Formatter (RPF)</b>			
Number of channels		Three channels (RPF0 to RPF2)	
Image Format	Input* <sup>3</sup>	YCbCr	YCbCr444-PL, SP, ILV* <sup>1</sup> YCbCr422-PL, SP, ILV* <sup>1</sup> YCbCr420-PL, SP* <sup>1</sup>
		Maximum size	H2048 × V2048 pixels (Frame) H2048 × V1024 pixels (Field)
		Minimum size	H80 × V80 pixel (Frame) H80 × V40 pixel (Field)
		Size setting unit	YCbCr420: 2-pixel units both horizontally and vertically. YCbCr422: 2-pixel units horizontally and 1-pixel units vertically. In other formats, the size can be set in 1-pixel units.
<b>Write Pixel Formatter (WPF)</b>			
Number of channels		One channel (WPF)	
Image format	Output	RGB	RGB332, RGB444, RGB565, RGB666, RGB888, $\alpha$ RGB8666, $\alpha$ RGB8888, $\alpha$ RGB4444, $\alpha$ RGB1555 $\alpha$ value is fixed.
		YCbCr	YCbCr444-PL, SP, ILV* <sup>1</sup> YCbCr422-PL, SP, ILV* <sup>1</sup> YCbCr420-PL, SP* <sup>1</sup>
		Maximum size	H2048 × V2048 pixels
		Minimum size	H80 × V80 pixel
		Size setting unit	YCbCr420: 2-pixel units both horizontally and vertically. YCbCr422: 2-pixel units horizontally and 1-pixel units vertically. In other formats, the size can be set in 1-pixel units.
Color space conversion	YCbCr to RGB	Conversion expression	BT.601 (16, 235/240) to RGB (0, 255) BT.709 (16, 235/240) to RGB (0, 255) BT.601 (0, 255) to RGB (0, 255) BT.709 (16, 235/240) to RGB (16, 235)
Changing number of colors	Output	Reducing RGB color depth	Dithering, lower-order bit truncation, or rounding
		YCbCr422/420	CbCr skipping or CbCr vertical skipping and horizontal skipping

**Interlace to Progressive Converter (IPC)**

De-interlacing	Mode	Frame rate	Equal rate (60i to 60p) Half rate (60i to 30p)
		Interpolation (luma)	2D-3D adaptive* <sup>2</sup> 2D fixed 3D fixed* <sup>2</sup>
		Interpolation (chroma)	2D fixed
		Algorithm	Motion adaptive (luma only)
Diagonal line interpolation		Supported (luma only)	

Notes: 1. PL: Planar, SP: Semi-planar, ILV: Interleaved

2. Source picture structures (field-structure or frame-structure) should be the same structure among the all input pictures.
3. In processing by RPF0 and RPF2, the chroma components (Cb and Cr, or U and V) are not read from the system bus when the format is planar or semi-planar. The chroma components are discarded once they are read in combination with the luma components when the format is interleaved because the RPF0 and RPF2 only handle fixed 2D de-interlacing of the luma components, and so do not require the chroma components.

## Preface

Definition of operators and functions

The following operators, notations are defined for explaining the functions of the FDP1.

$\langle x \rangle$

Discard decimal places of value x

H'

The notation “H” is used as prefix for hexadecimal numbers. For example, H'80 means 80 in hexadecimal and 128 in decimal.

B'

The notation “B” is used as prefix for binary numbers. For example, B'10000000 means 80 in hexadecimal and 128 in decimal. When a number is used without prefix, it means decimal number.

–

The notation “\_” is used as a separator of binary digit for binary number. There is no functional and logical meaning. The meaning of B'10101 and B'1\_0101 is the same.

[msb:lsb]

This notation specifies a part of bits or all bits of registers and signals. For example, eval[3:0] means bits 3 to 0 of the signal or register whose name is “eval”.

clip0 (x)

Clip to 0 value if x is less than 0. [  $x = (x < 0) ? 0 : x$  ]

clip3 (min., max., x)

The value x shall be clipped so that x shall be min. < x < max. [  $x = (x < \text{min}) ? \text{min} : ((x > \text{max}) ? \text{max} : )$  ]

## Unit

The unit is defined here for explaining FDP1's functions.

[bpp]: bits per pixel

The FDP1 can handle a number of image formats. Each image format has different number of data bits. The unit [bpp] shows a number of data bits for one pixel. For example, RGB 8 bpp means that its format is RGB and the pixel consists of 8 data bits.

## 27.3 Registers

### 27.3.1 Access Restrictions

FDP1 supports only 32-bit access to read or write all addresses in FDP1 area. Do not access any of otherwise access units.

### 27.3.2 Register Type Definitions

There are 3 types of registers in FDP1: immediate register, V-update Register and V-update Status Register. The values of immediate registers are reflected to H/W behavior immediately after the changing its values. Hence, do not change these immediate registers while FDP1 is processing unless this manual allows it explicitly. The values of V-update registers are reflected to H/W behavior at the timing of V-interruption (at the timing of FD1\_CTL\_IRQSTA.VINT is set to 1). Users can change these V-update registers while FDP1 is processing. To reflect V-update registers to the H/W, users have to set FD1\_CTL\_REGEND.REGEND to 1 after the all V-update registers which are intended to be changed are completely set. The values of V-update Status Registers are updated at the timing of V-interruption. Therefore, the status (FD1\_CTL\_STATUS) of de-interlacing process which is conducted before a V-interruption must be referred after that V-interruption.

To confirm the types of registers, refer to Table 27.4.

### 27.3.3 Notational Conventions for Registers and Bit Fields

This document uses the following notational conventions for the FDP1 registers and bit fields.

1. The names of registers and bits are written in uppercase.
2. A bit or bit field in a register is indicated as [register name.bit name]. For example, the STRCMD bit in the FD1\_CTL\_CMD register is indicated as FD1\_CTL\_CMD.STRCMD.
3. Lowercase "n" in a register name or a bit name indicates an integer and the range of value n is defined when necessary. For example, FD1\_RPFn\_ADDR\_Y.PSRC\_ADDR (n = 0, 1, 2) indicates the PSRC\_ADDR bits in three registers FD1\_RPF0\_ADDR\_Y.PSRC\_ADDR and FD1\_RPF1\_ADDR\_Y.PSRC\_ADDR, and FD1\_RPF2\_ADDR\_Y.PSRC\_ADDR. For RPFn when the range of value n is not defined, RPFn (n = 0, 1, 2) are assumed.
4. In each subsection for register description in section 27.3, when only a bit name is written without showing its register name, the bit is in the register described in that subsection.
5. A wildcard (\*) indicates any characters in a name and represents all registers or bits that match the specified first part of a name. For example, when there are three registers FD1\_RPF0\_ADDR\_Y, FD1\_RPF1\_ADDR\_C0 and FD1\_RPF1\_ADDR\_C1, FD1\_RPF1\_ADDR\_\* indicates three registers.

### 27.3.4 Register Configuration

The FDP1 registers are arranged in the following order; the general control registers control the operation of the entire FDP1, and the other registers control each image processing and specify parameters for the processing. The functions of the registers are described in this order starting from section 27.3.7.

1. General control registers (FD1\_CTL\_\*)
2. RPF control registers (FD1\_RPF\_\*)
3. WPF control registers (FD1\_WPF\_\*)
4. IPC control registers (FD1\_IPC\_\*)

### 27.3.5 Restrictions on Access to Registers and Lookup Tables

The FDP1 has control registers and lookup tables. When accessing the addresses where these registers and lookup tables are allocated, the following restrictions should be satisfied. If any restriction is violated, the FDP1 will not operate correctly.

1. For the read-only bits and reserved bits in all FDP1 registers, writing 1 is prohibited unless otherwise specified.
2. Addresses undefined in section 27.3.7, Memory Map, are reserved areas and write access is prohibited in these areas.
3. For all immediate registers and lookup tables, except FD1\_CTL\_SGCMD, FD1\_CTL\_SRESET and FD1\_CTL\_IRQ\*, modifying register values during operation of the module is prohibited. Modify registers while the FDP1 is stopped. For the operating status of the FDP1, refer to section 27.3.8.8.

### 27.3.6 Procedure of FDP1 Start and Stop

#### 27.3.6.1 Register usages for FDP1 Start and Stop

Registers FD1\_CTL\_CMD, FD1\_CTL\_SGCMD, and FD1\_CTL\_REGEND must be used correctly in the procedures of FDP1 start and stop as specified in Tables 27.2 and 27.3.

**Table 27.2 Register Usages for Starting FDP1**

Register	Start the First Frame (FR[0])	Start the Second or Later Frame (FR[f], f = 1, 2, 3, ...)
FD1_CTL_SGCMD.SGEN	After all registers have been set completely, it must be set as 1 to generate V-Interruption.	It must be kept as 1 from the previous frame FR[f-1].
FD1_CTL_REGEND.REGEND	After all registers except FD1_CTL_SGCMD.SGEN have been set completely, it must be set 1. As the results, at the first V-interruption, all V-update registers are reflected for hardware reference, FD1_CTL_CMD.STRCMD is referred to start the first frame.	After V-interruption of starting the previous frame FR[f-1], it must be set 1 after all registers about FR[f] have been set completely. As the results, at the V-interruption of the end of frame FR[f-1], the V-update registers will be reflected to hardware reference, FD1_CTL_CMD.STRCMD is referred to start the frame FR[f].
FD1_CTL_CMD.STRCMD	It must be set 1 when all registers except FD1_CTL_SGCMD.SGEN, FD1_CTL_REGEND.REGEND are set. At the first V-Interruption it is referred by hardware to start the frame.	It must be set 1 when all registers except FD1_CTL_REGEND.REGEND are set. At the next V-Interruption (boundary between FR[t-1] and FR[t]) it is referred by hardware to start the frame.

**Table 27.3 Register Usages for Stopping FDP1**

Register	Stopping Immediately by Software Reset	Stopping after Current Process Finished
FD1_CTL_SGCMD.SGEN	It must be cleared before setting the value of FD1_CTL_SRESET.SRST as 1 so that no more V-Interruption after FDP1 stopped.	After V-interruption at the final frame end (FD1_CTL_IRQSTA.FRE is set as 1) occurred, it must be cleared so that no more V-Interruption is generated after FDP1 stopped
FD1_CTL_REGEND.REGEND		No Interrupt Mode  After V-interruption of starting the final frame, it must be set 1 right after clearing FD1_CTL_CMD.STRCMD so that the final V-interruption occurs and operation status of the final frame is updated to V-update status registers for Software reference.  Other modes  Right after V-interruption at starting the final frame, it must be set 1 right after clearing FD1_CTL_CMD.STRCMD so that operation status of the final frame is updated to V-update status registers for Software reference.
FD1_CTL_CMD.STRCMD	After FDP1 stopped successfully (FD1_CTL_IRQSTA.FRE is set as 1), it must be cleared to prevent wrong operation when the FDP1 is restarted.	After V-interruption of starting the final frame, it must be cleared to prevent wrong operation when the FDP1 is restarted.

### 27.3.6.2 Register Setting Order for FDP1 Start and Stop

#### (1) Interrupt Mode or Best Effort Mode

##### (a) To start the first frame of FDP1 process, set registers in following order.

1. Set all registers other than FD1\_CTL\_CMD, FD1\_CTL\_SGCMD, and FD1\_CTL\_REGEND.  
Set FD1\_CTL\_CMD.STRCMD to the value 1.
2. Set FD1\_CTL\_REGEND.REGEND to the value 1.
3. Set FD1\_CTL\_SGCMD.SGEN to the value 1, then FDP1 starts its process. FD1\_CTL\_SGCMD.SGEN must be not cleared to continue the second or later frames.

##### (b) To start the second or later frame, set registers in following order:

1. After V-interruption of the previous frame start timing occurred, set all registers other than FD1\_CTL\_CMD and FD1\_CTL\_REGEND.
2. Set FD1\_CTL\_CMD.STRCMD to the value 1.
3. Set FD1\_CTL\_REGEND.REGEND to the value 1.
4. At the V-interruption of the previous frame end timing, FDP1 starts the target frame. The V-interruption of the previous frame end timing and the one of the target frame start timing are the same.

##### (c) To stop FDP1 operation after currently frame finished, set registers as the following.

1. After V-interruption of the current frame start timing occurred, set FD1\_CTL\_CMD.STRCMD to the value 0. Set FD1\_CTL\_REGEND.REGEND to the value 1. If this register was completed before the V-Interruption of frame end timing, FDP1 stops its operation and currently frame becomes the last frame of the image sequence. If these register setting could not be completed before the V-Interruption of frame end timing, FDP1 stops its operation in the next V-

interruption. In the latter case, V-update status registers are not updated at V-interruption of frame end but at the next V-interruption at which DF1\_CTL\_REGEND.REGEND is set as 1.

2. Set FD1\_CTL\_SGCMD.SGEN to the value 0, then FDP1 will stop generating V-interruption.

**(d) To stop FDP1 operation immediately, set registers as the following.**

1. Set FD1\_CTL\_SGCMD.SGEN to the value 0, then FDP1 will stop generating V-interruption.
2. Set FD1\_CTL\_SRESET.SRST to the value 1. FDP1 will invoke termination process immediately.
3. Wait frame end interrupt from FDP1 or until the register bit FD1\_CTL\_IRQSTA.FRE is set to 1. After it occurs, FDP1 have finished its processing. With this operation, FDP1 can stop its process quickly, but the output frame of the last frame is corrupted.

**(2) No interrupt mode**

**(a) To start the first frame, set registers in following order.**

Same as (1) (a).

**(b) To start the second or later frame, set registers in following order.**

Same as (1) (b).

**(c) To stop FDP1 operation after current frame finished, set registers as the following.**

1. After V-interruption of the current frame start timing occurred, set FD1\_CTL\_CMD.STRCMD to the value 0.
2. Set FD1\_CTL\_REGEND.REGEND to the value 1. At the V-Interruption of frame end timing, FDP1 stops its operation and current frame becomes the last frame of the image sequence.
3. Set FD1\_CTL\_SGCMD.SGEN to the value 0, then FDP1 will stop generating V-interruption.

**(d) To stop FDP1 operation after current frame finished, set registers as the following.**

Same as (1) (d).

### 27.3.7 Memory Map

Table 27.4 shows the FDP1 memory map. Immediate registers are specified as “Imm”, the V-update registers are indicated as “Vupdt” and the V-update status registers are indicated as “VupdtSt” in register type column in Table 27.4.

#### Base address of each FDP1:

Ch0: H'FE94 0000

Ch1: H'FE94 4000 [RZ/G1H/M/N only]

Ch2: H'FE94 8000 [RZ/G1H only]

**Table 27.4 FDP1 Memory Map**

### 27.3.8 General Control Registers

#### 27.3.8.1 FDP1 Start Register (FD1\_CTL\_CMD)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	STR CMD
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	STRCMD	0	R/W	Start Command FDP1 starts the de-interlacing processing if this bit is set to 1. Set this bit after all relevant registers are surely set except for FD1_CTL_REGEN and FD1_CTL_SGCM. Set this bit to 1 before the FD1_CTL_REGEN.REGEN and FD1_CTL_SGCM. if FDP1 has to execute process. This bit will keep the value 1 after the set. To clear this bit, write the value 0 to this bit. 0: NOP or stops process at the next timing of V-Interruption. 1: Start FDP1 process at the next timing of V-Interruption. Note that setting of this registers are valid if the register FD1_CTL_REGEN.REGEN is set to the value 1 at the timing of next V-Interruption.

**27.3.8.2 Sync Generator Register (FD1\_CTL\_SGCMD)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SGEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SGEN	0	R/W	<p>V-Interruption Generator Enable</p> <p>This bit controls V-Interruption. This bit should be set to the value 1 after other all registers are set, and only at the first field of the sequence.</p> <p>Set this bit to the value 1 to execute process in all V-Interruption modes described in section 27.3.8.5.</p> <p>0: Disable V-Interruption 1: Enable V-Interruption</p> <p>[Important]</p> <p>In case of software reset (FD1_CTL_SRESET.SRST), set this SGEN bit to the value 0.</p> <p>If this bit is cleared during process V-interruption will not occur after FDP1 finished current frame. As a result, FDP1 will not start the next frame because STRCMD is not captured and V-update status registers will not be updated about process information of current frame.</p>

**27.3.8.3 Register Set End Register (FD1\_CTL\_REGEND)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	REGEND	0	R/W	Register Setting Ready Flag Set the value 1 to this bit after complete the setting of parameter registers. Do not write the value 0 to this bit. This bit will be cleared by FDP1 automatically. 0: <u>Writing 0 is prohibited</u> except for after the completion of S/W reset sequence. 1: Registers which are set by SW is ready to be reflected for Hardware reference. The V-update status registers is ready to be reflected for Software reference. The second or later V-interruption in the case No interrupt mode can be generated.

**27.3.8.4 Channel Activation Register (FD1\_CTL\_CHACT)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	SMW	WR	—	—	—	—	SMR	RD[2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9	SMW	0	R/W	Refer to Table 27.5 for setting these register fields. The setting of each register field depends on the setting of FD1_IPC_MODE.DIM register bits. Do not set the other values which are specified in Table 27.5.
8	WR	0	R/W	
7 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3	SMR	0	R/W	Refer to Table 27.5 for setting these register fields. The setting of each register field depends on the setting of FD1_IPC_MODE.DIM register bits. Do not set the other values which are specified in Table 27.5.
2 to 0	RD[2:0]	000	R/W	

**Table 27.5 FD1\_CTL\_CHACT Setting for FD1\_IPC\_MODE.DIM Parameter**

PRG*1	DIM[2:0]*2		SMW	WR	SMR	RD2	RD1	RD0	LWord Expression
0 (Interlace Mode)	B'000 (Adaptive2D/3D)	First field	1	1	0	0	1	0	H'0000_0302
		Second field	1	1	0	1	1	1	H'0000_0307
		Final field	0	1	0	0	1	0	H'0000_0102
		Otherwise	1	1	1	1	1	1	H'0000_030F
	B'010 (Fixed 3D)	First field	0	1	0	0	1	0	H'0000_0102
		Second field	0	1	0	1	1	1	H'0000_0107
		Final field	0	1	0	0	1	0	H'0000_0102
		Otherwise	0	1	0	1	1	1	H'0000_0107
B'001 (Fixed 2D)		0	1	0	0	1	0	H'0000_0102	
B'011 (Previous field)		0	1	0	0*3	1	1	H'0000_0103	
B'100 (Next field)		0	1	0	1	1	0*3	H'0000_0106	
1 (Progressive Mode)	Set DIM [2:0] as B'001		0	1	0	0	1	0	H'0000_0102

Notes: Field order means an input field order to the FDP1.

For example, the first field is the first input field to the FDP1; the first field is processed but not output.

1. FD1\_CTL\_OPMODE.PRG

2. FD1\_CTL\_IPC\_MODE.DIM[2:0]
3. Value 1 can be set but the corresponding data is not read

### 27.3.8.5 Operation Mode Register (FD1\_CTL\_OPMODE)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	PRG	0	R/W	Progressive Mode When the register field is set to 1, the de-interlacing processing is not executed and the incoming image data is passed through IPC module. 0: Interlace Mode 1: Progressive Mode
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	VIMD[1:0]	00	R/W	V-Interruption Mode This register field sets V-Interruption mode of FDP1. Refer to Table 27.6 for detail. 00: Normal 01: Best Effort 10: No interrupt

**Table 27.6 V-Interruption Mode**

VIMD[1:0]	V-Interruption Mode Timing		STRCMD Captured Timing
	First Time	Second Time or Later	
B'00 (Normal)	V-Interruption occurs when changes FD1_CTL_SGCMD.SGEN from 0 to 1 and FDP1 is not doing de-interlacing process.	Fixed period interrupt specified by FD1_CTL_VPERIOD in spite of the de-interlacing processing.	Captured at V-Interruption
B'01 (Best effort)		Fixed period interrupt specified by FD1_CTL_VPERIOD  If the de-interlacing processing is not completed at the timing specified by FD1_CTL_VPERIOD, V-Interruption is deferred to the end of the processing.	
B'10 (No interrupt)		If FD1_CTL_REGEND is set 1 before the end of the processing (frame end interruption FD1_CTL_IRQSTA .FRE is set as 1) V-Interruption occurs right after the end of the processing.  If FD1_CTL_REGEND is set 1 after the end of processing (frame end interruption FD1_CTL_IRQSTA .FRE is set as 1) V-Interruption occurs right after FD1_CTL_REGEND is set.  If FD1_CTL_REGEND is not set 1 V-Interruption does not occur.

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SRST
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SRST	0	R/W	<p>FDP1 Software Reset</p> <p>FDP1 stops its operation after this bit is set to 1. FDP1 aborts all processings and quits bus/memory accesses. Do not start next process by FD1_CTL_CMD until the software processing is completed. When this processing is completed, the FD1_CTL_IRQSTA.FRE interrupt source bit is set to 1, when the FRE interrupt is enabled. This interrupt notifies the end of the reset processing.</p> <p>The end of software reset processing is notified through the FRE bit, but the software reset issued while FDP1 is stopped is ignored as NOP. As it takes a while until the reset is actually issued after the reset bit is set, the FDP1 may complete operation before the reset is actually issued. In this case, no interrupt is output for the software reset that is issued after the FDP1 completes operation. But even through in this case, not that the output image may be destroyed due to software reset process.</p> <p>This bit is always read as 0.</p> <p>0: NOP 1: Software Reset</p> <p>[Important ] Set FD1_CTL_SGCMD.SGEN to the value 0 before write 1 to this SRST bit.</p>

## 27.3.8.9 Operating Status Register (FD1\_CTL\_STATUS)

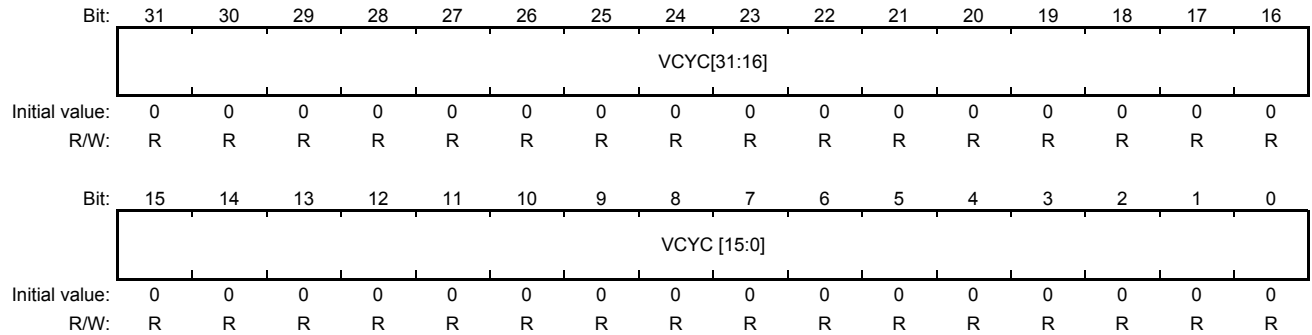

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	VINT_CNT [15:0]	H'0000	R	V-Sync Interrupt Counter Status This bit field shows the number of interruption times of V-Sync interrupt. Hence, the value of this bit indicates the number of progressive output frames which is generated by FDP1. This counter value is reset to 0 when FD1_CTL_SGCMD.SGEN is set to 1.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10	SGREGSET	0	R	Register Set End Status This bit represents the register set status updated at V-Sync. The status is controlled by FD1_CTL_REGEND.REGEND bit and the internal timing. 0: Registers are not set for the operation 1: Registers are set for the operation
9	SGVERR	0	R	V-Sync End Error Status This bit represents the V-Sync end error status updated at V-Sync. 0: No error 1: V-Sync end error (De-interlacing cannot be finished by the timing of V-Sync)
8	SGFREND	0	R	Frame End Status This bit represents the frame end status updated at V-Sync. 0: The de-interlacing is not finished 1: Frame end (The de-interlacing is finished)
7 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	BSY	0	R	FDP1 Operating Status This bit indicates the operating or stopped state of control FDP1. 0: FDP1 is stopped. 1: FDP1 is operating.

**27.3.8.10 V-Cycles Status Register (FD1\_CTL\_VCYCLE\_STAT)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	VCYC[31:0]	H'0000_000 0	R	Number of Cycles of the Previous Frame Processing  This status register shows the number of cycles of previous frame de-interlacing processing. FDP1 updates this register at the timing of V-Sync interrupt.

### 27.3.8.11 Interrupt Enable Register (FD1\_CTL\_IRQENB)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	VERE

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	VINTE	—	—	—	FREE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	VERE	0	R/W	Interrupt Enable for V-Sync End Error The interrupt of V-Sync end error is asserted at the timing that FDP1 does not complete the de-interlacing processing at the V-Sync. 0: Interrupt Disabled 1: Interrupt Enabled
15 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	VINTE	0	R/W	Interrupt Enable for V-Sync The interrupt of V-Sync is asserted at the timing of V-Sync specified by FD1_CTL_OPMODE.VIMD register field. If VIMD is set to 2, this interrupt is not asserted. 0: Interrupt Disabled 1: Interrupt Enabled
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	FREE	0	R/W	Interrupt Enable for Frame End The interrupt of frame end is asserted at the timing that FDP1 completes the de-interlacing processing. 0: Interrupt Disabled 1: Interrupt Enabled

Each bit controls the interrupt enable of the corresponding interrupt source.

Each bit in FD1\_CTL\_IRQSTA is set to 1 when the corresponding interrupt source is generated. FD1\_CTL\_IRQENB specifies whether to output an interrupt signal for the generated source. When an interrupt is disabled in this register, no interrupt signal is generated even when the corresponding bit in FD1\_CTL\_IRQSTA is set to 1. When an interrupt is enabled in this register, an interrupt signal is output when the corresponding bit in FD1\_CTL\_IRQSTA is set to 1.

**27.3.8.12 Interrupt Status Register (FD1\_CTL\_IRQSTA)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	VER
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	VER	0	R/W	Interrupt Status and Clear for V-Sync End Error [Read Access] Interrupt Status 0: No interrupt 1: Interrupt activated [Write Access] Interrupt Clear 0: The interrupt status is cleared to 0 1: Hold the interrupt status value
15 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	VINT	0	R/W	Interrupt Status and Clear for V-Sync [Read Access] Interrupt Status 0: No interrupt 1: Interrupt activated [Write Access] Interrupt Clear 0: The interrupt status is cleared to 0 1: Hold the interrupt status value
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	FRE	0	R/W	Interrupt Status and Clear for Frame End [Read Access] Interrupt Status 0: No interrupt 1: Interrupt activated [Write Access] Interrupt Clear 0: The interrupt status is cleared to 0 1: Hold the interrupt status value

The read value from each bit is the status of the interrupt source, and the write access to each bit controls the interrupt status.

FD1\_CTL\_IRQSTA indicates the state of the interrupt sources generated in the FDP1. Whether to output a FDP1 interrupt when an interrupt source is generated and the corresponding bit is set to 1 is determined by the corresponding bit setting in FD1\_CTL\_IRQENB.

While an interrupt is disabled in FD1\_CTL\_IRQENB, the FDP1 does not output an interrupt signal even when an interrupt source is generated, but the source flag in this register is set to 1.

R/W:	R	R	R/W	R/W	R	R	R	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	CIPM	0	R/W	Set 0 when FD1_CTL_OPMODE.PRG is set to 1, otherwise set the value 1 to this bit.
15, 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13	RSPYCS	0	R/W	RPF Input Mode Setting 1 When the input format is YUY2, set this bit to 1 and set the RDFMT bits to 71 (H'47). When the input format is YVYU, set this bit and the RSPUVS bit to 1 and set the RDFMT bits to 71 (H'47). In other cases, set this bit to 0.
12	RSPUVS	0	R/W	RPF Input Mode Setting 2 When the input format is NV61, set this bit to 1 and set the RDFMT bits to 65 (H'41). When the input format is NV21, set this bit to 1 and set the RDFMT bits to 66 (H'42). When the input format is YVYU, set this bit and the RSPYCS bit to 1 and set the RDFMT bits to 71 (H'47). In other cases, set this bit to 0.
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	CF	0	R/W	Current Field This bit specifies current field parity. Note that the previous or next field pictures should be the opposite parity of the current field specified by this bit. 0: Current field is top field 1: Current field Bottom field
7	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
6 to 0	RDFMT [6:0]	All 0	R/W	<p>RPF Input Image Format Setting</p> <p>These bits select the format of the image input from the external SDRAM to the RPFn. Select a value corresponding to the desired format from those shown in Table 27.7.</p> <p>Note: Number of input pixels When YCbCr4:2:2 is selected through the RDFMT bits, the horizontal size of the input image should be specified in 2-pixel units. When YCbCr4:2:0 is selected, the vertical and horizontal sizes should be specified in 2-pixel units.</p>

**Table 27.7 YCbCr Formats for RPF Input\*<sup>5</sup> and WPF Output\*<sup>4</sup>**

RDFMT[6:0], WRFMT[6:0]	Packed YCbCr Input Format	Reference
H'00 to H'3F	Reserved	—
H'40	YCbCr4:4:4 semi-planar	Figure 27.6
H'41	YCbCr4:2:2 semi-planar (NV16, NV61* <sup>1</sup> )	
H'42	YCbCr4:2:0 semi-planar (NV12, NV21* <sup>1</sup> )	
H'43 to H'45	Reserved	—
H'46	YCbCr4:4:4 interleaved	Figure 27.7
H'47	YCbCr4:2:2 interleaved type 0 (UYVY, YUY2* <sup>2</sup> , YVYU* <sup>3</sup> )	
H'48	YCbCr4:2:2 interleaved type 1	
H'49	Reserved	
H'4A	YCbCr4:4:4 planar	Figure 27.8
H'4B	YCbCr4:2:2 planar (YV16)	
H'4C	YCbCr4:2:0 planar (YV12, YU12)	
H'4D to H'7F	Reserved	—

- Notes:
- When the input format is NV61 or NV21, set the RSPUVS bit to 1.
  - When the input format is YUY2, set the RSPYCS bit to 1.
  - When the input format is YVYU, set the RSPUVS bit to 1 and RSPYCS bit to 1.
  - The performance of FDP1 depends on the format because of the limited bus buffer size. The following formats may decrease the tolerance of the bus latency and may decrease the performance of FDP1.
    - YCbCr 4:4:4 interleaved
    - YCbCr 4:4:4 semi-planar
    - YCbCr 4:2:2 interleaved type0 and 1
  - In processing by RPF0 and RPF2, the chroma components (Cb and Cr, or U and V) are not read from the system bus when the format is planar or semi-planar. The chroma components are discarded once they are read in combination with the luma component when the format is interleaved because the RPF0 and RPF2 only handle fixed 2D de-interlacing of the luma component, and so do not require the chroma components.

In write format case shown in section 27.3.10.1, FD1\_WPF\_FORMAT.WSPYCS and WSPUVS correspond to RSPYCS and RSPUVS, respectively.

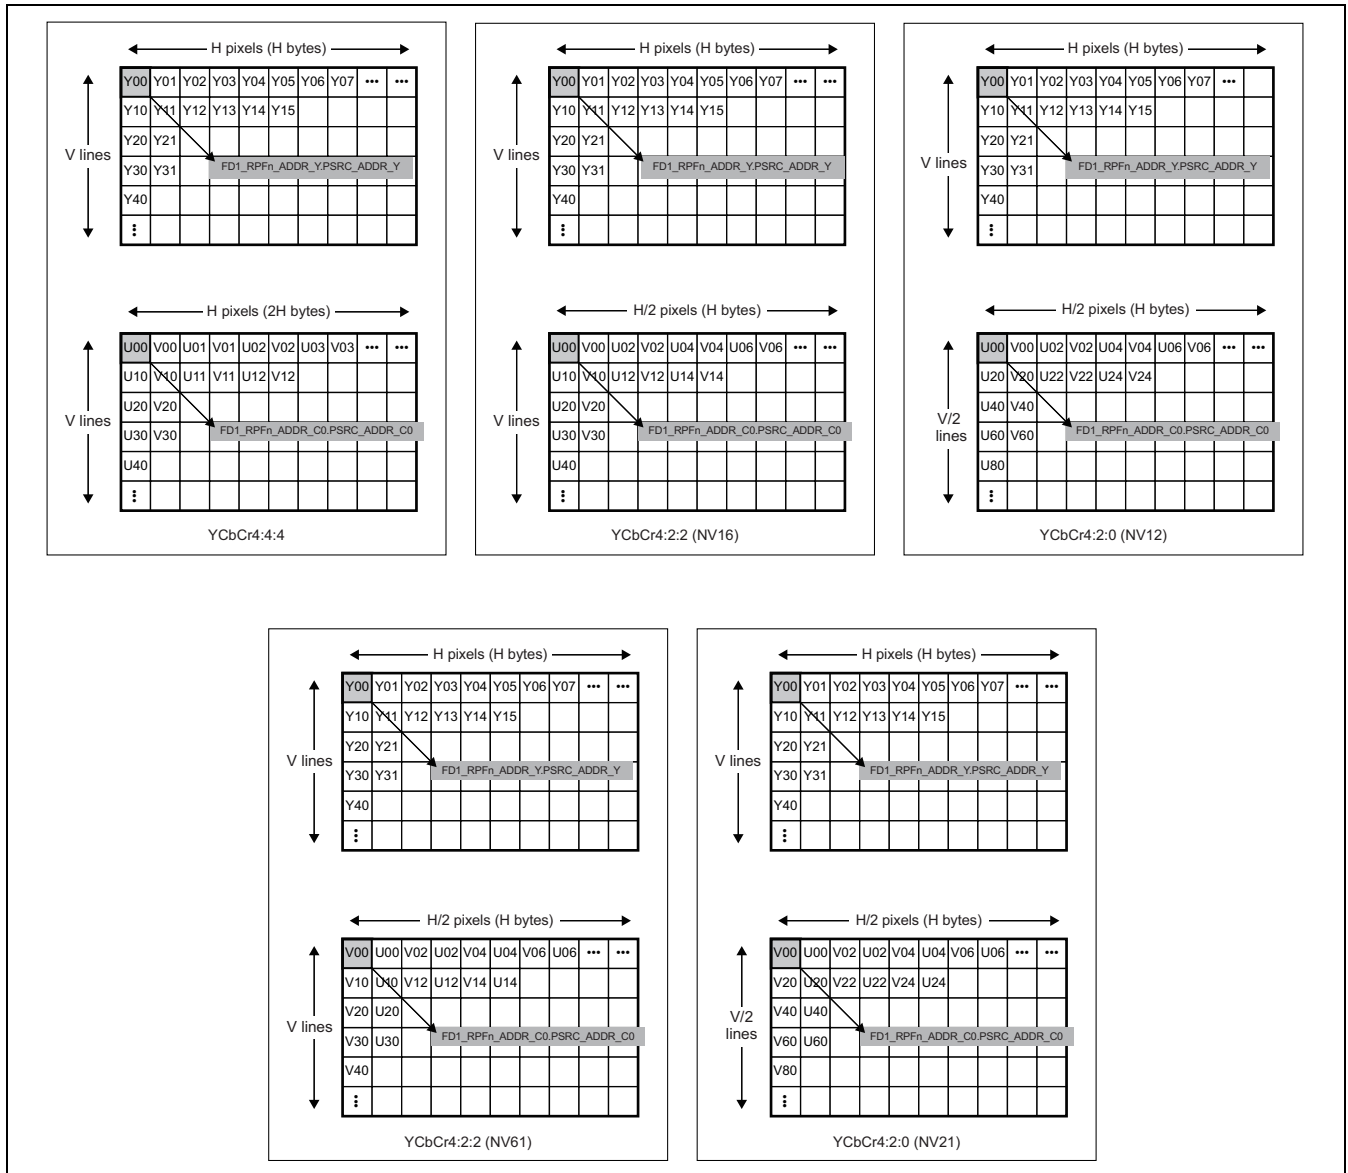

Figure 27.6 YCbCr Semi-Planar Formats

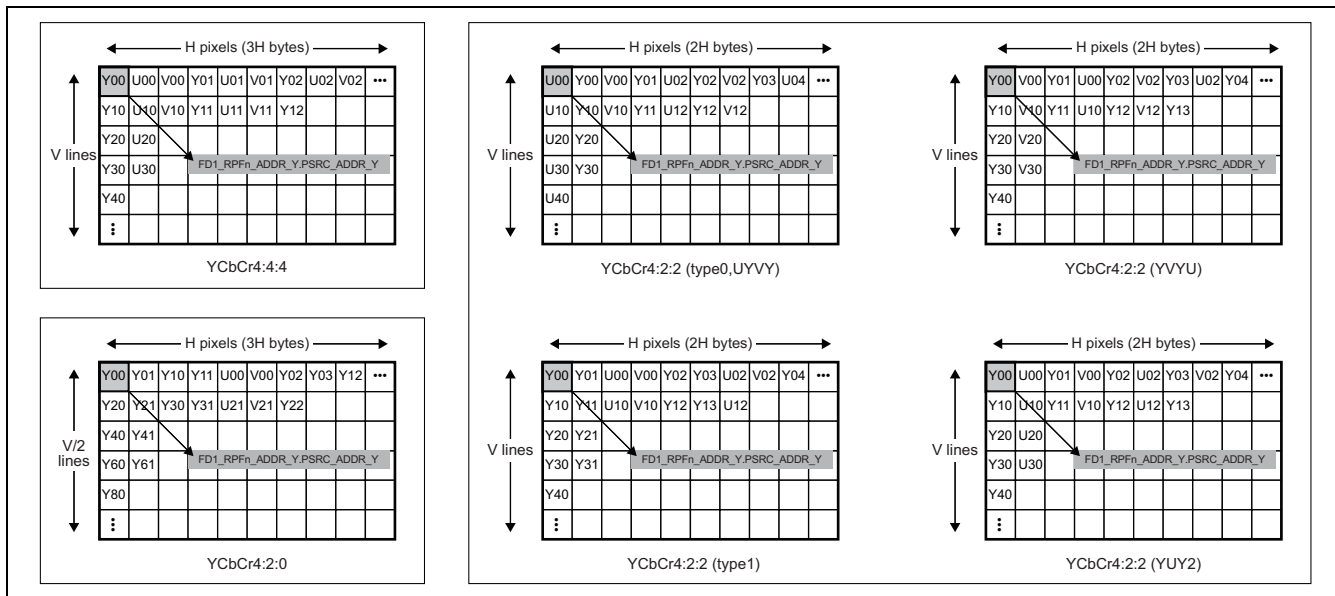

Figure 27.7 YCbCr Interleaved Formats

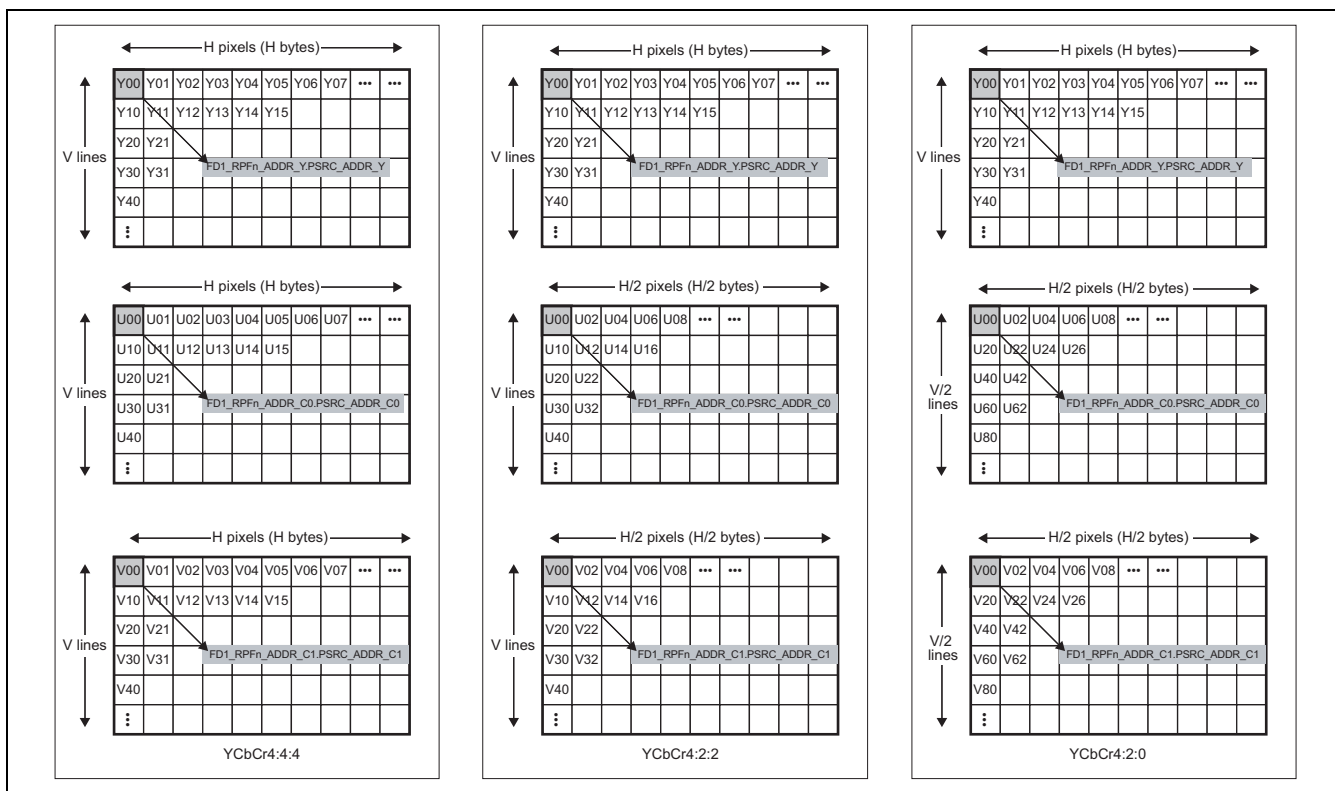

Figure 27.8 YCbCr Planar Formats

**27.3.9.3 Source Picture Stride Register (FD1\_RPF\_PSTRIDE)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

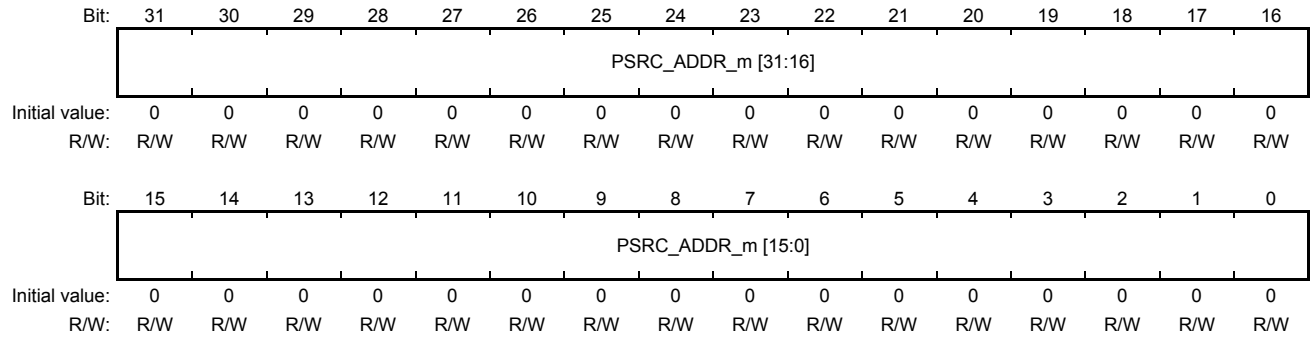

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	SRC_STRD_Y [15:0]	H'0000	R/W	Memory Stride of Source Picture Y Plane These bits specify in 1-byte units the memory stride of the source picture Y plane read by the RPFn (n=0, 1, 2). A value from H'0050 to H'1FFE can be specified.
15 to 0	SRC_STRD_C [15:0]	H'0000	R/W	Memory Stride of Source Picture C Plane These bits specify in 1-byte units the memory stride of the source picture C plane read by the RPF1. A value from H'0050 to H'1FFE can be specified. In the YCbCr planar format, this setting is used as the memory stride of the Cb and Cr planes.

Note: As described above, stride value of source pictures (past, current, future) are common one. Therefore frame structures of all input pictures should be the same format. For example, the case that past picture which is supplied to RPF0 is frame-structure, and other input pictures to RPF1 and 2 are field picture, is prohibited.

**27.3.9.4 RPFn Source Component-m Address Register**  
**(FD1\_RPFn\_ADDR\_m: where {n, m} is any of {0, Y}, {1, Y}, {1, C0}, {1, C1}, or {2, Y}))**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	PSRC_ADDR_m [31:0]	H'0000_0000	R/W	<p>RPFn Source Field Address for Component-m (where {n, m} is any of {0, Y}, {1, Y}, {1, C0}, {1, C1}, or {2, Y})</p> <p>These bits specify in 1-byte units the start address of the source component-m plane read by the RPFn.</p> <p>A value from H'0000_0000 to H'FFFF_FFFF can be specified.</p>

**27.3.9.5 Still Mask Address Register (FD1\_RPF\_SMSK\_ADDR)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SMSK_ADDR [31:0]	H'0000_0000	R/W	<p>Still Mask Buffer Address.</p> <p>These bits specify the memory address at which the still mask data is located.</p> <p>These bits should be set to a value ranging from H'0000_0000 to H'FFFF_FFFF.</p> <p>The still mask is intermediate data generated during IP conversion only when adaptive 2D/3D (FD1_CTL_OPMODE.PRG = 0 and FD1_CTL_IPC_MODE.DIM [2:0] = 0) is specified. The still mask setting is effective when either of bits FD1_CTL_CHACT.SMW or FD1_CTL_CHACT.SMR is set to 1. The still mask data is generated and repeatedly used by the FDP1. The still mask data should be stored in the SDRAM.</p> <p>The FDP1 needs two separate buffers of the same size for this data; one is common to all top fields and the other is common to all bottom fields. Therefore, the top and bottom fields must have different source addresses. When FD1_RPF_FORMAT.CF is 0, set the buffer address of the top field in these bits. Otherwise, set the buffer address of the bottom field in these bits.</p> <p>The memory stride of each buffer is expressed as the following equation.</p> $2 \times \{(FD1\_RPF\_SIZE.HSIZE + 7)/8\} \text{ [byte]}$ <p>The memory space of each buffer is expressed as below.</p> $2 \times \{(FD1\_RPF\_SIZE.HSIZE + 7)/8\} \times FD1\_RPF\_SIZE.VSIZE \text{ [byte]}$ <p>Figure 27.9 shows the usage of the still mask data buffers and Table 27.8 shows how to set this register.</p>

**27.3.10 WPF Control Registers**

**27.3.10.1 Destination Picture Format Register (FD1\_WPF\_FORMAT)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	PDV[7:0]	H'00	R/W	<p>PAD Value in Output Packed Data</p> <p>These bits specify the value to be stored in the bit field indicated as PAD or P in the output formats shown in Table 27.7. A value from 0 to 255 can be specified.</p>
23 to 16	—	All 0	R	<p>Reserved</p> <p>These bits are always read as 0. The write value should always be 0.</p>
15	WSPYCS	0	R/W	<p>WPF Output Mode Setting 1</p> <p>When the output format is YUY2, set this bit to 1 and set the WRFMT bits to 71 (H'47).</p> <p>When the output format is YVYU, set this bit and the WSPUVS bit to 1 and set the WRFMT bits to 71 (H'47).</p> <p>In other cases, set this bit to 0.</p>
14	WSPUVS	0	R/W	<p>WPF Output Mode Setting 2</p> <p>When the output format is NV61, set this bit to 1 and set the WRFMT bits to 65 (H'41).</p> <p>When the output format is NV21, set this bit to 1 and set the WRFMT bits to 66 (H'42).</p> <p>When the output format is YVYU, set this bit and the WSPYCS bit to 1 and set the WRFMT bits to 71 (H'47).</p> <p>In other cases, set this bit to 0.</p>

Bit	Bit Name	Initial Value	R/W	Description
13, 12	DITH[1:0]	00	R/W	<p>Dithering Enable/Disable</p> <p>When the output format specified through the WRFMT bits is RGB with 18 bpp (262144 colors) or less, the color reduction processing is applied to match the number of colors. The color reduction processing may generate the artifacts of pseudo gradation, which can be suppressed through dithering. The DITH bits enable or disable dithering during color reduction.</p> <p>When the output format specified through the WRFMT bits is YCbCr, specify 0 in these bits.</p> <p>00: Dithering is disabled 01: Setting prohibited 10: Setting prohibited 11: Dithering is enabled</p>
11 to 9	WRTM[2:0]	000	R/W	<p>CSC Conversion Expression Setting</p> <p>These bits select the expression for color space conversion. The conversion direction is RGB to YCbCr when the format specified in the WRFMT bits is RGB, or YCbCr to RGB when the format is YCbCr.</p> <p>000: BT.601 YCbCr [16,235/240] → RGB [0,255] 001: BT.601 YCbCr [0,255] → RGB [0,255] 010: BT.709 YCbCr [16,235/240] → RGB [0,255] 011: BT.709 YCbCr [16,235/240] → RGB [16,235] 100 to 111: Setting prohibited</p>
8	CSC	0	R/W	<p>Color Space Conversion Setting</p> <p>Enables or disables YCbCr ↔ RGB color space conversion to be executed in the WPF. The characteristics of color space conversion are determined by the WRTM setting.</p> <p>0: Color space is not converted. 1: Color space is converted.</p>
7	—	0	R	<p>Reserved</p> <p>This bit is always read as 0. The write value should always be 0.</p>
6 to 0	WRFMT[6:0]	All 0	R/W	<p>WPF Output Image Format Setting</p> <p>These bits select the format of the image output from the WPF to the external memory from among those listed in Tables 27.10 and 27.7.</p> <p>Note: Number of output pixels When YCbCr4:2:2 is specified through WRFMT, the horizontal size of the output image should be a multiple of 2 pixels. When YCbCr4:2:0 is specified, the vertical and horizontal sizes of the output image should be multiples of 2 pixels.</p>

### 27.3.10.2 Destination Picture Rounding Control Register (FD1\_WPF\_RNDCTL)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	CBRM	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	CLMD[1:0]	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	CBRM	0	R/W	Bit Count Reduction Selection for Data Storage in Packed RGB This bit specifies the method for reducing the number of bits when data is stored in the bit fields indicated as R, G, and B in Table 27.10 and the target bit fields are not eight bits. 0: Bit count conversion: The lower-order bits are truncated 1: Bit count conversion: Rounding (rounding off)
27 to 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13, 12	CLMD[1:0]	00	R/W	Color Data Clipping These bits specify the method for clipping the YCbCr color data output from the WPF. When RGB color data is output from the WPF, specify 0 in these bits. 00: Output value is not clipped (0-255) 01: Output value is clipped: YCbCr mode 1 (16-235 (Y), 16-240 (Cb/Cr)) 10: Output value is clipped: YCbCr mode 2 (Y/Cb/Cr = 1-254) 11: Setting prohibited
11 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

**27.3.10.3 Destination Picture Stride Register (FD1\_WPF\_PSTRIDE)**

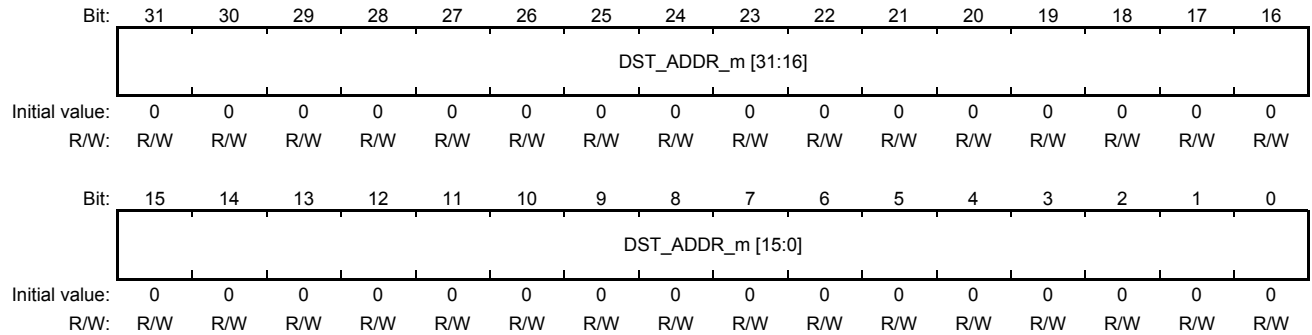

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	DST_STRD_Y [15:0]	H'0000	R/W	<p>Memory Stride of Destination Picture Y/RGB Plane</p> <p>These bits specify in 1-byte units the memory stride of the destination picture in the external memory to be written to by the WPF.</p> <p>A value from H'0050 to H'1FFE can be specified.</p>
15 to 0	DST_STRD_C [15:0]	H'0000	R/W	<p>Memory Stride of Destination Picture C Plane</p> <p>These bits specify in 1-byte units the memory stride for the C plane of the destination picture in the external memory to be written to by the WPF. When the WPF outputs images in an RGB format, this setting is not used. When the WPF outputs images in YCbCr planar format, this setting is applied to both the Cb and Cr planes.</p> <p>A value from H'0050 to H'1FFE can be specified.</p>

**27.3.10.4 Destination Component-m Address Register (FD1\_WPF\_ADDR\_m: m = Y, C0, C1)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DST_ADDR_m [31:0]	H'0000_0000	R/W	Destination Address for Component-m (m = Y, C0, C1) These bits specify in 1-byte units the address for storing the destination component-m plane to be written to the external memory by the WPF. A value from H'0000_0000 to H'FFFF_FFFF can be specified.

**27.3.10.5 WPF Data Swap Register (FD1\_WPF\_SWAP)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	—	SSWAP[3:0]				OSWAP[3:0]			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7 to 4	SSWAP[3:0]	H'0	R/W	Set the same value with FD1_RPF_SWAP.ISWAP.
3 to 0	OSWAP[3:0]	H'0	R/W	Output Swap Setting for Image Data This bit field specifies the data swapping function. Each bit corresponds to the following data swapping. Refer to Table 27.9 for the data alignment after data swapping. Bit[3]: Long longword (64-bit) swap Bit[2]: Longword (32-bit) swap Bit[1]: Word (16-bit) swap Bit[0]: Byte (8-bit) swap

### 27.3.11 IPC Control Registers

**Table 27.11** IPC registers categorized in function

Function	Registers
IP Conversion Control	FD1_IPC_MODE
3D de-interlace	FD1_IPC_COMB_DET
Adaptive 2D/3D de-interlacing	FD1_IPC_MOTDEC
Diagonal line interpolation	FD1_IPC_DLI_BLEND FD1_IPC_DLI_HGAIN FD1_IPC_DLI_SPRS FD1_IPC_DLI_ANGLE FD1_IPC_DLI_ISOPIX0 FD1_IPC_DLI_ISOPIX1
Film detection	FD1_SENSOR_m (m = 0,1,...,17) FD1_SENSOR_CTL0 FD1_SENSOR_CTL1 FD1_SENSOR_CTL2 FD1_SENSOR_CTL3 SENSOR_TH0 SENSOR_TH1

For chroma component, IPC cannot process 3D de-interlace, adaptive 2D/3D de-interlacing, diagonal line interpolation and film detection but can process fixed 2D IP conversion.

**27.3.11.1 IPC Mode Register (FD1\_IPC\_MODE)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	DLI	—	—	—	—	—	DIM[2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	DLI	0	R/W	Set the value 1 to this bit.
7 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2 to 0	DIM[2:0]	000	R/W	De-Interlacing Mode These bits specify the de-interlacing mode of luma component as following. The de-interlacing process of chroma component is fixed 2D de-interlacing regardless of these bits. 000: Adaptive 2D/3D de-interlacing 001: Fixed 2D de-interlacing 010: Fixed 3D de-interlacing 011: Select previous field for interpolated lines 100: Select next field for interpolated lines

**27.3.11.2 Still Mask Threshold Register (FD1\_IPC\_SMSK\_THRESH)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

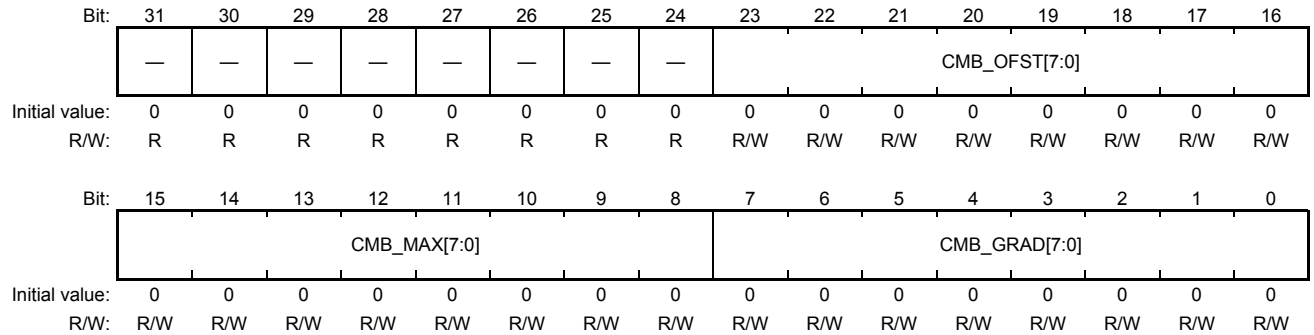

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	FSM0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	FSM0	0	R/W	Set the value 1 to this bit. Other setting value is used for purpose of h/w debugging. Do not set other value.
15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7 to 0	SMSK_TH [7:0]	H'00	R/W	Set the value 2 to this bit. Other setting value is used for purpose of h/w debugging. Do not set other value.

**27.3.11.3 Comb Detection Parameter Register (FD1\_IPC\_COMB\_DET)**

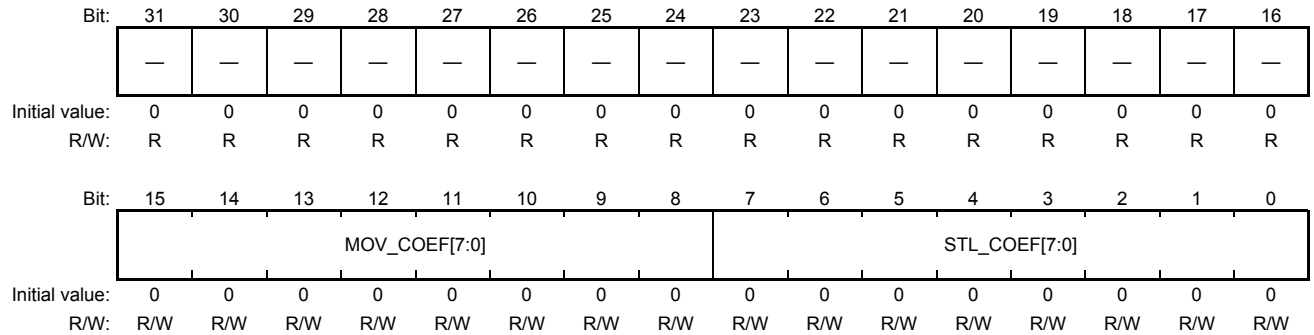

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	CMB_OFST [7:0]	H'00	R/W	Set the value H'20 to this bit. Other setting value is used for purpose of h/w debugging. Do not set other value.
15 to 8	CMB_MAX [7:0]	H'00	R/W	Set the value 0 to this bit. Other setting value is used for purpose of h/w debugging. Do not set other value.
7 to 0	CMB_GRAD [7:0]	H'00	R/W	Set the value H'40 to this bit. Other setting value is used for purpose of h/w debugging. Do not set other value.

**27.3.11.4 Motion Decision Parameter Register (FD1\_IPC\_MOTDEC)**

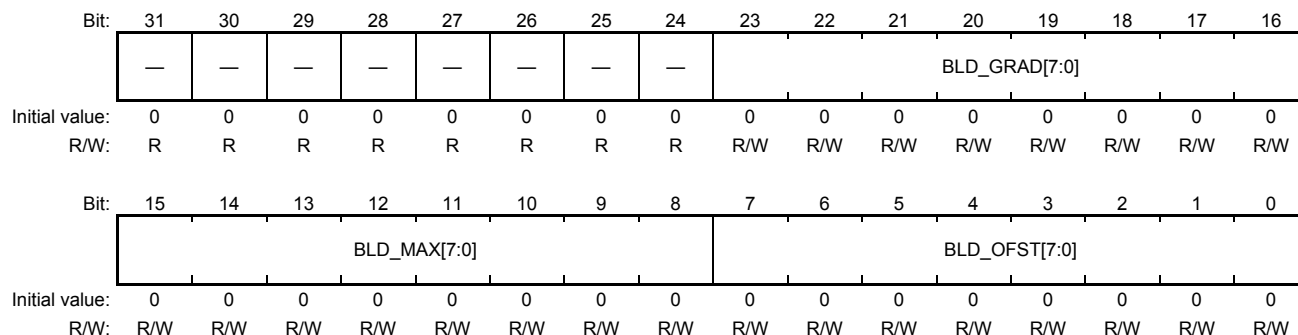

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 8	MOV_COEF [7:0]	H'00	R/W	Set the value H'80 to this bit. Other setting value is used for purpose of h/w debugging. Do not set other value.
7 to 0	STL_COEF [7:0]	H'00	R/W	Set the value H'20 to this bit. Other setting value is used for purpose of h/w debugging. Do not set other value.

**27.3.11.5 DLI Blend Parameter Register (FD1\_IPC\_DLI\_BLEND)**

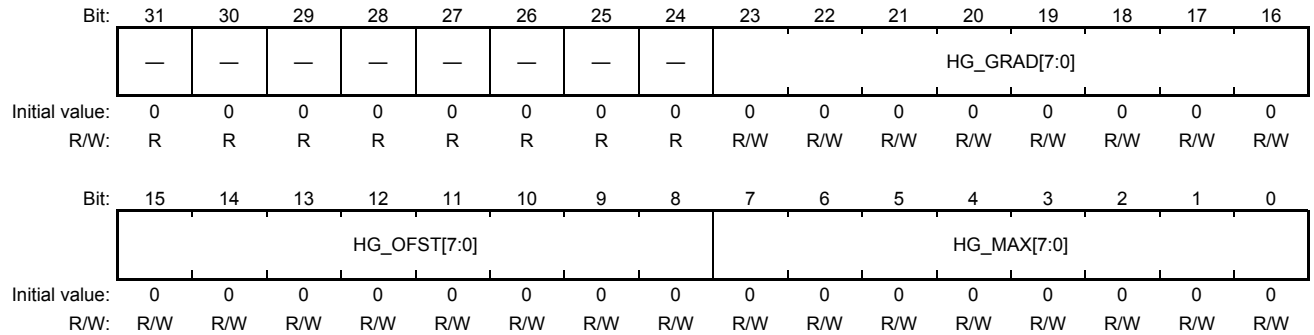

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	BLD_GRAD [7:0]	H'00	R/W	Set the value H'80 to this bit. Other setting value is used for purpose of h/w debugging. Do not set other value.
15 to 8	BLD_MAX [7:0]	H'00	R/W	Set the value H'FF to this bit. Other setting value is used for purpose of h/w debugging. Do not set other value.
7 to 0	]BLD_OFST [7:0]	H'00	R/W	Set the value H'02 to this bit. Other setting value is used for purpose of h/w debugging. Do not set other value.

**27.3.11.6 DLI Horizontal Frequency Gain Register (FD1\_IPC\_DLI\_HGAIN)**

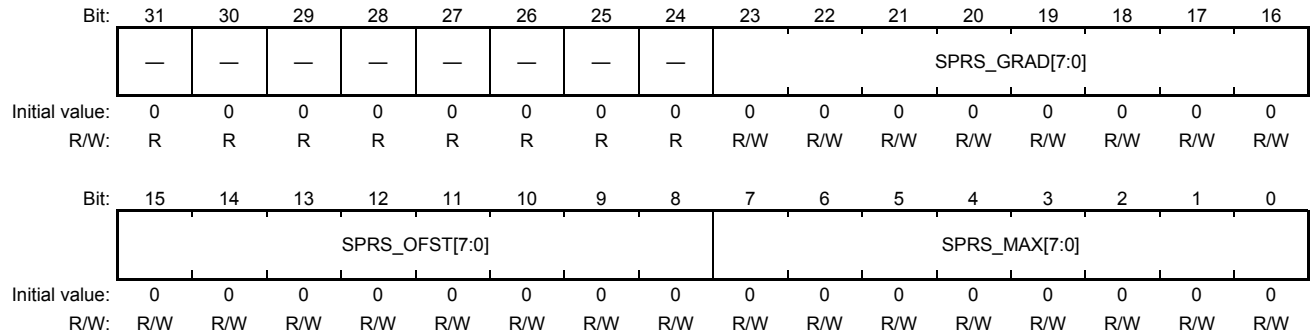

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	HG_GRAD [7:0]	H'00	R/W	Set the value H'10 to this bit. Other setting value is used for purpose of h/w debugging. Do not set other value.
15 to 8	HG_OFST [7:0]	H'00	R/W	Set the value H'00 to this bit. Other setting value is used for purpose of h/w debugging. Do not set other value.
7 to 0	HG_MAX [7:0]	H'00	R/W	Set the value H'FF to this bit. Other setting value is used for purpose of h/w debugging. Do not set other value.

**27.3.11.7 DLI Suppression Parameter register (FD1\_IPC\_DLI\_SPRS)**

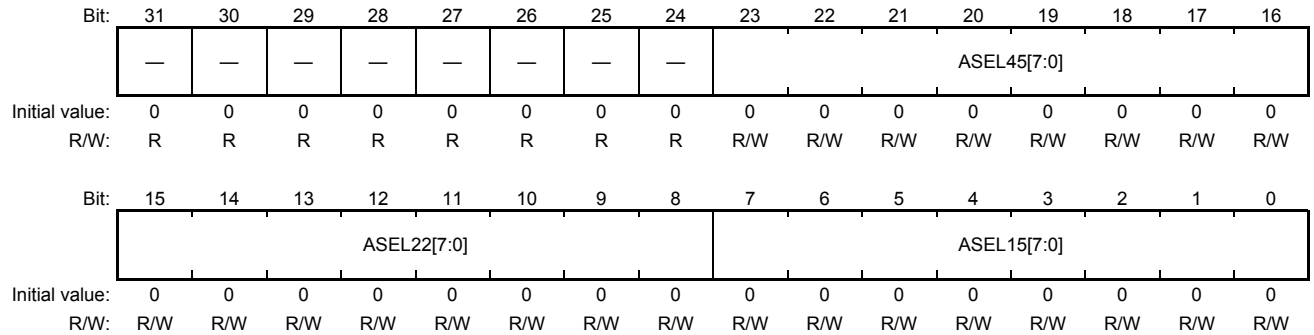

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	SPRS_GRAD [7:0]	H'00	R/W	Set the value H'90 to this bit. Other setting value is used for purpose of h/w debugging. Do not set other value.
15 to 8	SPRS_OFST [7:0]	H'00	R/W	Set the value H'04 to this bit. Other setting value is used for purpose of h/w debugging. Do not set other value.
7 to 0	SPRS_MAX [7:0]	H'00	R/W	Set the value H'FF to this bit. Other setting value is used for purpose of h/w debugging. Do not set other value.

**27.3.11.8 DLI Angle Parameter Register (FD1\_IPC\_DLI\_ANGLE)**

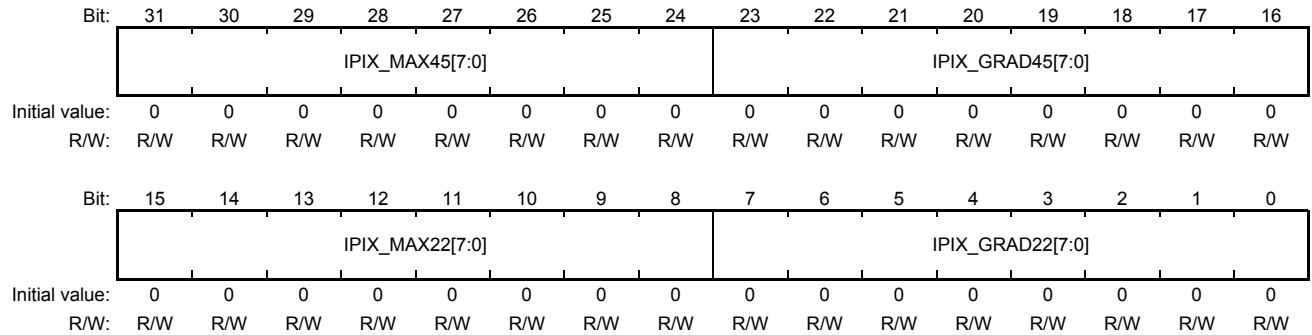

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	ASEL45 [7:0]	H'00	R/W	Set the value H'04 to this bit. Other setting value is used for purpose of h/w debugging. Do not set other value.
15 to 8	ASEL22 [7:0]	H'00	R/W	Set the value H'08 to this bit. Other setting value is used for purpose of h/w debugging. Do not set other value.
7 to 0	ASEL15 [7:0]	H'00	R/W	Set the value H'0C to this bit. Other setting value is used for purpose of h/w debugging. Do not set other value.

**27.3.11.9 DLI Isolated Pixel Parameter Register 0 (FD1\_IPC\_DLI\_ISOPIX0)**

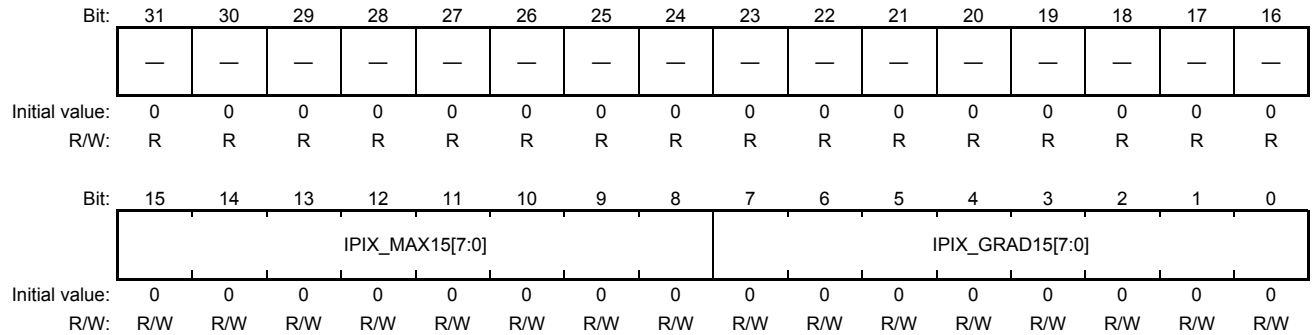

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	IPIX_MAX45 [7:0]	H'00	R/W	Set the value H'FF to this bit. Other setting value is used for purpose of h/w debugging. Do not set other value.
23 to 16	IPIX_GRAD45 [7:0]	H'00	R/W	Set the value H'10 to this bit. Other setting value is used for purpose of h/w debugging. Do not set other value.
15 to 8	IPIX_MAX22 [7:0]	H'00	R/W	Set the value H'FF to this bit. Other setting value is used for purpose of h/w debugging. Do not set other value.
7 to 0	IPIX_GRAD22 [7:0]	H'00	R/W	Set the value H'10 to this bit. Other setting value is used for purpose of h/w debugging. Do not set other value.

**27.3.11.10 DLI Isolated Pixel Parameter Register 1 (FD1\_IPC\_DLI\_ISOPIX1)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 8	IPIX_MAX15 [7:0]	H'00	R/W	Set the value H'FF to this bit. Other setting value is used for purpose of h/w debugging. Do not set other value.
7 to 0	IPIX_GRAD15 [7:0]	H'00	R/W	Set the value H'10 to this bit. Other setting value is used for purpose of h/w debugging. Do not set other value.

**27.3.11.11 IPC Sensor Threshold Register 0 (FD1\_IPC\_SENSOR\_TH0)**

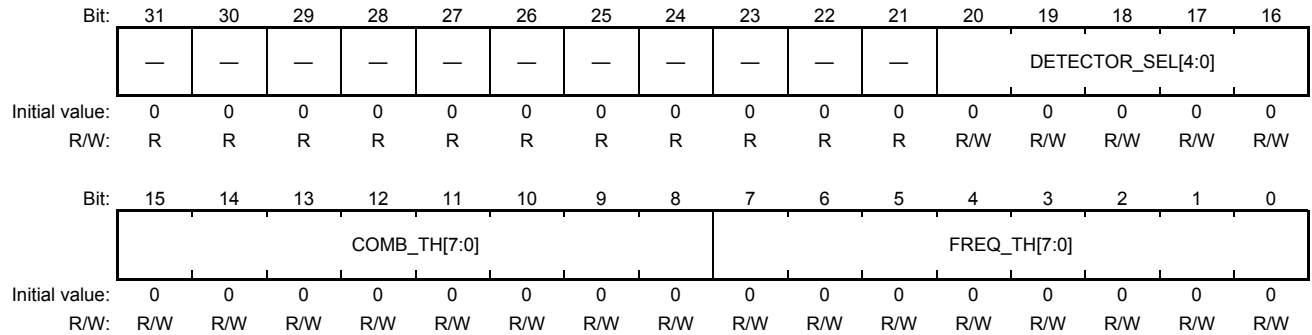

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	VFQ_TH[7:0]	H'00	R/W	Set the value H'20 to this bit. Other setting value is used for purpose of h/w debugging. Do not set other value.
23 to 16	HFQ_TH[7:0]	H'00	R/W	Set the value H'20 to this bit. Other setting value is used for purpose of h/w debugging. Do not set other value.
15 to 8	DIF_TH[7:0]	H'00	R/W	Set the value H'80 to this bit. Other setting value is used for purpose of h/w debugging. Do not set other value.
7 to 0	SAD_TH[7:0]	H'00	R/W	Set the value H'80 to this bit. Other setting value is used for purpose of h/w debugging. Do not set other value.

**27.3.11.12 IPC Sensor Threshold Register 1 (FD1\_IPC\_SENSOR\_TH1)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20 to 16	DETECTOR_SEL[4:0]	All 0	R/W	Set the value H'00 to this bit. Other setting value is used for purpose of h/w debugging. Do not set other value.
15 to 8	COMB_TH [7:0]	H'00	R/W	Set the value H'00 to this bit. Other setting value is used for purpose of h/w debugging. Do not set other value.
7 to 0	FREQ_TH [7:0]	H'00	R/W	Set the value H'00 to this bit. Other setting value is used for purpose of h/w debugging. Do not set other value.

<b>RZ/G1M</b>	<b>RZ/G1E</b>

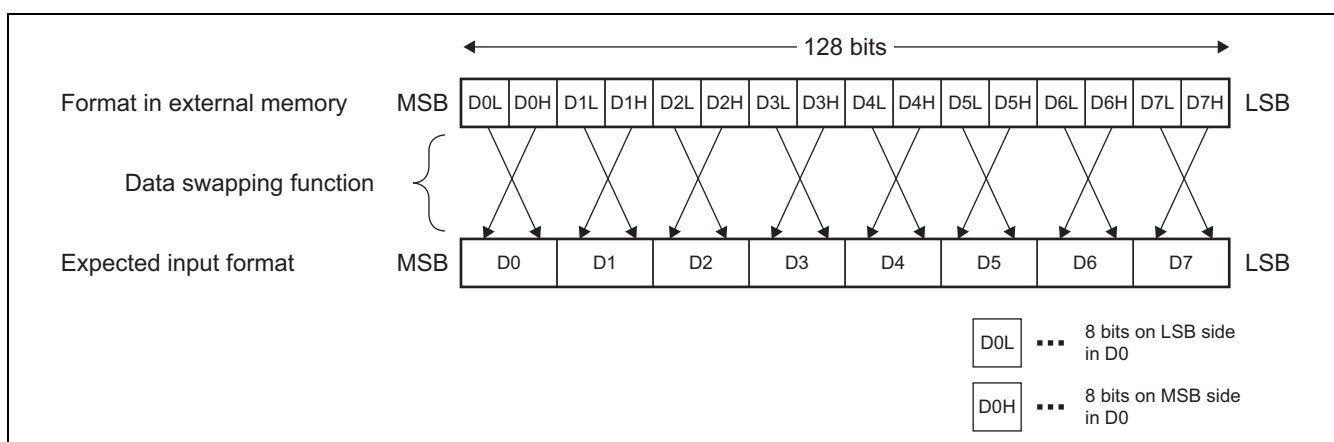

### 27.4 Input/Output Data Format

The FDP1 input/output data should be stored in a format where the address is incremented in the direction from the MSB to the LSB as in big endian. For example, the FDP1 reads and writes data to and from the external memory through the dedicated bus interface with a 128-bit width, and the data that should come first should be stored in the MSB side regardless of the unit data size as shown in Figure 27.10.

**Figure 27.10 FDP1 Input/Output Data Format**

However, data may be arranged in a way unexpected by the FDP1 depending on the address handling method (such as little endian) of the FDP1 access destination in some cases as in the external memory format shown in Figure 27.10. In such a case, use the data swapping function (refer to sections 27.3.9.6 and 27.3.10.5) in the FDP1 to convert the data format to be suitable for the FDP1.

**Figure 27.11 Input Data Alignment by Data Swapping Function**

## 27.5 Lookup Table (LUT) Setting

RZ/G1H	RZ/G1N
RZ/G1M	RZ/G1E

FDP1 has the lookup tables (LUT) shown in Table 27.12 to change the characteristic of the de-interlacing function. The LUT is an 8-bit entry and 8-bit output table. Note that users can access to LUT only by 32 bits access. Do not access other bit length such as 8 bits access or 16 bits access. LUT behaves like immediate registers described in section 27.3.2, so do not change the value in LUT while FDP1 is under processing.

**Table 27.12 List of LUT**

LUT Name
DIF_ADJ
SAD_ADJ
BLD_GAIN
DIF_GAIN
MDET

The LUT is used for making the non-linear characteristic shown in Figure 27.12 where X and Y are input and output of LUT respectively.

**Figure 27.12. LUT for Changing the De-Interlacing Characteristic**

For MDET-LUT, the 2D interpolating likelihood is the input to the LUT and the blending coefficient (Alpha) is the output from the LUT. The final output image is expressed by the following equation.

$$(\text{Output image}) = (\text{Alpha}/255) \times (2\text{D interpolated image}) + ((255-\text{Alpha})/255) \times (3\text{D interpolated image})$$

When the output value of the LUT is set to 0 for all input value, the output image from FDP1 is always 3D interpolated image in spite of the motion in the video.

Table 27.13 indicates the setting of each LUT. Note that other setting is used for purpose of h/w debugging. Do not set other value to LUT except for MDET.

Table 27.13 Meaning of X/Y Axis of LUT

## 28. VSP1

RZ/G1H

RZ/G1N

RZ/G1M

RZ/G1E

This section describes the configurations of VSP1 on this LSI. Descriptions in this section show the full-function specifications of the VSP1 IP. Some of the functions described in this section are not available on VSP1 with restrictions written here.

### Configurations of VSP1

This LSI incorporates three different types of VSP1 modules (VSPR, VSPS, VSPD) as image processing systems.

**VSPR:** VSPR stands for VSP for “Resizing”. [RZ/G1H only]

**VSPS:** VSPS stands for VSP Standard which supports various functions of the VSP1 IP.

**VSPD:** VSPD stands for VSP for the display unit (DU) which outputs the display data to DU directly. Two channels are supported for RZ/G1H/M/N. Single channel is supported for RZ/G1E.

Tables 28.1 to 28.3 show the restrictions of each type of VSP1 unit on this LSI.

All the registers and functions listed in Tables 28.1 to 28.3 should be treated as un-implemented functions in each VSP1 unit. Do not set any registers related to the restricted function without any statement.

**Table 28.1 VSPS Configuration [RZ/G1H/M/N/E]**

Category	Restriction Target	Restriction Description
Module	LIF	[RZ/G1H only]
	UDS1-2 [RZ/G1M/N/E]	LIF is not implemented on VSPS. Functions and registers cannot be used. In addition, a setting of DPR routing with LIF is prohibited. [RZ/G1M/N/E] These modules listed at left column are not implemented on VSPS. Functions and registers cannot be used. In addition, a setting of DPR routing with these modules is prohibited.
Function	RPF/CLUT	CLUT is only available on RPF ch1 and ch2 (not available on ch0, ch3, and ch4). Related register: VI6_RPFn_INFMT.RDFMT, VI6_CLUT0_TBL*, VI6_CLUT3_TBL*, VI6_CLUT4_TBL*

**Table 28.2 VSPR Configuration [RZ/G1H Only]**

Category	Restriction Target	Restriction Description
Module	CLU	These modules listed at left column are not implemented on VSPR. Functions and registers cannot be used. In addition, a setting of DPR routing with these modules is prohibited.
	LUT	
	UDS1-2	
	HGO	
	HGT	
	LIF	
Function	RPF/CLUT	CLUT is only available on RPF ch2 (not available on ch0, ch1, ch3, and ch4). Related register: VI6_RPFn_INFMT.RDFMT, VI6_CLUT0_TBL*, VI6_CLUT1_TBL*, VI6_CLUT3_TBL*, VI6_CLUT4_TBL*

**Table 28.3 VSPD Configuration [RZ/G1H/M/N/E]**

Category	Restriction Target	Restriction Description
Module	RPF4	These modules listed at left column are not implemented on VSPD. Functions and registers cannot be used. In addition, a setting of DPR routing with these modules is prohibited.
	CLU	
	UDS1-2	
	SRU	
	WPF1-3	
	HGT	
Function	RPF/CLUT	CLUT is only available on RPF ch2 (not available on ch0, ch1, and ch3). Related register: VI6_RPFn_INFMT.RDFMT, VI6_CLUT0_TBL*, VI6_CLUT1_TBL*, VI6_CLUT3_TBL*
	WPF/Vertical Flipping	Vertical flipping function is not implemented. Related register: VI6_WPF0_OUTFMT.FLP

## Preface

### Terminology

The terminology for VSP1. Refer to section 28.1, Overview for detail.

#### Read Pixel Formatter (RPF)

The RPF can read image data from external memory such as SDRAM. The RPF supplies image data to the internal sub modules in VSP1. At the same time, RPF can execute format conversion, color space conversion and color keying for each input image source. There are five RPFs in VSP1, and each RPF is called as RPF0, RPF1 and so on.

#### Virtual RPF

There is an image compositing sub module named as BRU which can execute image blending or raster operation. The BRU has 4 input ports for compositing multiple images. There must be a RPF module as the start of data processing. Each RPF can be a source of data input to BRU. In addition to these RPF modules, the BRU has a function which generates monochrome color image internally. This functionality is useful because the data access to an external memory is not required. This function is called as virtual RPF.

Refer to sections 28.2.8.1, 28.2.16.2, 28.2.16.3 and 28.2.16.4 for virtual RPF.

#### Write Pixel Formatter (WPF)

The WPF can input image data from internal image processing and output to the external memory such as SDRAM. At the same time, the WPF can execute color space conversion and format conversion. There are four WPFs in VSP1, and each WPF is called as WPF0, WPF1 and so on. The start of VSP1 equals to the start of each WPF by setting registers shown in section 28.2.5.1.

#### Target WPF

The VSP1 has five RPFs (RPF 0 to 4) and four WPFs (WPF0 to 3) and execute image processing. One data path consists of more than one RPF, one WPF and other image functional modules if necessary. The WPF which is reached from specific RPF(s) in the data path is called as target WPF for the RPF(s). The number of target WPFs is always one for the data path.

#### Source RPF

The data source in the data path for the specific WPF is called as source RPF for that WPF. The number of source RPFs is not always one, may be more than one for image blend operation or raster operation.

#### Layer

In case of image composite operation such as image blending or raster operation for multiple images, there is hierarchical relationship for each image. One layer is assigned to one RPF or one virtual RPF indicating one image in hierarchical relationship.

#### Master Layer

The master layer is a base layer for image compositing of multiple images, and the size of the master layer equals to that of BRU output. When the image compositing is not applied, there is one layer. This layer is also called as the master layer.

#### Sub Layer

The Layers except the master layer are called as sub layer.

### Alpha

The VSP1 can execute both color data and its transparent data. The alpha is 8-bit data and expresses the transparency of pixel. The value H'FF represents opaque pixel, and the value H'00 represents transparent pixel.

### Plane

One layer consists of color components such as R/G/B or Y/Cb/Cr, and alpha data representing its transparency of the pixel. The frame which is one of color components and alpha data is called as a plane.

### Picture Plane

The picture plane represents color data in one layer.

### Alpha Plane

The alpha plane represents transparent data in one layer.

### Blending

The image blending means the image composite operation with alpha data. The composite ratio of image blending depends on the relationship of each layer and alpha values.

### Raster Operation (ROP)

The bitwise operation such as AND or OR is called as raster operation (ROP).

### Color Space Conversion (CSC)

The CSC means the conversion of YCbCr, RGB and HSV color spaces.

### **Definition of operators and functions**

The following operators, notations are defined for explaining the functions of VSP1.

$\langle x \rangle$

Discard decimal places of value x

H'

The notation “H” is used as prefix for hexadecimal numbers. For example, H'80 means 80 in hexadecimal and 128 in decimal.

B'

The notation “B” is used as prefix for binary numbers. For example, B'10000000 means 80 in hexadecimal and 128 in decimal. When a number is used without prefix, it means decimal number.

—

The notation “\_” is used as a separator of binary digit for binary number. There is no functional and logical meaning. The meaning of B'10101 and B'1\_0101 is the same.

[msb:lsb]

This notation specifies a part of bits or all bits of registers and signals. For example, eval[3:0] means bit 3 to 0 of the signal or register which name is “eval” .

clip0 (x)

Clip to 0 value if x is less than 0. [  $x = (x < 0)? 0 : x$  ]

clip3 (min, max, x)

The value x shall be clipped so that x shall be  $min < x < max$ .

[  $x = (x < min)? min : ((x > max)? max : x)$  ]

### **Unit**

The unit is defined here for explaining VSP1’s functions.

[bpp] : bits per pixel

VSP1 can handle a number of image formats. Each image format has different number of data bits. The unit [bpp] shows a number of data bits for one pixel. For example, RGB 8 bpp means that its format is RGB and the pixel consists of 8 data bits.

## 28.1 Overview

RZ/G1H

RZ/G1N

RZ/G1M

RZ/G1E

The VSP1 is the successor IP of Renesas' VIO6-IP series which supports image processing such as image enhancing, up/down scaling, color management function with lookup tables, image blending.

### 28.1.1 Features

1. Supports Various Data Formats and Conversion
  - Supports YCbCr444/422/420, RGB,  $\alpha$ RGB,  $\alpha$  plane
  - Color space conversion and changes to the number of colors by dithering
  - Color keying
  - Vertical flipping
2. Full HD Video Processing
  - Up and down scaling with arbitrary scaling ratio
  - Super resolution processing
  - Blending of four picture layers and raster operations (ROPs)
3. Full HD Picture Quality/Color Correction
  - $\gamma$  correction and gain correction
  - Correction of color (to adjust skin tones or colors in memory)
  - Hue, brightness, and saturation adjustment
  - 1D and 2D histogram
4. Direct Connection to Display Module
  - Display Unit (DU) supported

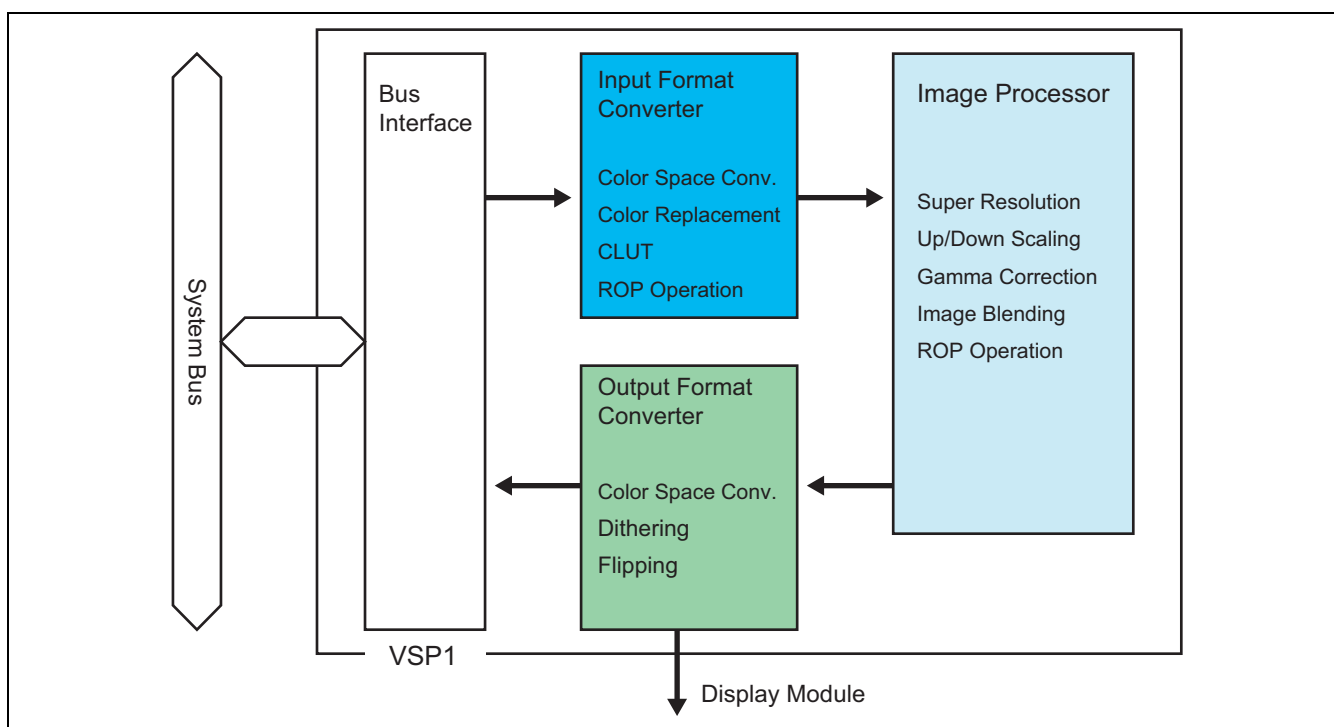

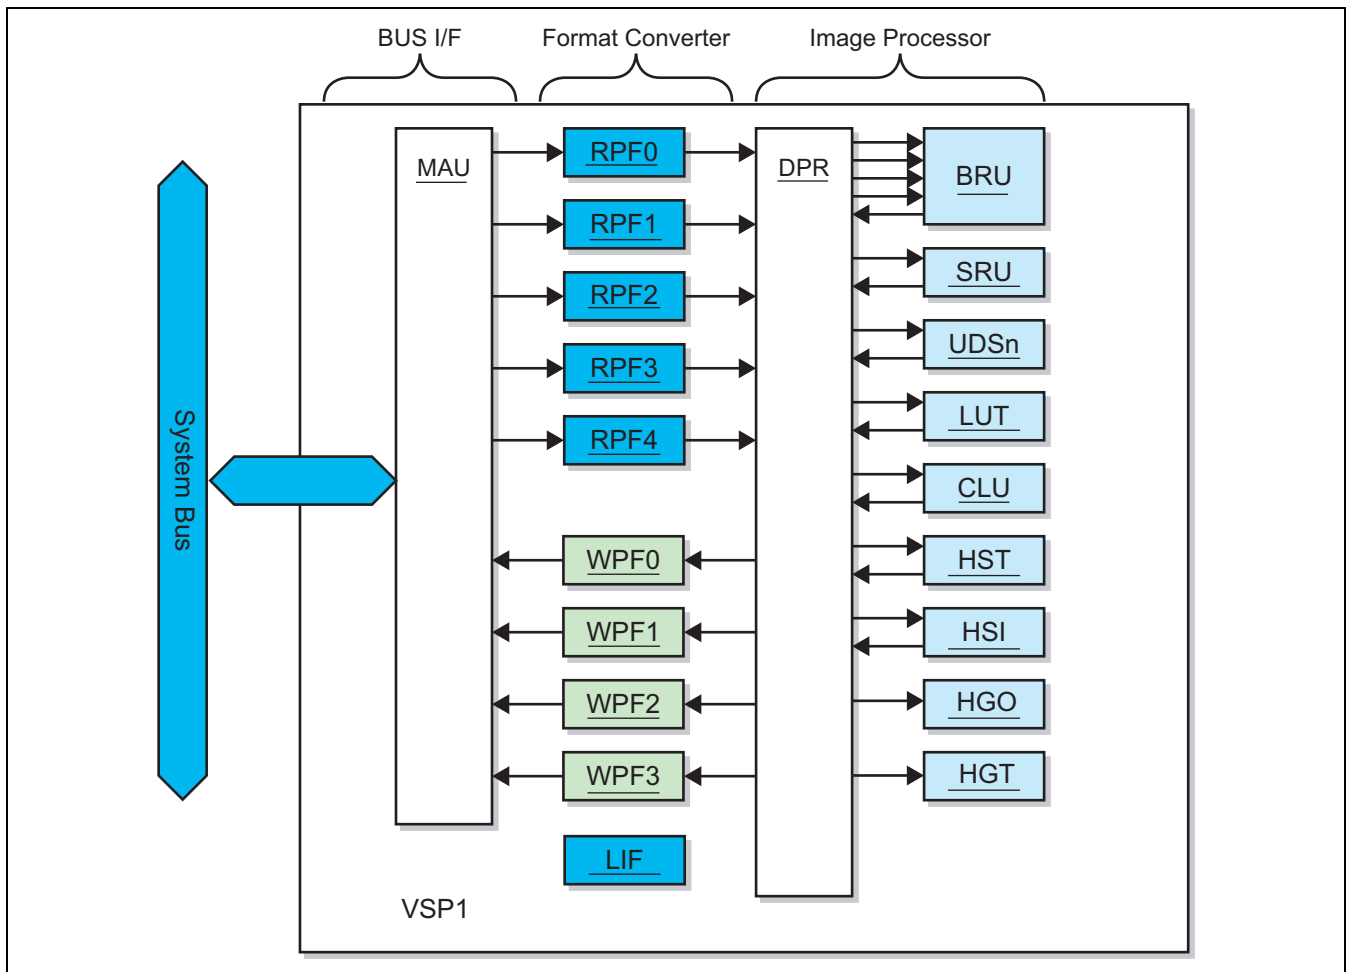

Figure 28.1 Top Level Architecture of VSP1

### 28.1.2 VSP1 Architecture

Figure 28.2 shows the configuration of VSP1 sub modules.

**Figure 28.2 VSP1 Module Configuration**

The following gives an overview of each block function shown in Figure 28.2. The operation of these functions is determined by the register setting explained in section 28.2. Refer to section 28.2 for the relationship between the register setting and the functional behavior.

**(1) Memory Access Unit (MAU)**

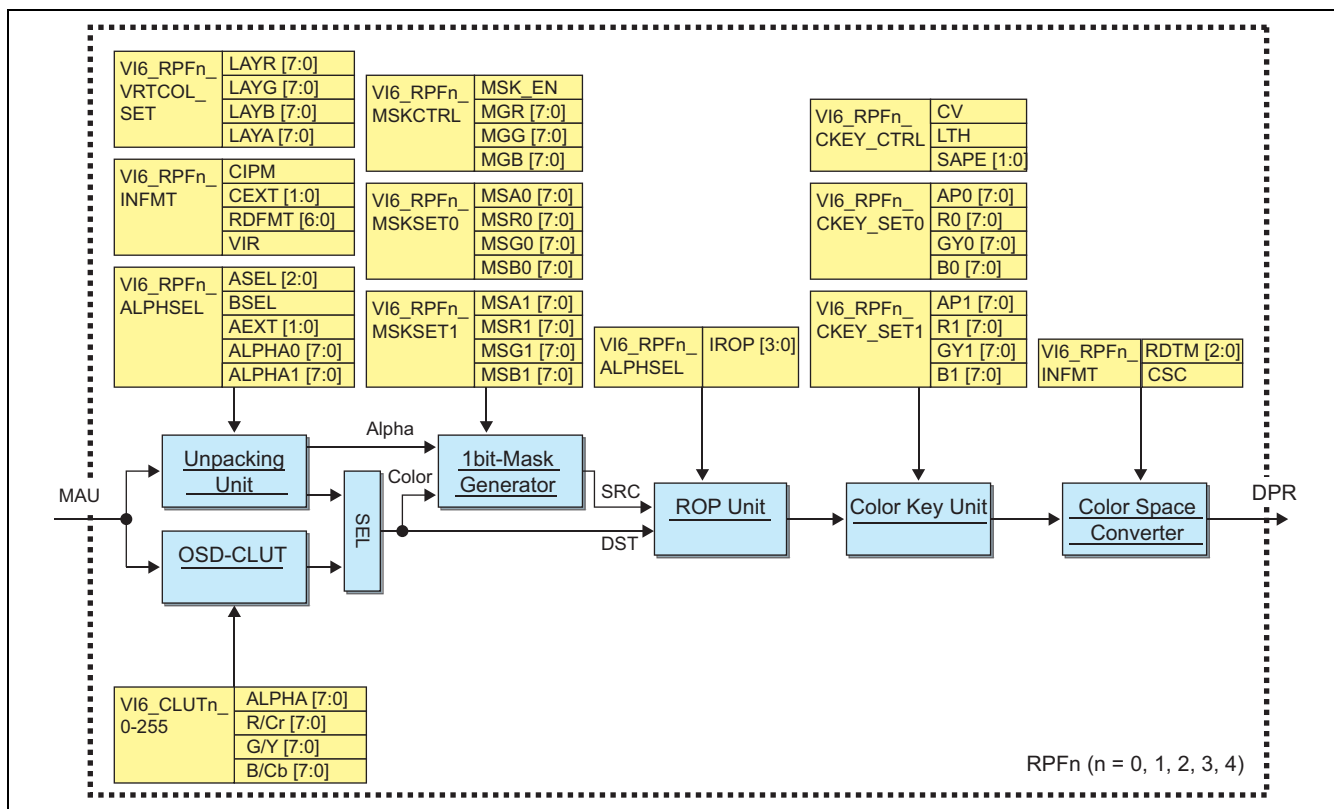

The VSP1 applies processing to the image data stored in the external memory and writes the resultant data back to the external memory. The data transfer between the external memory and VSP1 necessary for this operation is done by the MAU, which works as the bus master, according to the register settings. The MAU executes this data transfer between the external memory and VSP1.

**(2) Command Transfer Unit (CTU)**

The VSP1 can directly read register parameters for image processing by display lists stored in external memory. The CTU module is a bus interface and controls display lists when the CTU reads display lists as a bus master.

**(3) Read Pixel Formatter (RPF)**

The RPF reads image data from the external memory through the MAU, unpacks data according to the specified format, converts the color space, converts the number of colors, executes color keying, ROP operation, and OSD processing, and outputs the resultant data to the DPR. The RPF has an input format unpacking unit, an index color expanding unit (OSD-CLUT), a 1-bit mask generator, a raster operation unit (ROP unit), a color keying unit, and a color space converter. Figure 28.3 shows the processing flow in the RPF.

**Figure 28.3 RPF Processing Flow**

The input format unpacking unit and index color expanding unit (OSD-CLUT) expand the image data input from the MAU into the image format for internal processing, and the 1-bit mask generator generates a 1-bit image mask from the image data expanded through the unpacking unit and OSD-CLUT. Alternately, a 1-bit image mask can be generated from the alpha plane that is different from the picture plane read through the MAU.

The raster operation unit (ROP unit) executes raster operation between the data from the 1-bit mask generator and the image data expanded from the input format, and the color keying unit applies color replacement and specifies the transparent color for the image data input from the ROP unit. The color space converter converts the color space (RGB-YCbCr) of the image data input from the color keying unit as necessary.

The VSP1 provides maximum five RPF modules (RPF0 to RPF4). The implementation of OSD-CLUT depends on the configuration of each LSI.

#### **(4) Data Path Router (DPR)**

The DPR controls the data paths among RPFs, function modules, and WPFs. The DPR selects one of the images input from RPFs, outputs it to a function module (BRU, SRU, UDS<sub>n</sub> (n = 0 to 2), MED, LUT, CLU, HST, HSI, HGO, HGT or ILV), and selects one of WPFs as the destination where the image data processed in the function module will be output. Before output to the WPF, the output from each function module can be input to another function module, which enables multiple image processing functions to be executed continuously without involving the external memory.

#### **(5) Super Resolution Unit (SRU)**

The SRU is a module connected to the DPR, which executes the super resolution processing.

#### **(6) Up/Down Scaler (UDS)**

The UDS is a module connected to the DPR, which upscales or downscales the image size. It can also upscale or downscale the alpha value.

#### **(7) LUT (LookUp Table)**

This is a 1D-LUT that converts each of three color components by using a lookup table. The LUT is connected to the DPR and can be used for gamma correction, negative-positive conversion, posterization, and binarization through desired tone curve settings.

### (8) Blend ROP Unit (BRU)

The BRU is a module connected to the DPR, which executes the image blending processing and ROP operation. The BRU has four blend/ROP operation units (blend/ROP unit m, m = A to D), an ROP operation unit, a blend/ROP input switch (SEL) for selecting the input to these operation units, and a divider for normalization (div unit).

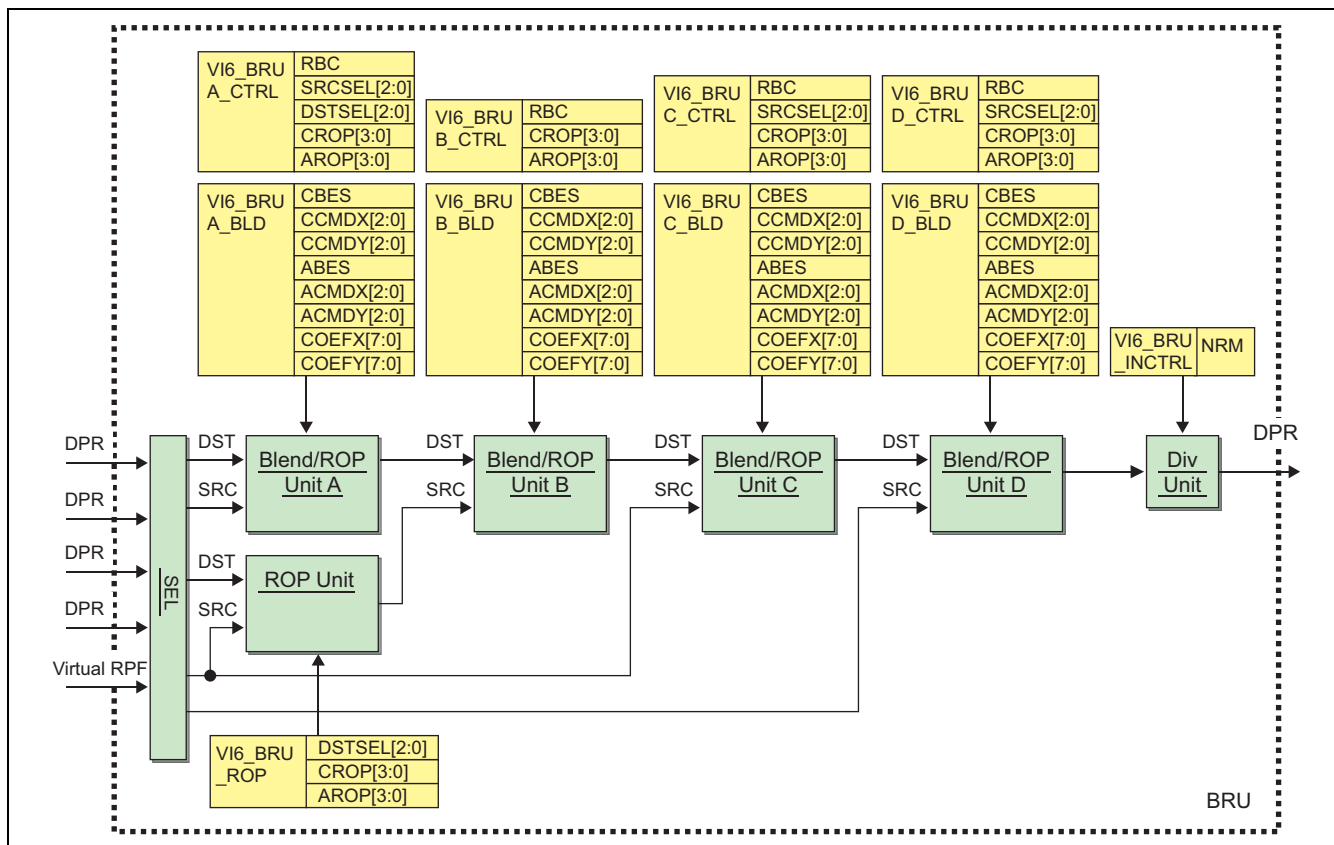

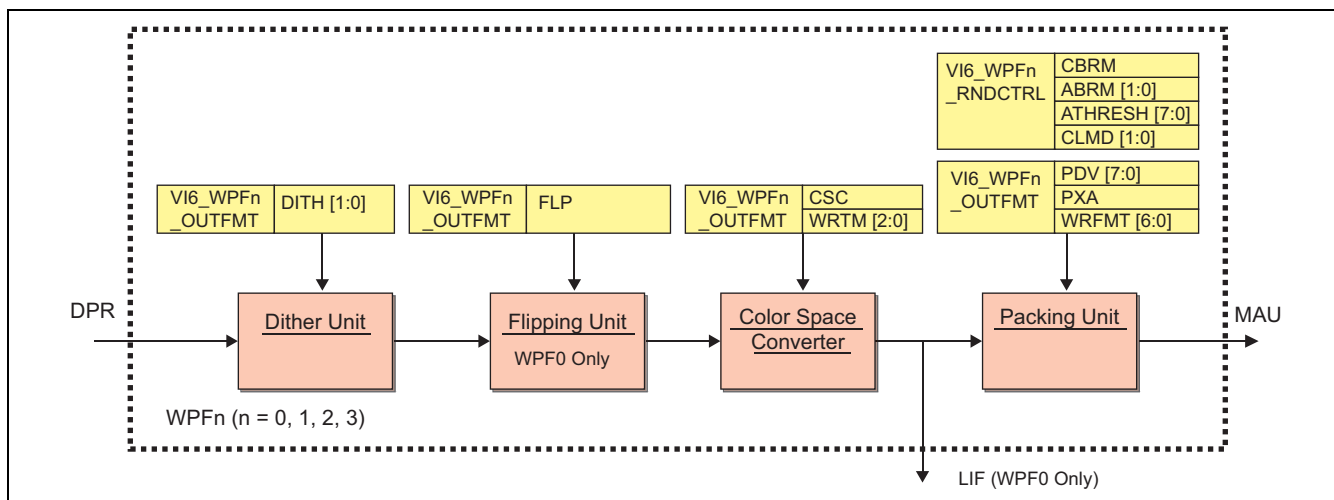

Figure 28.4 BRU Processing Flow

Each of the four blend-ROP operation units (blend/ROP unit m) receives the output from the SEL, blend/ROP Unit m, or ROP unit, and executes blending or raster operation (ROP) of images. The ROP unit receives the output from the SEL and executes 2-input raster operation (ROP2). By combining the ROP operation in the blend/ROP unit m and ROP2 operation in the ROP unit, 256-type 3-input raster operation (ROP3) can be implemented.

The divider for normalization (div unit) divides the pixel value by the  $\alpha$  value.

### (9) Write Pixel Formatter (WPF)

The WPF is an output module that receives image data from the DPR, converts the color space, number of colors, and format of the data, and outputs the results of VSP1 image processing to external memory through the MAU. The WPF is mainly configured from a color space converter and an output format converter (the packing unit).

**Figure 28.5 WPF Processing Flow**

The color space converter converts the color space between RGB and YCbCr, and the packing unit converts the format into the picture plane storing format. The VSP1 provides maximum four WPFs (WPF0 to WPF3). The WPF0 has the output to LIF module after the color space conversion for transferring the video data to the display module.

#### (10) Cubic LookUp table (CLU)

This is a three-dimensional LUT (3D-LUT) that converts the input three-color-component data into desired three color components by using a lookup table. The 1D-LUT can only control each of three color components separately, but the 3D-LUT can convert a specified color into a different color. The CLU is connected to the DPR and can be used for specific color adjustment, such as correction to memorable color.

#### (11) Hue Saturation value Transform (HST)

The HST is a module connected to the DPR, which converts the RGB color space into the HSV color space. The HSV color space can represent a color with the hue, saturation, and value (brightness), and it makes color control through the LUT easier than in the RGB color space.

#### (12) Hue Saturation value Inverse transform (HSI)

The HSI is a module connected to the DPR, which converts the HSV color space into the RGB color space. It executes conversion in the direction opposite to that of the HST.

#### (13) Histogram Generator-One dimension (HGO)

The HGO is a module connected to the DPR and generates the one-dimensional histogram for the dynamic gamma correction. There is no output port of the image data. The middleware of the dynamic gamma correction will be released by Renesas.

#### (14) Histogram Generator-Two dimension (HGT)

The HGT is a module connected to the DPR and generates the two-dimensional histogram for the dynamic color correction. There is no output port of the image data. The middleware of the dynamic color correction will be released by Renesas.

#### (15) Lcdc InterFace (LIF)

The LIF module is used for transferring image data to the display module such as DU (Display Unit). The input port of the LIF module is connected to WPF0, and the output port of the LIF module is connected to DU.

### 28.1.3 Function List

Table 28.4 shows a functional overview of the VSP1 module.

**Table 28.4 Functional Overview of VSP1**

<b>Data Transfer Function</b>			
Bus interface	Data alignment	Conversion method	Byte, Word, LW, or LLW data swapping
	Data alignment	Channel	Data alignment can be specified separately for each input/output channel
	Input	Address setting	1-byte units
Image memory	Output	Address setting	1-byte units
	Output	Memory area	Images can be written to the same memory area where the master layer is stored.
	Supported by RPF0 to RPF4		Note the restrictions shown in Table 28.5.
Tile transfer mode		Interleaved, planer, or semi-planer	
<b>Read Pixel Formatter (RPF)</b>			
Number of channels		Five channels (RPF0 to RPF4)	
Image format	Input	RGB	RGB888, RGB565, RGB666, αRGB8888, αRGB4444, αRGB1555, α plane (8 bpp, 1 bpp)
		YCbCr	YCbCr4:4:4/YCbCr4:2:2/YCbCr4:2:0 α plane (8 bpp, 1 bpp)
		Maximum size	8,190 × 8,190 pixels. The internal data path modules have separate restrictions on the maximum image size. For details, refer to Table 28.6.
		Minimum size	1 × 1 pixel The internal data path modules have separate restrictions on the minimum image size. For details, refer to Table 28.6.
		Size setting unit	YCbCr420: 2-pixel units both horizontally and vertically. YCbCr422: 2-pixel units horizontally and 1-pixel units vertically. In other formats, the size can be set in 1-pixel units.
Color keying	Color replacement	Compared data	RGB888 or Y
		Replaced data	αRGB8888 or αYCbCr
		Comparison Mode	Matched color mode
		Input source	RPF0 to RPF4
	Transparent color	Compared data	RGB888 or Y
		Replaced data	α
		Comparison Mode	Matched color mode, luma threshold mode
		Input source	RPF0 to RPF4
OSD/CLUT	Format	Memory storage format	8 bpp
		Image format	αRGB32 or αYCbCr32
	Input channel	RPF0 to RPF4	

**Read Pixel Formatter (RPF)**

Raster operation	ROP2 (within input channels)	Operator	16 types (OpenGL2.0 is supported)
		Sources of operation	ROP2 operation between the 1-bpp $\alpha$ plane and RGB/YCbCr data in RPF0 to RPF4. Note that 1-bpp $\alpha$ is converted to $\alpha$ RGB888 or $\alpha$ YCbCr4:4:4.
Color space conversion	RGB to YCbCr	Conversion expression	RGB (0, 255) to BT601 (16, 235/240) RGB (0, 255) to BT709 (16, 235/240) RGB (0, 255) to BT601 (0, 255) RGB (16, 235) to BT709 (16, 235/240)
		Target of conversion	RPF0 to RPF4
	YCbCr to RGB	Conversion expression	BT.601 (16, 235/240) to RGB (0, 255) BT.709 (16, 235/240) to RGB (0, 255) BT.601 (0, 255) to RGB (0, 255) BT.709 (16, 235/240) to RGB (16, 235)
		Target of conversion	RPF0 to RPF4
Changing number of colors	Reducing RGB color depth	Target format	RGB666, RGB565, RGB555, RGB444, or RGB332
		Target of conversion	RPF0 to RPF4
	Increasing RGB color depth		Padded with 0. Copied from the most significant bits.
	YCbCr444 generation		CbCr copying or CbCr vertical copying and horizontal interpolation.
Virtual display	RPF0 to RPF4	Color format	$\alpha$ RGB8888 or $\alpha$ YCbCr4:4:4 single-color
		Display size	Same as the size of the input channel
	Virtual RPF	Color format	$\alpha$ RGB8888 or $\alpha$ YCbCr4:4:4 single-color
		Display size	Maximum: 8,190 × 8,190 pixels Minimum: 4 × 4 pixels
$\alpha$ bit count conversion	Input	Bit increase	Padded with 0. Copied from the most significant bits.

**Write Pixel Formatter (WPF)**

Number of channels			Four channels (WPF0 to WPF3)
Image format	Output	RGB	RGB332, RGB444, RGB565, RGB666, RGB888, αRGB8666, αRGB8888, αRGB4444, αRGB1555
		YCbCr	YCbCr4:4:4, YCbCr4:2:2, YCbCr4:2:0
		Maximum size	2,048 × 2,048 The internal data path modules have separate restrictions on the maximum image size. For details, refer to Table 28.6.
		Minimum size	1 × 1 pixel The internal data path modules have separate restrictions on the minimum image size. For details, refer to Table 28.6.
		Size setting unit	YCbCr420: 2-pixel units both horizontally and vertically. YCbCr422: 2-pixel units horizontally and 1-pixel units vertically. In other formats, the size can be set in 1-pixel units.
Color space conversion	RGB to YCbCr	Conversion expression	RGB (0, 255) to BT.601 (16, 235/240) RGB (0, 255) to BT.709 (16, 235/240) RGB (0, 255) to BT.601 (0, 255) RGB (16, 235) to BT.709 (16, 235/240)
		Target of conversion	WPF0 to WPF3
	YCbCr to RGB	Conversion expression	BT.601 (16, 235/240) to RGB (0, 255) BT.709 (16, 235/240) to RGB (0, 255) BT.601 (0, 255) to RGB (0, 255) BT.709 (16, 235/240) to RGB (16, 235)
		Target of conversion	WPF0 to WPF3
Changing number of colors	Output	Reducing RGB color depth	Dithering, lower-order bit truncation, or rounding
		YCbCr422/420	CbCr skipping or CbCr vertical skipping and horizontal skipping
α bit count conversion	Output	Bit reduction	Truncation, rounding, or comparison with threshold (for 1 bpp)

**Image Compositing**

α blending	Input α value selection	RGB	Pixel α, fixed α value, α plane, or 1-bit α converted from the color specified for pixels
		YCbCr	α plane, fixed α value, or 1-bit α converted from the color specified for pixels
	α blending expression	Plane A: Upper plane Plane B: Lower plane	$x_A + y_B$ , $x_A - y_B$ Coefficients x and y should be selected from the following. Fixed α value, (α for plane A), (1 - α for plane A), (α for plane B), (1 - α for plane B)
α blending	Output α value selection	RGB	Fixed α value, $x \cdot (\alpha \text{ for plane A}) + y \cdot (\alpha \text{ for plane B})$ , $x \cdot (\alpha \text{ for plane A}) - y \cdot (\alpha \text{ for plane B})$ Coefficients x and y should be selected from the following. Fixed α value, (α for plane A), (1 - α for plane A), (α for plane B), (1 - α for plane B)
		Blending planes	Number of planes
		Order of planes	The order of five planes selected from RPF0 to RPF4, virtual RPF, and video processing function output can be changed as desired.
	α plane	Format	8 bpp or 1 bpp (α value can be specified through register)
		Input source	RPF0 to RPF4
	Fixed α value	Format	8 bpp
Input source		RPF0 to RPF4, virtual RPF, or video processing function output	
Raster operation	ROP2 (between input channels)	Operator	16 types (OpenGL2.0 is supported)
		Sources of operation	RPF0 to RPF4, virtual RPF, and video processing function output
		Operation control	RGB/YCbCr and α are operated separately.
	ROP3 (between input channels)	Operator	256-type ROP3 is available by combining ROP2 operations
		Sources of operation	RPF0 to RPF4, virtual RPF, and video processing function output
		Operation control	RGB/YCbCr and α are operated separately.

**Video Processing Functions**

Super resolution	Processing method		Processing within one frame
	Scaling ratio		$\times 1$ (same size) or $\times 2$
	Arbitrary scaling ratio		Super resolution processing can be combined with the arbitrary ratio scaling function.
	$\alpha$ processing		Fixed $\alpha$ output
Scaler with arbitrary scaling ratio	Scaling factor		1/16 to 16
	Scaling ratio setting	Expression	1/[Mant.Frac]
		Precision	Mant = 4 bits, Frac = 12 bits
	$\alpha$ processing		Supported (for scale-up or scale-down to 1/4 to 1/1)
Simultaneous processing	All video processing functions and color adjustment functions can be processed simultaneously (the order of function execution is limited).		

**Color Adjustment Function**

1D-LUT	LUT configuration	Independent R/Y, G/Cb, and B/Cr. 256 entries each
3D-LUT	Number of grid points	$17 \times 17 \times 17$
HSV color space conversion	RGB to HSV	Eight bits each for H/S/V
	HSV to RGB	Eight bits each for H/S/V
1D Histogram	Letter box detection	Supported
	Number of bins	64 for each color component
2D Histogram	Letter box detection	Supported
	Number of hue areas	6
	Number of bins	32 for each hue area

When the data output from the VSP1 is written back to the same memory area where the input data for the VSP1 has been read, the VSP1 has the following restrictions.

1. The access order and format on the frame memory are the same between the input pixels and output pixels.
2. Specifying a larger output image size than the input image size, either vertically or horizontally or both vertically and horizontally, is prohibited.
3. When the YCbCr4:2:0 format is input, operation between color components is prohibited.

These restrictions are summarized in Table 28.5. Refer to the descriptions of the registers related to each restriction. In the table, RPF<sub>m</sub> indicates the RPF<sub>n</sub> that inputs the master layer, and WPF<sub>wb</sub> indicates the WPF<sub>n</sub> that writes back the output image to the source image area for the master layer.

**Table 28.5 Restrictions on Use when Output Data is Written Back to Input Data Area**

No.	Restriction	Related Registers
Restriction 1	The RPF <sub>m</sub> input format and the WPF <sub>wb</sub> output format should be the same.	VI6_RPFn_INFMT.RDFMT VI6_RPFn_INFMT.VIR
	The RPF <sub>m</sub> source image storing address and the WPF <sub>wb</sub> destination address should be the same.	VI6_RPFn_SRCM_ADDR_*
	The RPF <sub>m</sub> source picture memory stride and the WPF <sub>wb</sub> destination memory stride should be the same.	VI6_RPFn_SRCM_PSTRIDE VI6_RPFn_SRCM_ASTRIDE
	The RPF <sub>m</sub> and WPF <sub>wb</sub> data swapping settings should be the same.	VI6_WPFn_DSWAP
	The image vertical flipping function cannot be used if WPF <sub>wb</sub> is WPF0.	VI6_WPFn_OUTFMT.FLP
Restriction 2	Super resolution processing with double scale-up by the SRU is prohibited (super resolution processing of the same size is allowed).	VI6_SRU_CTRL0
	Scale-up and color filling by UDSn is prohibited.	VI6_UDSn_SCALE VI6_UDSn_CLIP_SIZE
	The value of scaling filter horizontal and vertical phase registers should be zero in case of using UDSn.	VI6_UDSn_IPC
	The RPF <sub>m</sub> basic read size and extended read size should be the same.	VI6_RPFn_SRC_BSIZE VI6_RPFn_SRC_ESIZE
Restriction 3*	Color space conversion is prohibited in RPF <sub>m</sub> and WPF <sub>wb</sub> .	VI6_RPFn_INFMT.CSC VI6_WPFn_OUTFMT.CSC
	Use of the CLU is prohibited. Make sure that the CLU is not used in DPR routing.	VI6_DPR_CLU_ROUTE.RT
	NOP should be specified for IROP operation.	VI6_RPFn_ALPH_SEL.IROP
	Color keying is prohibited.	VI6_RPFn_CKEY_CTRL.CV

Note: \* When the input format is not YCbCr4:2:0, restriction 3 in not applied.

### 28.1.4 VSP1 Input Size

Table 28.6 is a list of input size specifications.

**Table 28.6 List of Input Size Specifications**

Module	Min. Input Size	Max. Input Size	Restrictions on Setting Unit
RPF	1 (horizontal) × 1 (vertical) pixel	8,190 (horizontal) × 8,190 (vertical) pixels	<p>YCbCr422: 2-pixel units horizontally and 1-pixel units vertically.</p> <p>YCbCr420: 2-pixel units both horizontally and vertically.</p> <p>Other formats: 1-pixel units both horizontally and vertically.</p> <p>Notes: 1. When the 1-bpp alpha plane*1 is input, the size can always be specified in 8-pixel units both horizontally and vertically regardless of the input format.</p> <p>2. These restrictions including note 1 are applied to the following.</p> <p>VI6_RPFn_SRC_BSIZE</p> <p>VI6_RPFn_SRC_ESIZE</p>
SRU	4 (horizontal) × 4 (vertical) pixels	<p>Without scaling (same size):</p> <p>2,048 (horizontal) × 8,190 (vertical) pixels</p> <p>With double scale-up :</p> <p>1,024 (horizontal) × 4,095 (vertical) pixels</p>	1-pixel units both horizontally and vertically.
UDSn (n = 0, 1, 2)	4 (horizontal) × 4 (vertical) pixels	8,190 (horizontal)*2 × 8,190 (vertical) pixels	1-pixel units both horizontally and vertically.
LUT	1 (horizontal) × 1 (vertical) pixel	8,190 (horizontal) × 8,190 (vertical) pixels	1-pixel units both horizontally and vertically.
CLU	1 (horizontal) × 1 (vertical) pixel	8,190 (horizontal) × 8,190 (vertical) pixels	1-pixel units both horizontally and vertically.
HST	1 (horizontal) × 1 (vertical) pixel	8,190 (horizontal) × 8,190 (vertical) pixels	1-pixel units both horizontally and vertically.
HSI	1 (horizontal) × 1 (vertical) pixel	8,190 (horizontal) × 8,190 (vertical) pixels	1-pixel units both horizontally and vertically.
BRU	1 (horizontal) × 1 (vertical) pixel	8,190 (horizontal) × 8,190 (vertical) pixels	1-pixel units both horizontally and vertically.
HGO	1 (horizontal) × 1 (vertical) pixel	8,190 (horizontal) × 8,190 (vertical) pixels	1-pixel units both horizontally and vertically.
HGT	1 (horizontal) × 1 (vertical) pixel	8,190 (horizontal) × 8,190 (vertical) pixels	1-pixel units both horizontally and vertically.
LIF	1 (horizontal) × 1 (vertical) pixel	8,190 (horizontal) × 8,190 (vertical) pixels	1-pixel units both horizontally and vertically.
WPF	1 (horizontal) × 1 (vertical) pixel	2,048 (horizontal) × 2,048 (vertical) pixels	<p>YCbCr422: 2-pixel units horizontally and 1-pixel units vertically.</p> <p>YCbCr420: 2-pixel units both horizontally and vertically.</p> <p>Other formats: 1-pixel units both horizontally and vertically.</p> <p>Note: This restriction on the WPF only applies to the WPF output size. The WPF input size should be specified in 1-pixel units.</p>

- Notes: 1. When VI6\_RPFn\_ALPH\_SEL.ASEL is set to B'011.  
 2. When the image size is downscaled and the horizontal UDS output size is 2,048 pixels or smaller, the UDS input size can be 2,048 pixels or larger.

The most important restriction shown in Table 28.6 is the setting unit. Make appropriate register settings so that the size of the image input to each module does comply with setting units and does not exceed the limits shown in Table 28.6. Especially for the register settings of SRU and UDSn, where the size can be changed within the modules, be careful not to exceed the input size limit for the module connected behind each of them.

### 28.1.5 VSP1 Output Size

The size of the output from each WPF is determined by the results of processing in the modules connected with the DPR. As shown in Figure 28.2, the data input to the VSP1 is sent to the WPF output modules through the RPF and the modules connected with the DPR. When there is no processing that changes the image size through this data path, the WPF output size is the same as the RPF input size. Table 28.7 is a list of the processing that changes image size.

**Table 28.7 Image Processing that Changes Image Size**

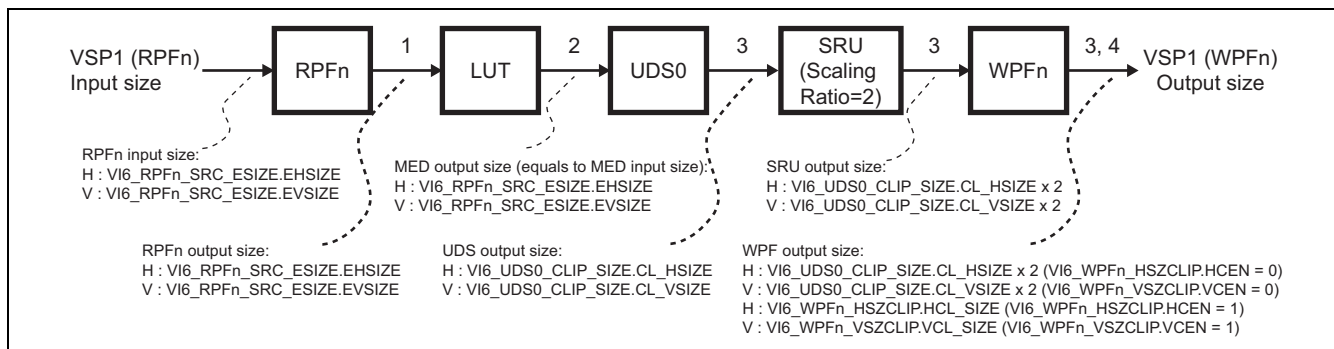

Module	Function*1	Related Register	Size of Output from Module
SRU	Super resolution with double scale-up	VI6_SRU_CTRL0	Super resolution without scaling (same size): Input size Super resolution with double scale-up: Input size × 2
UDSn	Output size clipping	VI6_UDSn_CLIP_SIZE	Horizontal output size: VI6_UDSn_CLIP_SIZE.CL_HSIZE setting Vertical output size: VI6_UDSn_CLIP_SIZE.CL_VSIZE setting
WPF	Input size clipping	VI6_WPFn_HSZCLIP VI6_WPFn_VSZCLIP	When this function is disabled, the input size and the output size are the same. When this function is enabled, the output is in the following size. Horizontal output size: VI6_WPFn_HSZCLIP.HCL_SIZE *2 setting Vertical output size: VI6_WPFn_VSZCLIP.VCL_SIZE *2 setting

- Notes: 1. For details of each function, refer to the descriptions of the related registers.  
 2. Refer to section 28.2.1, Notational Conventions for Registers and Bit Fields for explanation of register bit field.

The input image size can be changed only with the modules and functions shown in Table 28.7. With the other modules and functions, the input size and output size are the same. Accordingly, after module connections with the DPR are determined, the VSP1 output size can also be determined through the following steps.

1. The image size (VI6\_RPFn\_SRC\_ESIZE) read from the external memory and sent to the DPR by the RPFn is the initial value.
2. When the module connected with the DPR is not a module (function) shown in Table 28.7, the output size from the module is the same as the input size; the image size does not need to be updated.
3. When a module connected with the DPR is a module (function) shown in Table 28.7, the output image size should be updated to the size shown in the table, which should be used as the input image size for the module connected behind it.
4. When the final image size at the WPFn is determined, this size is the VSP1 output size for that WPFn path.

Figure 28.6 shows how to determine the image size in a sample DPR connection through the above steps. The related conditions that determine the image size are also shown.

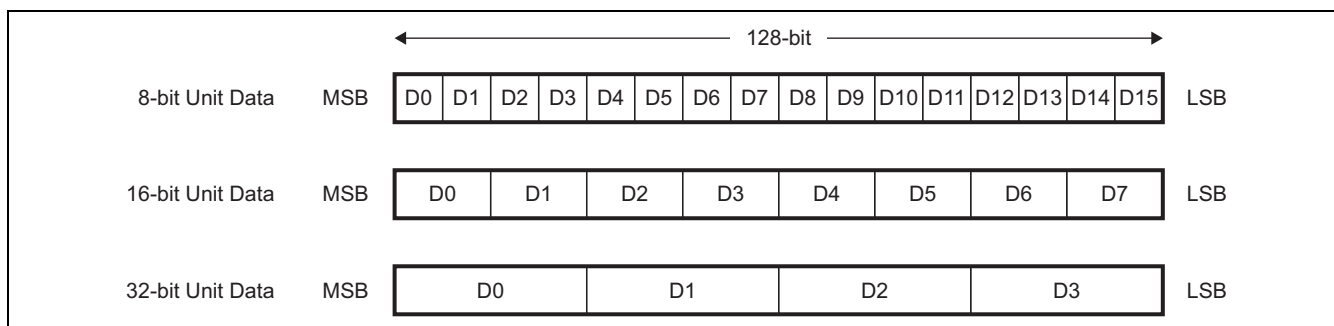

**Figure 28.6 Input/Output Size for Each Module in a Sample DPR Connection**

Make appropriate register settings in each module so that the VSP1 output image size determined as shown in the figure does not violate the restrictions shown in Table 28.7.

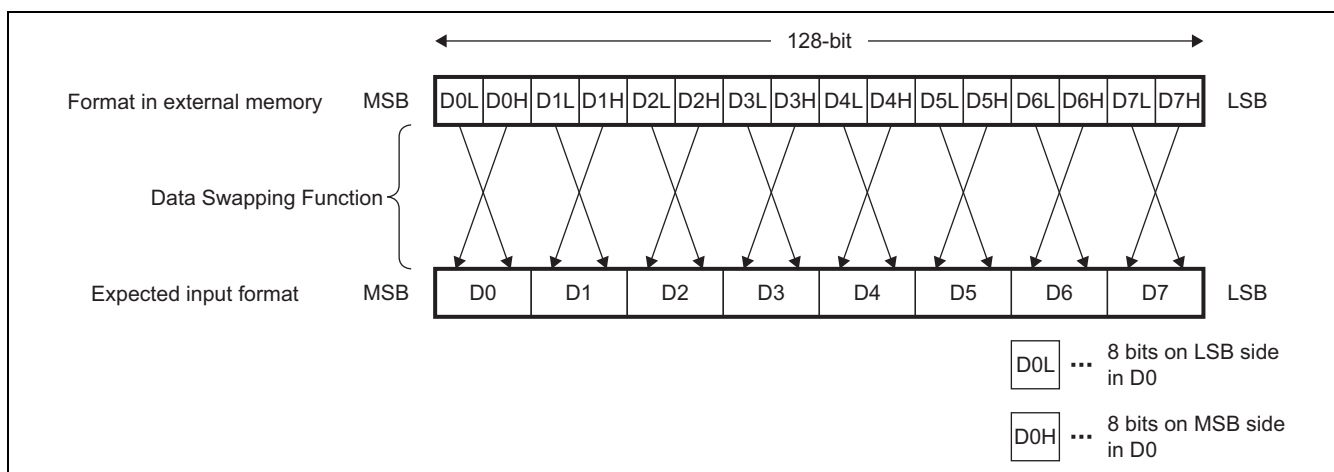

**28.1.6 Input/Output Data Format**

The VSP1 input/output data should be stored in a format where the address is incremented in the direction from the MSB to the LSB as in big endian. For example, the VSP1 reads and writes data to and from the external memory through the dedicated bus interface with a 128-bit width, and the data that should come first should be stored in the MSB side regardless of the unit data size as shown in Figure 28.7.

**Figure 28.7 VSP1 Input/Output Data Format**

However, data may be arranged in a way unexpected by the VSP1 depending on the address handling method (such as little endian) of the VSP1 access destination in some cases as in the external memory format shown in Figure 28.8. In such a case, use the data swapping function (refer to sections 28.2.7.4 and 28.2.8.5) in the VSP1 to convert the data format to be suitable for the VSP1.

**Figure 28.8 Input Data Alignment by Data Swapping Function**

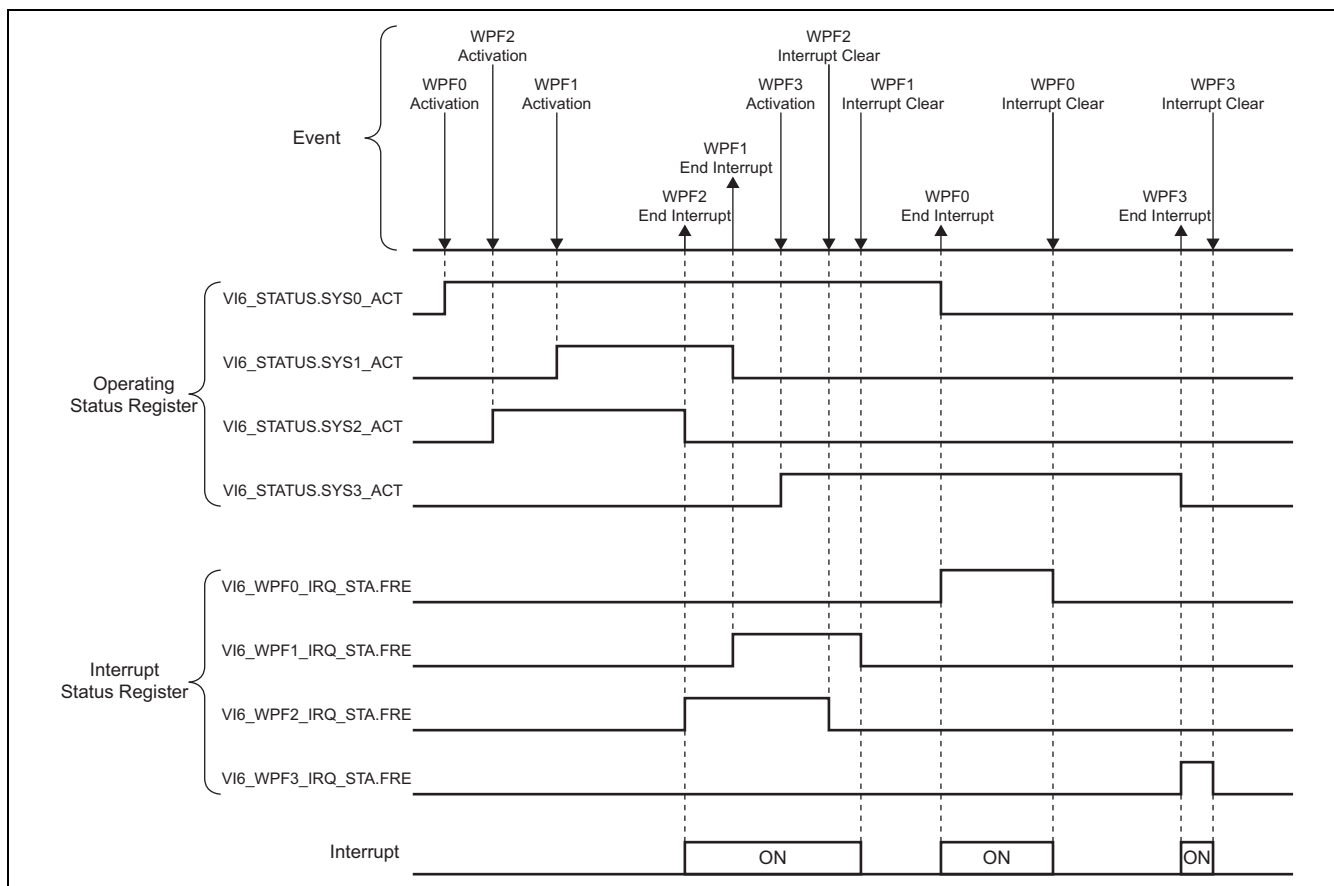

### 28.1.7 Concept of VSP1 Operation Starting and Stopping

The VSP1 provides four channels of image processing. Each channel is started by setting the corresponding start register. Here, starting a processing channel means starting one of WPF0 to WPF3, which are output modules of the VSP1. Use the start registers shown in Table 28.8 to start WPF modules.

After a WPF module is started and specified processing is completed, the corresponding channel stops operation and notifies the end of processing through an end interrupt. End interrupts are generated through the end interrupt source registers shown in Table 28.8; clearing a source register cancels the corresponding interrupt signal (for details of interrupt processing, refer to section 28.1.9, Interrupt Processing). Each of the operating status registers shown in the table indicates the busy state after the corresponding channel is started through the start register until processing is completed and operation stops. Figure 28.9 shows these operation timings.

**Table 28.8 Target Module and Corresponding Registers for Starting and Stopping Operation**

Target Module	Start Register	End Interrupt Source Register	Operating Status Register
WPF0	VI6_CMD0.STRCMD	VI6_WPF0_IRQ_STA. FRE	VI6_STATUS.SYS0_ACT
WPF1	VI6_CMD1.STRCMD	VI6_WPF1_IRQ_STA. FRE	VI6_STATUS.SYS1_ACT
WPF2	VI6_CMD2.STRCMD	VI6_WPF2_IRQ_STA. FRE	VI6_STATUS.SYS2_ACT
WPF3	VI6_CMD3.STRCMD	VI6_WPF3_IRQ_STA. FRE	VI6_STATUS.SYS3_ACT

**Figure 28.9 VSP1 Startup and Status of Each Register and Interrupt**

The following describes the operating states (operating or stopped) of VSP1 internal modules. As described in section 28.1.2, the VSP1 has several image processing modules and the connections between modules are determined by the DPR. Accordingly, the operating state of a module is the same as that of the target WPF for that module. For example, when the target WPF for the CLU is WPF2, the CLU operating state is the same as that of WPF2; that is, the CLU operating state is indicated by the VI6\_STATUS.SYS2\_ACT as shown in Table 28.8 and the status change timing is shown as VI6\_STATUS.SYS 2\_ACT in Figure 28.9. Likewise, the operating states of all modules connected to WPF2 are indicated by VI6\_STATUS.SYS 2\_ACT.

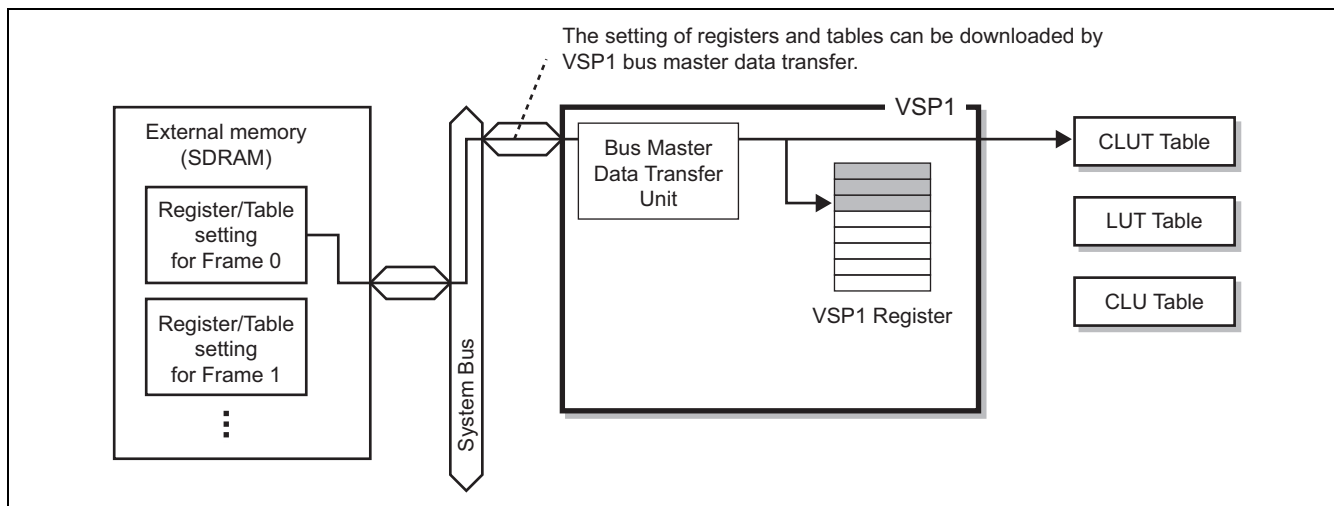

After connections through the DPR are changed and the target WPF for a module is changed, refer to the correct register for the new target WPF to check the operating state of that module. In the above example, after the target WPF for the CLU is changed from WPF2 to WPF0, the CLU operating state is indicated by VI6\_STATUS.SYS 0\_ACT.

Connections should be changed through the DPR-related registers (described later) while all modules to be affected by any change in connections are stopped. If connections through the DPR are changed during operation, the VSP1 will hang.

### 28.1.8 Display List

#### (1) Functional Description

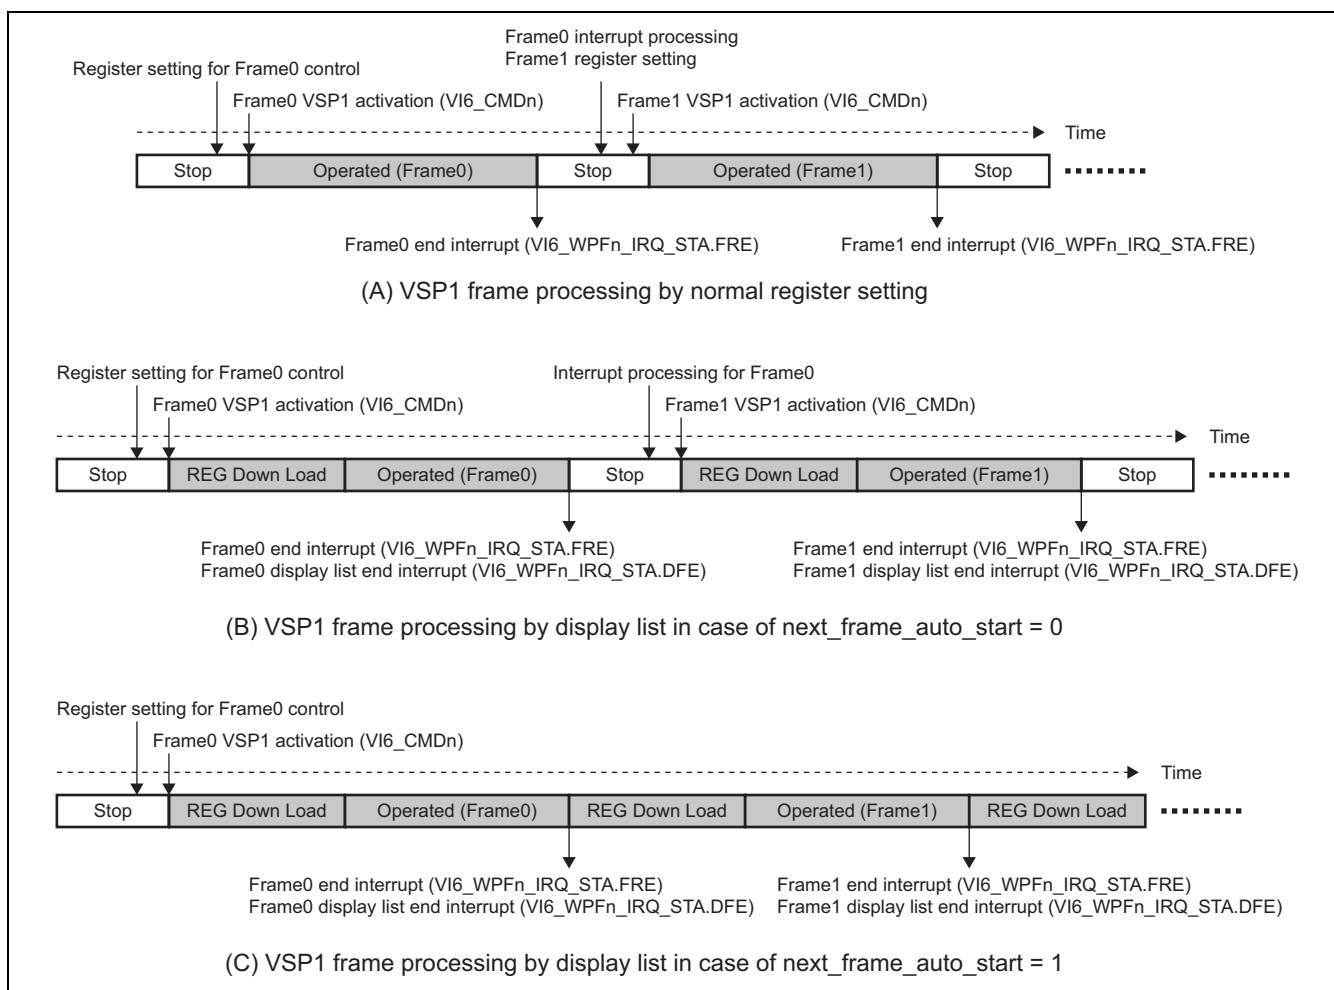

The VSP1 provides the display list function. As a display list, the VSP1 automatically downloads the register settings except for the control registers (sections 28.2.5 and 28.2.6) from external memory and stores the settings in the VSP1 registers. This function is advantageous in that the interrupt processing or register setting modification processing can be executed without CPU intervention during multiple-frame processing because the register settings used for VSP1 processing are prepared in advance in external memory such as SDRAM.

**Figure 28.10 Concept of Display List**

To use display lists, specify the external memory addresses to the display list control registers described in section 28.2.6. The register settings or various types of information should be stored in external memory in the format described in section 28.1.8 (2).

Figure 28.11 shows the difference between VSP1 operation through normal register settings and through display lists.

**Figure 28.11 Comparison of VSP1 Operation between Normal Register Settings and Display Lists**

As shown in Figure 28.11 (A), in the VSP1 processing through normal register settings, all registers should be set up before the VSP1 is started for each frame. After the VSP1 processing is completed, the VSP1 outputs a frame end interrupt (`VI6_WPFn_IRQ_STA.FRE`). This method requires a certain amount of time for register settings or interrupt processing by the CPU between frames. In contrast, when display lists are used, the VSP1 automatically downloads register settings from external memory as shown in Figure 28.11 (B) and (C), which reduces the load on the CPU between frames.

Figure 28.11 (B) shows the display list usage where the VSP1 stops at the end of every frame; only the VSP1 start processing for each frame is done by the CPU. This is suitable for the cases when the CPU controls synchronization of frame processing in frame buffer management or when the amount of register values or table data to be set in the VSP1 is large. In the case shown in Figure 28.11 (C), as soon as the frame processing ends, the VSP1 automatically begins next frame operation and starts downloading new register settings. This is the fastest operation using display lists.

Table 28.9 shows the modes of the display list and the supported functions for each mode. The detail of each mode is described in the following sections.

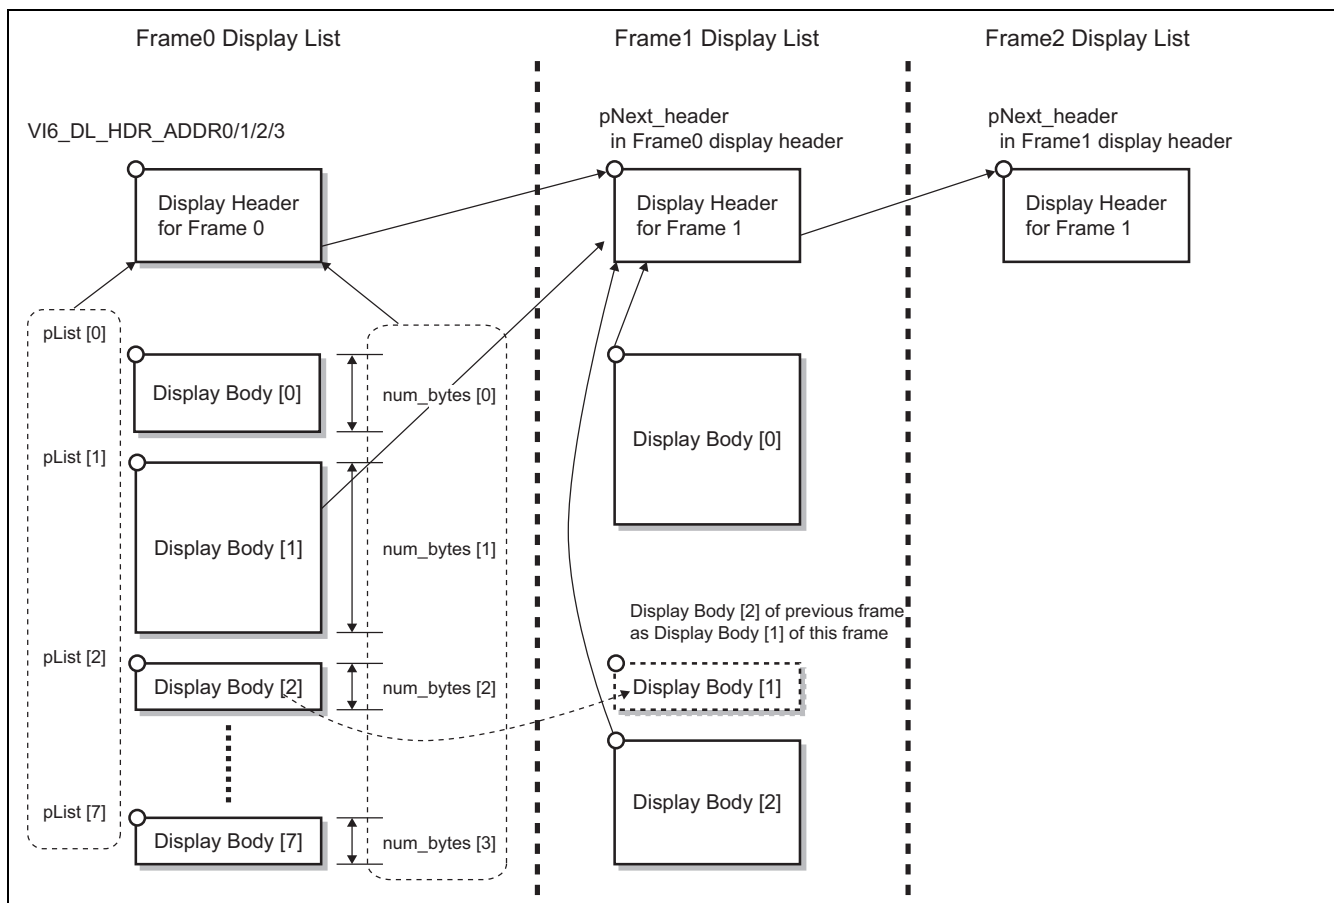

**Table 28.9 Display List Mode and Supported Functions**

Mode	Extended Display List	Continuous Frames
Normal Display List Mode	Supported	Controlled by “ <code>next_frame_auto_start</code> ” in the header of the display list.
Header-less Display List Mode	Not Supported	Controlled by <code>VI6_DL_CTRL.CFM0</code> bit.

## (2) Normal Display List Mode

The VSP1 display lists include control information as well as simple register settings in order to control multiple-frame processing in an optimum way for each application. Figure 28.12 shows the display list structure.

**Figure 28.12 Structure and Concept of VSP1 Display List**

A VSP1 display list consists of two sections; a header section for storing various information and control flags and a body section for storing register and table settings. A combination of these two sections is defined as a display list for a frame. The register and table settings can be divided and stored in up to eight separate bodies allocated in memory. Therefore, the separate bodies storing the register settings for one frame (for example, frame 0) can have non-sequential start addresses; that is, the bodies for one frame can be allocated to areas distant from each other in memory. To gather these bodies and configure the register settings for one frame, a header is used. A display header stores the number of bodies linked with the header and the start address and size of each body.

The VSP1 analyzes the header to gather register and table settings stored in separate memory areas and reconfigure the complete register settings.

The addresses of display headers should be specified in the VSP1 registers described in section 28.2.6. When activated in a mode that uses display lists, the VSP1 downloads display headers from the addresses specified in `VI6_DL_HDR_ADDR0/1/2/3` (numbers 0 to 3 correspond to the WPF channel index numbers), analyzes the numbers of bodies and the address and data size of each body, downloads the bodies, and completes register and table settings. After display list downloading is completed, the VSP1 becomes ready for frame image processing; the VSP1 then starts the actual frame processing.

After processing of a frame ends, the VSP1 proceeds to the next frame processing. Here, there are two modes for starting the next frame processing as shown in Figure 28.11. In one mode, the VSP1 stops operation and waits for the next activation by the CPU in the same way as when display lists are not used. In this mode, the address used for downloading

the display header of the next frame is kept by the internal hardware. Therefore, if valid address information is not stored in the display header for the previous frame, a correct value should be specified in VI6\_DL\_HDR\_ADDR0/1/2/3 while the VSP1 is stopped. When the VSP1 is started after a correct value is specified, the VSP1 starts next frame processing with the same procedure for the previous frame. In contrast to this mode, which stops the VSP1 after the end of one-frame processing, there is another mode for automatically starting next frame processing. In automatic start mode, the VSP1 downloads the next display header as soon as the previous frame processing ends. After downloading ends, the VSP1 starts image processing. The information regarding mode selection, that is, whether to automatically start next frame processing, should be stored in the display header downloaded for the previous frame.

In the automatic start mode, the VSP1 continues processing until the display header for a frame specifies that the next frame should not be started automatically. To stop processing during automatic execution, use a software reset (VI6\_SRESET).

To strictly define the display list format described above, the following shows the grammatical structure of a display list using pseudo-code. First, to simplify the description of the display list format in the following pages, Table 28.10 defines a function. Function `zero_bits (num_bits)` generates a string of one-bit 0s for the number of bits specified by the parameter for the function. By using this function, Table 28.11 defines the header section format of a display list and Table 28.12 defines the body section format.

Table 28.10 Definition of a Function for Simple Description

Syntax	Bit Count
zero_bits (num_bits)	
{	
for (i=0; i<num_bits; i++) {	
<b>zero_bit</b>	1
}	
}	

Bit String	Contents
zero_bit	zero_bit indicates a 1-bit integer having a value of 0.

Table 28.11 Format of Display List Header Section

Syntax	Bit Count
display_header () /* Fixed length */	
{	
zero_bits (29)	
<b>num_list_minus1</b>	3
for (i=0; i<8; i++)	
zero_bits (15)	
<b>num_bytes [i]</b>	17
<b>pList [i]</b>	32
}	
<b>pNext_header</b>	32
zero_bits (30)	
<b>current_frame_int_enable</b>	1
<b>next_frame_auto_start</b> /* 76 bytes from the beginning of this header*/	1
if (VI6_DL_EXT_CTRL.EXT) {	
zero_bits (32) /* padding zero 4 bytes for alignment */	
zero_bits (6)	
<b>pre_ext_dl_exec</b>	1
<b>post_ext_dl_exec</b>	1
zero_bits (8)	
<b>pre_ext_dl_num_cmd</b>	16
<b>pre_ext_dl_pList</b>	32
zero_bits (16)	
<b>post_ext_dl_num_cmd</b>	16
<b>post_ext_dl_pList</b> /* 96 bytes from the beginning of this header*/	32
}	
}	

Bit String	Contents
num_list_minus1	Specifies the value obtained by subtracting 1 from the total number of display list bodies linked with the display header. For example, when this bit field is set to 0, this display list uses one body.
num_bytes [i]	Specifies the number of bytes in the i-th display list body (indicated by index i). Be sure to specify a multiple of eight bytes. For the bodies that are not defined in num_list_minus1 (for example, i = 5 to 7 when num_list_minus1 is set to 4), specify 0.
pList [i]	Specifies the start address of the i-th display list body (indicated by index i). Be sure to specify an address aligned with an 8-byte boundary (the lower-order three bits are 0). For the bodies that are not defined in num_list_minus1 (for example, i = 5 to 7 when num_list_minus1 is set to 4), specify 0.
pNext_header	Specifies the address of the display list header for the next frame. After display list downloading ends, the VSP1 keeps its value in the internal memory and uses it in the next display list header downloading.
current_frame_int_enable	<p>This is a flag that indicates whether to set the display list end interrupt source (VI6_WPFn_IRQ_STA.DFE) to 1 when the current frame processing ends. If this flag is set to 0, the display list end interrupt source (VI6_WPFn_IRQ_STA.DFE) is not set to 1 when one-frame processing by this display header ends. In this state, even if the display list end interrupt is enabled (VI6_WPFn_IRQ_ENB.DFEE is set to 1), no interrupt will be generated.</p> <p>If this flag is set to 1, the display list end interrupt source (VI6_WPFn_IRQ_STA.DFE) is set to 1 when one-frame processing by this display header ends. In this state, if the display list end interrupt is enabled (VI6_WPFn_IRQ_ENB.DFEE is set to 1), the VSP1 generates an interrupt.</p>
Next_frame_auto_start	Enables or disables automatic start of next frame processing when one-frame processing by this display header ends. If this bit is set to 1, the VSP1 starts next frame processing as soon as one-frame processing by this display header ends, and starts downloading the next frame display header from the pNext_header address specified in this display header. If this bit is set to 0, the VSP1 stops operation when one-frame processing by this display header ends. In this case, start the VSP1 through VI6_CMDn to process the next frame.
pre_ext_dl_exec	Enables execution of the extended display list for frame preprocessing when VI6_DL_EXT_CTRL.EXT is 1. If this bit is set to 1, the VSP1 executes the extended display list for frame preprocessing. The VSP1 does not execute it if this bit is set to 0. This bit setting is ignored when VI6_DL_EXT_CTRL.EXT is 0.
post_ext_dl_exec	Enables execution of the extended display list for frame post processing when VI6_DL_EXT_CTRL.EXT is 1. If this bit is set to 1, the VSP1 executes the extended display list for frame post processing. The VSP1 does not execute it if this bit is set to 0. This bit setting is ignored when VI6_DL_EXT_CTRL.EXT is 0.
pre_ext_dl_num_cmd	Specifies the number of commands in the extended display list body section for frame preprocessing when VI6_DL_EXT_CTRL.EXT is 1. The number of commands that can be specified is 1 to 65,535, and a command is 16 bytes. When pre_ext_dl_exec is set to 0, the extended display list for frame preprocessing is not executed; specify 0 in this bit. This bit setting is ignored when VI6_DL_EXT_CTRL.EXT is 0.
pre_ext_dl_pList	Specifies the start address of the area where the extended display list body section for frame preprocessing is stored when VI6_DL_EXT_CTRL.EXT is 1. Be sure to specify an address aligned with a 16-byte boundary (lower-order four bits are 0). When pre_ext_dl_exec is set to 0, the extended display list for frame preprocessing is not executed; specify 0 in this bit. This bit setting is ignored when VI6_DL_EXT_CTRL.EXT is 0.
post_ext_dl_num_cmd	Specifies the number of commands in the extended display list body section for frame post processing when VI6_DL_EXT_CTRL.EXT is 1. The number of commands that can be specified is 1 to 65,535, and a command is 16 bytes. When post_ext_dl_exec is set to 0, the extended display list for frame post processing is not executed; specify 0 in this bit. This bit setting is ignored when VI6_DL_EXT_CTRL.EXT is 0.

Bit String	Contents
post_ext_dl_pList	Specifies the start address of the area where the extended display list body section for frame post processing is stored when VI6_DL_EXT_CTRL.EXT is 1. Be sure to specify an address aligned with a 16-byte boundary (lower-order four bits are 0). When post_ext_dl_exec is set to 0, the extended display list for frame post processing is not executed; specify 0 in this bit. This bit setting is ignored when VI6_DL_EXT_CTRL.EXT is 0.

Table 28.12 Format of Display List Body Section

Syntax	Bit Count
display_list (num_bytes) /* Variable length (num_bytes) */	
for (i=0; i<num_bytes; i+=8) {	
<b>set_address</b>	32
<b>set_data</b>	32
}	
}	

Bit String	Contents
set_address	Specifies the address where the value specified by set_data is to be stored. Specify a register address.
set_data	Specifies the value to be stored in the address specified by set_address. Specify a value to be set in a register.

**Table 28.13 Format of Extended Display List Body Section**

Syntax	Bit width
ext_dl_display_list (num_llw) /* Variable length (pre/post_ext_dl_num_bytes) */	
for (i=0; i<num_llw; i+=2) {	
<b>ext_dl_cmd</b>	64
<b>ext_dl_data</b>	64
}	
}	

Bit string	Contents								
ext_dl_cmd	<p>ext_dl_cmd specifies a 64-bit control command for the extended display list. The upper-order 32 bits hold a command and the lower-order 32 bits are bits for masking or enabling data to be handled by the command. In the upper-order 32 bits (command), bits 63 to 43 should always be set to 0, bits 42 to 40 specify data swapping during command execution (described later), and bits 39 to 32 specify the command type.</p> <p><u>Bit 42: Data swapping in long word (32-bit) units during command execution</u> When this bit is 1, the data read or written for command execution is swapped in long word (32-bit) units.</p> <p><u>Bit 41: Data swapping in word (16-bit) units during command execution</u> When this bit is 1, the data read or written for command execution is swapped in word (16-bit) units.</p> <p><u>Bit 40: Data swapping in byte (8-bit) units during command execution</u> When this bit is 1, the data read or written for command execution is swapped in byte (8-bit) units.</p> <p><u>Bits 39 to 32 are H'00: Write Data</u> The value stored in ext_dl_data [31:0] is written to the address stored in ext_dl_data [63:32] specified after this command. In the lower-order 32 bits of this command (ext_dl_cmd [31:0]), specify the bits whose value should be updated with the value of ext_dl_data [31:0]. Specify 1 for the bits whose value should be updated, and specify 0 for the bits whose current value should be retained.</p> <p><u>Bits 39 to 32 are H'01: Wait Event</u> Until the value stored in the address indicated by ext_dl_data [63:32] specified after this command matches the value stored in ext_dl_data [31:0], processing of this extended display list body section is stalled. The bits used for comparison are masked with the lower-order 32 bits of this command (ext_dl_cmd [31:0]). To compare all bits, the lower-order 32 bits of this command should be set to all 1s.</p>								
ext_dl_data	<p>Specifies the data used by ext_dl_cmd [63:0].</p> <p>When ext_dl_cmd [39:32] is H'0000, specify these bits as follows.</p> <table border="1"> <tr> <td>ext_dl_data [63:32]:</td> <td>Write destination address</td> </tr> <tr> <td>ext_dl_data [31:0]:</td> <td>Write data</td> </tr> </table> <p>When ext_dl_cmd [39:32] is H'0001, specify these bits as follows.</p> <table border="1"> <tr> <td>ext_dl_data [63:32]:</td> <td>Reference address</td> </tr> <tr> <td>ext_dl_data [31:0]:</td> <td>Comparison data</td> </tr> </table>	ext_dl_data [63:32]:	Write destination address	ext_dl_data [31:0]:	Write data	ext_dl_data [63:32]:	Reference address	ext_dl_data [31:0]:	Comparison data
ext_dl_data [63:32]:	Write destination address								
ext_dl_data [31:0]:	Write data								
ext_dl_data [63:32]:	Reference address								
ext_dl_data [31:0]:	Comparison data								

### (3) Header-less Display List Mode

The header-less display list does not have the display header listed in Table 28.11, and it has the simplest structure that has only single body. The extended display list function is not available in case of the header-less display list mode. Set the value 1 to VI6\_DL\_CTRL.NH0 (see section 28.2.6.1) to use the header-less display list. The start address downloaded by the header-less display list should be set to VI6\_DL\_HDR\_ADDR0. And the size of the display body which is originally defined in the display header should be set to VI6\_DL\_BODY\_SIZE0. The header-less display list is available only in WPF0.

### (4) Restrictions on Display List Usage

Access to the general control registers and display list control registers through a display list is prohibited. When using display lists, be sure to observe the following restrictions on register access by the CPU.

1. Do not execute write access to the same register (same address) from the CPU and through a display list at the same time. If such a conflict occurs, correct operation of the VSP1 is not guaranteed.
2. Do not execute write access to the same CLUT, CLU, or LUT lookup table from the CPU and through a display list at the same time. If such a conflict occurs, correct operation of the VSP1 is not guaranteed. Here, the same lookup table means the address space having the same space name shown in Table 28.37 or Table 28.38.
3. When read access by the CPU and write access through a display list to the same register (same address) occur at the same time, the read value returned to the CPU is not guaranteed.
4. When read access by the CPU and write access through a display list to the same CLUT, CLU, or LUT lookup table occur at the same time, the read value returned to the CPU is not guaranteed. Here, the same lookup table means the address space having the same space name shown in Table 28.37 or Table 28.38.
5. For other restrictions on values and timing of register setting through display lists, refer to the restrictions on normal register settings described in section 28.2.3.
6. Manipulation and setting of the registers described in sections 28.2.4 and 28.2.6 through a display list is prohibited.
7. Do not use extended display lists on this LSI.

## 28.1.9 Interrupt Processing

The VSP1 provides multiple image processing channels (WPF0 to WPF3) and they can operate simultaneously in parallel. When a WPF module generates an internal source that should be notified, an interrupt signal is output. As internal sources are generated in each WPF independently, the VSP1 has the following registers to control interrupts in each WPF.

- WPF Interrupt Enable Registers (VI6\_WPFn\_IRQ\_ENB: n = 0, 1, 2, 3) (refer to section 28.2.5.5)
- WPF Interrupt Status Registers (VI6\_WPFn\_IRQ\_STA: n = 0, 1, 2, 3) (refer to section 28.2.5.6)

While multiple WPF modules operate in parallel, they may output interrupt requests at the same time (this is called a multiple interrupt state). Read the WPF Interrupt Status Registers (VI6\_WPFn\_IRQ\_STA: n = 0, 1, 2, 3) in sequence and execute the interrupt response processing for each interrupt source.

Note: To use interrupts, enable them through WPF interrupt enable registers. If an interrupt source register has already been set to 1 for some reason, an unintended interrupt will occur as soon as the corresponding interrupt enable register is set as enabled. To avoid this, before enabling interrupts through WPF interrupt enable registers, be sure to clear all WPF interrupt sources to be enabled to 0. Be careful about this procedure when setting up registers before starting the VSP1.

### 28.2.1 Notational Conventions for Registers and Bit Fields

This document uses the following notational conventions for the VSP1 registers and bit fields.

1. The names of registers and bits are written in uppercase.
2. A bit or bit field in a register is indicated as [register name.bit name]. For example, the STRCMD bit in the VI6\_CMD0 register is indicated as VI6\_CMD0.STRCMD.
3. Lowercase "n" in a register name or a bit name indicates an integer and the range of value n is defined when necessary. For example, VI6\_CMDn.STRCMD (n = 0, 1) indicates the STRCMD bit in two registers VI6\_CMD0.STRCMD and VI6\_CMD1.STRCMD. For RPFn, WPFn, and UDSn, when the range of value n is not defined, RPFn (n = 0, 1, 2, 3, 4), WPFn (n = 0, 1, 2, 3), and UDSn (n = 0, 1, 2) are assumed.
4. In each subsection for register description in section 28.2, when only a bit name is written without showing its register name, the bit is in the register described in that subsection.
5. A wildcard (\*) indicates any characters in a name and represents all registers or bits that match the specified first part of a name. For example, VI6\_RPF\_SRC\_\* indicates both VI6\_RPF\_SRC\_BSIZE and VI6\_RPF\_SRC\_ESIZE register.

### 28.2.2 Register Configuration

The VSP1 registers are arranged in the following order; the general control registers to frame sync control registers control operation of the entire R-VSP1, and the other registers control each image processing and specify parameters for the processing. The functions of the registers are described in this order starting from section 28.2.4.

1. General control registers (VI6\_CMDn (n = 0, 1, 2, 3), VI6\_SRESET, VI6\_STATUS, VI6\_WPFn\_IRQ\_\* (n = 0, 1, 2, 3))
2. Display list control registers (VI6\_DL\_\*)
3. RPF control registers (VI6\_RPFn\_\* (n = 0, 1, 2, 3, 4))
4. WPF control registers (VI6\_WPFn\_\* (n = 0, 1, 2, 3))
5. DPR control registers (VI6\_DPR\_\*)
6. SRU control registers (VI6\_SRU\_\*)
7. UDSn control registers (VI6\_UDSn\_\* (n = 0, 1, 2))
8. LUT control register (VI6\_LUT\_CTRL)
9. CLU control register (VI6\_CLU\_CTRL)
10. HST control register (VI6\_HST\_CTRL)
11. HSI control register (VI6\_HSI\_CTRL)
12. BRU control registers (VI6\_BRU\_\*)
13. HGO control registers (VI6\_HGO\_\*)
14. HGT control registers (VI6\_HGT\_\*)
15. LIF control registers (VI6\_LIF\_\*)
16. Security control registers (VI6\_SECURE\_\*)

The VSP1 has five RPF channels and the register configuration is the same for all of RPF0 to RPF4. However, some bit fields have restrictions in certain RPFs. These restrictions are included in the description of the corresponding bit fields and registers. Likewise, the register configuration is the same for all four WPF channels (WPF0 to WPF3), but some bit fields have restrictions in certain WPFs; the restrictions are included in the description of the corresponding bit fields and registers.

For each register address, refer to section 28.2.4, Memory Map.

### 28.2.3 Restrictions on Access to Registers and Lookup Tables

The VSP1 has control registers and lookup tables. When accessing the addresses where these registers and lookup tables are allocated, the following restrictions should be satisfied. If any restriction is violated, the VSP1 will not operate correctly.

1. For the read-only bits and reserved bits in all VSP1 registers, writing 1 is prohibited unless otherwise specified.
2. Addresses undefined in section 28.2.4, Memory Map, are reserved areas and write access is prohibited in these areas.
3. For all registers and lookup tables, except VI6\_SRESET and VI6\_\*IRQ\*, modifying register values during operation of the module is prohibited. Modify registers while the corresponding module is stopped. For the operating status of the target module, refer to section 28.1.7.

**Table 28.14 Correspondence between Modules and Register Names**

Module Name	Register Name
RPFn (n = 0 to 4)	VI6_RPFn_*
WPFn (n = 0 to 3)	VI6_WPFn_*
DPR	VI6_DPR_*
SRU	VI6_SRU_*
UDSn (n = 0 to 2)	VI6_UDSn_*
LUT	VI6_LUT_CTRL
CLU	VI6_CLU_CTRL
HST	VI6_HST_CTRL
HSI	VI6_HSI_CTRL
BRU	VI6_BRU_*
HGO	VI6_HGO_*
HGT	VI6_HGT_*

## 28.2.4 Memory Map

### (1) Base Address

Below are the base addresses of each VSP unit (\$VSP\_BASE) in this LSI:

VSPR:	H'FE92 0000 [RZ/G1H only]
VSPS:	H'FE92 8000
VSPD0:	H'FE93 0000
VSPD1:	H'FE93 8000 [RZ/G1H/M/N only]

### (2) Register/Table Address

Table 28.15 shows the VSP1 memory map (represents in relative address).

**Table 28.15 VSP1 Memory Map**

Space	Register Type	Register Name	Relative Address from Base Address of Each VSP Unit	RZ/G Series Products			
				RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
Register	General control registers	VI6_CMD0	\$VSP_BASE + H'0000	√	√	√	√

## 28.2.5 General Control Registers

### 28.2.5.1 VSP1 Start Registers n (VI6\_CMDn: n = 0, 1, 2, 3)

Note: See Table 28.15 for details on which RZ/G series products have which registers.

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	STRCMD
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	STRCMD	0	R/W	Start Command VSP1 has four output channels (WPFs). Starting WPF0 to WPF3 starts operation of VSP1. Only a single WPF can be started, and all four WPFs can also be started at the same time. VI6_CMD0.STRCMD to VI6_CMD3.STRCMD respectively control WPF0 to WPF3. Writing 1 to this bit starts WPFn in VSP1. Set this bit for activation only after all register settings in each output channel have been completed. This bit is always read as 0. 0: NOP 1: WPFn is started (VSP1 is started).

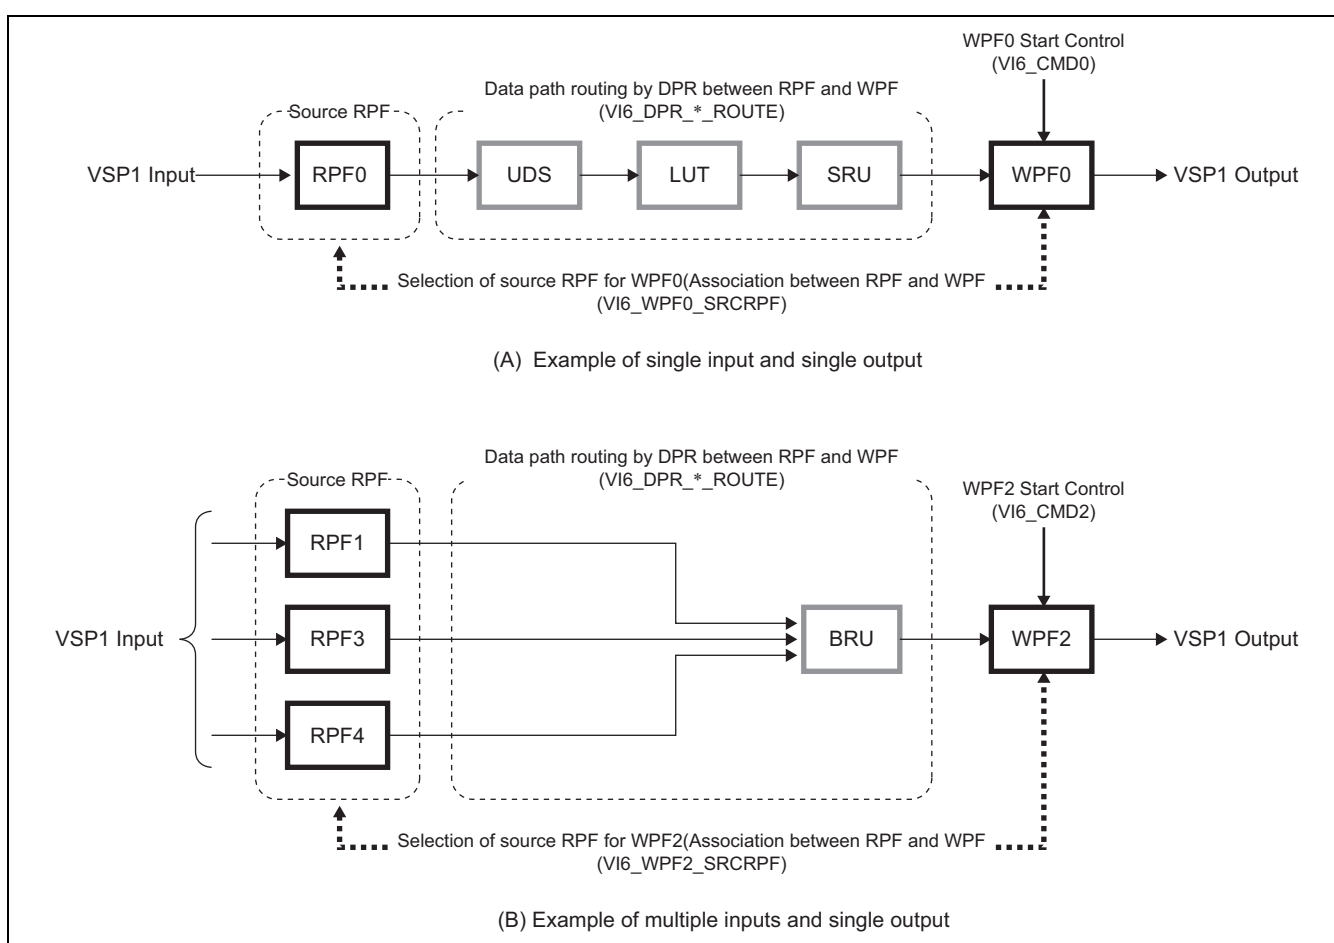

The basic concept of image processing operation started by activating the VSP1 is shown in Figure 28.13. The actual data input/output is executed by the MAU, which is the bus interface module, as described in section 28.1.2, but conceptually the RPF works as the data entry point to the VSP1 and the WPF works as the data exit point. To process images through the VSP1, the RPF (entrance) and WPF (exit) should be connected and a data path from the RPF to the WPF should be formed.

To connect RPFn to WPFn, specify RPFn as the source RPF for WPFn in VI6\_WPFn\_SRCRPF, which is a register for WPFn (refer to section 28.2.8.1). This setting determines that RPFn will be started when WPFn is started through VI6\_CMDn.

A data path to execute desired image processing should then be formed between the RPF (entrance) and WPF (exit). To form a data path, connect the necessary function modules in the VSP1 between RPF and WPF. This function is provided by the DPR; specify the information for each module connection in data path routing registers VI6\_DPR\_\*\_ROUTE (refer to section 28.2.9).

After a data path is formed (RPF<sub>n</sub> → WPF<sub>n</sub>) as described above, starting output module WPF<sub>n</sub> in the VSP1 through VI6\_CMD<sub>n</sub> starts all function modules connected to WPF<sub>n</sub> and the desired image processing is executed. According to this design concept, starting a WPF module means starting the VSP1.

There are two types of data path configuration in the VSP1; one is "a single input module to a single output module" as shown in Figure 28.13 (A), and the other is "multiple input modules to a single output module" as shown in Figure 28.13 (B). Figure 28.13 (A) shows an example of a configuration where modules with single input and single output are implemented through the DPR. Figure 28.13 (B) shows another configuration example where the module with multiple input and single output is implemented through the DPR. As shown in the figure, there is no conflict over internal module resources between these two connection examples, and the data paths in Figure 28.13 (A) and (B) can be started at the same time (for details of the DPR, refer to section 28.2.9). To start them together, make the register settings related to the modules used in each data path, and then set VI6\_CMD0 and VI6\_CMD2 to start WPF0 and WPF2, respectively. These two paths are completely independent. Even if the register settings for path (B) are incomplete, path (A) can be started regardless of the state of path (B) when the register settings for path (A) are complete.

**Figure 28.13 Basic Concept of VSP1 Startup**

The DPR in the VSP1 can realize more advanced data paths than those shown in Figure 28.13. For example, two activations are necessary for the combination of paths (A) and (B) in Figure 28.13. However, the same processing may be started through one activation by improving the data path configuration, depending on the data processing flow in some cases, as shown in Figure 28.14. When the data path configuration is improved, the capacity of memory used and the amount of bus transfer in the system can be reduced. When determining the starting units in the VSP1, carefully examine the data processing flow and configure an optimal data path.

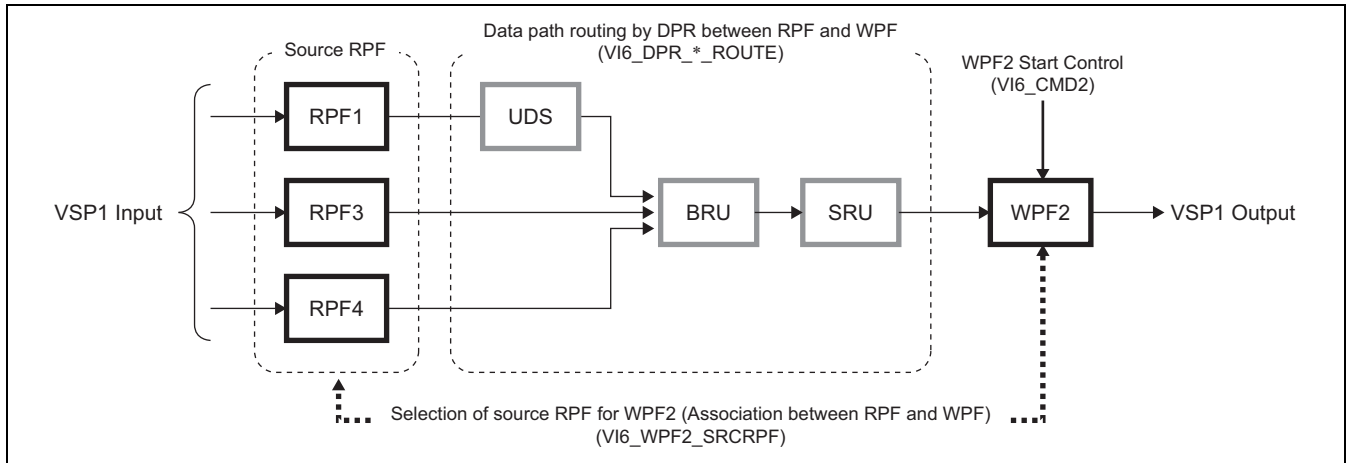

Figure 28.14 Sample Configuration of Combining Data Paths in Figure

### 28.2.5.2 Dynamic Clock Stop Control Register (VI6\_CLK\_DCSWT)

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 8	CSTPW[7:0]	H'00	R/W	Dynamic Clock Stop Control 1 Always specify 8.
7 to 0	CSTRW[7:0]	H'00	R/W	Dynamic Clock Stop Control 2 Always specify 8.

### 28.2.5.3 Software Reset Register (VI6\_SRESET)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	SRST3	SRST2	SRST1	SRST0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3	SRST3	0	R/W	WPFn Software Reset (SRSTn, n = 0 to 3)
2	SRST2	0	R/W	Writing 1 to this bit aborts the current processing in WPFn (the partially-completed image undergoing processing is output). The period until this software reset processing is completed depends on the bus state.
1	SRST1	0	R/W	When this reset processing is completed, the VI6_WPFn_IRQ_STA.FRE interrupt source bit is set to 1; when the FRE interrupt is enabled, the FRE end interrupt is output to notify the end of the reset processing.
0	SRST0	0	R/W	This bit is always read as 0. 0: NOP 1: WPF3 software reset*

Notes: \* Applying a software reset to each WPF has the following restrictions.

1. A software reset can be applied to only one of WPF0 to WPF3 through single write access to VI6\_SRESET.
2. After a software reset is issued, no more software reset can be issued to another WPF until the issued software reset processing is completed
3. After a software reset is issued to a channel, correct operation of other channels cannot be guaranteed; apply software reset to all channels in sequence.
4. The end of software reset processing is notified through the FRE bit in VI6\_WPFn\_IRQ\_STA, but the software reset issued while WPF is stopped is ignored as NOP. As it takes a while until the reset is actually issued after the reset bit is set, the VSP1 may complete operation before the reset is actually issued. In this case, no interrupt is output for the software reset that is issued after the VSP1 completes operation.
5. If a software reset is issued during downloading of a display list, the downloading processing is not aborted. After the end of downloading that is in progress when a software reset is issued, a frame end interrupt is output.

### 28.2.5.4 Operating Status Register (VI6\_STATUS)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	All 0	R	Reserved These bits are read as 0 or 1. Don't care about this value. Write access is prohibited.
11	SYS3_ACT	0	R	WPFn Operating Status (SYSn_ACT, n = 0 to 3)
10	SYS2_ACT	0	R	Each bit indicates the operating or stopped state of control channel n (WPFn). 0: WPFn is stopped. 1: WPFn is operating.
9	SYS1_ACT	0	R	
8	SYS0_ACT	0	R	
7 to 4	—	All 0	R	Reserved These bits are read as 0 or 1. Don't care about this value. Write access is prohibited.
3	—	0	R	WPFn Internal Control Monitor Signal
2	—	0	R	Each bit indicates a value of 0 or 1. Don't use the value read from this bit.
1	—	0	R	
0	—	0	R	

### 28.2.5.5 WPF Interrupt Enable Registers (VI6\_WPFn\_IRQ\_ENB: n = 0, 1, 2, 3)

Note: See Table 28.15 for details on which RZ/G series products have which registers.

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DFEE	FREE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	DFEE	0	R/W	Interrupt Enable for WPFn (n = 0 to 3) Display List Frame End 0: Interrupt Disabled 1: Interrupt Enabled
0	FREE	0	R/W	Interrupt Enable for WPFn (n = 0 to 3) Frame End 0: Interrupt Disabled 1: Interrupt Enabled

Each bit in VI6\_WPFn\_IRQ\_STA is set to 1 when the corresponding interrupt source is generated.

VI6\_WPFn\_IRQ\_ENB specifies whether to output an interrupt signal for the generated source. When an interrupt is disabled in this register, no interrupt signal is generated even when the corresponding bit in VI6\_WPFn\_IRQ\_STA is set to 1. When an interrupt is enabled in this register, an interrupt signal is output when the corresponding bit in VI6\_WPFn\_IRQ\_STA is set to 1.

### 28.2.5.6 WPF Interrupt Status Registers (VI6\_WPFn\_IRQ\_STA: n = 0, 1, 2, 3)

Note: See Table 28.15 for details on which RZ/G series products have which registers.

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DFE	FRE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are read as 0 or 1. Don't care about this value. The write value should always be 0.
1	DFE	0	R/W	Interrupt Status and Clear for WPFn (n = 0 to 3) Display List Frame End This interrupt source bit is set to 1 when VSP1 completes one-frame processing while the <code>current_frame_int_enable</code> value stored in the display list header is 1 (refer to section 28.1.8 (2)). When display lists are not used, this bit is not used. In this case, clear <code>VI6_WPFn_IRQ_ENB.DFEE</code> to 0 to mask the interrupt generation by this interrupt source. [Read Access] Interrupt Status 0: No interrupt 1: Interrupt activated [Write Access] Interrupt Clear 0: The interrupt status is cleared to 0 1: Hold the interrupt status value
0	FRE	0	R/W	Interrupt Status and Clear for WPFn (n = 0 to 3) Frame End This interrupt source bit is set to 1 when VSP1 completes one-frame processing. This bit is also set to 1 when one-frame processing using a display list is completed. [Read Access] Interrupt Status 0: No interrupt 1: Interrupt activated [Write Access] Interrupt Clear 0: The interrupt status is cleared to 0 1: Hold the interrupt status value

VI6\_WPFn\_IRQ\_STA indicates the state of the interrupt sources generated in the VSP1. Whether to output a VSP1 interrupt when an interrupt source is generated and the corresponding bit is set to 1 is determined by the corresponding

bit setting in VI6\_WPFn\_IRQ\_ENB. While an interrupt is disabled in VI6\_WPFn\_IRQ\_ENB, the VSP1 does not output an interrupt signal even when an interrupt source is generated, but the source flag in this register is set to 1.

Note that the interrupt source bits in this register cannot be cleared by write access using a display list.

### 28.2.5.7 Display Interrupt Enable Register (VI6\_DISP\_IRQ\_ENB)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E

0	LNE0E	0	R/W	Interrupt Enable for 1 Line Data Read End of RFP0 0: Interrupt Disabled 1: Interrupt Enabled

### 28.2.5.8 Display Interrupt Status Register (VI6\_DISP\_IRQ\_STA)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	DST	—	—	MAE	LNE4	LNE3	LNE2	LNE1	LNE0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	DST	0	R/W	Interrupt Status and Clear for Display Start This bit is set to 1 when LIF module transfers the first data to the display module at the beginning of each frame. The timing depends on the output buffer status of LIF module. [Read Access] Interrupt Status 0: No interrupt 1: Interrupt activated [Write Access] Interrupt Clear 0: The interrupt status is cleared to 0 1: Hold the interrupt status value
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5	MAE	0	R/W	Interrupt Status and Clear for Display Read Data End This bit is set to 1 when all RPFs transfer the last data of the frame to LIF module. The RPF module which is not used by LIF module does not affect this bit. [Read Access] Interrupt Status 0: No interrupt 1: Interrupt activated [Write Access] Interrupt Clear 0: The interrupt status is cleared to 0 1: Hold the interrupt status value

Bit	Bit Name	Initial Value	R/W	Description
4	LNE4	0	R/W	Interrupt Status and Clear for 1 Line Data Read End of RFP4 This bit is set to 1 when RPF4 completes 1-line data transfer. [Read Access] Interrupt Status 0: No interrupt 1: Interrupt activated [Write Access] Interrupt Clear 0: The interrupt status is cleared to 0 1: Hold the interrupt status value
3	LNE3	0	R/W	Interrupt Status and Clear for 1 Line Data Read End of RFP3 [Read Access] Interrupt Status 0: No interrupt 1: Interrupt activated [Write Access] Interrupt Clear 0: The interrupt status is cleared to 0 1: Hold the interrupt status value
2	LNE2	0	R/W	Interrupt Status and Clear for 1 Line Data Read End of RFP2 [Read Access] Interrupt Status 0: No interrupt 1: Interrupt activated [Write Access] Interrupt Clear 0: The interrupt status is cleared to 0 1: Hold the interrupt status value
1	LNE1	0	R/W	Interrupt Status and Clear for 1 Line Data Read End of RFP1 [Read Access] Interrupt Status 0: No interrupt 1: Interrupt activated [Write Access] Interrupt Clear 0: The interrupt status is cleared to 0 1: Hold the interrupt status value
0	LNE0	0	R/W	Interrupt Status and Clear for 1 Line Data Read End of RFP0 [Read Access] Interrupt Status 0: No interrupt 1: Interrupt activated [Write Access] Interrupt Clear 0: The interrupt status is cleared to 0 1: Hold the interrupt status value

### 28.2.5.9 WPFn Output Line Count Register (VI6\_WPFn\_LINE\_CNT: n = 0, 1, 2, 3)

Note: See Table 28.15 for details on which RZ/G series products have which registers.

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20 to 0	LINE_CNT [20:0]	All 0	R	Number of WPFn Output Lines From the value read from these bits, the number of lines output from VSP1 can be obtained. <u>The value of these bits can be read only within a limited period; read these bits with the timing described later.</u> These bits indicate the number of lines output from WPFn as an immediate value. In the frame buffer starting from VI6_WPFn_DSTN_ADDR_*, WPFn has completed data output up to the line number indicated in these bits. For example, when these bits are set to 1, valid data is output only in the first line. When one-frame processing is completed correctly, this value indicates the number of lines output from WPFn.

The LINE\_CNT value is valid only for the period between a frame end interrupt (section 28.2.5.6) and next frame startup (section 28.2.5.1) or the period between a display list frame end interrupt (section 28.2.5.6) and next frame startup. This register value read outside these periods cannot be used.

The LINE\_CNT value depends on the flipping mode (VI6\_WPFn\_OUTFMT.FLP) as shown in Figure 28.15. This correspondence is shown in Table 28.16.

**Table 28.16 VSP1 Output Line Count According to VI6\_WPFn\_OUTFMT.FLP Setting**

VI6_WPFn_OUTFMT.FLP Setting	Corresponding Case Shown in Figure 28.15
0	case 1
1	case 2

15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12	DC2	0	R/W	Display List Control 2 Specify the same value as the DLE bit.
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	DC1	0	R/W	Display List Control 1 Specify the same value as the DLE bit.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	DC0	0	R/W	Display List Control 0 Specify the same value as the DLE bit.
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2	CFM0	0	R/W	Continuous Frame Mode for Header-less Display List This bit determines whether the next frame is automatically started or not. When the updated flag of the display list, VI6_DL_BODY_SIZE0.UPD0, is not updated, the display list of the next frame is not transferred and the same register values are used for the next frame. When the value of VI6_DL_BODY_SIZE0.UPD0 is updated, the new display list is transferred. 0: Stopped at the end of every frame 1: The next frame is automatically started

Bit	Bit Name	Initial Value	R/W	Description
1	NH0	0	R/W	<p>Header-less Display List Mode</p> <p>This bit is used for specifying the header-less display list mode. In case of header-less mode, the number of the display lists is 1. The address of the display body is set in VI6_DL_HDR_ADDR0 register, and the body size is set in VI6_DL_BODY_SIZE0 register.</p> <p>When this bit is changed, make sure that VSP1 is stopped. And also make sure the following before starting VSP1.</p> <ul style="list-style-type: none"> <li>- Header Address (VI6_DL_HDR_ADDR0)</li> <li>- Body Size (VI6_DL_BODY_SIZE0) in case of header-less mode</li> </ul> <p>0: Use Display List Header (Normal DL Mode) 1: Don't use Display List Header (Header-less Mode)</p> <p>Note: Only WPF0 supports header-less display list. WPFn (n = 1 to 3) work as the normal display list mode even if the WPF0 is set to header-less display list mode.</p>
0	DLE	0	R/W	<p>Display List Enable/Disable</p> <p>Enables or disables the VSP1 display list function. When the display list function is enabled through this bit, all WPF processing channels work in display list mode.</p> <p>When using display lists, note the restrictions in section 28.2.3.</p> <p>0: The display list function is disabled 1: The display list function is enabled</p>

### 28.2.6.2 Display List-n Header Address Register (VI6\_DL\_HDR\_ADDRn: n = 0, 1, 2, 3)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DL_HDR_PTR-n [31:0]	H'0000 0000	R/W [31:4] R [3:0]	<p>Display List-n Header Address</p> <p>These bits specify the address of the display list header to be read for display list-n in 16-byte units (the lower-order four bits are read-only). When WPFn is first started in display list mode, the display list header is loaded from the address specified in this register. After loading of the header is completed, the register value of the display list address is updated to the next header address stored in the loaded header to prepare for loading of the next display list header. After that, this header address updating is repeated.</p> <p>A value from H'00000000 to H'FFFFFFF0 can be specified.</p>

### 28.2.6.3 Display List Data Swapping Register (VI6\_DL\_SWAP)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2	LWS	0	R/W	Display List Data Swapping in Longword Units 0: Data swapping in longword (32-bit) units is disabled 1: Data swapping in longword (32-bit) units is enabled
1	WDS	0	R/W	Display List Data Swapping in Word Units 0: Data swapping in word (16-bit) units is disabled 1: Data swapping in word (16-bit) units is enabled
0	BTS	0	R/W	Display List Data Swapping in Byte Units 0: Data swapping in byte (8-bit) units is disabled 1: Data swapping in byte (8-bit) units is enabled

### 28.2.6.4 Extended Display List Control Register (VI6\_DL\_EXT\_CTRL)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	NWE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	POLINT [5:0]					—	—	DLPRI	EXPRI	—	—	—	—	EXT
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	NWE	0	R/W	No Wait for Polling When this bit is set to 1, the polling condition for extended display lists is always assumed to be true.
15, 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13 to 8	POLINT[5:0]	All 0	R/W	Extended Display List Command Control Always specify 2.
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5	DLPRI	0	R/W	Display List Control 0 Always specify 1.
4	EXPRI	0	R/W	Display List Control 1 Always specify 0.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	EXT	0	R/W	Extended Display List Enables or disables the extended display list function. When extended display lists are used, the display list header size is 96 bytes; when they are not used, the header size is 80 bytes. 0: No extended display lists are used 1: Extended display lists are used Note: When using extended display lists, be sure to also use normal display list mode (VI6_DL_CTRL.DLE); executing only extended display lists is not possible. When the header-less display list mode is activated, this bit should be set to 0. The extended display list cannot be used with the header-less display list mode.

### 28.2.6.5 Display List Body Size Register-n (VI6\_DL\_BODY\_SIZE<sub>n</sub>: n = 0)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	UPD0	0	R/W	Update Flag This bit controls the download of the display list at the next downloading timing in case that the header-less display list mode is used. When this bit is set to 1, the value of VI6_DL_HDR_ADDR <sub>n</sub> and VI6_DL_BODY_SIZE <sub>n</sub> .BS0 (n = 0) should not be changed. 0: Display List is not downloaded (Registers are not updated) 1: Display List is downloaded (Registers are updated)
23 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16 to 0	BS0[16:0]	All 0	R/W	Header-less Display List Body Size (WPF <sub>n</sub> , n = 0) These bits are used for specifying the body size of the display list in case of header-less display list mode. The unit of the size is byte. The value should be set in multiples of 8.

## 28.2.7 RPF Control Registers

### 28.2.7.1 RPFn Basic Read Size Registers (VI6\_RPFn\_SRC\_BSIZE)

Note: See Table 28.15 for details on which RZ/G series products have which registers.

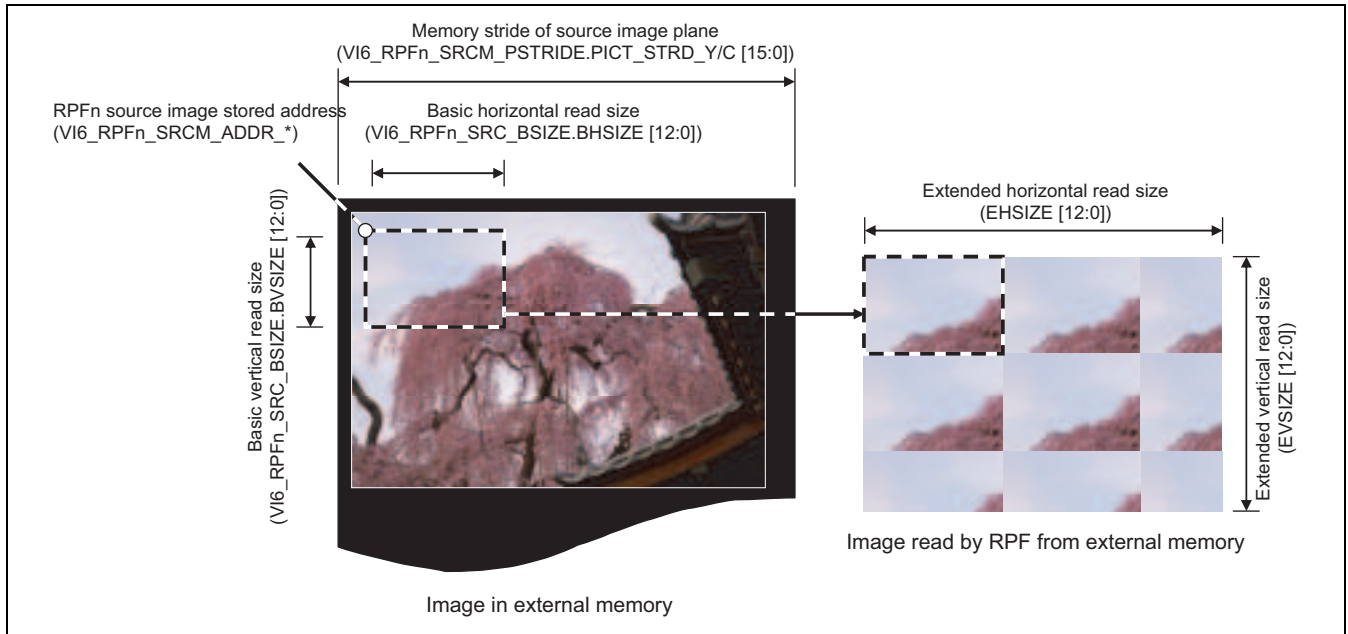

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28 to 16	BHSIZE [12:0]	H'0000	R/W	Horizontal Size of RPF Basic Read Area These bits specify the horizontal size of the basic area to be read from the external RAM by the RPFn. When the input format is YCbCr4:2:2 or YCbCr4:2:0, specify the size in 2-pixel units. A value from 1 to 8,190 can be specified. Specify a value equal to or smaller than the extended read size (VI6_RPFn_SRC_ESIZE.EHSIZE).
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12 to 0	BVSIZ [12:0]	H'0000	R/W	Vertical Size of RPF Basic Read Area These bits specify the vertical size of the basic area to be read from the external RAM by the RPFn. When the input format is YCbCr4:2:0, specify the size in 2-pixel units. A value from 1 to 8,190 can be specified. Specify a value equal to or smaller than the extended read size (VI6_RPFn_SRC_ESIZE.EVSIZE).

Figure 28.16 shows the relationship between the basic read size and extended read size. The RPF reads data from the source memory area specified by the basic read size. The RPF repeats reading the basic read area in the horizontal and vertical directions up to the extended read size and sends the read data to the processing modules in the VSP1.

For basic read size reading, the reading start address, called the RPFn source image storing address, should be specified in VI6\_RPFn\_SRCM\_ADDR\_\*. In the memory area where the basic read area image is stored, the distance (number of bytes) between addresses for lines n and n + 1 of two-dimensional image data, called the memory stride, should be specified in VI6\_RPFn\_SRCM\_PSTRIDE.

**Figure 28.16 Relationship between Basic Read Size and Extended Read Size**

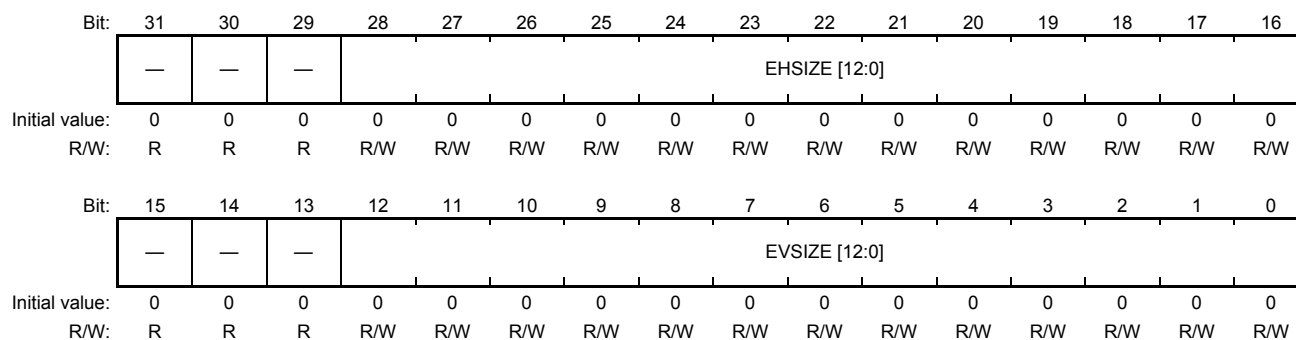

Refer also to the following sections.

- Section 28.2.7.2, RPFn Extended Read Size Registers (VI6\_RPFn\_SRC\_ESIZE)
- Section 28.2.7.13, RPFn Source Picture Memory Stride Setting Registers (VI6\_RPFn\_SRCM\_PSTRIDE)
- Section 28.2.7.15, RPFn Source Y/RGB Address Registers (VI6\_RPFn\_SRCM\_ADDR\_Y)
- Section 28.2.7.16, RPFn Source Chroma Address Registers 0 (VI6\_RPFn\_SRCM\_ADDR\_C0)
- Section 28.2.7.17, RPFn Source Chroma Address Registers 1 (VI6\_RPFn\_SRCM\_ADDR\_C1)

### 28.2.7.2 RPFn Extended Read Size Registers (VI6\_RPFn\_SRC\_ESIZE)

Note: See Table 28.15 for details on which RZ/G series products have which registers.

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28 to 16	EHSIZE [12:0]	H'0000	R/W	RPF Extended Horizontal Read Size These bits specify the horizontal size of the extended read area to which the RPFn reads data from the external RAM. As shown in Figure 28.16, the basic read area image is repeatedly placed in the extended read area; in the EHSIZE bits, specify a value not smaller than the horizontal size of the basic read area. When the input format is YCbCr4:2:2 or YCbCr4:2:0, specify the size in 2-pixel units (an even value). A value from 1 to 8,190 can be specified.
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12 to 0	EVSIZE [12:0]	H'0000	R/W	RPF Extended Vertical Read Size These bits specify the vertical size of the extended read area to which the RPFn reads data from the external RAM. As shown in Figure 28.16, the basic read area image is repeatedly placed in the extended read area; in the EVSIZE bits, specify a value not smaller than the vertical size of the basic read area. When the input format is YCbCr4:2:0, specify the size in 2-pixel units (an even value). A value from 1 to 8,190 can be specified.

VI6\_RPFn\_SRC\_ESIZE specifies the extended size for RPFn. The extended horizontal and vertical sizes should be equal to or greater than the basic sizes specified in VI6\_RPFn\_SRC\_BSIZE. The RPF internal data processing described later and image processing described in section 28.2.9 and later sections are all applied to the image in the extended read size shown on the right side in Figure 28.16.

### 28.2.7.3 RPFn Input Format Registers (VI6\_RPFn\_INFMT)

Note: See Table 28.15 for details on which RZ/G series products have which registers.

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	VIR	0	R/W	Virtual Input Enable Enables or disables the virtual input function of the RPFn. The image to be processed by the RPFn is usually read from the external memory by the MAU. Instead of this input, the virtual input function generates a single-color image within the RPFn and sends it to the modules in VSP1. When the virtual input function is enabled, the fixed value specified in VI6_RPFn_VRTCOL_SET is used as the input to the RPFn. While the virtual input function is enabled, data is not read from the external memory; that is, the $\alpha$ plane is not read and the IROP calculation thus cannot be executed. In this case, set VI6_RPFn_ALPH_SEL.ASEL to 4. Neither the color space conversion through CSC nor the color keying described in section 28.2.7.11 can be used. 0: RPFn uses general input. 1: RPFn uses virtual input.
27 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	CIPM	0	R/W	Horizontal Chrominance Interpolation Method Setting Image data is processed in the YCbCr444 format inside VSP1 in case of YCbCr color space. When the chrominance format of the input image is YCbCr422 or YCbCr420, data is upsampled as shown in Figure 28.17 for internal processing. This bit specifies the method of upsampling for this purpose. 0: The nearest-neighbor method is used for horizontal chrominance interpolation. 1: The bilinear method is used for horizontal chrominance interpolation.

Bit	Bit Name	Initial Value	R/W	Description
15	SPYCS	0	R/W	<p>RPF Input Mode Setting 1</p> <p>When the input format is YUY2, set this bit to 1 and set the RDFMT bits to 71 (H'47).</p> <p>When the input format is YVYU, set this bit and the SPUVS bit to 1 and set the RDFMT bits to 71 (H'47).</p> <p>In other cases, set this bit to 0.</p>
14	SPUVS	0	R/W	<p>RPF Input Mode Setting 2</p> <p>When the input format is NV61, set this bit to 1 and set the RDFMT bits to 65 (H'41).</p> <p>When the input format is NV21, set this bit to 1 and set the RDFMT bits to 66 (H'42).</p> <p>When the input format is YVYU, set this bit and the SPYCS bit to 1 and set the RDFMT bits to 71 (H'47).</p> <p>In other cases, set this bit to 0.</p>
13, 12	CEXT[1:0]	00	R/W	<p>Lower-Bit Color Data Extension Method Setting</p> <p>When an RGB input format where each color component is expressed in less than eight bits are selected from Table 28.18 through the RDFMT bits, VSP1 internally extends each color component to eight bits before using the data. These bits select this extension method.</p> <p>00: Lower-order bits of color data are extended with 0.</p> <p>01: Upper-order bits of color data are copied to the lower -order bits.</p> <p>10: Lower-order bits of color data are extended with 0. The maximum value is limited to H'FF.</p> <p>11: Setting prohibited</p>
11 to 9	RDTM[2:0]	000	R/W	<p>CSC Conversion Expression Setting</p> <p>These bits select the expression used for color space conversion. The conversion direction is RGB → YCbCr when RGB is selected through the RDFMT bits; the direction is YCbCr → RGB when YCbCr is selected.</p> <p>000: BT.601 YCbCr [16,235/240] ↔ RGB [0,255]</p> <p>001: BT.601 YCbCr [0,255] ↔ RGB [0,255]</p> <p>010: BT.709 YCbCr [16,235/240] ↔ RGB [0,255]</p> <p>011: BT.709 YCbCr [16,235/240] ↔ RGB [16,235]</p> <p>100 to 111: Setting prohibited</p>
8	CSC	0	R/W	<p>Color Space Conversion Enable</p> <p>Enables or disables color space conversion between YCbCr and RGB to be executed in RPFn. The characteristics of color space conversion are determined by the RDTM bit setting. *</p> <p>When using the virtual input (VIR = 1), specify 0.</p> <p>0: Color space conversion is disabled.</p> <p>1: Color space conversion is enabled.</p>
7	—	0	R	<p>Reserved</p> <p>This bit is always read as 0. The write value should always be 0.</p>

Bit	Bit Name	Initial Value	R/W	Description
6 to 0	RDFMT [6:0]	H'00	R/W	<p>RPF Input Image Format Setting</p> <p>These bits select the format of the image input from the external RAM to the RPFn. Select a value corresponding to the desired format from those shown in Tables 28.18 and 28.19.</p> <p>When the virtual input function is used (VIR = 1), the color information for the virtual input should be specified in VI6_RPFn_VRTCOL_SET. If this color information is in the RGB format, set the RDFMT bits to 19. If the color information is in the YCbCr format, set these bits to 64.</p> <p>Notes: 1. Number of input pixels</p> <p>When YCbCr4:2:2 is selected through the RDFMT bits, the horizontal size of the input image should be specified in 2-pixel units. When YCbCr4:2:0 is selected, the vertical and horizontal sizes should be specified in 2-pixel units. Observe these restrictions when specifying the image size in VI6_RPFn_SRC_BSIZE and VI6_RPFn_SRC_ESIZE.</p> <p>2. CLUT Setting</p> <p>When the RDFMT bits are set to H'3F, RGB color data should be stored in the CLUT. When these bits are set to H'7F, YCbCr color data should be stored in the CLUT. Note that while the target WPF is operating, the RPF is also operating and the CLUT cannot be read or written to.</p>

Note: \* Note on color space settings

**Figure 28.17 Chrominance Interpolation Methods Selectable through CIPM Setting**

The color space for the image output from the RPF to VSP1 internal modules is determined by the combination of the color space for the image input to the RPF, which is selected through the VI6\_RPFn\_INFMT.RDFMT setting, and the enabled or disabled state of the color space conversion function, which is selected through the VI6\_RPFn\_INFMT.CSC setting (Table 28.17). For example, when the image input to the RPF is in the YCbCr format, the RPF outputs data to VSP1 internal modules in the YCbCr format if color space conversion is disabled through the CSC bit, and the RPF outputs data in the RGB format if color space conversion is enabled. When the image input to the RPF is in the RGB format, the relationship between the output format and the color space conversion setting is the opposite of the YCbCr case. For some VSP1 internal modules, the YCbCr format is recommended for image processing because of the characteristics of the processing, or the same color space needs to be specified between multiple RPF outputs. In these cases, set VI6\_RPFn\_INFMT.RDFMT and VI6\_RPFn\_INFMT.CSC appropriately so that the RPFs can output the required color space according to the color space conditions described above.

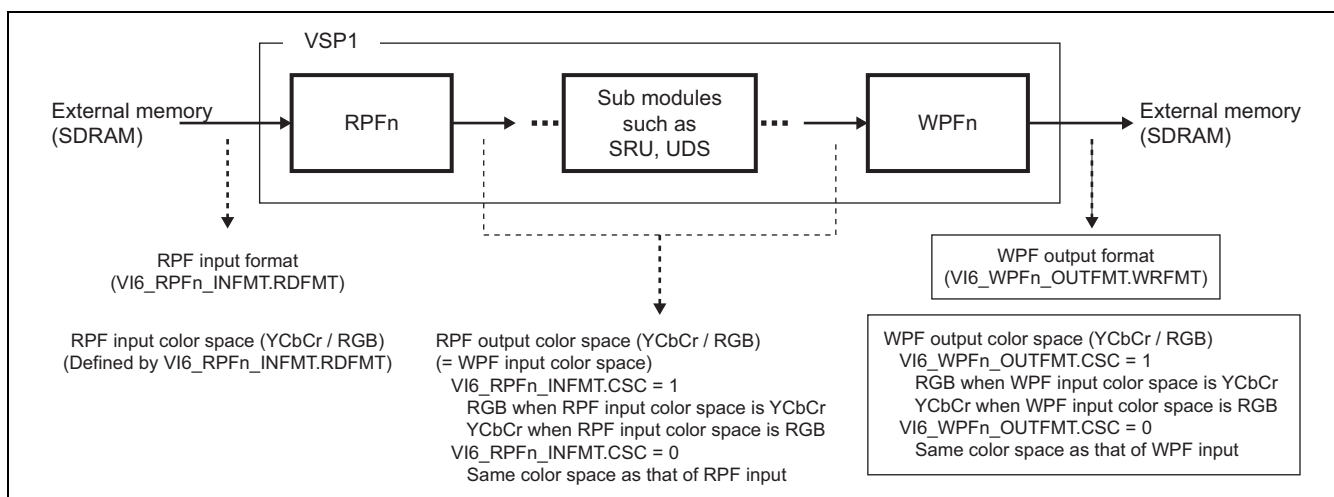

**Table 28.17 RPFn Input Color Space and Output Color Space**

RPFn Input Color Space (VI6_RPFn_INFMT.RDFMT)		Color Space Conversion Setting (VI6_RPFn_INFMT.CSC)		RPFn Output Color Space
RGB	(H'00 to H'3F)*	Disabled	(0) *	RGB
		Enabled	(1) *	YCbCr
YCbCr	(H'40 to H'7F)*	Disabled	(0) *	YCbCr
		Enabled	(1) *	RGB

Note: \* Value specified in the register

A color space conversion function equivalent to that in the RPFn is also provided by the WPF. As shown in Table 28.17, the color space (YCbCr or RGB) output from the RPF becomes the input format for the WPF. Here, the color space of the output image obtained by the color space conversion function of the WPF must match the color space of the format specified through VI6\_WPFn\_OUTFMT.WRFMT.

Figure 28.18 shows the relationship between the input/output format and color space. The input color space for the RPF is determined when the input image format for the RPF is specified through the RDFMT bits. The color space for the image output from the RPF to subsequent VSP1 internal modules depends on the combination of the RPF input format and CSC (color space conversion function) enabled or disabled state in the RPF as shown in Table 28.17 and Figure 28.18. The user should first determine whether the image processing in the VSP1 is done in YCbCr or RGB, and then specify the RPF input format and CSC enabled or disabled state to obtain the desired color space. The color space of the RPF output image is also that of the WPF input image; the color space of the data output from the WPF to the outside of VSP1 depends on the combination of the WPF input color space and the enabled or disabled state of the CSC implemented in the WPF as shown in Figure 28.18. The color space of the WPF output image must match that of the WPF output format (determined by VI6\_WPFn\_OUTFMT.WRFMT). For example, in the flow shown in Figure 28.18, YCbCr should not be specified as the WPF output format regardless of the fact that the color space of the WPF output image is in RGB format.

**Figure 28.18 Relationship between Input/Output Format and Color Space**

**Table 28.19 Packed YCbCr Formats for RPF Input**

<b>RDFMT [6:0]</b>	<b>Packed YCbCr Input Format</b>	<b>Reference</b>
H'40	YCbCr4:4:4 semi-planar	Figure 28.19
H'41	YCbCr4:2:2 semi-planar (NV16, NV61* <sup>1</sup> )	
H'42	YCbCr4:2:0 semi-planar (NV12, NV21* <sup>1</sup> )	
H'43 to H'45	Reserved	—
H'46	YCbCr4:4:4 interleaved	Figure 28.20
H'47	YCbCr4:2:2 interleaved type 0 (UYVY, YUY2* <sup>2</sup> , YVYU* <sup>3</sup> )	
H'48	YCbCr4:2:2 interleaved type 1	
H'49	YCbCr4:2:0 interleaved	
H'4A	YCbCr4:4:4 planar	Figure 28.21
H'4B	YCbCr4:2:2 planar (YV16)	
H'4C	YCbCr4:2:0 planar (YV12, YU12)	
H'4D to H'7E	Reserved	—
H'7F	YCBCR_CLUT_DATA* <sup>4</sup> * <sup>5</sup>	—

- Notes:
1. When the input format is NV61 or NV21, set the SPUVS bit to 1.
  2. When the input format is YUY2, set the SPYCS bit to 1.
  3. When the input format is YVYU, set the SPUVS bit to 1 and SPYCS bit to 1.
  4. When the RDFMT[6:0] bits are set to H'7F, it is necessary to set up the CLUT in the YCbCr color space.
  5. The Monochrome format can be implemented through the CLUT.

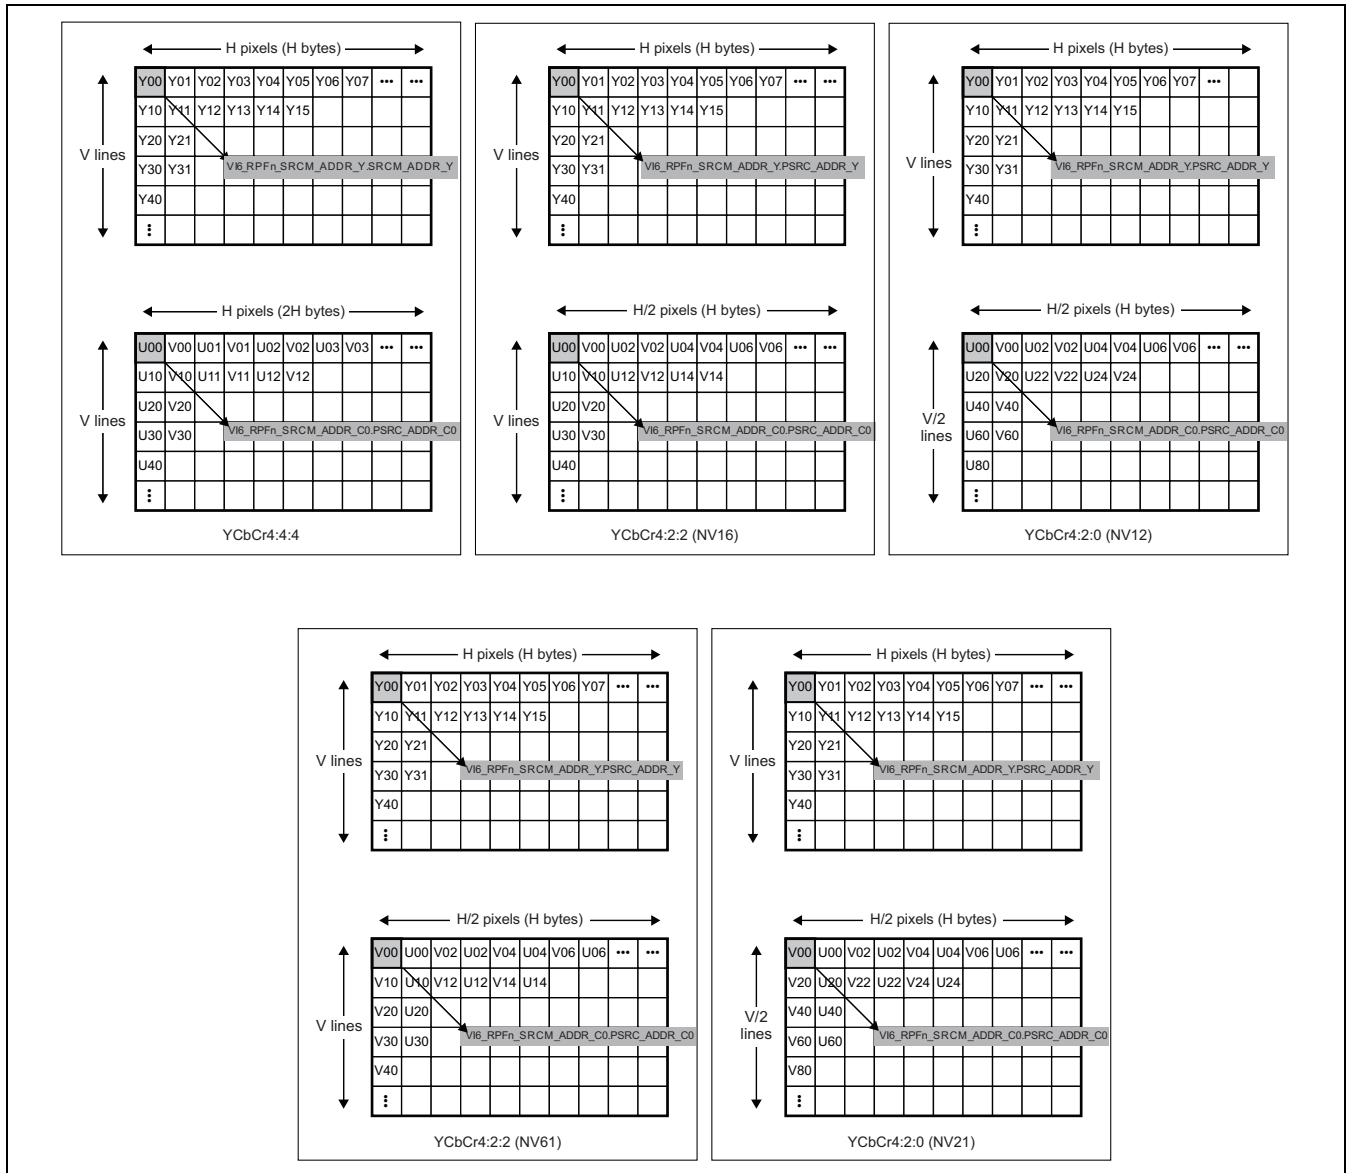

Figure 28.19 YCbCr Semi-Planar Formats

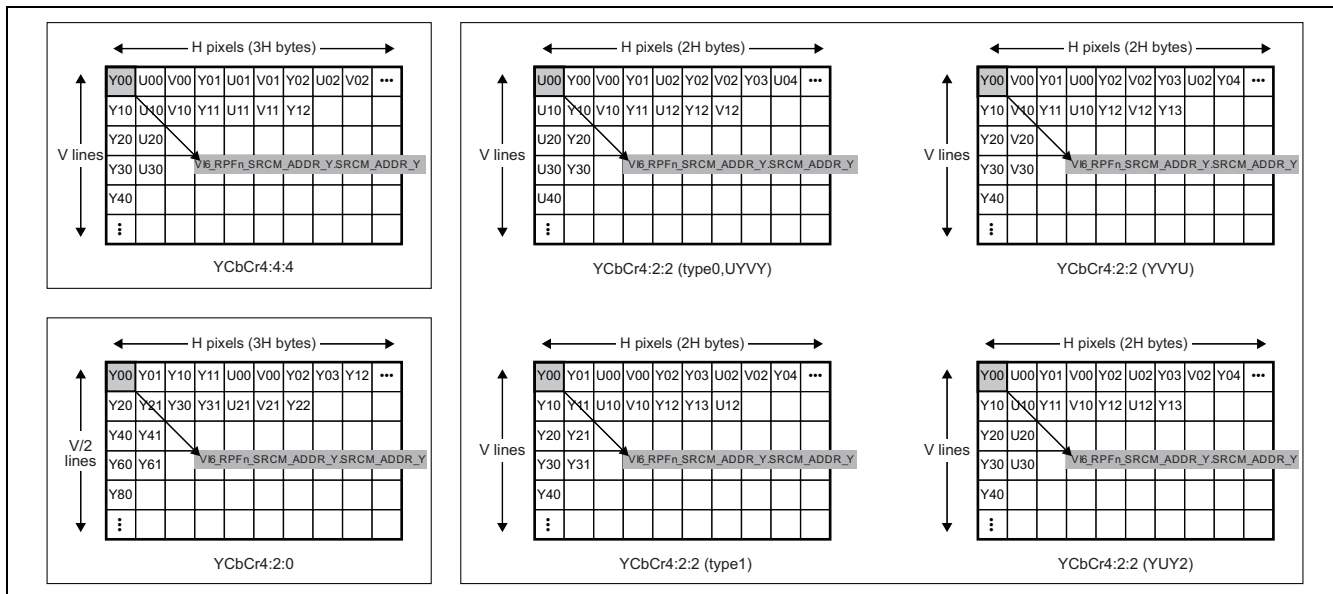

Figure 28.20 YCbCr Interleaved Formats

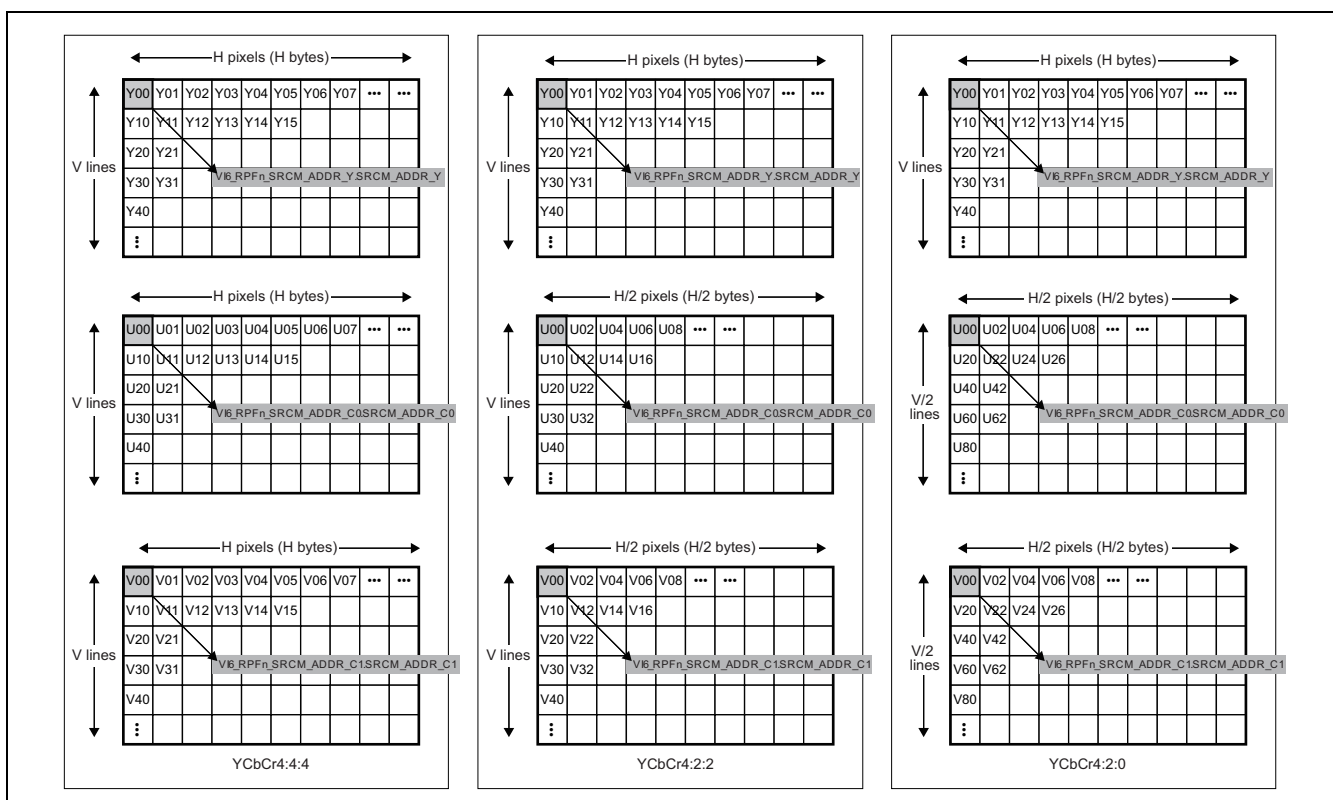

Figure 28.21 YCbCr Planar Formats

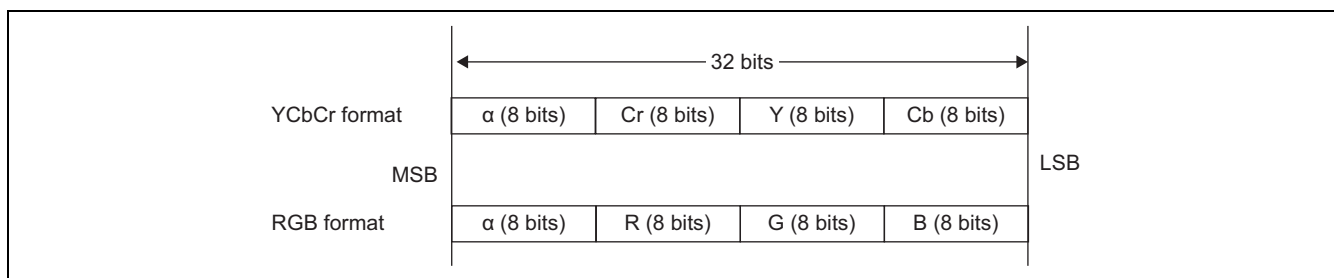

**[CLUT Setting]**

To set up the CLUT, store the values to replace each of R (Cr), G (Y), and B (Cb) components in the CLUT allocated as shown in Table 28.20. The CLUT space has 256 32-bit entries, which should be accessed in 32 bits in the same way as for register access. The address for each entry is obtained from the start address of each space (Table 28.20) + entry number × 4. For example, the CLUT address of entry 7 for RPF2 is \$VSP\_BASE + H'481C.

Figure 28.22 shows the CLUT format.

**Table 28.20 CLUT Space for Each RPF**

RPF	Address Area for CLUT Space
RPF0	\$VSP_BASE + H'4000 to \$VSP_BASE + H'43FF
RPF1	\$VSP_BASE + H'4400 to \$VSP_BASE + H'47FF
RPF2	\$VSP_BASE + H'4800 to \$VSP_BASE + H'4BFF
RPF3	\$VSP_BASE + H'4C00 to \$VSP_BASE + H'4FFF
RPF4	\$VSP_BASE + H'5000 to \$VSP_BASE + H'53FF

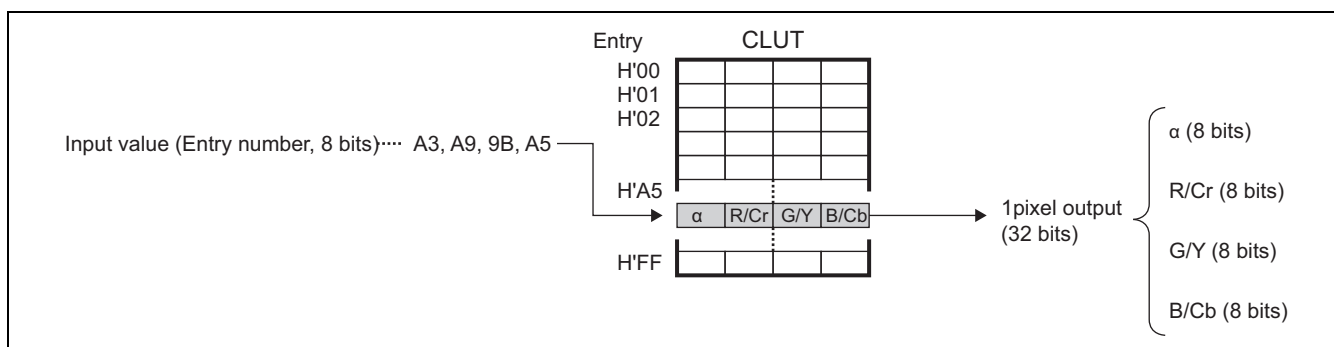

**Figure 28.22 CLUT Format**

According to the specified 256-entry replacement table (CLUT), input data is replaced as shown in Figure 28.23. Input data is eight bits but output data is 32 bits including  $\alpha$  and RGB or YCbCr components.

When writing to an entry in the CLUT, the host CPU writes all components at the same time. Therefore, specify replacement data for all components in the CLUT at the same time as shown in Figure 28.22.

Note that write access to the CLUT space is prohibited while the RPF is operating.

**Figure 28.23 Replacement of Input Data with Pixel Values Specified in CLUT**

### 28.2.7.4 RPFn Data Swapping Registers (VI6\_RPFn\_DSWAP)

Note: See Table 28.15 for details on which RZ/G series products have which registers.

### 28.2.7.5 RPFn Display Location Registers (VI6\_RPFn\_LOC)

Note: See Table 28.15 for details on which RZ/G series products have which registers.

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28 to 16	HCOORD [12:0]	All 0	R/W	Horizontal Coordinate of Sub layer Display Location on Master Layer These bits specify the left-end location of the sub layer displayed by the RPFn and the subsequent module connected through the DPR. Specify the horizontal coordinate of the location in pixel units with the left-end pixel of the master layer set at coordinate 0. When the RPFn is the master layer, set these bits to 0.  If the sub layer extends beyond the master layer according to the HCOORD setting, the extended section is cut off at the right end of the master layer. Even in this case, however, a bus transfer that is unnecessary for output image generation is executed since the whole sub layer data is read from the external memory. Appropriate coordinate setting is recommended so that the sub layer does not extend beyond the right end of the master layer.  If the HCOORD value is larger than the horizontal size of the master layer image, the entire sub layer goes outside of the master layer. Such setting is prohibited.  A value from 0 to 8,189 can be specified.
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
12 to 0	VCOORD [12:0]	All 0	R/W	<p>Vertical Coordinate of Sub layer Display Location on Master Layer</p> <p>These bits specify the top-end location of the sub layer displayed by the RPFn and the subsequent module connected through the DPR. Specify the vertical coordinate of the location in pixel units with the top-end pixel of the master layer set at coordinate 0. When the RPFn is the master layer, set these bits to 0.</p> <p>If the sub layer extends beyond the master layer according to the VCOORD setting, the extended section is cut off at the bottom end of the master layer. Even in this case, however, a bus transfer that is unnecessary for output image generation is executed since the whole sub layer data is read from the external memory. Appropriate coordinate setting is recommended so that the sub layer does not extend beyond the bottom end of the master layer.</p> <p>If the VCOORD value is larger than the vertical size of the master layer image, the entire sub layer goes outside of the master layer. Such setting is prohibited.</p> <p>A value from 0 to 8,189 can be specified.</p>

Figure 28.24 shows an example of RPF1 and RPF2 offsets with respect to master layer RPF0. Although this figure only shows sub layers RPF1 and RPF2, specify offsets for all RPFs other than the master layer in the same way as shown in this example.

Whether an RPFn is the master layer or a sub layer is determined through the selection of the source RPF for WPFn (the VI6\_WPFn\_SRCRPF setting). For details, refer to section 28.2.8.1.

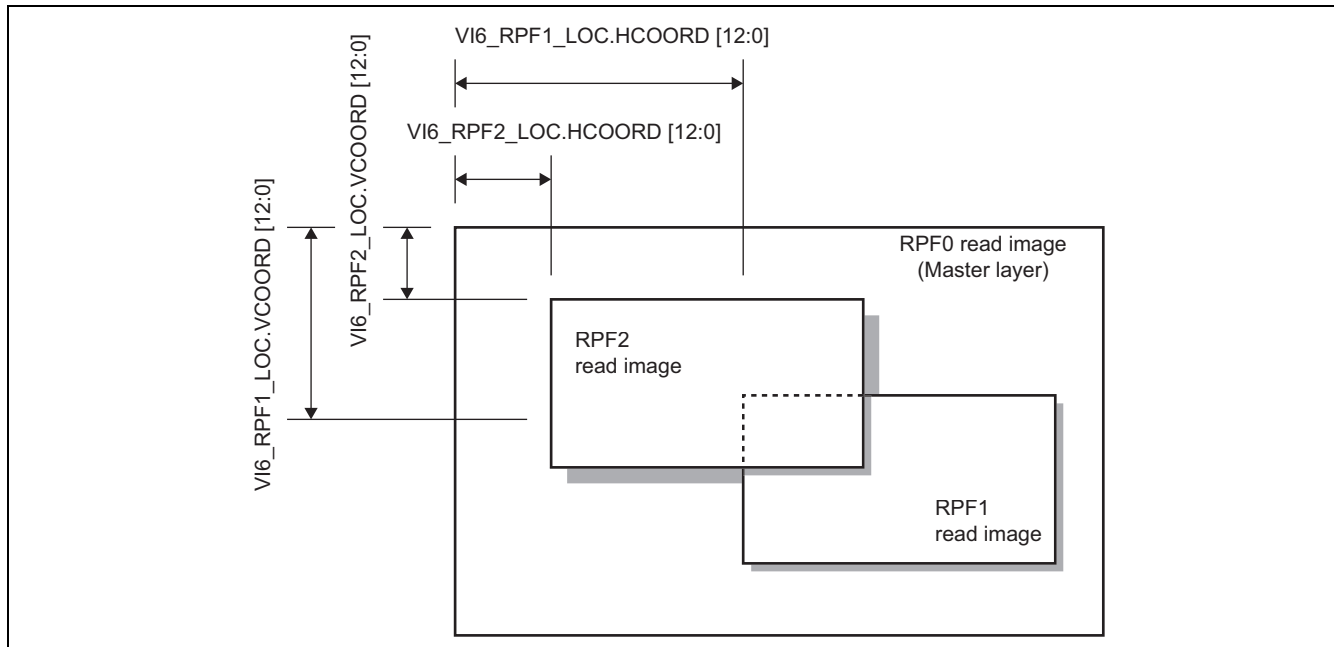

Figure 28.24 RPF1 and RPF2 Offsets from Master Layer

### 28.2.7.6 RPFn $\alpha$ Plane Selection Control Registers (VI6\_RPFn\_ALPH\_SEL)

Note: See Table 28.15 for details on which RZ/G series products have which registers.

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
30 to 28	ASEL[2:0]	000	R/W	<p><math>\alpha</math> Format and Processing Method Select</p> <p>These bits select how to handle the <math>\alpha</math> value to be used. The RPF handles two types of <math>\alpha</math> value; 8-bit and 1-bit values. When a 1-bit <math>\alpha</math> value is used, VSP1 assumes that the 1-bpp <math>\alpha</math> value for each pixel is stored in the order from MSB to LSB in each byte (big endian).</p> <p>The <math>\alpha</math> value is used as either transparency information or mask information. Transparency information is included in the <math>\alpha</math> plane read from external memory when the ASEL bits are set to 1 or 3 and in the <math>\alpha</math> value stored in the packed RGB bit field when these bits are set to 0 or 2. The <math>\alpha</math> value as transparency information is sent as the destination value to the IROP as shown in Figure 28.25 and then output to the subsequent modules. The output <math>\alpha</math> value is used, for example, for blending in the BRU.</p> <p>The <math>\alpha</math> value as mask information is used for IROP operation in the RPF. The mask information is included in the <math>\alpha</math> plane read from external RAM when the ASEL bits are set to 0 or 2 and the source value is used in IROP operation (IROP setting other than 0, 5, 10, or 15). This <math>\alpha</math> value is sent as the source value to the IROP as shown in Figure 28.25.</p> <p>Note that the <math>\alpha</math> value selected through the ASEL bits has a lower priority than the VI6_RPFn_CKEY_SET*.AP* value replaced through the color keying function. When the color keying function is used, the <math>\alpha</math> value may be replaced with the VI6_RPFn_CKEY_SET*.AP* value regardless of the ASEL bit setting.</p> <p>When using the virtual input function (VI6_RPFn_INFMT.VIR = 1), specify 4.</p>

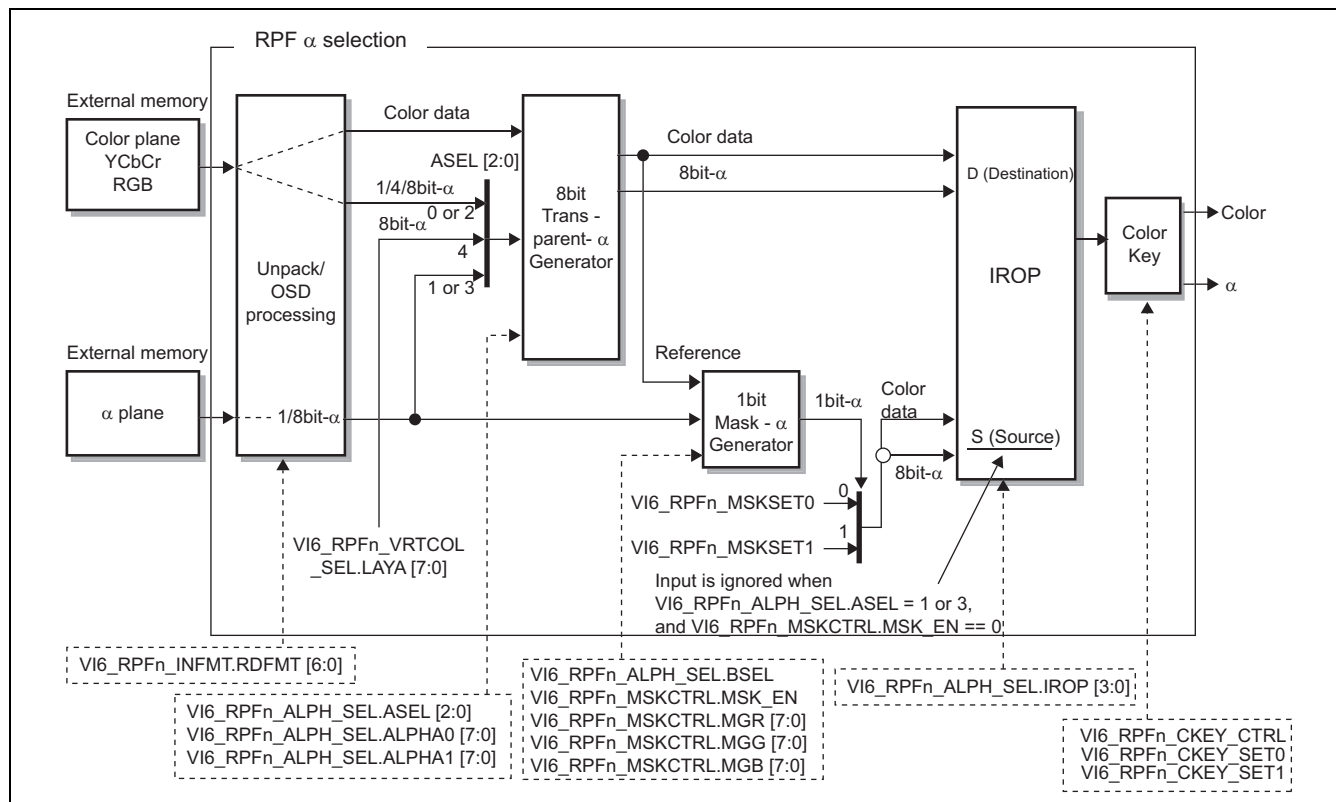

Bit	Bit Name	Initial Value	R/W	Description
30 to 28	ASEL[2:0]	000	R/W	<p><u>000: 1, 4, or 8-bit packed <math>\alpha</math> + plane <math>\alpha</math> (IROP ! = 0, 5, 10, 15)</u></p> <p>The <math>\alpha</math> bit field in 1, 4, or 8-bit packed <math>\alpha</math> is handled as transparency information. Be sure to specify the packed format that includes <math>\alpha</math> through VI6_RPFn_INFMT.RDFMT.</p> <p>When VI6_RPFn_MSKCTRL.MSK_EN is 0 and the IROP bit value is not 0, 5, 10, or 15, the <math>\alpha</math> plane should be read as mask information. Specify the number of <math>\alpha</math> data bits (BSEL) stored in the <math>\alpha</math> plane and the <math>\alpha</math> plane read start address (VI6_RPFn_SRCM_ADDR_AI). When the IROP bits are set to 0, 5, 10, or 15, the <math>\alpha</math> plane is not read.</p> <p><u>001: 8-bit plane <math>\alpha</math></u></p> <p>The 8-bit <math>\alpha</math> plane is read from external RAM as transparency information. When the packed RGB format has a bit field for <math>\alpha</math>, the information in the <math>\alpha</math> bit field is discarded. The <math>\alpha</math> plane read start address (VI6_RPFn_SRCM_ADDR_AI) should be specified. The <math>\alpha</math> value goes through the 8-bit transparent <math>\alpha</math> generator shown in Figure 28.25 without change.</p> <p>When VI6_RPFn_MSKCTRL.MSK_EN is 0, IROP operation cannot be executed; set the IROP bits to 0 in this case. When VI6_RPFn_MSKCTRL.MSK_EN is 1, IROP operation can be executed.</p> <p><u>010: 1-bit packed <math>\alpha</math> + plane <math>\alpha</math> (IROP ! = 0, 5, 10, 15)</u></p> <p>The 1-bit packed <math>\alpha</math> input is converted by the 8-bit transparent <math>\alpha</math> generator shown in Figure 28.25 according to the ALPHA0/1 setting into the 8-bit <math>\alpha</math> value as transparency information. Select the packed input format that includes a 1-bit <math>\alpha</math> field.</p> <p>When VI6_RPFn_MSKCTRL.MSK_EN is 0 and the IROP value is not 0, 5, 10, or 15, the <math>\alpha</math> plane should be read as mask information. Specify the number of <math>\alpha</math> data bits (BSEL) stored in the <math>\alpha</math> plane and the <math>\alpha</math> plane read start address (VI6_RPFn_SRCM_ADDR_AI). When the IROP bits are set to 0, 5, 10, or 15, the <math>\alpha</math> plane is not read.</p> <p><u>011: 1-bit plane <math>\alpha</math></u></p> <p>The 1-bit <math>\alpha</math> plane is read from external RAM and converted by the 8-bit transparent <math>\alpha</math> generator shown in Figure 28.25 according to the ALPHA0/1 setting into the 8-bit <math>\alpha</math> value as transparency information. When the packed RGB format has a bit field for <math>\alpha</math>, the information in the <math>\alpha</math> bit field is discarded. The <math>\alpha</math> plane read start address (VI6_RPFn_SRCM_ADDR_AI) should be specified.</p> <p>When VI6_RPFn_MSKCTRL.MSK_EN is 0, IROP operation cannot be executed; set the IROP bits to 0 in this case. When VI6_RPFn_MSKCTRL.MSK_EN is 1, IROP operation can be executed.</p> <p><u>100: Fixed <math>\alpha</math></u></p> <p>The fixed <math>\alpha</math> value (VI6_RPFn_VRTCOL_SET.LAYA value) is output from the RPF. IROP operation cannot be executed; set the IROP bits to 0 in this case.</p> <p><u>101 to 111: Setting prohibited.</u></p>

Bit	Bit Name	Initial Value	R/W	Description
27 to 24	IROP[3:0]	0000	R/W	<p>IROP Operation Setting</p> <p>These bits specify the operator to be executed in the IROP operation unit shown in Figure 28.25. The source (S) for the IROP operation is the pixel data and <math>\alpha</math> data specified in the VI6_RPFn_MSKSET0 or VI6_RPFn_MSKSET1 IROP input value register, which is selected according to the value (0 or 1) generated by the 1-bit mask generator. The destination (D) is the image data (RGB/YCbCr) and 8-bit <math>\alpha</math> data output from the unpack/OSD processor. IROP operation is applied both for the image data and <math>\alpha</math> data between the source and destination data.</p> <p>If these bits are set to the operation that involves the source (S) (IROP setting other than 0, 5, 10, or 15) while VI6_RPFn_MSKCTRL.MSK_EN is 0, the <math>\alpha</math> plane is read from the external RAM to be used for the <math>\alpha</math> value for IROP operation; specify the <math>\alpha</math> plane read start address (VI6_RPFn_SRCM_ADDR_A).</p> <p>When the virtual input function is used (VI6_RPFn_INFMT.VIR = 1), IROP operation is not available; set these bits to B'0000.</p> <p>0000: NOP(D)  0001: AND(S &amp; D)  0010: AND_REVERSE(S &amp; ~D)  0011: COPY(S)  0100: AND_INVERTED(~S &amp; D)  0101: CLEAR(0)  0110: XOR(S ^ D)  0111: OR(S   D)  1000: NOR(~(S   D))  1001: EQUIV(~(S ^ D))  1010: INVERT(~D)  1011: OR_REVERSE(S   ~D)  1100: COPY_INVERTED(~S)  1101: OR_INVERTED(~S   D)  1110: NAND(~(S &amp; D))  1111: SET(all 1)</p>
23	BSEL	0	R/W	<p><math>\alpha</math> Bit Count Conversion Selection for 1-Bit Mask Generator</p> <p>Specifies the number of bits in the <math>\alpha</math> plane to be read as mask information from the external RAM. The <math>\alpha</math> value in mask information is used for the source (S) in IROP. When <math>\alpha</math> plane data is eight bits, it is converted to one bit through the 1-bit mask generator shown in Figure 28.25.</p> <p>Note that this bit setting is valid when the ASEL bits are set to 0 or 2 and VI6_RPFn_MSKCTRL.MSK_EN is set to 0. In other cases, this bit setting has no effect.</p> <p><u>0: 8-bit <math>\alpha</math> is converted to 1-bit <math>\alpha</math> through the 1-bit mask generator.</u>  When the 8-bit <math>\alpha</math> value input to the RPF is not 0, it is converted to 1; when the value is 0, it is converted to 0.</p> <p><u>1: <math>\alpha</math> value goes through the 1-bit mask generator.</u>  The 1-bit <math>\alpha</math> value input to the RPF is output through the 1-bit mask generator without change.</p>
22 to 20	—	000	R	<p>Reserved</p> <p>These bits are always read as 0. The write value should always be 0.</p>

Bit	Bit Name	Initial Value	R/W	Description
19, 18	AEXT[1:0]	00	R/W	<p>Lower-Bit <math>\alpha</math> Value Extension Method Set</p> <p>These bits specify the method for extending the input <math>\alpha</math> data to eight bits through the unpack processing.</p> <p>00: The lower-order bits of <math>\alpha</math> value are extended with 0.</p> <p>01: The upper-order bits of <math>\alpha</math> value are copied to the lower-order bits.</p> <p>10: The lower-order bits of <math>\alpha</math> value are extended with 0. The maximum value is limited to H'FF.</p> <p>11: Setting prohibited</p>
17, 16	—	All 0	R	<p>Reserved</p> <p>These bits are always read as 0. The write value should always be 0.</p>
15 to 8	ALPHA1 [7:0]	H'00	R/W	<p>8-Bit <math>\alpha</math> Value Output when 1-Bit <math>\alpha</math> Value is 1</p> <p>These bits specify the 8-bit <math>\alpha</math> value to be output when 1-bit <math>\alpha</math> data is input and the <math>\alpha</math> value input to the 8-bit transparent <math>\alpha</math> generator shown in Figure 28.25 is 1. This setting is valid when the ASEL bits are set to B'010 or B'011.</p> <p>A value from 0 to 255 can be specified.</p>
7 to 0	ALPHA0 [7:0]	H'00	R/W	<p>8-Bit <math>\alpha</math> Value Output when 1-Bit <math>\alpha</math> Value is 0</p> <p>These bits specify the 8-bit <math>\alpha</math> value to be output when 1-bit <math>\alpha</math> data is input and the <math>\alpha</math> value input to the 8-bit transparent <math>\alpha</math> generator shown in Figure 28.25 is 0. This setting is valid when the ASEL bits are set to B'010 or B'011.</p> <p>A value from 0 to 255 can be specified.</p>

Figure 28.25 shows the relationship between the  $\alpha$  selector, IROP operation unit, color keying unit, and related registers (color space conversion is omitted but is behind the color keying unit as shown in Figure 28.3). The IROP operation unit receives two inputs, source and destination. The image data input from the external memory is processed through the unpack processor and 8-bit transparent  $\alpha$  generator and then input to the IROP operation unit as destination data. The  $\alpha$  plane data input from the external memory is sent to the 8-bit transparent  $\alpha$  generator when the ASEL bits are set to 1 or 3, or sent to the 1-bit mask  $\alpha$  generator when the ASEL bits are set to 0 or 2. For the pixel data and 8-bit  $\alpha$  value on the source side of the IROP operation unit, either the VI6\_RPFn\_MSKSET0 value or VI6\_RPFn\_MSKSET1 values will be selected according to the 1-bit  $\alpha$  value output by the 1-bit mask  $\alpha$  generator.

**Figure 28.25 Configuration of  $\alpha$  Selector and IROP Operation Unit in RPF**

The following describes the function of each block shown in Figure 28.25. Read the following while referring to the figure as necessary.

#### Unpack/OSD processor:

Unpacks each component and  $\alpha$  value of the image data according to the packed format specified in VI6\_RPFn\_INFMT.RDFMT.

#### 8-bit transparent $\alpha$ generator:

Converts the input  $\alpha$  value into 8-bit  $\alpha$  when the input  $\alpha$  is four bits or one bit.

When VI6\_RPFn\_ALPH\_SEL.ASEL are set to 0 (8-, 4-, or 1-bit packed  $\alpha$ ), this generator outputs the input  $\alpha$  value without change if the  $\alpha$  bit field in the packed  $\alpha$  data is eight bits; if the  $\alpha$  bit field is less than eight bits, it is converted to an 8-bit  $\alpha$  value by extending the LSB side according to the VI6\_RPFn\_ALPH\_SEL.AEXT setting.

When VI6\_RPFn\_ALPH\_SEL.ASEL are set to 1 (8-bit plane  $\alpha$ ) or 4 (fixed  $\alpha$ ), this generator outputs the input 8-bit plane  $\alpha$  without change. If a packed  $\alpha$  value is included in RGB data, it is discarded.

When VI6\_RPFn\_ALPH\_SEL.ASEL are set to 2 (1-bit packed  $\alpha$ ) or 3 (8-bit  $\alpha$  generated from 1-bit plane  $\alpha$ ), an 8-bit  $\alpha$  value is generated by using the VI6\_RPFn\_ALPH\_SEL.ALPHA0[7:0] value when the input 1-bit  $\alpha$  value is 0 or by using the VI6\_RPFn\_ALPH\_SEL.ALPHA1[7:0] value when the input 1-bit  $\alpha$  value is 1. When VI6\_RPFn\_ALPH\_SEL.ASEL is set to 3, a packed  $\alpha$  value that is included in RGB data is discarded.

**1-bit mask  $\alpha$  generator:**

Generates 1-bit  $\alpha$  data from the input 8-bit  $\alpha$  data or pixel data. When the input  $\alpha$  data is one bit, this generator outputs it without change.

When VI6\_RPFn\_ALPH\_SEL.ASEL are set to 0 (8-, 4-, or 1-bit packed  $\alpha$ ) or 2 (plane  $\alpha$ ) and VI6\_RPFn\_MSKCTRL.MSK\_EN is set to 0, the  $\alpha$  plane read from the external memory to be used in IROP is converted to 1-bit  $\alpha$  data when necessary. When the  $\alpha$  plane data read from the external RAM is eight bits (BSEL = 0), if the value is 0, a 1-bit  $\alpha$  value of 0 is generated; if the value is not 0, a 1-bit  $\alpha$  value of 1 is generated. When the  $\alpha$  plane data is one bit (BSEL = 1), this generator outputs it without change.

When the value of the 1-bit  $\alpha$  generated by the 1-bit mask  $\alpha$  generator is 0, the 8-bit  $\alpha$  and pixel data specified in VI6\_RPFn\_MSKSET0 are output as the source. When the generated 1-bit  $\alpha$  value is 1, the 8-bit  $\alpha$  and pixel data specified in VI6\_RPFn\_MSKSET1 are output as the source.

As shown in Figure 28.25, when VI6\_RPFn\_ALPH\_SEL.ASEL are set to 1 (8-bit plane  $\alpha$ ) or 3 (1-bit plane  $\alpha$ ), the  $\alpha$  plane read from the external RAM is sent to the 8-bit transparent  $\alpha$  generator as transparency information. When VI6\_RPFn\_MSKCTRL.MSK\_EN is set to 0, the 1-bit  $\alpha$  for masking is generated according to the input  $\alpha$  plane (refer to section 28.2.7.8), but the 1-bit mask  $\alpha$  generator does not refer to the input  $\alpha$  plane because it is input to the 8-bit transparent  $\alpha$  generator as transparency information. Accordingly, the 1-bit mask  $\alpha$  generator does not generate a 1-bit  $\alpha$  for masking and the data on the source side becomes invalid; that is, IROP operation cannot be executed. Set the IROP bits to 0 in this case. In contrast, when VI6\_RPFn\_MSKCTRL.MSK\_EN is set to 1, the 1-bit mask  $\alpha$  generator creates  $\alpha$  data for masking according to the pixel data instead of the input  $\alpha$  plane data, and IROP operation can be executed in this case.

**IROP operation unit**

Executes ROP operation according to the opcode specified in VI6\_RPFn\_ALPH\_SEL.IROP. For ROP operation (other than NOP), valid values should be input both for the source and destination. As described in the above (description of the 1-bit mask  $\alpha$  generator), when VI6\_RPFn\_ALPH\_SEL.ASEL are set to 1 or 3 and VI6\_RPFn\_MSKCTRL.MSK\_EN is set to 0, the source data for the IROP operation unit is treated as invalid; set VI6\_RPFn\_ALPH\_SEL.IROP to 0 (NOP). When VI6\_RPFn\_ALPH\_SEL.ASEL are set to 4, a fixed  $\alpha$  value is output from the RFP and IROP operation is not available. In the same way as the above case, set VI6\_RPFn\_ALPH\_SEL.IROP to 0 (NOP).

To specify a valid source value for the IROP operation unit and execute IROP operation (specify an opcode other than NOP in the IROP bits), specify register values as shown in Table 28.22. Where the source input state is indicated as "Valid" in the table, IROP operation can be executed. In the cases where IROP operation is not available, set the IROP bits to 0 (NOP).

**Table 28.22 Source Input State in IROP Operation Unit**

		VI6_RPFn_MSKCTRL.MSK_EN		
		0 (Source data is generated according to input $\alpha$ plane)		1 (Source data is generated according to the destination-side pixel data)
VI6_RPFn_ALPH_SEL.ASEL [2:0]				
B'000	(1-, 4-, or 8-bit packed $\alpha$ + plane $\alpha$ )	Valid	( $\alpha$ plane input)	Valid
B'001	(8-bit $\alpha$ plane)	Invalid	(IROP operation is not available; $\alpha$ plane is output to the subsequent modules behind RPF)	Valid
B'010	(8-bit $\alpha$ generated from 1-bit packed $\alpha$ + plane $\alpha$ )	Valid	( $\alpha$ plane input)	Valid
B'011	(8-bit $\alpha$ generated from 1-bit plane $\alpha$ )	Invalid	(IROP operation is not available; $\alpha$ plane is output to the subsequent modules behind RPF)	Valid
B'100	(Fixed $\alpha$ )	Invalid (IROP operation is not available; fixed $\alpha$ is output to the subsequent modules behind RPF)		

For the handling of the  $\alpha$  values shown in Figure 28.25 and Table 28.22, the relationship between the RPF input format and RPF output  $\alpha$  value is shown in Table 28.23. Where only bit names are shown in the table, the bits are in VI6\_RPFn\_ALPH\_SEL described in this section.

**Table 28.23  $\alpha$  Value Selected and Output according to ASEL Bits in Each Input Format**

ASEL Setting		$\alpha$ Value Output for Each Input Format		
		RGB	YCbCr	OSD-CLUT
B'000	(8-, 4-, or 1-bit packed $\alpha$ is input)	1-, 4-, or 8-bit pixel $\alpha$	H'FF*	$\alpha$ value in CLUT
B'001	(8-bit plane $\alpha$ is input)	8-bit $\alpha$ plane	8-bit $\alpha$ plane	8-bit $\alpha$ plane
B'010	(8-bit $\alpha$ is generated from the 1-bit packed $\alpha$ input)	ALPHA0 or ALPHA1 setting	H'FF*	H'FF
B'011	(8-bit $\alpha$ is generated from the 1-bit plane $\alpha$ input)	ALPHA0 or ALPHA1 setting	ALPHA0 or ALPHA1 setting	ALPHA0 or ALPHA1 setting
B'100	(Fixed $\alpha$ is output)	VI6_RPFn_VRTCOL_SET.LAYA setting		

Note: \* Fixed value H'FF is output because packed  $\alpha$  is not included in YCbCr.

### 28.2.7.7 RPFn Virtual Plane Color Information Registers (VI6\_RPFn\_VRTCOL\_SET)

Note: See Table 28.15 for details on which RZ/G series products have which registers.

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E

A value from 0 to 255 can be specified.</p>
7 to 0	LAYB [7:0]	H'00	R/W	<p>Virtual-Input Fixed B/Cb Component Value</p> <p>These bits specify the fixed B or Cb value generated in the RPFn when the virtual input function is enabled through the VI6_RPFn_INFMT.VIR setting. When VI6_RPFn_INFMT.RDFMT is set to 19, the value specified in these bits is used as the B value. When VI6_RPFn_INFMT.RDFMT is set to 64, the value specified in these bits is used as the Cb value. A value from 0 to 255 can be specified.</p>

### 28.2.7.8 RPFn Mask Control Registers (VI6\_RPFn\_MSKCTRL)

Note: See Table 28.15 for details on which RZ/G series products have which registers.

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	MSK_EN	0	R/W	Mask Generation Specification Specifies the method of $\alpha$ value generation in the 1-bit mask $\alpha$ generator shown in Figure 28.25. 0: A 1-bit mask value is generated according to the input $\alpha$ plane value. When the input $\alpha$ is in the 1-bit format (VI6_RPFn_ALPH_SEL.BSEL = 1), the 1-bit mask value is output without change. When the input $\alpha$ is in the 8-bit format (VI6_RPFn_ALPH_SEL.BSEL = 0), the 1-bit mask value is 0 if the $\alpha$ value is H'00; otherwise, the 1-bit mask value is 1. 1: The R/Cr, G/Y, and B/Cb components of the image input to the destination side of the IROP operation unit are compared with the values specified in the MGR, MGG, and MGB bits, respectively. When all values match, 1 is output as the 1-bit mask value, and in other cases, 0 is output. When the generated 1-bit mask data is not used, set VI6_RPFn_ALPH_SEL.IROP to 0.
23 to 16	MGR [7:0]	H'00	R/W	R/Cr Comparison Value for 1-Bit $\alpha$ Generation These bits specify the R/Cr value to be compared for 1-bit $\alpha$ generation by using the pixel data on the destination side. When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify an R value for comparison. When YCbCr is specified, specify a Cr value for comparison. This setting is ignored when the MSK_EN bit is set 0. A value from 0 to 255 can be specified.
15 to 8	MGG [7:0]	H'00	R/W	G/Y Comparison Value for 1-Bit $\alpha$ Generation These bits specify the G/Y value to be compared for 1-bit $\alpha$ generation by using the pixel data on the destination side. When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify a G value for comparison. When YCbCr is specified, specify a Y value for comparison. This setting is ignored when MSK_EN is set to 0. A value from 0 to 255 can be specified.

---

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	MGB [7:0]	H'00	R/W	<p>B/Cb Comparison Value for 1-Bit <math>\alpha</math> Generation</p> <p>These bits specify the B/Cb value to be compared for 1-bit <math>\alpha</math> generation by using the pixel data on the destination side. When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify a B value for comparison. When YCbCr is specified, specify a Cb value for comparison.</p> <p>This setting is ignored when MSK_EN is set to 0.</p> <p>A value from 0 to 255 can be specified.</p>

### 28.2.7.9 RPFn IROP-SRC Input Value Registers 0 (VI6\_RPFn\_MSKSET0)

Note: See Table 28.15 for details on which RZ/G series products have which registers.

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	MSA0 [7:0]	H'00	R/W	IROP-Source Input $\alpha$ Value when 1-Bit $\alpha$ is 0 These bits specify the 8-bit $\alpha$ value to be input as the source to the IROP operation unit when the internal 1-bit $\alpha$ value generated through the 1-bit mask generator is 0 (Figure 28.25). A value from 0 to 255 can be specified.
23 to 16	MSR0 [7:0]	H'00	R/W	IROP-Source Input R/Cr Value when 1-Bit $\alpha$ is 0 These bits specify the R/Cr value to be input as the source to the IROP operation unit when the internal 1-bit $\alpha$ value generated through the 1-bit mask generator is 0 (Figure 28.25). When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify an R component value. When YCbCr is specified, specify a Cr component value. A value from 0 to 255 can be specified.
15 to 8	MSG0 [7:0]	H'00	R/W	IROP-Source Input G/Y Value when 1-Bit $\alpha$ is 0 These bits specify the G/Y value to be input as the source to the IROP operation unit when the internal 1-bit $\alpha$ value generated through the 1-bit mask generator is 0 (Figure 28.25). When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify a G component value. When YCbCr is specified, specify a Y component value. A value from 0 to 255 can be specified.
7 to 0	MSB0 [7:0]	H'00	R/W	IROP-Source Input B/Cb Value when 1-Bit $\alpha$ is 0 These bits specify the B/Cb value to be input as the source to the IROP operation unit when the internal 1-bit $\alpha$ value generated through the 1-bit mask generator is 0 (Figure 28.25). When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify a B component value. When YCbCr is specified, specify a Cb component value. A value from 0 to 255 can be specified.

### 28.2.7.10 RPFn IROP-SRC Input Value Registers 1 (VI6\_RPFn\_MSKSET1)

Note: See Table 28.15 for details on which RZ/G series products have which registers.

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	MSA1 [7:0]	H'00	R/W	IROP-Source Input $\alpha$ Value when 1-Bit $\alpha$ is 1 These bits specify the 8-bit $\alpha$ value to be input as the source to the IROP operation unit when the internal 1-bit $\alpha$ value generated through the 1-bit mask generator is 1. A value from 0 to 255 can be specified (Figure 28.25).
23 to 16	MSR1 [7:0]	All 0	R/W	IROP-Source Input R/Cr Value when 1-Bit $\alpha$ is 1 These bits specify the R/Cr value to be input as the source to the IROP operation unit when the internal 1-bit $\alpha$ value generated through the 1-bit mask generator is 1 (Figure 28.25). When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify an R component value. When YCbCr is specified, specify a Cr component value. A value from 0 to 255 can be specified.
15 to 8	MSG1 [7:0]	All 0	R/W	IROP-Source Input G/Y Value when 1-Bit $\alpha$ is 1 These bits specify the G/Y value to be input as the source to the IROP operation unit when the internal 1-bit $\alpha$ value generated through the 1-bit mask generator is 1 (Figure 28.25). When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify a G component value. When YCbCr is specified, specify a Y component value. A value from 0 to 255 can be specified.
7 to 0	MSB1 [7:0]	All 0	R/W	IROP-Source Input B/Cb Value when 1-Bit $\alpha$ is 1 These bits specify the B/Cb value to be input as the source to the IROP operation unit when the internal 1-bit $\alpha$ value generated through the 1-bit mask generator is 1 (Figure 28.25). When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify a B component value. When YCbCr is specified, specify a Cb component value. A value from 0 to 255 can be specified.

### 28.2.7.11 RPFn Color Keying Control Registers (VI6\_RPFn\_CKEY\_CTRL)

Note: See Table 28.15 for details on which RZ/G series products have which registers.

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

A value from 0 to 255 can be specified.</li> </ul>
7 to 0	Bm [7:0]	H'00	R/W	<p>B*/Cb Component Data in Color Keying Color Information-m</p> <ul style="list-style-type: none"> <li>In transparent color-matched color mode for color keying Specify the B component value for comparison enabled through the VI6_RPFn_CKEY_CTRL.SAPEm setting. When the RPFn input is in YCbCr format, the color keying module does not compare the Cb component, and the setting of these bits is ignored.</li> <li>In transparent color-luma threshold mode for color keying The color keying module does not refer this bit field, and the setting of these bits is ignored.</li> <li>In color replacement mode for color keying Specify the B component value to be compared with the input data in the color replacement function of the color keying module. A value from 0 to 255 can be specified.</li> </ul>

Note: \* When comparison data is specified in an RGB format, if a packed format is selected for RGB input and each of the RGB components is not eight bits, the lower-order bits of input data are extended as specified through VI6\_RPFn\_INFMT.CEXT before comparison. The RGB components to be compared with the input should also be extended in the same way and the extended values should be specified in this register.

### 28.2.7.13 RPFn Source Picture Memory Stride Setting Registers (VI6\_RPFn\_SRCM\_PSTRIDE)

Note: See Table 28.15 for details on which RZ/G series products have which registers.

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	PICT_STRD_Y [15:0]	H'0000	R/W	<p>Memory Stride of Source Picture Y/RGB Plane</p> <p>These bits specify in 1-byte units the memory stride of the source picture Y/RGB plane read by the RPFn.</p> <p>A value from 0 to 65,535 can be specified. Refer to Figure 28.26 for settings.</p>
15 to 0	PICT_STRD_C [15:0]	H'0000	R/W	<p>Memory Stride of Source Picture C Plane</p> <p>These bits specify in 1-byte units the memory stride of the source picture C plane read by the RPFn. When an RGB-format picture is read, these bits do not need to be set.</p> <p>A value from 0 to 65,535 can be specified. Refer to Figure 28.26 for settings.</p> <p>In the YCbCr planar format, this setting is used as the memory stride of the Cb and Cr planes.</p>

This register specifies the memory stride of the picture planes in the source area as shown in Figure 28.26. The memory stride of the  $\alpha$  plane should be specified through VI6\_RPFn\_SRCM\_ASTRIDE.ALPH\_STRD. When the RPF input is in an RGB format, only the RGB plane is read; when the input is in YCbCr format, the Y and C planes are read as shown in Figure 28.26. When the  $\alpha$  plane is used, the  $\alpha$  plane is also read. According to the image format and the necessity of the  $\alpha$  plane, specify the necessary addresses where the source image is stored (VI6\_RPFn\_SRCM\_ADDR\_Y, VI6\_RPFn\_SRCM\_ADDR\_C, and VI6\_RPFn\_SRCM\_ADDR\_AI).

Whether the  $\alpha$  plane needs to be read is determined according to the  $\alpha$  plane selection method and IROP operation type. For details, refer to section 28.2.7.6.

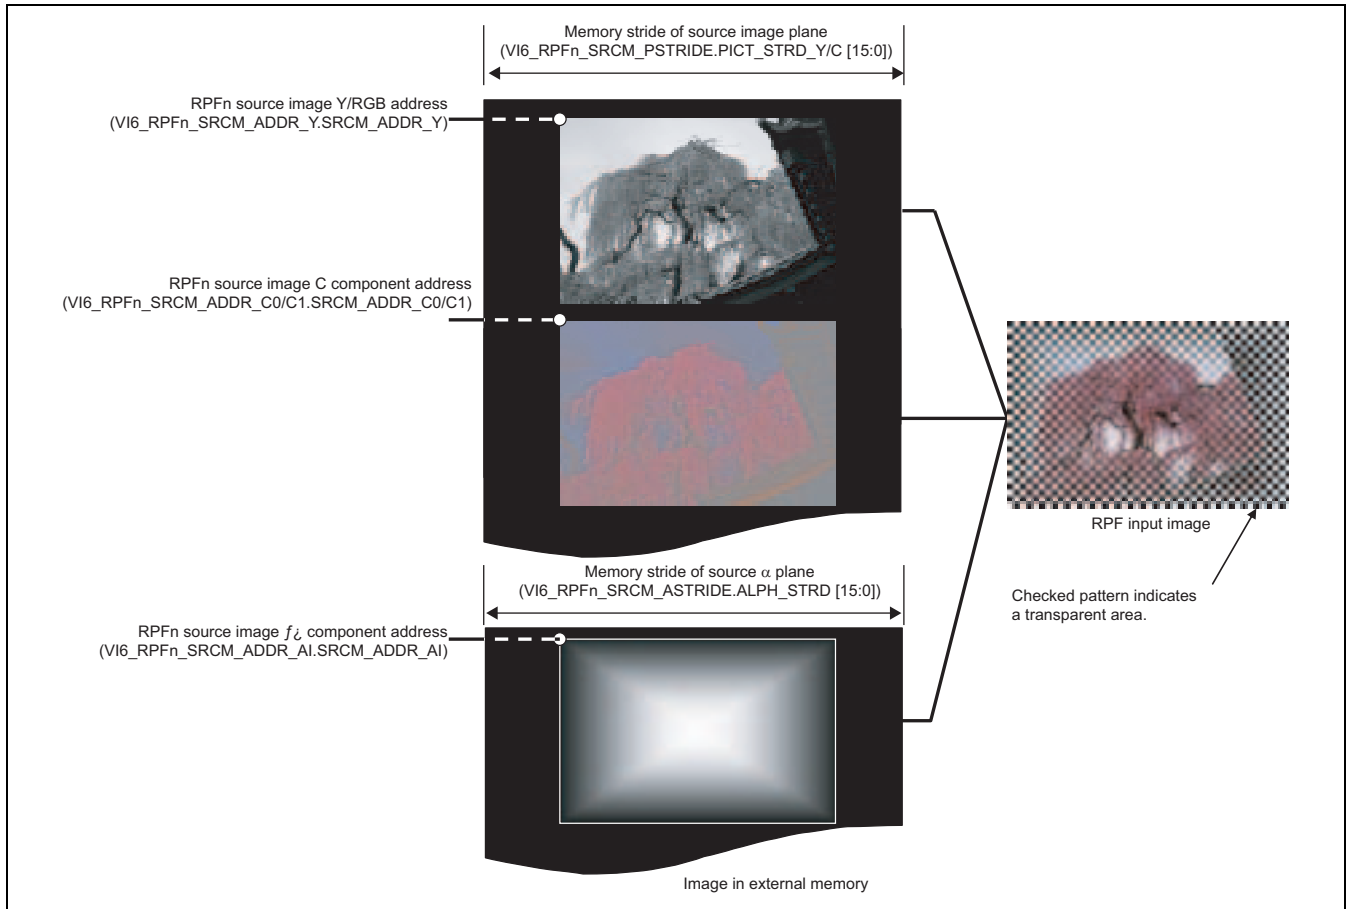

Figure 28.26 Reading an Image from RPFn Source Area

### 28.2.7.14 RPFn Source $\alpha$ Memory Stride Setting Registers (VI6\_RPFn\_SRCM\_ASTRIDE)

Note: See Table 28.15 for details on which RZ/G series products have which registers.

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	ALPH_STRD [15:0]	H'0000	R/W	Memory Stride of Source $\alpha$ Plane These bits specify in 1-byte units the memory stride of the source $\alpha$ plane read by the RPFn. A value from 0 to 65,535 can be specified. Refer to Figure 28.26 for settings.

### 28.2.7.15 RPFn Source Y/RGB Address Registers (VI6\_RPFn\_SRCM\_ADDR\_Y)

Note: See Table 28.15 for details on which RZ/G series products have which registers.

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

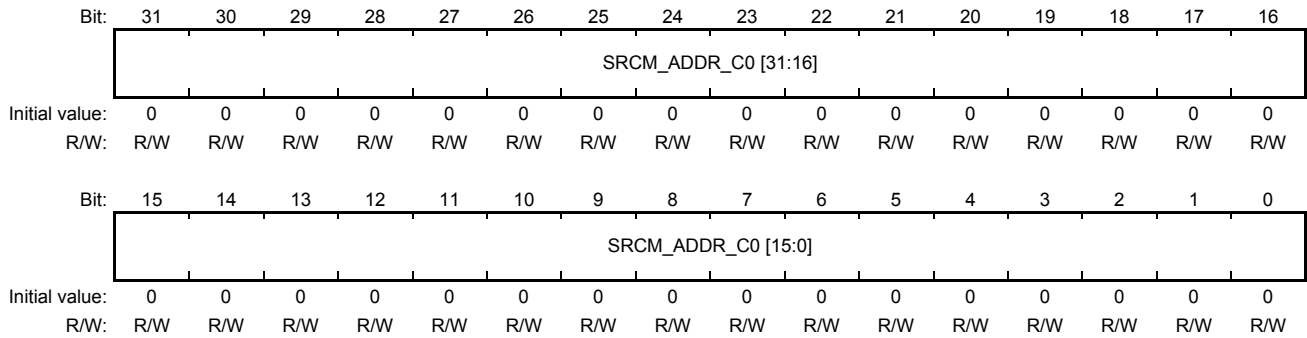

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SRCM_ADDR_Y [31:0]	H'0000 0000	R/W	<p>Source Image Y/RGB Plane Storing Address</p> <p>These bits specify in 1-byte units the start address of the source image Y plane and packed RGB plane read by the RPFn.</p> <p>A value from H'00000000 to H'FFFFFFFF can be specified. Refer to Figure 28.26 in section 28.2.7.13 for settings.</p>

### 28.2.7.16 RPFn Source Chroma Address Registers 0 (VI6\_RPFn\_SRCM\_ADDR\_C0)

Note: See Table 28.15 for details on which RZ/G series products have which registers.

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

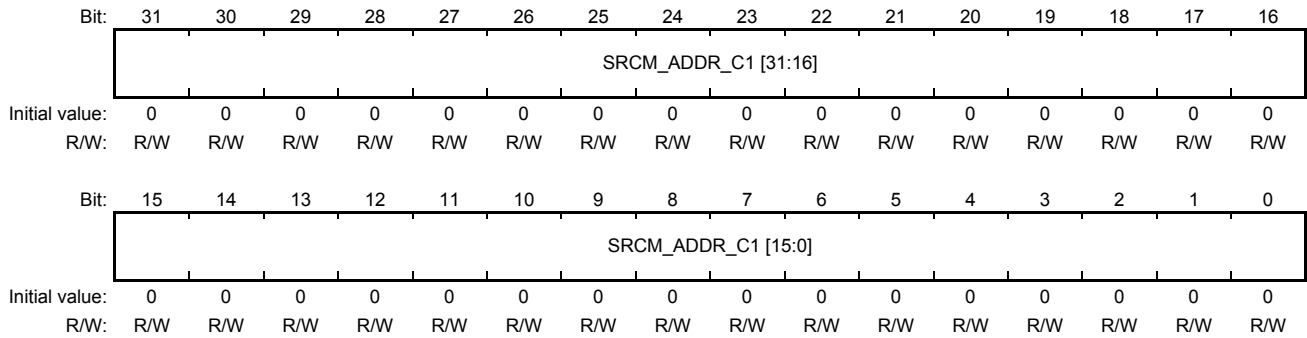

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SRCM_ADDR_C0 [31:0]	H'0000 0000	R/W	<p>Source Image C Plane Storing Address 0</p> <p>These bits specify in 1-byte units the start address of the source image C plane read by the RPFn. Here, the C plane indicates the combined CbCr plane when a semi-planar format is selected from the packed YCbCr formats shown in Table 28.19 or the Cb plane when a planar format is selected. When an interleaved format is selected or the RPF input is in an RGB format, this setting is not used.</p> <p>A value from H'00000000 to H'FFFFFFFF can be specified. Refer to Figure 28.26 in section 28.2.7.13 for settings.</p>

### 28.2.7.17 RPFn Source Chroma Address Registers 1 (VI6\_RPFn\_SRCM\_ADDR\_C1)

Note: See Table 28.15 for details on which RZ/G series products have which registers.

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

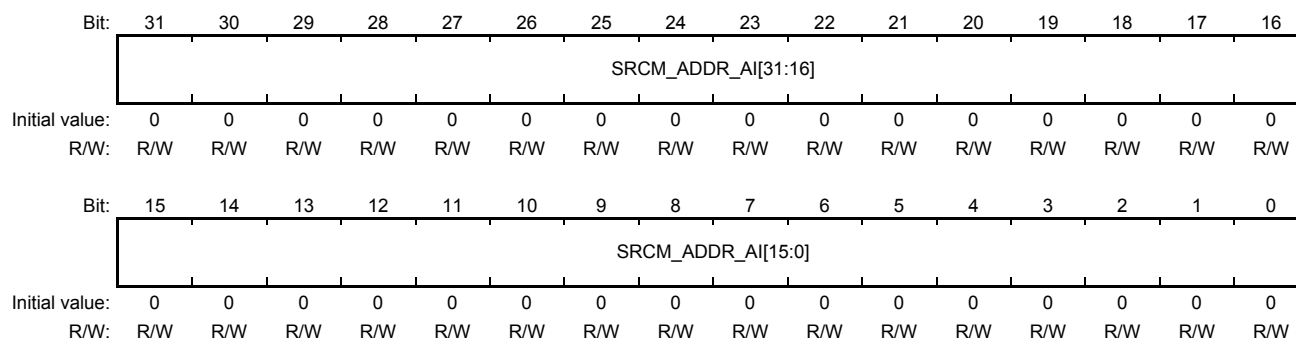

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SRCM_ADDR_C1 [31:0]	H'0000 0000	R/W	<p>Source Image C Plane Storing Address 1</p> <p>These bits specify in 1-byte units the start address of the Cr plane when a planar YCbCr format shown in Table 28.19 is read by the RPFn.</p> <p>This setting is not used when the RPF input is in YCbCr format that is not a planar format or in an RGB format.</p> <p>A value from H'00000000 to H'FFFFFFFF can be specified. Refer to Figure 28.26 in section 28.2.7.13 for settings.</p>

### 28.2.7.18 RPFn Source $\alpha$ Address Registers (VI6\_RPFn\_SRCM\_ADDR\_AI)

Note: See Table 28.15 for details on which RZ/G series products have which registers.

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SRCM_ADDR_AI [31:0]	H'0000 0000	R/W	<p>Source Image <math>\alpha</math> Plane Storing Address</p> <p>These bits specify in 1-byte units the start address of the <math>\alpha</math> plane of the source image read by the RPFn. Specify in the same way as the start address of the picture plane. When the <math>\alpha</math> plane is not read from the source area, these bits do not need to be set.</p> <p>A value from H'00000000 to H'FFFFFFFF can be specified. Refer to Figure 28.26 in section 28.2.7.13 for settings.</p>

## 28.2.8 WPF Control Registers

### 28.2.8.1 WPFn-Source-RPF Registers (VI6\_WPFn\_SRCRPF)

Note: See Table 28.15 for details on which RZ/G series products have which registers.

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
29, 28	VIR_ACT [1:0]	00	R/W	Virtual RPF Start Enable in BRU These bits enable start of the virtual RPF in the BRU as the source RPF for the WPFn when the WPFn is started. For details of the virtual RPF, refer to the following. Section 28.2.16.1, BRU Input Control Register (VI6_BRU_INCTRL) Section 28.2.16.2, Size Register of BRU Input Virtual RPF (VI6_BRU_VIRRRPF_SIZE) Section 28.2.16.3, Display Location Register of BRU Input Virtual RPF (VI6_BRU_VIRRRPF_LOC) Section 28.2.16.4, Color Information Register of BRU Input Virtual RPF (VI6_BRU_VIRRRPF_COL) Note that the virtual RPF is in the BRU as shown in Figure 28.44 and there are no register bits for DPR setting related to the virtual RPF. 00: The virtual RPF in the BRU is not started. 01: The virtual RPF in the BRU is started as a sub layer source RPF for the WPFn. 10: The virtual RPF in the BRU is started as the master-layer source RPF for the WPFn. 11: Setting prohibited
27 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
9, 8	RPF4_ACT [1:0]	00	R/W	RPFn Start Enable (RPFn_ACT, n = 0 to 4)
7, 6	RPF3_ACT [1:0]	00	R/W	These bits enable start of RPFn as the source RPF for the WPFn when the WPFn is started. When RPFn is not started by any of the WPF0 to WPF3, set the VI6_DPR_RPFn_ROUTE.RT_RPFn bits to 63 (H'3F).
5, 4	RPF2_ACT [1:0]	00	R/W	00: RPFn is not started.
3, 2	RPF1_ACT [1:0]	00	R/W	01: RPFn is started as a sub layer source RPF for the WPFn. 10: RPFn is started as the master-layer source RPF for the WPFn.
1, 0	RPF0_ACT [1:0]	00	R/W	11: Setting prohibited

When the WPFn is started through the VSP1 start register n (VI6\_CMDn: n = 0, 1, 2, 3), the RPF and virtual RPF in the BRU specified as the source RPF in this register are also started to supply data to the VSP1 internal modules.

Note the following when specifying the source RPF.

- Each source RPF can be assigned to only one target WPFn; a single RPF cannot be assigned as the source RPF for multiple WPFs. For example, when setting VI6\_WPF0\_SRCRPF to H'00000008 and VI6\_WPF1\_SRCRPF to H'00000004 is attempted, the VSP1 will not operate correctly (these settings are prohibited) because RPF1 is assigned as both the master-layer source RPF for WPF0 and a sub layer source RPF for WPF1.
- When blending or ROP operation is applied to multiple images through the BRU, multiple source RPFs are necessary for one WPF. When multiple source RPFs are used, images should be classified into a master layer and sub layers; assign one of the source RPFs as the master-layer source RPF and other RPFs as sub layer source RPFs. Do not assign all RPFs as sub layer source RPFs (VI6\_WPF1\_SRCRPF = H'00000015) or two or more RPFs as the master-layer source RPF (VI6\_WPF3\_SRCRPF = H'0000025A) (such settings are prohibited).
- When the BRU is not used, there should be only one source RPF for one WPF. In this case, the source RPF should be assigned as the master-layer source RPF.
- Calculate the master layer and sub layer sizes as described in section 28.1.5. When the BRU is used and the SRU or UDS is used between the RPF and BRU, the master layer and sub layer sizes may have been upscaled or downscaled before input to the BRU with respect to the sizes output from the source RPF. When determining the relative locations among layers for blending or ROP operation, take account of the size of each image input to the BRU. In particular, be careful not to place the entire sub layer outside the master layer as explained in the description of the HCOORD and VCOORD bits in VI6\_RPFn\_LOC in section 28.2.7.5.

### 28.2.8.2 WPFn Horizontal Input Size Clipping Registers (VI6\_WPFn\_HSZCLIP)

Note: See Table 28.15 for details on which RZ/G series products have which registers.

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	HCEN	0	R/W	Horizontal Size Clipping Enable/Disable Enables or disables clipping of the horizontal size of the WPFn input image. 0: Horizontal size clipping is disabled 1: Horizontal size clipping is enabled
27 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	HCL_OFST [7:0]	H'00	R/W	Horizontal Size Clipping Offset Value Setting These bits specify the offset size (pixels) from the left end of the image in horizontal size clipping when the HCEN bit is 1 (Figure 28.27). The left side of the image input to the WPF is cut off for the size specified in these bits. When the HCEN bit is 0, this setting is ignored. A value from 0 to 255 can be specified. (HCL_OFST + HCL_SIZE) should not exceed the horizontal size of the WPF input. If the setting shown in the bottom example in Figure 28.27 is made, VSP1 does not operate correctly.
15 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
11 to 0	HCL_SIZE [11:0]	H'000	R/W	<p>Horizontal Clipping Size Setting</p> <p>When the HCEN bit is 1, these bits specify the clipping size for horizontal clipping processing. Through this processing, the area of the horizontal size specified through the HCL_SIZE bits starting from the offset position specified through the HCL_OFST bits is determined as the valid image area. Accordingly, the right-side pixels beyond the (HCL_OFST + HCL_SIZE) size in the WPFn input image are discarded. When the HCEN bit is 0, this setting is ignored.</p> <p>A value from 1 to 2,048 can be specified. (HCL_OFST + HCL_SIZE) should not exceed the horizontal size of the WPF input. If the setting shown in the bottom example in Figure 28.27 is made, VSP1 does not operate correctly.</p> <p>Note: When the WPFn output format is YCbCr4:2:2 or YCbCr4:2:0, specify an even value in these bits.</p>

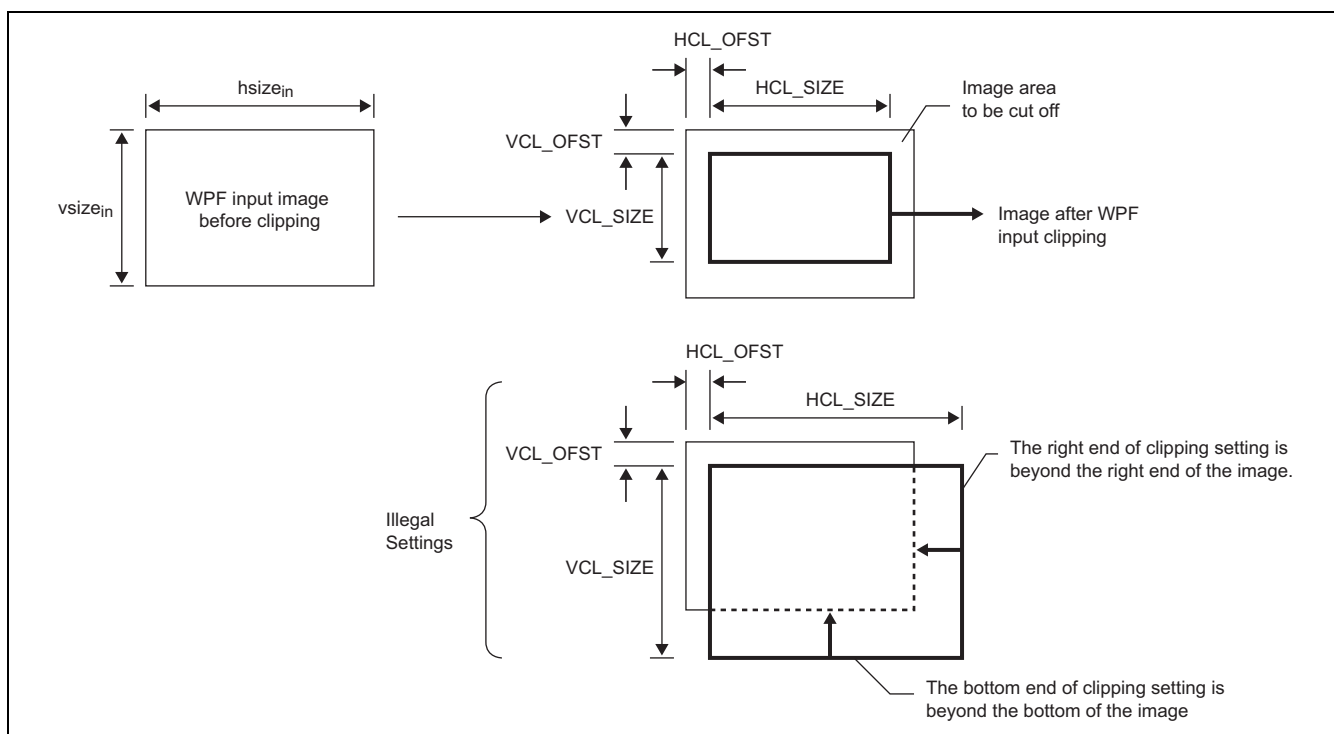

Figure 28.27 Image Clipping in WPF Input Section

### 28.2.8.3 WPFn Vertical Input Size Clipping Registers (VI6\_WPFn\_VSZCLIP)

Note: See Table 28.15 for details on which RZ/G series products have which registers.

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	PDV [7:0]	H'00	R/W	<p>PAD Value in Output Packed Data</p> <p>These bits specify the value to be stored in the bit field indicated as PAD or P in the output formats shown in Table 28.24. To store this value in PAD, specify 0 in the PXA bit. A value from 0 to 255 can be specified.</p>
23	PXA	0	R/W	<p>PAD Data Select</p> <p>Selects the value to be stored in the bit field indicated as PAD or P in the packed RGB output formats shown in Table 28.24. Both the value specified in the PDV bits and the <math>\alpha</math> data input from the DPR to WPF are eight bits, but some of the PAD and P bit fields shown in Table 28.24 are four bits or one bit. When the target bit field is not eight bits, the number of bits in the PDV value and the <math>\alpha</math> data input from the DPR to WPF is reduced according to the VI6_WPFn_RNDCTRL.ABRM setting. For bit count reduction, refer to Figure 28.28 and the description of VI6_WPFn_RNDCTRL.ABRM.</p> <p>0: The value specified in the PDV bits is stored in the PAD shown in Table 28.24.</p> <p>1: The <math>\alpha</math> value output from DPR in pixel units is stored in the PAD shown in Table 28.24.</p>
22 to 17	—	All 0	R	<p>Reserved</p> <p>These bits are always read as 0. The write value should always be 0.</p>

Bit	Bit Name	Initial Value	R/W	Description
16	FLP	0	R/W	<p>Vertical flipping Select</p> <p>This bit selects the vertical flipping processing to be applied to the WPFn output image. Figure 28.29 shows the correspondence between the original image and the vertical flipping result according to this setting.</p> <p>0: No vertical flipping 1: vertical flipping</p> <p><u>Flipping can be specified only in WPF0. In other channels, always specify 0 in these bits.</u></p> <p>Note that the destination address setting should be changed according to the setting of these bits. For details, refer to section 28.2.8.9.</p> <p>When the LIF module is used (VI6_LIF_CTRL.LIF_EN = 1), set 0 to FLP.</p>
15	SPYCS	0	R/W	<p>WPF Output Mode Setting 1</p> <p>When the output format is YUY2, set this bit to 1 and set the WRFMT bits to 71 (H'47).</p> <p>When the output format is YVYU, set this bit and the SPUVS bit to 1 and set the WRFMT bits to 71 (H'47).</p> <p>In other cases, set this bit to 0.</p>
14	SPUVS	0	R/W	<p>WPF Output Mode Setting 2</p> <p>When the output format is NV61, set this bit to 1 and set the WRFMT bits to 65 (H'41).</p> <p>When the output format is NV21, set this bit to 1 and set the WRFMT bits to 66 (H'42).</p> <p>When the output format is YVYU, set this bit and the SPYCS bit to 1 and set the WRFMT bits to 71 (H'47).</p> <p>In other cases, set this bit to 0.</p>
13, 12	DITH[1:0]	00	R/W	<p>Dithering Enable/Disable</p> <p>When the output format specified through the WRFMT bits is RGB with 18 bpp (262,144 colors) or less, the color reduction processing is applied to match the number of colors. The color reduction processing may generate the artifacts of pseudo gradation, which can be suppressed through dithering. The DITH bits enable or disable dithering during color reduction.</p> <p>When the output format specified through the WRFMT bits is YCbCr, specify 0 in these bits.</p> <p>And when VI6_WPFn_OUTFMT.CSC is set to 1, specify 0 in these bits even in the case that the output format specified through the WRFMT bits is RGB.</p> <p>00: Dithering is disabled 11: Dithering is enabled 01, 10: Setting prohibited</p>

Bit	Bit Name	Initial Value	R/W	Description
11 to 9	WRTM[2:0]	000	R/W	<p>CSC Conversion Expression Setting</p> <p>These bits select the expression for color space conversion. The conversion direction is RGB to YCbCr when the format specified in the WRFMT bits is RGB, or YCbCr to RGB when the format is YCbCr.</p> <p>000: BT.601 YCbCr [16,235/240] ↔ RGB [0,255]            001: BT.601 YCbCr [0,255] ↔ RGB [0,255]            010: BT.709 YCbCr [16,235/240] ↔ RGB [0,255]            011: BT.709 YCbCr [16,235/240] ↔ RGB [16,235]            100 to 111: Setting prohibited</p>
8	CSC	0	R/W	<p>Color Space Conversion Setting</p> <p>Enables or disables YCbCr ↔ RGB color space conversion to be executed in the WPFn. The characteristics of color space conversion are determined by the WRTM setting.</p> <p>There are some points to be noted about the relationship between the CSC setting and output format (WRFMT). For details refer to section 28.2.7.3, RPFn Input Format Registers (VI6_RPFn_INFMT).</p> <p>0: Color space is not converted.            1: Color space is converted.</p>
7	—	0	R	<p>Reserved</p> <p>This bit is always read as 0. The write value should always be 0.</p>
6 to 0	WRFMT[6:0]	H'00	R/W	<p>WPF Output Image Format Setting</p> <p>These bits select the format of the image output from the WPFn to the external memory from among those listed in Tables 28.24 and 28.25.</p> <p>Notes:</p> <ol style="list-style-type: none"> <li>Number of output pixels           <p>When YCbCr4:2:2 is specified through WRFMT, the horizontal size of the output image should be a multiple of 2 pixels. When YCbCr4:2:0 is specified, the vertical and horizontal sizes of the output image should be multiples of 2 pixels. Specify an appropriate data flow of the source RPF → DPR → target WPF so that the size of the image input to the target WPF satisfies the above restrictions. In particular, when the data flow includes a module or a function that modifies (upscales, downscales, or clips) the image size, take special care about the module or function settings.</p> </li> <li>Output lines in YCbCr4:2:0           <p>In the YCbCr4:2:0 output format, the number of chrominance lines in the vertical direction is one-half the number of luminance lines. For this reason, the WPF outputs only even-numbered chrominance lines (lines 0, 2, 4, 6, ...) (conversion from (A) to (B) in Figure 28.30). When vertical flipping is also specified through the FLP bits, the flipping processing is executed last and the chrominance line locations are inverted (lines 1, 3, 5, 7, ...) in the output image ((C) in Figure 28.30).</p> </li> </ol>

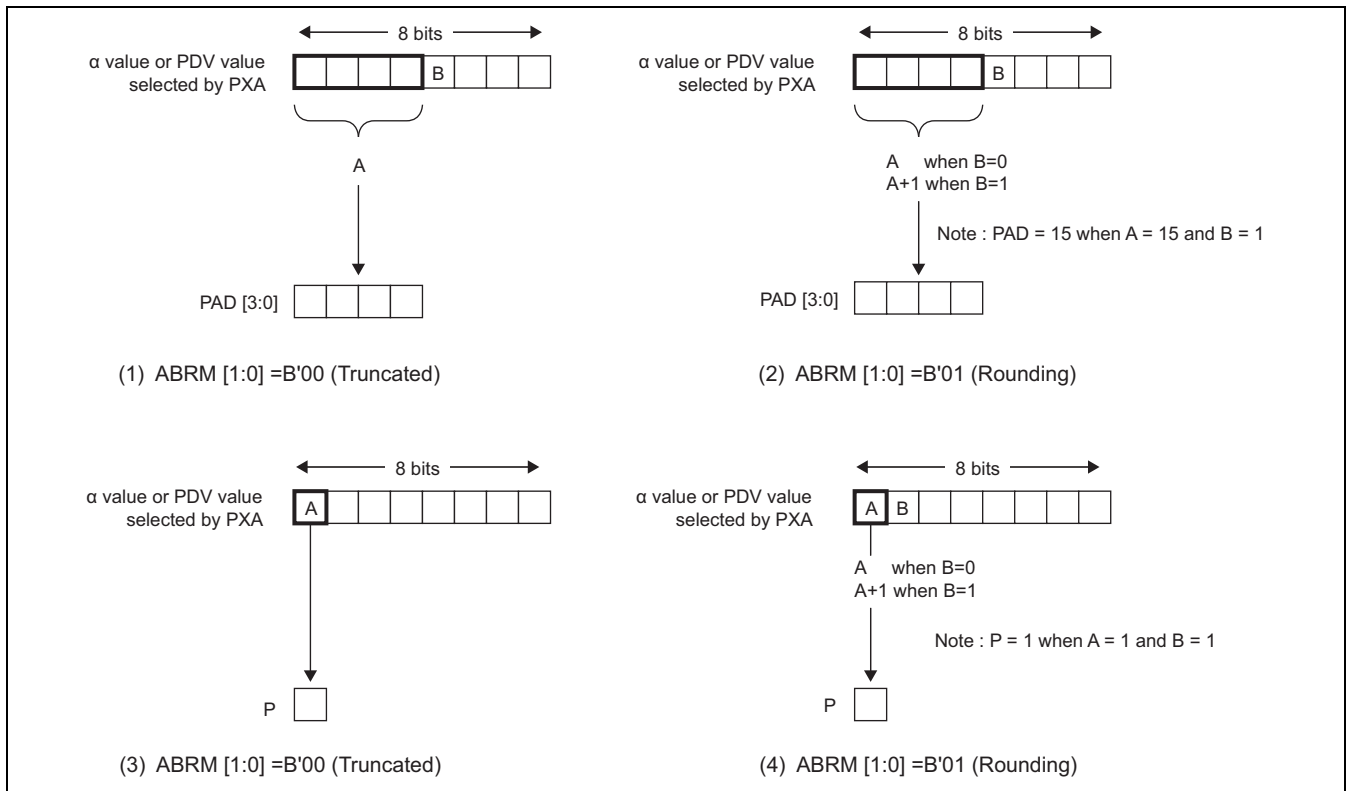

Figure 28.28 Selection of PAD Value and Reduction of Bit Count through PXA Setting

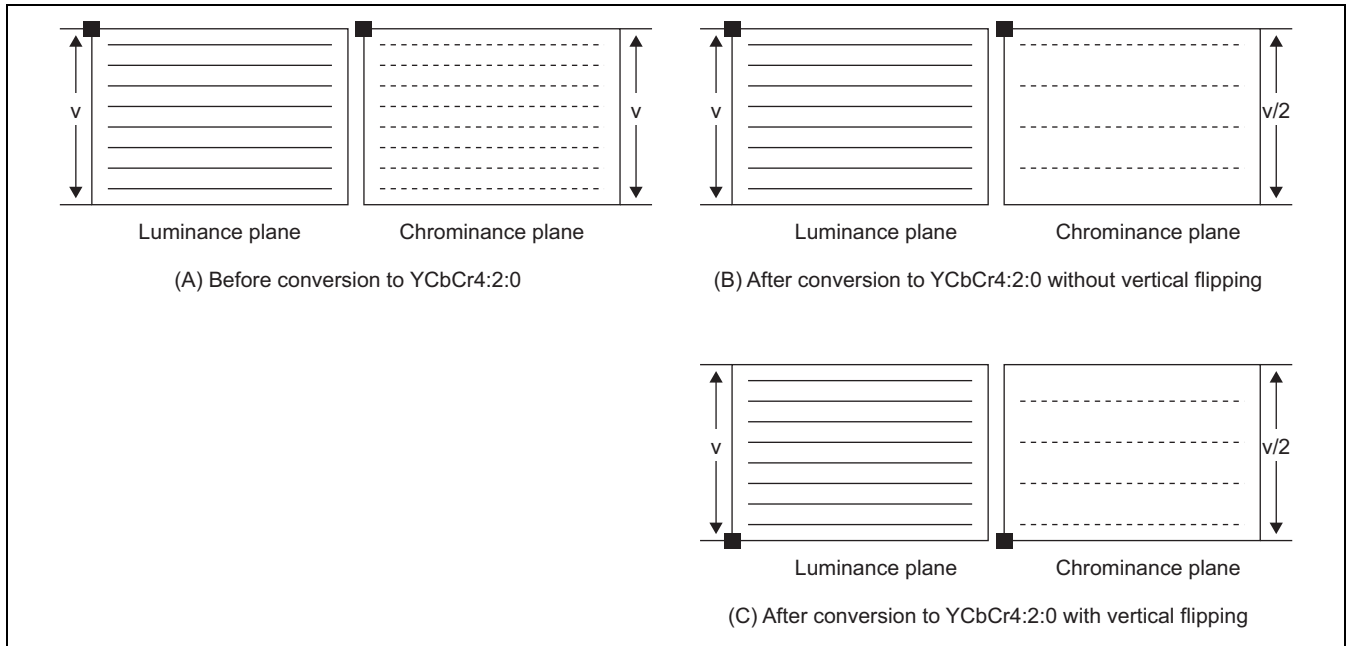

Figure 28.29 Correspondence between Original Image and Vertical Flipping Result according to FLP Setting

**Table 28.25 Packed YCbCr Formats for WPF Output**

WRFMT [6:0]	Packed YCbCr Output Format	Reference
H'40	YCbCr4:4:4 semi-planar	Figure 28.19
H'41	YCbCr4:2:2 semi-planar (NV16, NV61* <sup>1</sup> )	
H'42	YCbCr4:2:0 semi-planar (NV12, NV21* <sup>1</sup> )	
H'43 to H'45	Reserved	—
H'46	YCbCr4:4:4 interleaved	Figure 28.20
H'47	YCbCr4:2:2 interleaved type 0 (UYVY, YUY2* <sup>2</sup> , YVYU* <sup>3</sup> )	
H'48	YCbCr4:2:2 interleaved type 1	
H'49	YCbCr4:2:0 interleaved	
H'4A	YCbCr4:4:4 planar	Figure 28.21
H'4B	YCbCr4:2:2 planar (YV16)	
H'4C	YCbCr4:2:0 planar (YV12, YU12)	
H'4D to H'7F	Reserved	—

Notes: 1. When the output format is NV61 or NV21, set SPUVS (bit 14) to 1.  
 2. When the output format is YUY2, set SPYCS (bit 15) to 1.  
 3. When the output format is YVYU, set SPUVS (bit 14) to 1 and SPYCS (bit 15) to 1.

For details of each YCbCr format, refer to Figures 28.19, 28.20, and 28.21. In these figures, registers for the RPF are indicated; read them as registers for the WPF as follows.

(RPF registers in the figures)	→	(Corresponding WPF registers)
VI6_RPFn_SRCM_ADDR_Y.SRCM_ADDR_Y	→	VI6_WPFn_DSTM_ADDR_Y.DSTM_ADDR_Y
VI6_RPFn_SRCM_ADDR_C0.SRCM_ADDR_C0	→	VI6_WPFn_DSTM_ADDR_C0.DSTM_ADDR_C0
VI6_RPFn_SRCM_ADDR_C1.SRCM_ADDR_C1	→	VI6_WPFn_DSTM_ADDR_C1.DSTM_ADDR_C1

### 28.2.8.5 WPFn Data Swapping Registers (VI6\_WPFn\_DSWAP)

Note: See Table 28.15 for details on which RZ/G series products have which registers.

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	CLMD [1:0]		—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	CBRM	0	R/W	Bit Count Reduction Method Selection for Data Storage in Packed RGB  This bit specifies the method for reducing the number of bits when data is stored in the bit fields indicated as R, G, and B in Table 28.24 and the target bit fields are not eight bits.  0: Bit count conversion: The lower-order bits are truncated 1: Bit count conversion: Rounding (rounding off)
27, 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
25, 24	ABRM[1:0]	00	R/W	Bit Count Reduction Method Selection for Data Storage in PAD  These bits specify the method for reducing the number of bits when the data selected through VI6_WPFn_OUTFMT.PXA is stored in the bit fields indicated as PAD or P in Table 28.24 and the target bit field is four bits or one bit.  A value of B'10 can be specified only when the packed RGB format specified through VI6_WPFn_OUTFMT.WRFMT includes a 1-bit P field. In this case, when the data selected through VI6_WPFn_OUTFMT.PXA is greater than the ATHRESH value, 1 is stored in the P field; when the selected data is not greater than the ATHRESH value, 0 is stored.  00: Bit count conversion: The lower-order bits are truncated 01: Bit count conversion: Rounding (rounding off) 10: Bit count conversion: Comparison with the threshold value (this setting is allowed only when the storage field is one bit) 11: Setting prohibited

Bit	Bit Name	Initial Value	R/W	Description
23 to 16	ATHRESH [7:0]	H'00	R/W	<p>Threshold for Conversion to 1-Bit <math>\alpha</math> Data</p> <p>These bits specify the threshold value used for conversion from 8-bit <math>\alpha</math> data to one bit when the ABRM bits are set to B'10. When the 8-bit <math>\alpha</math> value before bit count reduction is equal to or smaller than the ATHRESH value, 0 is stored as the reduced 1-bit <math>\alpha</math> data. In other cases, 1 is stored as the 1-bit <math>\alpha</math> data.</p> <p>A value from 0 to 255 can be specified.</p>
15, 14	—	All 0	R	<p>Reserved</p> <p>These bits are always read as 0. The write value should always be 0.</p>
13, 12	CLMD[1:0]	00	R/W	<p>Color Data Clipping</p> <p>These bits specify the method for clipping the YCbCr color data output from the WPF. When RGB color data is output from the WPF, specify 0 in these bits.</p> <p>00: Output value is not clipped (0 to 255)</p> <p>01: Output value is clipped: YCbCr mode 1 (16 to 235 (Y), 16 to 240 (Cb/Cr))</p> <p>10: Output value is clipped: YCbCr mode 2 (Y/Cb/Cr = 1 to 254)</p> <p>11: Setting prohibited</p>
11 to 0	—	All 0	R	<p>Reserved</p> <p>These bits are always read as 0. The write value should always be 0.</p>

### 28.2.8.7 WPFn Destination Y Plane Memory Stride Registers (VI6\_WPFn\_DSTM\_STRIDE\_Y)

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	PICT_STRD_C [15:0]	H'0000	R/W	Memory Stride of Destination Picture C Plane These bits specify in 1-byte units the memory stride for the C plane of the destination picture in the external memory to be written to by the WPFn as shown in Figure 28.31. When the WPFn outputs images in an RGB format, this setting is not used. When the WPFn outputs images in YCbCr planar format, this setting is applied to both the Cb and Cr planes. A value from H'0000 to H'FFFF can be specified.

### 28.2.8.9 WPFn Destination Y/RGB Address Registers (VI6\_WPFn\_DSTM\_ADDR\_Y)

Note: See Table 28.15 for details on which RZ/G series products have which registers.

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DSTM_ADDR_Y [31:0]	H'0000 0000	R/W	<p>Destination Image Y/RGB Plane Storing Address</p> <p>These bits specify in 1-byte units the address for storing the destination-image Y plane or packed RGB plane to be written to by the WPFn in the method described later.</p> <p>A value from H'00000000 to H'FFFFFFFF can be specified.</p>

#### (Destination Address Specification Method)

When flipping is not used, the start address of a frame (address FHA shown in Figure 28.32) should be specified as the destination address. When flipping is used, the destination address is not the frame head address (FHA); one of addresses A0 to A1 shown in Figure 28.32 should be selected according to the combination of desired and flipping (VI6\_WPFn\_OUTFMT.FLP setting).

To strictly define locations A0 to A1, let the memory stride (VI6\_WPFn\_DSTM\_STRIDE\_Y/C setting) be S as shown in Figure 28.32). Calculate the destination address (one of A0 to A1) using the formula shown in Table 28.26 and specify it in the destination address storing register.

Figure 28.32 Location of Destination Address to be Specified for Vertical Flipping

**Table 28.26 Destination Address A<sub>0</sub>, and A<sub>1</sub> Calculation Formulas**

VI6_WPFn_OUTFMT.FLP Setting	Formula for Calculating Address to be Set in VI6_WPFn_DSTM_ADDR_Y, VI6_WPFn_DSTM_ADDR_C0, and VI6_WPFn_DSTM_ADDR_C1

1, 0	WBMD[1:0]	00	R/W	Display Data Write Back Control This bit is used for selecting the write back mode when the value of VI6_LIF_CTRL.LIF_EN bit is set to 1. 00: Write Back Disabled 01: Write Back Enabled

## 28.2.9 DPR Control Registers

### 28.2.9.1 Concept of DPR Settings

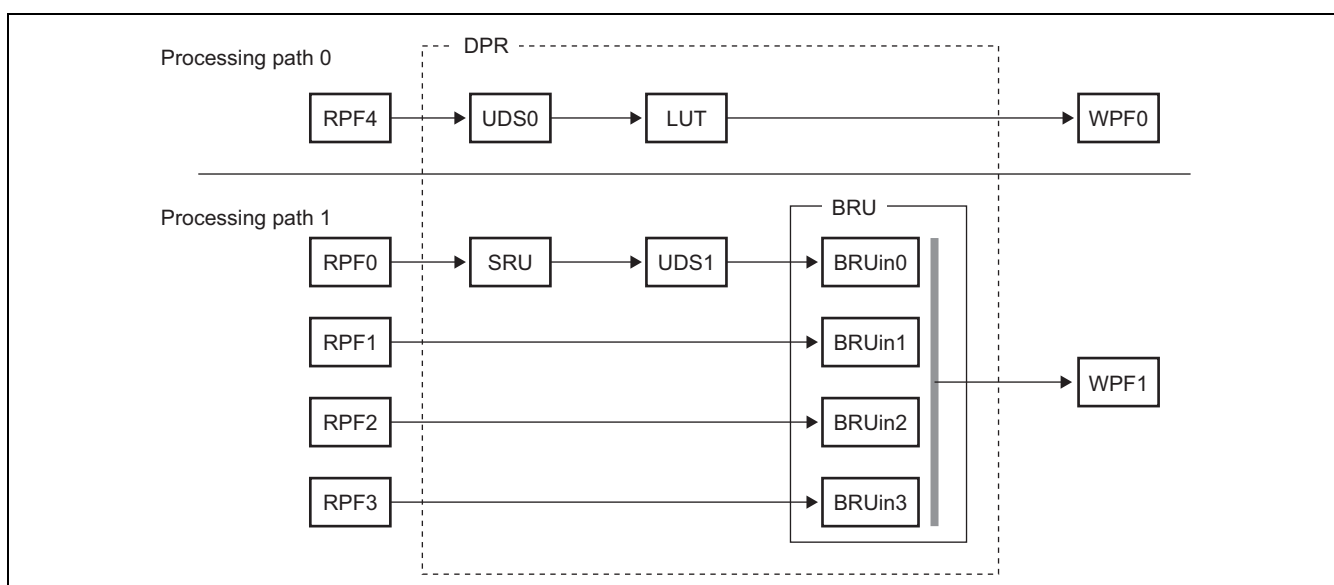

**Figure 28.33 Node Register Names and Target Node Values on Data Path Router**

In the VSP1 internal data path, the order of processes can be specified as desired. The module for performing each process has a unique node value. Set each bit field in `VI6_DPR_*_ROUTE` to an appropriate node value shown in Figure 28.33 to specify the target node to be connected behind each module.

For DPR settings, all of the following restrictions should be observed. If any of them is violated, even the WPF paths operating correctly at that time will be affected as well as the WPF paths connected through the DPR, and correct operation will not be guaranteed (for example, if a restriction is violated for the DPR setting related to WPF2, even WPF0 and WPF1 that are operating correctly will be affected).

1. Specify 63 for the output node values of all RPFs and processing modules that are not used in the DPR. Here, make sure that no module is connected to a module for which 63 is specified as the node value.
2. When specifying a value other than 63 for an output node value in the DPR, make sure that valid inputs (RPF0 to RPF4 or virtual RPF) and a target WPF are determined.
3. When a certain module is not implemented due to the LSI-specific restrictions described in Tables 28.1 to 28.3, specify 63 for the corresponding `VI6_DPR_*_ROUTE.RT_*`.
4. Only one module can be connected to each module; specifying the same target node value for two or more modules is prohibited.
5. Desired modules can be connected between each RPF and BRU input port, but all RPFs specified as the sources for a BRU input port should have the same target WPF.
6. Make appropriate routing or RPF register settings so that the color space formats (RGB/YCbCr) for all BRU input ports are the same.
7. Connect data paths appropriately so that each of UDS0 to UDS2 is used only once throughout all paths from RPF<sub>n</sub> (n = 0 to 4) to WPF<sub>n</sub> (n = 0 to 3). Connecting UDS0 to UDS2 in serial is prohibited even when there is another module between them.

8. When the BRU is connected between RPF<sub>n</sub> and WPF<sub>n</sub>, any of UDS0 to UDS2 can be connected in parallel with each path from RPF<sub>n</sub> to BRU input ports 0 to 3. Note that when any of UDS0 to UDS2 is connected before BRU input ports 0 to 3, UDS0 to UDS2 cannot be used behind the BRU. In such a parallel UDS connection, the performance may be degraded. For details, contact a Renesas Electronics sales representative.
9. Do not connect the output of any module as the input to the same module (in the BRU case, any input port) even when there is another module between the output and input (creating a loop is prohibited).
10. Each node can be used only once throughout all paths from RPF<sub>n</sub> to WPF<sub>n</sub>. When a module shown in Figure 28.33 is assigned in one RPF – WPF path, it cannot be used in another RPF – WPF path.
11. While a WPF is operating, modifying the DPR connection settings in VI6\_DPR\_\*\_ROUTE is prohibited for modules used by the WPF but allowed for modules not used by the WPF. Be careful not to accidentally modify the settings of the modules included in the WPF path that is operating.

**Figure 28.34 Examples of Internal Data Path Routing**

Figure 28.34 shows examples of internal data path routing. Path 0 is assigned to WPF0 (RPF4 is the source RPF), and path 1 is assigned to WPF1 (RPF0 to RPF3 are the source RPFs). Each path has the configuration shown in Figure 28.34. Path 0 performs UDS and LUT processing (e.g., up/down scaling and  $\gamma$  correction). Path 1 performs super resolution processing and scaling for input 0 (RPF0) and then applies blending or raster operation between the resultant data and input data 1 to 3 (RPF1 to RPF3). The VI6\_DPR\_\*\_ROUTE settings for these examples are shown in Table 28.27. The bit fields for the modules that are not used in the examples should be set to 63.

**Table 28.27 VI6\_DPR\*\_ROUTE Register Settings in Connection Examples Shown in Figure 28.34**

Register Name	Setting	
VI6_DPR_RPF0_ROUTE	16	(To SRU)
VI6_DPR_RPF1_ROUTE	24	(To BRUin1)
VI6_DPR_RPF2_ROUTE	25	(To BRUin2)
VI6_DPR_RPF3_ROUTE	26	(To BRUin3)
VI6_DPR_RPF4_ROUTE	17	(To UDS0)
VI6_DPR_SRU_ROUTE	18	(To UDS1)
VI6_DPR_UDS0_ROUTE	22	(To LUT)
VI6_DPR_UDS1_ROUTE	23	(To BRUin0)
VI6_DPR_UDS2_ROUTE	63	(UNUSED)
VI6_DPR_LUT_ROUTE	56	(To WPF0)
VI6_DPR_CLU_ROUTE	63	(UNUSED)
VI6_DPR_HST_ROUTE	63	(UNUSED)
VI6_DPR_HSI_ROUTE	63	(UNUSED)
VI6_DPR_BRU_ROUTE	57	(To WPF1)

Although both examples shown in Figure 28.34 include operation in image processing modules, connect the RPF to the WPF directly when only image format conversion or packed format conversion is required.

### 28.2.9.2 RPFn Routing Register (VI6\_DPR\_RPFn\_ROUTE: n = 0, 1, 2, 3, 4)

Note: See Table 28.15 for details on which RZ/G series products have which registers.

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 8	TGW [2:0]	000	R/W	Target WPF Index for {mod} These bits are used for specifying the target WPF index of {mod}. If {mod} is not used, set B'111 to these bits.
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5 to 0	PT[5:0]	H'00	R/W	Target Node Index for {mod} Histogram Sampling {mod} generates the histogram for the target node specified by these bits. For example, if these bits are set to 0, {mod} module generates the histogram for the output data of RPF0. Refer to Table 28.28 for the target node index which can be used for {mod}. If {mod} is not used, set 63 to these bits.

**Table 28.28 Target Node Index for {mod} Module**

Node Index	Module for Histogram Generation
0 to 4	RPF0 to 4
16	SRU
17 to 19	UDS0 to 2
22	LUT
27	BRU
29	CLU
30	HST
31	HSI
55	LIF*

Note: \* Do not set the value 55 to PT in case of LIF write back is used (i.e. VI6\_WPF0\_WRBACK\_CTRL.WBMD [1:0] = 1).

## 28.2.10 SRU Control Registers

### 28.2.10.1 Super Resolution Control Register 0 (VI6\_SRU\_CTRL0)

Note: See Table 28.15 for details on which RZ/G series products have which registers.

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	SRU_PARAM1 [4:0]				—	SRU_MODE [2:0]		SRU_PARAM2	SRU_PARAM3	SRU_PARAM4	SRU_EN		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24 to 16	SRU_PARAM0 [8:0]	All 0	R/W	Super Resolution Parameter 0 Specify an appropriate value shown in Table 28.29; do not specify any other value.
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12 to 8	SRU_PARAM1 [4:0]	All 0	R/W	Super Resolution Parameter 1 Specify an appropriate value shown in Table 28.29; do not specify any other value.
7	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
6 to 4	SRU_MODE [2:0]	000	R/W	Super Resolution Mode Setting These bits specify a super resolution mode. In super resolution without scaling, the output size is the same as the input size. In super resolution with double scale-up, the output size is twice the input size. 000: Super resolution without scaling 100: Super resolution with double scale-up Other settings are prohibited.
3	SRU_PARAM2	0	R/W	Super Resolution Parameter 2 This parameter setting depends on the color space of the image input to the SRU. Specify an appropriate value shown in Table 28.30; do not specify any other value.
2	SRU_PARAM3	0	R/W	Super Resolution Parameter 3 Specify an appropriate value shown in Table 28.30; do not specify any other value.

Bit	Bit Name	Initial Value	R/W	Description
1	SRU_PARAM4	0	R/W	Super Resolution Parameter 4 This parameter setting depends on the color space of the image input to the SRU. Specify an appropriate value shown in Table 28.30; do not specify any other value.
0	SRU_EN	0	R/W	Super Resolution Processing Enable/Disable Enables or disables super resolution processing. This setting has the highest priority over all other SRU registers. 0: Super resolution processing is disabled (input goes through the SRU without change) 1: Super resolution processing is enabled

YCbCr format is recommended for the super resolution processing. If the super resolution processing is applied to an RGB-format image, adverse effects such as color blur may be generated; when using an RGB format, evaluate the image quality carefully before applying the processing to practical use.

To execute the super resolution processing in YCbCr format, set up the RPF and DPR appropriately so that YCbCr-format image data is input to the SRU. Specifically, make the RPFn output YCbCr-format image data and send the output data to the SRU through the DPR. For details of RPFn input/output settings, refer to section 28.2.7.3. For DPR settings, refer to sections 28.2.9.1 to 28.2.9.4.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TDIPC	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
30	AMD	0	R/W	Pixel Count at Scale-Up Specifies the number of pixels generated through scale-up in the UDS. This bit setting is ignored for scale-down. 0: Pixel count after scale-up is $1 + \langle n - 1 \rangle \times \text{scale-up factor}$ 1: Pixel count after scale-up is $\langle n \rangle \times \text{scale-up factor}$ Note: n: Number of pixels input to UDS
29	FMD	0	R/W	Padding for Insufficient Clipping Size When the scaling filter outputs an image that is smaller than the clipping size (VI6_UDSn_CLIP_SIZE), pixels are interpolated to match the clipping size. This bit specifies the pixel filling method. 0: Pixels are filled by copying pixels at the right edge and the bottom edge. 1: Pixels are filled with the color specified by VI6_UDSn_FILL_COLOR.
28	BLADV	0	R/W	Bilinear or Nearest Neighbor Interpolation Characteristic Control Controls the characteristics of bilinear or nearest neighbor interpolation. Setting this bit to 1 improves the aliasing characteristics at $\times 1/2$ to $1/8$ scaling (VI6_UDS_SCALE.VMANT/HMANT = 2 to 8). Note that the apparent resolution around edges may deteriorate. In multi-tap mode, this control is not available; to use this control, set the BC bit to 0.
27, 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
25	AON	0	R/W	<p>Scale-Up/Down of <math>\alpha</math> Plane</p> <p>These bits specify whether to enable or disable scale-up/down of the <math>\alpha</math> plane when scaling up/down in the RGB format. When the AON bit is set to 0, the UDS outputs the value of the VI6_UDSn_ALPVAL.ALPH_VAL0 bits as a fixed <math>\alpha</math> value.</p> <p>0: <math>\alpha</math> scale-up/-down is not performed 1: <math>\alpha</math> scale-up/-down is performed</p>
24	ATHON	0	R/W	<p><math>\alpha</math> Output Data Threshold Comparison Enable/Disable</p> <p>Enables or disables comparison with the <math>\alpha</math> output data threshold. When this bit is 1, the output <math>\alpha</math> value is replaced according to the VI6_UDSn_ALPTH and VI6_UDSn_ALPVAL values.</p> <p>When the AON bit is 0 (scale-up/-down of the <math>\alpha</math> plane is disabled), this bit setting has no effect.</p> <p>0: <math>\alpha</math> output data threshold comparison is disabled 1: <math>\alpha</math> output data threshold comparison is enabled</p>
23 to 21	—	All 0	R	<p>Reserved</p> <p>These bits are always read as 0. The write value should always be 0.</p>
20	BC	0	R/W	<p>Pixel Component Interpolation Method at Scale-Up/Down</p> <p>Specifies the method for interpolating pixel components at scale-up/-down.</p> <p>0: Bilinear or nearest neighbor interpolation method is used 1: Interpolation method equivalent to 4 to 17 taps in accordance with the scaling factor is used (multi-tap mode)</p> <p>Note that the <math>\alpha</math> component is interpolated by the method specified in the NE_A bit instead of the multi-tap method.</p> <p>When the BC and AON bits are both set to 1, the scaling shall be scale-up, no scaling, or scale-down with scaling factor 1/1 to 1/2.</p>
19	NE_A	0	R/W	<p><math>\alpha</math> Interpolation Method</p> <p>Specifies the interpolation method of the <math>\alpha</math> plane. When the AON bit is 0 (scale-up/-down of the <math>\alpha</math> plane is disabled), this bit setting has no effect.</p> <p>0: Bilinear method 1: Nearest neighbor method*</p>
18	NE_RCR	0	R/W	<p>R/Cr Interpolation Method When Bilinear/Nearest Neighbor Interpolation is Selected</p> <p>Specifies the interpolation method of the R/Cr component when bilinear/nearest neighbor interpolation is selected (BC = 0).</p> <p>0: Bilinear method 1: Nearest neighbor method*</p>
17	NE_GY	0	R/W	<p>G/Y Interpolation Method When Bilinear/Nearest Neighbor Interpolation is Selected</p> <p>Specifies the interpolation method of the G/Y component when bilinear/nearest neighbor interpolation is selected (BC = 0).</p> <p>0: Bilinear method 1: Nearest neighbor method*</p>

Bit	Bit Name	Initial Value	R/W	Description
16	NE_BCB	0	R/W	B/Cb Interpolation Method When Bilinear/Nearest Neighbor Interpolation is Selected Specifies the interpolation method of the B/Cb component when bilinear/nearest neighbor interpolation is selected (BC = 0). 0: Bilinear method 1: Nearest neighbor method*
15 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	TDIPC	0	R/W	2D-IPC function Enable/Disable Select 0: 2D IPC function Disable 1: 2D IPC function Enable UDSn execute 2D IPC function based on this bit and the setting of VI6_UDSn_IPC register. See section 28.2.11.6, 2D IPC Setting Register (VI6_UDSn_IPC) for more details.
0	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

Note: \* This method can be used only when the scale-up/-down factor is 1/1 to 1/4.

### 28.2.11.2 Scaling Factor Registers (VI6\_UDSn\_SCALE)

Note: See Table 28.15 for details on which RZ/G series products have which registers.

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	HMANT[3:0]	H'0	R/W	<p>Multiplier (Integral Part) of Horizontal Scaling Factor</p> <p>These bits specify the integral part of the horizontal scaling factor. The image size to be obtained changes according to this setting. Calculate an appropriate value using the formula shown later to obtain a desired image size.</p> <p>A value from H'0 to H'F can be specified. Select a value within the range shown in Table 28.31.</p>
27 to 16	HFRAC[11:0]	H'000	R/W	<p>Multiplier (Fractional Part) of Horizontal Scaling Factor</p> <p>These bits specify the fractional part of the horizontal scaling factor. The image size to be obtained changes according to this setting. Calculate an appropriate value using the formula shown later to obtain a desired image size.</p> <p>A value from H'100 to H'FFF can be specified when an image is upsampled (the HMANT value is 0) in the horizontal direction. A value from H'000 to H'FFF can be specified when an image is downsampled (the HMANT value is not 0) in the horizontal direction. Select a value within the range shown in Table 28.31.</p>
15 to 12	VMANT[3:0]	H'0	R/W	<p>Multiplier (Integral Part) of Vertical Scaling Factor</p> <p>These bits specify the integral part of the vertical scaling factor. The image size to be obtained changes according to this setting. Calculate an appropriate value using the formula shown later to obtain a desired image size.</p> <p>A value from H'0 to H'F can be specified. Select a value within the range shown in Table 28.31.</p>
11 to 0	VFRAC[11:0]	H'000	R/W	<p>Multiplier (Fractional Part) of Vertical Scaling Factor</p> <p>These bits specify the fractional part of the vertical scaling factor. The image size to be obtained changes according to this setting. Calculate an appropriate value using the formula shown later to obtain a desired image size.</p> <p>A value from H'100 to H'FFF can be specified when an image is upsampled (the VMANT value is 0) in the vertical direction. A value from H'000 to H'FFF can be specified when an image is downsampled (the VMANT value is not 0) in the vertical direction. Select a value within the range shown in Table 28.31.</p>

The HMANT and HFRAC bits set the scale-up/-down factor for an image in the horizontal direction, and the VMANT and VFRAC bits set the scale-up/-down factor for an image in the vertical direction. The UDS operation switches between horizontal scale-up and horizontal scale-down according to the HMANT and HFRAC bit settings, as shown in Table 28.31. (Setting a value outside the ranges of Table 28.31 in UDS operation is prohibited). Table 28.31 is for the horizontal direction, but it is similar for the vertical direction. In this case, replace HMANT with VMANT and HFRAC with VFRAC when reading.

Note that settings for scaling in the horizontal direction and settings for scaling in the vertical direction can be made independently. Therefore, a setting for scale-up in the horizontal direction and scale-down in the vertical direction is possible. In such a case, because the formula (described later) for obtaining the image size after scale-up/-down is different between scale-up and scale-down, a formula matching the scale-up or scale-down operation should be selected independently for the horizontal direction and vertical direction.

**Table 28.31 Switching of Horizontal Scale-Up/Down Operation According to HMANT and HFRAC Bit Settings**

HMANT	HFRAC	UDS Operation
H'0	H'100 to H'FFF	Scale-up
H'1	H'000	Same size (no scale-up/-down)
	H'001 to H'FFF	Scale-down
H'2 to H'F	H'000 to H'FFF	

Described here is the method for calculating the size of the upscaled/downscaled image that was obtained based on this register setting. First, define the variables necessary for calculating the horizontal size of the upscaled/downscaled image, as shown below.

$$h_{scale} = \frac{4096}{4096 \times m_h + f_h}$$

$m_h$  is the value of VI6\_UDSn\_SCALE.HMANT, and  $f_h$  is the value of VI6\_UDSn\_SCALE.HFRAC. This formula expresses the estimate of the scale-up/-down factor processed by the UDS. If the horizontal size of the image before scale-up/-down is set as  $h_{size_{org}}$ , the horizontal size of the image after scale-up/-down can be roughly obtained through  $h_{size_{org}} \times h_{scale}$ .

Similarly, define the variables necessary for calculating the vertical size of the upscaled/downscaled image.

$$v_{scale} = \frac{4096}{4096 \times m_v + f_v}$$

When setting  $m_v$  as the value of VI6\_UDSn\_SCALE.VMANT,  $f_v$  as the value of VI6\_UDSn\_SCALE.VFRAC, and  $v_{size_{org}}$  as the vertical size of the image before scale-up/-down, the vertical size of the image after scale-up/-down can be roughly obtained through  $v_{size_{org}} \times v_{scale}$ .

When the UDSn performs scale-down with the settings of Table 28.31, using the variables defined so far, the horizontal size of the downscaled image  $h_{size_{down\_scaled}}$  and the vertical size of the downscaled image  $v_{size_{down\_scaled}}$  become as follows:

$$hsize_{down\_scaled} = \left\langle 1 + \left( \left\langle 1 + \frac{\langle hsize_{org} - 1 \rangle}{m_h'} \right\rangle - 1 \right) \times m_h' \times hscale \right\rangle$$

$$vsize_{down\_scaled} = \left\langle 1 + \left( \left\langle 1 + \frac{\langle vsize_{org} - 1 \rangle}{m_v'} \right\rangle - 1 \right) \times m_v' \times vscale \right\rangle$$

Since the division of *hscale* and *vscale* has to be executed at the end of the above formulas, respectively, formulas considering the order of operation become as follows:

$$hsize_{down\_scaled} = \left\langle 1 + \left( \left( \left\langle 1 + \frac{\langle hsize_{org} - 1 \rangle}{m_h'} \right\rangle - 1 \right) \times m_h' \times 4096 \right) / (4096 \times m_h + f_h) \right\rangle$$

$$vsize_{down\_scaled} = \left\langle 1 + \left( \left( \left\langle 1 + \frac{\langle vsize_{org} - 1 \rangle}{m_v'} \right\rangle - 1 \right) \times m_v' \times 4096 \right) / (4096 \times m_v + f_v) \right\rangle$$

The value of  $m_h'$  or  $m_v'$ , which is shown in Table 28.32, changes according to the setting of VI6\_UDSn\_SCALE.HMANT or VI6\_UDSn\_SCALE.VMANT.

**Table 28.32**  $m_h'$  or  $m_v'$  Setting

VI6_UDSn_SCALE.HMANT Setting (VI6_UDSn_SCALE.VMANT Setting)	$m_h'$ ( $m_v'$ )
1 to 3	1
4 to 7	2
8 to 15	4

When the UDSn performs scale-up with the settings of Table 28.31 and VI6\_UDSn\_CTRL.AMD is 0, the horizontal size of the upscaled image  $hsize_{up\_scaled}$  and the vertical size of the upscaled image  $vsize_{up\_scaled}$  become as follows:

$$hsize_{up\_scaled} = \left\langle 1 + (hsize_{org} - 1) \times hscale \right\rangle$$

$$vsize_{up\_scaled} = \left\langle 1 + (vsize_{org} - 1) \times vscale \right\rangle$$

Similar to the scale-down case, formulas considering the division of *hscale* and *vscale* become as follows:

$$hsize_{up\_scaled} = \left\langle 1 + ((hsize_{org} - 1) \times 4096) / (4096 \times m_h + f_h) \right\rangle$$

$$vsize_{up\_scaled} = \left\langle 1 + ((vsize_{org} - 1) \times 4096) / (4096 \times m_v + f_v) \right\rangle$$

When VI6\_UDSn\_CTRL.AMD is 1, the horizontal size of the upscaled image  $hsize_{up\_scaled}$  and the vertical size of the upscaled image  $vsize_{up\_scaled}$  become as follows:

$$hsize_{up\_scaled} = \langle hsize_{org} \times hscale \rangle$$

$$vsize_{up\_scaled} = \langle vsize_{org} \times vscale \rangle$$

After considering the division of hscale and vscale, the formulas become as follows:

$$hsize_{up\_scaled} = \langle (hsize_{org} \times 4096) / (4096 \times m_h + f_h) \rangle$$

$$vsize_{up\_scaled} = \langle (vsize_{org} \times 4096) / (4096 \times m_v + f_v) \rangle$$

### 28.2.11.3 $\alpha$ Data Threshold Setting Registers (VI6\_UDSn\_ALPTH)

Note: See Table 28.15 for details on which RZ/G series products have which registers.

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 8	ALPH_TH1 [7:0]	H'00	R/W	$\alpha$ Data Threshold Setting 1 When the $\alpha$ value is equal to or greater than the value of the ALPH_TH1 bits, the $\alpha$ value is replaced with that of VI6_UDSn_ALPVAL.ALPH_VAL2. When VI6_UDSn_CTRL.AON is 0 (scale-up/-down of the $\alpha$ plane is disabled), the setting of these bits has no effect. A value from H'00 to H'FF can be specified.
7 to 0	ALPH_TH0 [7:0]	H'00	R/W	$\alpha$ Data Threshold Setting 0 When the $\alpha$ value is equal to or smaller than the value of the ALPH_TH0 bits, the $\alpha$ value is replaced with that of VI6_UDSn_ALPVAL.ALPH_VAL0. When VI6_UDSn_CTRL.AON is 0 (scale-up/-down of the $\alpha$ plane is disabled), the setting of these bits has no effect. A value from H'00 to H'FF can be specified.

### 28.2.11.4 $\alpha$ Data Replacing Value Setting Registers (VI6\_UDSn\_ALPVAL)

Note: See Table 28.15 for details on which RZ/G series products have which registers.

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	ALPH_VAL2 [7:0]	H'00	R/W	Replacing $\alpha$ Value Setting 2 These bits set a value that replaces the $\alpha$ value when it is equal to or greater than the value of VI6_UDSn_ALPTH.ALPH_TH1. When VI6_UDSn_CTRL.AON is 0 (scale-up/-down of the $\alpha$ plane is disabled), the setting of these bits has no effect. A value from H'00 to H'FF can be specified.
15 to 8	ALPH_VAL1 [7:0]	H'00	R/W	Replacing $\alpha$ Value Setting 1 These bits set a value that replaces the $\alpha$ value when it is greater than the value of VI6_UDSn_ALPTH.ALPH_TH0 and also smaller than that of VI6_UDSn_ALPTH.ALPH_TH1. When VI6_UDSn_CTRL.AON is 0 (scale-up/-down of the $\alpha$ plane is disabled), the setting of these bits has no effect. A value from H'00 to H'FF can be specified.
7 to 0	ALPH_VAL0 [7:0]	H'00	R/W	Replacing $\alpha$ Value Setting 0 These bits set a value that replaces the $\alpha$ value when it is equal to or smaller than the value of VI6_UDSn_ALPTH.ALPH_TH0. When VI6_UDSn_CTRL.AON is 0 (scale-up/-down of the $\alpha$ plane is disabled), $\alpha$ output value for the UDS is the fixed value specified in these bits. A value from H'00 to H'FF can be specified.

### 28.2.11.5 Passband Registers (VI6\_UDSn\_PASS\_BWIDTH)

22 to 16	BWIDTH_H [6:0]	All 0	R/W	Horizontal Signal Passband at Image Scale-Up/Down Set these bits following the method described later.
15 to 7	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
6 to 0	BWIDTH_V [6:0]	All 0	R/W	Vertical Signal Passband at Image Scale-Up/Down Set these bits following the method described later.

The method for setting the passband in the horizontal direction of an image is described. When the VI6\_UDSn\_SCALE.HMANT bits for horizontal scale-up/-down factor setting are not 0, set the BWIDTH\_H bits according to the following formula. When the VI6\_UDSn\_SCALE.HMANT bits are 0, set 64 in the BWIDTH\_H bits.

$$BWIDTH\_H = \left\langle 64 \times \frac{4096 \times m_h'}{4096 \times m_h + f_h} \right\rangle \quad (VI6\_UDSn\_SCALE.HMANT \neq 0)$$

$$BWIDTH\_H = 64 \quad (VI6\_UDSn\_SCALE.HMANT = 0)$$

$m_h$  is the value of VI6\_UDSn\_SCALE.HMANT, and  $f_h$  is the value of VI6\_UDSn\_SCALE.HFRAC. For the  $m_h'$  value, see Table 28.32. The method for setting the passband in the vertical direction of an image is similar to that for the horizontal direction described earlier. Since only the correspondence relationship of the registers is changed as shown below, replace the variables in the previous explanation as shown below when reading.

BWIDTH\_H → BWIDTH\_V

$m_h'$  →  $m_v'$

$m_h$  →  $m_v$

$f_h$  →  $f_v$

VI6\_UDSn\_SCALE.HMANT → VI6\_UDSn\_SCALE.VMANT

VI6\_UDSn\_SCALE.HFRAC → VI6\_UDSn\_SCALE.VFRAC

### 28.2.11.6 2D IPC Setting Register (VI6\_UDSn\_IPC)

Note: See Table 28.15 for details on which RZ/G series products have which registers.

27	FIELD	0	R/W	Top/Bottom Field Select Select Top/Bottom Field of image data when 2D IPC function is enabled (VI6_UDSn_CTRL.TDIPC = 1). 0: Top Field 1: Bottom Field
26 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

- Set 1 to VI6\_UDSn\_CTRL.TDIPC.
- Set appropriate setting of processing image  
Top Field: H'0000 0000  
Bottom Field: H'0800 0000

Notes: 1. Recommend usage case: Frame rate after 2D UPC is more than 50 fps.  
2. Be sure to set H'0000 0000 this register and set VI6\_UDSn\_CTRL.TDIPC

This register can be used for the image division mode or 2D interlace to progressive conversion (2D-IPC). When this register is not used, set VI6\_UDSn\_CTRL.TDIPC to 00. If the 2D-IPC mode is used, contact to Renesas for detail.

### 28.2.11.7 UDS Output Size Clipping Registers (VI6\_UDSn\_CLIP\_SIZE)

Note: See Table 28.15 for details on which RZ/G series products have which registers.

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
27 to 16	CL_HSIZE [11:0]	H'000	R/W	Clipping Size of Horizontal Pixel Count after Scale-Up/-Down The horizontal width of an image output from the scaling filter is adjusted (clipped or padded) to match the pixel count set in the CL_HSIZE bits. The setting range is 4 to 2,048 in a scale-down operation (see Table 28.31) and 4 to 2,048 in a scale-up operation. These bits always have to be set when using the UDSn, regardless of the scale-up, scale-down, or no-scaling setting by the VI6_UDSn_SCALE register.
15 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 0	CL_VSIZE [11:0]	H'000	R/W	Clipping Size of Vertical Pixel Count after Scale-Up/-Down The vertical width of an image output from the scaling filter is adjusted (clipped or padded) to match the pixel count set in the CL_VSIZE bits. The setting range is 4 to 2,048 in a scale-down operation (see Table 28.31) and 4 to 2,048 in a scale-up operation. These bits always have to be set when using the UDSn, regardless of the scale-up, scale-down, or no-scaling setting by the VI6_UDSn_SCALE register.

Figure 28.35 shows the configuration of the UDSn. The UDSn consists of a scaling filter and clipping circuit, such as the configuration shown in Figure 28.35. The scaling filter and clipping circuit are independent of each other.

**Figure 28.35 UDSn Configuration**

The size of the image actually output by the scaling filter (refer to section 28.2.11.2 for calculation) is determined from the size of the image input to the scaling filter and the VI6\_UDSn\_SCALE setting; that is, three types of image are output by the UDSn according to the relationship between the size of the image actually output from the scaling filter ( $hsize_{scaled}$  and  $vsize_{scaled}$ ) and this register setting as shown in Figure 28.36.

**Figure 28.36 UDS Output Image for Each CL\_HSIZE/VSIZE Setting**

When the settings of the CL\_HSIZE and CL\_VSIZE bits are smaller than the horizontal and vertical pixel counts ( $hsize_{scaled}$  and  $vsize_{scaled}$ ) actually output by the scaling filter, the upscaled/downscaled image is clipped to become the UDSn output image.

When the settings of the CL\_HSIZE and CL\_VSIZE bits are equal to the horizontal and vertical pixel counts ( $hsize_{scaled}$  and  $vsize_{scaled}$ ) actually output by the scaling filter, the image actually output by the scaling filter becomes the UDSn output image without change.

When the settings of the CL\_HSIZE and CL\_VSIZE bits are greater than the horizontal and vertical pixel counts ( $hsize_{scaled}$  and  $vsize_{scaled}$ ) actually output by the scaling filter, in order to obtain the UDSn output image, the image is padded in the mode set by VI6\_UDSn\_CTRL.FMD for the area in which the settings of the CL\_HSIZE and CL\_VSIZE bits have exceeded the number of pixels actually output by the scaling filter.

### 28.2.11.8 Color Fill Register (VI6\_UDSn\_FILL\_COLOR)

Note: See Table 28.15 for details on which RZ/G series products have which registers.

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	RFILC[7:0]	H'00	R/W	R/Cr Component of Fill Color A value from H'00 to H'FF can be specified.
15 to 8	GFILC[7:0]	H'00	R/W	G/Y Component of Fill Color A value from H'00 to H'FF can be specified.
7 to 0	BFILC[7:0]	H'00	R/W	B/Cb Component of Fill Color A value from H'00 to H'FF can be specified.

The scaling filter creates an upscaled/downscaled image based on the scaling factor settings of the VI6\_UDSn\_SCALE register. If the size of the upscaled/downscaled image created by the scaling filter smaller than the clipping size set in the VI6\_UDSn\_CLIP\_SIZE register (lowest case in Figure 28.36) while VI6\_UDSn\_CTRL.FMD is set to 1, the color specified by this register is used to fill the space until the clipping size is reached.

The  $\alpha$  value of the area to be padded by this register is dependent on VI6\_UDSn\_CTRL.FMD setting. When VI6\_UDSn\_CTRL.FMD is 0 (repetition), the pixel value at the right edge (bottom edge) of the image is repeated as the  $\alpha$  value. When VI6\_UDSn\_CTRL.FMD is 1 (color information of this register is used), the  $\alpha$  value is 0.

## 28.2.12 LUT Control Register

### 28.2.12.1 LUT Control Register (VI6\_LUT\_CTRL)

Note: See Table 28.15 for details on which RZ/G series products have which registers.

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	LUT_EN	0	R/W	1D-LUT Enable/Disable Enables or disables the 1D-LUT function by the LUT. When the 1D-LUT is used, the color component curve information needs to be set separately in the LUT table. For the LUT table settings, refer to section 28.3.1. 0: 1D-LUT function is disabled 1: 1D-LUT function is enabled

In the LUT, various image processing, such as curves with high operation load (e.g.,  $\gamma$  correction), negative-positive conversion, and gain adjustment of images, can be achieved by the data replacement processing by the 1D-LUT. As shown in Figure 28.37, the LUT replaces each component of the input pixel data using the set replacement table of 256 entries. For example, if the LUT is set as in Figure 28.38, when there is an input of 150, the data stored in address 150 of the 1D-LUT is read and output as the LUT output. Figure 28.38 shows a case in which the input and output become equal for convenience in explaining.

In the LUT settings shown in Figure 28.39, the input bits are reversed. This has the effect of negative-positive flipping. In Figure 28.40,  $\gamma$  correction ( $\gamma = 1.8$  is shown as an example) is possible. As described above, information to be set in the LUT indicates LUT processing characteristics. If the same value is set for each component in the LUT, an equal effect can be obtained for each component of the input image when it is processed. If the LUT is set with different characteristics for each component, the processing characteristics can be changed for each component.

3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	M2D	0	R/W	LUT Dimension Number Specifies the number of LUT dimensions. The details of each mode will be described later. 2D mode can be used only when the CLU input color space is YCbCr. 0: Operates in 3D mode 1: Operates in 2D mode
0	CLU_EN	0	R/W	CLU Processing Enable/Disable Enables or disables the 3D/2D color correction function by the CLU. When the CLU is used, the color component information needs to be set in the CLU table. For how to set data in the CLU table, see section 28.3.2. 0: CLU color correction is disabled 1: CLU color correction is enabled

The CLU handles three-dimensional or two-dimensional LUTs. A three-dimensional LUT is called a 3D-LUT and a two-dimensional LUT is called a 2D-LUT. The 3D or 2D operating mode of the CLU is selected by the M2D bit.

In 3D mode, a three-dimensional space such as that shown in Figure 28.41 (a) is considered. The total number of coordinate points that can exist in this three-dimensional space is the total number of combinations of input data. For the CLU, this becomes the cube of each 8-bit component (= 16,777,216 points). Since it is impractical to have table values (= table memory) for the same number of these coordinate points, the CLU divides the three-dimensional space of Figure 28.41 (a) into grids as shown in Figure 28.41 (b) in 3D mode. The apex in each divided grid is defined as the coordinate point in the three-dimensional space, and a table value with three component values is set for all of these coordinate points. The total number of coordinate points in Figure 28.41 (b) is  $173 = 4,913$ . For the method of setting the table value for these 4,913 points, refer to section 28.3.2.

**Figure 28.41 Concept and Division Count of a 3-Dimensional LUT**

**Figure 28.42 Conceptual Diagram of LUT Space When CLU Is in 3D Mode**

To express a three-dimensional space such as that shown in Figure 28.41, consider the three-dimensional coordinates and axes shown in Figure 28.42 and define the minimum value and maximum value of each axis as 0 and 256, respectively. In 3D-LUT operation, the CLU forcibly assigns the four components of input data ( $\alpha$ , R/Cr/H, G/Y/S, and B/Cb/V) to axes: R, Cr, and H components to the first axis (A1), G, Y, and S components to the second axis (A2), and B, Cb, and V components to the third axis (A3). (The case of 2D mode is described later.) Among multiple components assigned to each axis (e.g., R, Cr, and H components for the first axis), one component is selected according to the format of the data input to the CLU. For example, when the color space of the data input to the CLU is RGB, the first axis (A1) shows the R component, the second axis (A2) shows the G component, and the third axis (A3) shows the B component. In a YCbCr color space, the first axis (A1) shows the Cr component, the second axis (A2) shows the Y component, and the third axis (A3) shows the Cb component.

Each component value of the CLU input data becomes a value on each axis. Since the input data ranges from 0 to 255, the maximum value of 256 is handled as a virtual point in a grid space like that shown in Figure 28.41. In a case where the coordinates obtained by plotting the values of the input three components on axes are exactly on a grid point (e.g.,  $p_0$  in Figure 28.42 (b)), the 3-component value of the table value ( $p_0$ ) set to that location becomes the CLU output. If the input value of the three components result in an intermediate location between grid points and not on a grid point, such as position P in Figure 28.42 (b), value P of the three components is interpolated from the table values ( $p_0$  to  $p_7$  in Figure 28.42 (b)) for the eight surrounding grid points and this is used as the CLU output.

By setting arbitrary table value for a three-dimensional LUT space (three-dimensional color space) such as that shown in Figure 28.41 using the processing described above, not only color conversion or color correction for the entire color space, but color conversion or color correction (memory color correction, skin smoothing, etc.) for a particular color area can be achieved.

Next, a 2D-LUT that is used when the CLU is operating in 2D mode is described (M2D bit should be set to 1 for operation in 2D mode). 2D-LUT mode is similar to 3D-LUT mode. However, since the axes for selecting the LUT become two-dimensional, the concept of a 3D-LUT space illustrated in Figure 28.42 changes to a 2D-LUT space like that shown in Figure 28.43.

**Figure 28.43 Conceptual Diagram of LUT Space when CLU is in 2D Mode**

As shown in Figure 28.43 (a), the first axis (A1) and second axis (A2) are used, and the A1-A2 plane becomes the LUT space in 2D mode. Because the third axis (A3) is not used, the CLU always handles the value on the A3 axis as 0.

2D mode can be used only when the CLU input is in the YCbCr color space. The input value of axis A1 is the input  $\alpha$  value of the CLU, and the input value of axis A2 is the input luminance Y of the CLU. If the coordinates in the 2D-LUT space which were determined by the input values are exactly on a grid point (e.g., p2 in Figure 28.43 (b)), the table value (p2) set to that location becomes the output value of the 2D-LUT. If the input 2-component value exists at an intermediate location between grid points and not on a grid point, such as position P in Figure 28.43 (b), value P is interpolated from the table values (p0 to p3 in Figure 28.43 (b)) for the four surrounding grid points and this is used as the 2D-LUT output. The interpolated component of the second axis of the 2D-LUT output acquired in this manner becomes the Y component output of the CLU. In 2D mode, the Cb/Cr component is a pass-through output.

For the CLU table values in Figure 28.43 in 2D mode, set a value for only the component value of the second axis, and set 0 for the component values of the first and third axes. For details on the setting method, see section 28.3.2.

## 28.2.14 HST Control Register

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	HST_EN	0	R/W	HSV Conversion (RGB → HSV) Enable/Disable Enables or disables RGB → HSV conversion. H indicates hue, S indicates saturation, and V indicates a value (brightness). 0: RGB → HSV conversion is disabled 1: RGB → HSV conversion is enabled

Various color correction processing can be applied to HSV-format images by combining the 1D-LUT and 3D-LUT. For details on the 1D-LUT and 3D-LUT, see sections 28.2.12.1 and 28.2.13.1.

To return HSV-converted data to RGB data, HSV → RGB conversion is used (see section 28.2.15.1). RGB ↔ HSV conversion causes an operation error. Therefore, even when only just performing conversion of RGB → HSV → RGB, the original RGB value and converted RGB value will not completely match.

31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	HSI_EN	0	R/W	Reversed HSV Conversion (HSV → RGB) Enable/Disable Enables or disables HSV → RGB conversion to return HSV data that was converted by HSV conversion (see section 28.2.14.1) back to RGB data. 0: HSV → RGB conversion is disabled 1: HSV → RGB conversion is enabled

RGB ↔ HSV conversion causes an operation error. Therefore, even when only just performing conversion of RGB → HSV → RGB, the original RGB value and converted RGB value will not completely match.

## 28.2.16 BRU Control Registers

### 28.2.16.1 BRU Input Control Register (VI6\_BRU\_INCTRL)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	NRM	—	—	—	—	—	—	—	—	D3ON	D2ON	D1ON	D0ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	DITH3 [2:0]			—	DITH2 [2:0]			—	DITH1 [2:0]			—	DITH0 [2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W

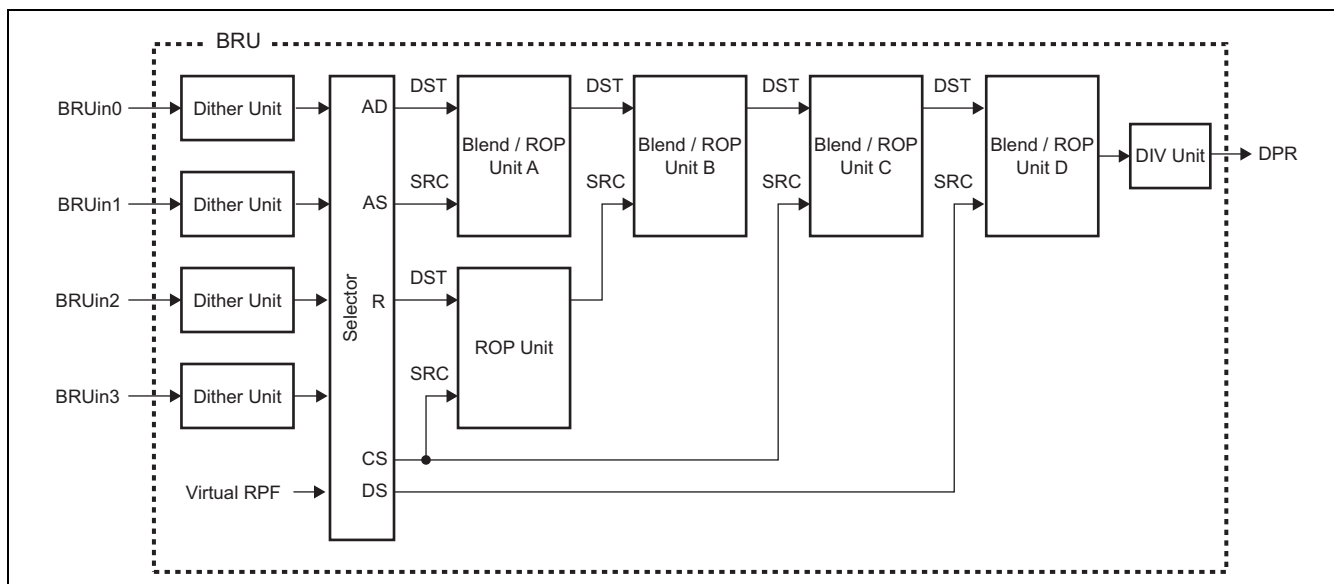

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	NRM	0	R/W	Color Data Normalization Enables or disables division by the $\alpha$ value of the color data in BRU blending operation. This is used when converting the RGB color data format to which the $\alpha$ value is multiplied (premultiplied color) into the RGB color data format to which the $\alpha$ value is not multiplied (non-premultiplied color). Do not use this for the YCbCr format. 0: Divider (DIV unit in Figure 28.44) does not divide the color value by $\alpha$ 1: Divider (DIV unit in Figure 28.44) divides the color value by $\alpha$
27 to 20	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
19	D3ON	0	R/W	Dithering Enable of BRU Input 3 Enables or disables dithering (color reduction) of BRU input 3 (BRUin3 in Figure 28.44). 0: Dithering of BRUin3 is disabled 1: Dithering of BRUin3 is enabled
18	D2ON	0	R/W	Dithering Enable of BRU Input 2 Enables or disables dithering (color reduction) of BRU input 2 (BRUin2 in Figure 28.44). 0: Dithering of BRUin2 is disabled 1: Dithering of BRUin2 is enabled
17	D1ON	0	R/W	Dithering Enable of BRU Input 1 Enables or disables dithering (color reduction) of BRU input 1 (BRUin1 in Figure 28.44). 0: Dithering of BRUin1 is disabled 1: Dithering of BRUin1 is enabled

Bit	Bit Name	Initial Value	R/W	Description
16	D0ON	0	R/W	Dithering Enable of BRU Input 0 Enables or disables dithering (color reduction) of BRU input 0 (BRUin0 in Figure 28.44). 0: Dithering of BRUin0 is disabled 1: Dithering of BRUin0 is enabled
15	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
14 to 12	DITH3 [2:0]	000	R/W	Dithering of CH3 Input to BRU These bits specify the number of colors for pixels after dithering (color reduction) when dithering (color reduction) for pixel information is enabled through the D3ON bit. When dithering (color reduction) for pixel information is disabled, specify 0 in these bits. 000: Dithering of BRUin3 input image is disabled 001: Dithering of BRUin3 input image at 18 bpp (RGB666: 262,144 colors) 010: Dithering of BRUin3 input image at 16 bpp (RGB565: 65,536 colors) 011: Dithering of BRUin3 input image at 15 bpp (RGB555: 32,768 colors) 100: Dithering of BRUin3 input image at 12 bpp (RGB444: 4,096 colors) 101: Dithering of BRUin3 input image at 8 bpp (RGB332: 256 colors) 110, 111: Setting prohibited
11	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
10 to 8	DITH2 [2:0]	000	R/W	Dithering of CH2 Input to BRU These bits specify how to perform dithering of the CH2 input to the BRU. The setting method is the same as that for the DITH3 bits. Read the description of the DITH3 bits with BRUin2 and D2ON replacing BRUin3 and D3ON, respectively.
7	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
6 to 4	DITH1 [2:0]	000	R/W	Dithering of CH1 Input to BRU These bits specify how to perform dithering of the CH1 input to the BRU. The setting method is the same as that for the DITH3 bits. Read the description of the DITH3 bits with BRUin1 and D1ON replacing BRUin3 and D3ON, respectively.
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	DITH0 [2:0]	000	R/W	Dithering of CH0 Input to BRU These bits specify how to perform dithering of the CH0 input to the BRU. The setting method is the same as that for the DITH3 bits. Read the description of the DITH3 bits with BRUin0 and D0ON replacing BRUin3 and D3ON, respectively.

Figure 28.44 shows the configuration of the BRU. For the BRU inputs, there are four inputs from the DPR and one internal input as a virtual RPF. BRUin0 to BRUin3 are input ports that have the target node values shown in Figure 28.33, and they can be connected to any module on the DPR. The same color space (YCbCr or RGB) has to be used for the four inputs from the DPR to the BRU.

The virtual RPF inside the BRU is an input unit not connected to the DPR. It is called the "virtual RPF" because it outputs images internally created by the BRU. Starting of the virtual RPF is controlled by VI6\_WPFn\_SRCRPF.VIR\_ACT, and the single-color data created at the virtual RPF can be used for blending or raster operation (ROP) with data from the other input units BRUin0 to BRUin3. The color space for the single color to be set for the virtual RPF needs to match the color space of the four inputs from the DPR to the BRU. For this setting method, see section 28.2.16.4.

**Figure 28.44 BRU Configuration**

The selector in Figure 28.44 is used to select the SRC and DST inputs to blending/ROP units A to D and the ROP unit from BRUin0 to BRUin3 which are inputs from the DPR and the virtual RPF. The SRC and DST input sources for blending/ROP units A to D and the ROP unit are either uniquely determined based on the configuration shown in Figure 28.44 (Table 28.33) or selected as desired by registers. The input sources that can be arbitrarily selected by registers are AD, AS, R, CS, and DS, which correspond to the registers shown in Table 28.34.

**Table 28.33 SRC and DST with Unique Input Sources**

Input	Input Source	Register Bits
Blending/ROP unit B - DST	Output from blending/ROP unit A	—
Blending/ROP unit B - SRC	Output from ROP unit	—
Blending/ROP unit C - DST	Output from blending/ROP unit B	—
Blending/ROP unit D - DST	Output from blending/ROP unit C	—
ROP unit - SRC	CS which is a selector output	VI6_BRUC_CTRL.SRCSEL

**Table 28.34 Correspondence between Selector Output Destinations and Register Bits**

Selector Output	Output Destination	Register Bits
AD	Blending/ROP unit A - DST	VI6_BRUA_CTRL.DSTSEL
AS	Blending/ROP unit A - SRC	VI6_BRUA_CTRL.SRCSEL
R	ROP unit - DST	VI6_BRU_ROP.DSTSEL
CS	Blending/ROP unit C - SRC	VI6_BRUC_CTRL.SRCSEL
DS	Blending/ROP unit D - SRC	VI6_BRUD_CTRL.SRCSEL

### 28.2.16.2 Size Register of BRU Input Virtual RPF (VI6\_BRU\_VIRRPF\_SIZE)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28 to 16	VIR_HSIZE [12:0]	H'0000	R/W	Virtual RPF Horizontal Size These bits set the horizontal size of an image from the virtual RPF shown in Figure 28.44. A value from 1 to 8,190 can be specified.
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12 to 0	VIR_VSIZE [12:0]	H'0000	R/W	Virtual RPF Vertical Size These bits set the vertical size of an image from the virtual RPF shown in Figure 28.44. A value from 1 to 8,190 can be specified.

The virtual RPF has only a function to output a fixed  $\alpha$  value and a fixed pixel value. The virtual RPF can internally create a single-color image without accessing external memory via the MAU. Same as images from the other BRU input ports, a sub layer can be blended on an image created in this manner with the image used as the background (master layer). In turn, when using the image as a sub layer, it can be drawn on the master layer as a window.

Note that the virtual RPF is fixed to input port 5 of the BRU, and the data path route cannot be changed by the DPR.

### 28.2.16.3 Display Location Register of BRU Input Virtual RPF (VI6\_BRU\_VIRRPF\_LOC)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28 to 16	HCOORD [12:0]	H'0000	R/W	Horizontal Coordinate of Virtual RPF Location on Master Layer These bits specify the horizontal coordinate of where to locate the left-edge pixel of the virtual RPF's layer, with the left-edge pixel of the master layer set at coordinate 0. This setting should be made in pixel units. A value from 0 to 8,189 can be specified. When the virtual RPF is specified as the master layer by VI6_WPFn_SRCRPF.VIR_ACT, set these bits to 0.
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12 to 0	VCOORD [12:0]	H'0000	R/W	Vertical Coordinate of Virtual RPF Location on Master Layer These bits specify the vertical coordinate of where to locate the top-edge pixel of the virtual RPF's layer, with the top-edge pixel of the master layer set at coordinate 0. This setting should be made in pixel units. A value from 0 to 8,189 can be specified. When the virtual RPF is specified as the master layer by VI6_WPFn_SRCRPF.VIR_ACT, set these bits to 0.

### 28.2.16.4 Color Information Register of BRU Input Virtual RPF (VI6\_BRU\_VIRRPF\_COL)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	COL_A[7:0]	H'00	R/W	Fixed $\alpha$ of Virtual RPF These bits set the fixed $\alpha$ value when the virtual RPF creates a virtual plane. A value from 0 to 255 can be specified.
23 to 16	COL_RCR [7:0]	H'00	R/W	Fixed R/Cr of Virtual RPF These bits set the fixed R/Cr value when the virtual RPF creates a virtual plane. A value from 0 to 255 can be specified.
15 to 8	COL_GY [7:0]	H'00	R/W	Fixed G/Y of Virtual RPF These bits set the fixed G/Y value when the virtual RPF creates a virtual plane. A value from 0 to 255 can be specified.
7 to 0	COL_BCB [7:0]	H'00	R/W	Fixed B/Cb of Virtual RPF These bits set the fixed B/Cb value when the virtual RPF creates a virtual plane. A value from 0 to 255 can be specified.

The transparency information and color information of the single color that is created by the virtual RPF are set in the bits of this register. As described earlier, the color information is set for the YCbCr or RGB color space. The color space to be set in this register depends on the register settings of the environment and other modules to which the BRU is connected by the DPR. Two cases can be considered. Since the  $\alpha$  value (COL\_A) is transparency information and irrelevant to the concept of color space, the same setting is made for either the YCbCr or RGB color space.

#### (Case 1: When an input other than the virtual RPF is used)

When the source RPF is connected to any one of the BRU input ports (BRUin0 to BRUin3) other than the virtual RPF and valid data is being supplied, the same color space data as the color space for the BRU inputs should be set in this register as the color space for the virtual RPF's color information. This is based on the restriction of "all BRU inputs must have the same color space", as described in section 28.2.9.1 or 28.2.16.1.

#### (Case 2: When only the virtual RPF is used)

When only the virtual RPF is used as the source RPF of WPFn, RPFn is not connected to the BRU, as shown in Figure 28.45. Thus, there is no color space for another input that the color space for the virtual RPF has to follow, as in case 1. This means that the color space of the data output by the BRU is determined by the WPF setting.

**Figure 28.45 Relationship between DPR Connection and Color Space when Only Virtual RPF is Used**

As shown in Figure 28.45, the output color space of the VSP1 (= output color space of WPFn) is determined by VI6\_WPFn\_OUTFMT.WRFMT. When bit 6 in VI6\_WPFn\_OUTFMT.WRFMT (WRFMT[6]) is 0, the color space is RGB, while when it is 1, the color space is YCbCr. Next, the WPF input color space (= BRU output color space) is determined by the relationship between the WPF output color space and VI6\_WPFn\_OUTFMT.CSC. When VI6\_WPFn\_OUTFMT.CSC is 0, the WPF output color space and WPF input color space (= BRU output color space) are the same. When VI6\_WPFn\_OUTFMT.CSC is 1, the WPF output color space and WPF input color space (= BRU output color space) are the opposite. This relationship is summarized in Table 28.35.

The color space for the virtual RPF's color information should be set in this register according to the "BRU output color space" shown in Table 28.35.

**Table 28.35 Relationship between WPF Output Color Space and BRU Output Color Space**

VI6_WPFn_OUTFMT Register Bit Settings		BRU Output Color Space (= WPF Input Color Space)	
Bit 6 in WRFMT	CSC		
0 (WPF output is RGB)	0 (YCbCr → RGB conversion is disabled)	RGB	
0 (WPF output is RGB)	1 (YCbCr → RGB conversion is enabled)	YCbCr	
1 (WPF output is YCbCr)	0 (RGB → YCbCr conversion is disabled)	YCbCr	
1 (WPF output is YCbCr)	1 (RGB → YCbCr conversion is enabled)	RGB	

### 28.2.16.5 BRU Control Registers (VI6\_BRUm\_CTRL: m = A, B, C, D)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E

### 28.2.16.6 BRU Blend Control Registers (VI6\_BRUm\_BLD: m = A, B, C, D)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit	Bit Name	Initial Value	R/W	Description
31	CBES	0	R/W	Blending Expression Selection Selects the blending expression of the color data in the BRU (VI6_BRUm_CTRL.RBC = 1). Blending coefficients are specified by the CCMDX and CCMDY bits. 0: $CCMDX \times (DST \text{ color data}) + CCMDY \times (SRC \text{ color data})$ 1: $CCMDX \times (DST \text{ color data}) - CCMDY \times (SRC \text{ color data})$
30 to 28	CCMDX[2:0]	000	R/W	Blending Coefficient X Selection These bits specify coefficient X used in the blending expression determined by the CBES bit. 000: DST $\alpha$ data is used as blending coefficient X 001: $255 - (DST \alpha \text{ data})$ is used as blending coefficient X 010: SRC $\alpha$ data is used as blending coefficient X 011: $255 - (SRC \alpha \text{ data})$ is used as blending coefficient X 100: Fixed $\alpha$ value 0 (COEFX setting)
27	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
26 to 24	CCMDY[2:0]	000	R/W	Blending Coefficient Y Selection These bits specify coefficient Y used in the blending expression determined by the CBES bit. 000: DST $\alpha$ data is used as blending coefficient Y 001: $255 - (DST \alpha \text{ data})$ is used as blending coefficient Y 010: SRC $\alpha$ data is used as blending coefficient Y 011: $255 - (SRC \alpha \text{ data})$ is used as blending coefficient Y 100: Fixed $\alpha$ value 1 (COEFY setting)
23	ABES	0	R/W	Blending $\alpha$ Creation Expression Specifies the expression for creating $\alpha$ data after blending by blending/ROP unit m (m = A, B, C, D). $\alpha$ creation coefficients are specified by the ACMDX and ACMDY bits. 0: $ACMDX \times (DST \alpha \text{ data}) + ACMDY \times (SRC \alpha \text{ data})$ 1: $ACMDX \times (DST \alpha \text{ data}) - ACMDY \times (SRC \alpha \text{ data})$

Bit	Bit Name	Initial Value	R/W	Description
22 to 20	ACMDX[2:0]	000	R/W	<p><math>\alpha</math> Creation Coefficient X</p> <p>These bits specify <math>\alpha</math> creation coefficient X used in the <math>\alpha</math> creation expression determined by the ABES bit.</p> <p>000: (<math>\alpha</math> creation coefficient X) = (DST <math>\alpha</math> data)            001: (<math>\alpha</math> creation coefficient X) = 255 – (DST <math>\alpha</math> data)            010: (<math>\alpha</math> creation coefficient X) = (SRC <math>\alpha</math> data)            011: (<math>\alpha</math> creation coefficient X) = 255 – (SRC <math>\alpha</math> data)            100: (<math>\alpha</math> creation coefficient X) = Fixed <math>\alpha</math> value 0 (COEFX setting)            101 to 111: Setting prohibited</p>
19	—	0	R	<p>Reserved</p> <p>This bit is always read as 0. The write value should always be 0.</p>
18 to 16	ACMDY[2:0]	000	R/W	<p><math>\alpha</math> Creation Coefficient Y</p> <p>These bits specify <math>\alpha</math> creation coefficient Y used in the <math>\alpha</math> creation expression determined by the ABES bit.</p> <p>000: (<math>\alpha</math> creation coefficient Y) = (DST <math>\alpha</math> data)            001: (<math>\alpha</math> creation coefficient Y) = 255 – (DST <math>\alpha</math> data)            010: (<math>\alpha</math> creation coefficient Y) = (SRC <math>\alpha</math> data)            011: (<math>\alpha</math> creation coefficient Y) = 255 – (SRC <math>\alpha</math> data)            100: (<math>\alpha</math> creation coefficient Y) = Fixed <math>\alpha</math> value 1 (COEFY setting)            101 to 111: Setting prohibited</p>
15 to 8	COEFX[7:0]	H'00	R/W	<p>Fixed <math>\alpha</math> Value 0</p> <p>These bits specify fixed <math>\alpha</math> value 0 used when the CCMDX or ACMDX bits are set to B'100. A value from H'00 to H'FF can be specified.</p>
7 to 0	COEFY[7:0]	H'00	R/W	<p>Fixed <math>\alpha</math> Value 1</p> <p>These bits specify fixed <math>\alpha</math> value 1 used when the CCMDY or ACMDY bits are set to B'100. A value from H'00 to H'FF can be specified.</p>

R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 23	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
22 to 20	DSTSEL[2:0]	000	R/W	Input Selection for DST Side of ROP Unit These bits select the input for the DST side of the ROP unit. For the SRC side, the same data as the input for the SRC side of blending/ROP unit C is input. 000: BRU input 0 (BRUin0) is input to DST 001: BRU input 1 (BRUin1) is input to DST 010: BRU input 2 (BRUin2) is input to DST 011: BRU input 3 (BRUin3) is input to DST 100: Virtual RPF is input to DST 101 to 111: Setting prohibited
19 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7 to 4	CROP[3:0]	0000	R/W	Color Data ROP Operator These bits select the ROP operator of the color data in the ROP unit. Select the opcode for ROP operation from Table 28.36.
3 to 0	AROP[3:0]	0000	R/W	$\alpha$ Data ROP Operator These bits select the ROP operator of the $\alpha$ data in the ROP unit. Select the opcode for ROP operation from Table 28.36.

## 28.2.17 HGO Control Registers

### 28.2.17.1 HGO Detection Window Offset Register (VI6\_HGO\_OFFSET)

Note: See Table 28.15 for details on which RZ/G series products have which registers.

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
29 to 16	HOFFSET[13:0]	H'0000	R/W	Horizontal Offset of Histogram Detection Window The HGO creates a histogram for the detection window in the input image (Figure 28.46). In these bits, specify the value of horizontal offset (hoffset shown in Figure 28.46) in pixel units. A value from 0 to 8,191 can be specified. The value of HOFFSET shall be smaller than that of the input image size of HGO.
15, 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13 to 0	VOFFSET[13:0]	H'0000	R/W	Vertical Offset of Histogram Detection Window The HGO creates a histogram for the detection window in the input image (Figure 28.46). In these bits, specify the value of vertical offset (voffset shown in Figure 28.46) in pixel units. A value from 0 to 8,191 can be specified. The value of VOFFSET shall be smaller than that of the input image size of HGO.

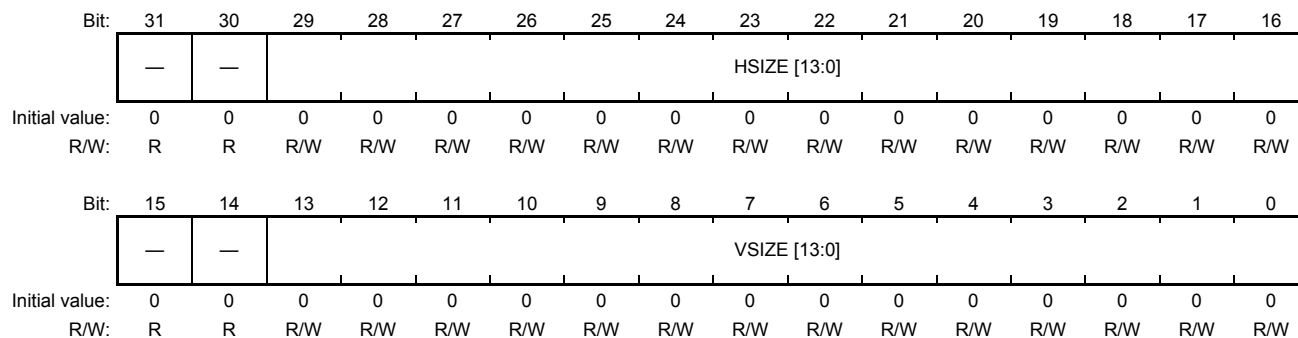

Figure 28.46 Histogram Detection Window of HGO

### 28.2.17.2 HGO Detection Window Size Register (VI6\_HGO\_SIZE)

Note: See Table 28.15 for details on which RZ/G series products have which registers.

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
29 to 16	HSIZE[13:0]	H'0000	R/W	Horizontal Size of Histogram Detection Window The HGO creates a histogram for the detection window in the input image (Figure 28.46). In these bits, specify the value of horizontal size (hsize shown in Figure 28.46) in pixel units. A value from 1 to 8,192 can be specified.
15, 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13 to 0	VSIZ[13:0]	H'0000	R/W	Vertical Size of Histogram Detection Window The HGO creates a histogram for the detection window in the input image (Figure 28.46). In these bits, specify the value of vertical size (vsize shown in Figure 28.46) in pixel units. A value from 1 to 8,192 can be specified.

### 28.2.17.3 HGO Mode Register (VI6\_HGO\_MODE)

Note: See Table 28.15 for details on which RZ/G series products have which registers.

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7	MAXRGB	0	R/W	Histogram Source Component Setting 0: The histogram is generated from 3 color components independently. 1: The histogram is generated from the maximum value of input R, G and B data.
6	OFSB_R	0	R/W	Offset Binary Mode for R/Cr/H Component 0: Straight binary 1: Offset binary In offset binary mode, values are converted to absolute values before they are used to detect the maximum value, minimum value, sum, and black band. Note that values without conversion are always used for histogram creation regardless of this mode setting.
5	OFSB_G	0	R/W	Offset Binary Mode for G/Y/S/max (R, G, B) Component 0: Straight binary 1: Offset binary In offset binary mode, values are converted to absolute values before they are used to detect the maximum value, minimum value, sum, and black band. Note that values without conversion are always used for histogram creation regardless of this mode setting.
4	OFSB_B	0	R/W	Offset Binary Mode for B/Cb/V Component 0: Straight binary 1: Offset binary In offset binary mode, values are converted to absolute values before they are used to detect the maximum value, minimum value, sum, and black band. Note that values without conversion are always used for histogram creation regardless of this mode setting.

Bit	Bit Name	Initial Value	R/W	Description
3, 2	HRATIO[1:0]	00	R/W	<p>Horizontal Pixel Skipping Mode for Histogram Detection</p> <p>00: No skipping for horizontal pixels.</p> <p>01: Horizontal 1/2 skipping. One pixel is discarded from every two pixels before a histogram is created.</p> <p>10: Horizontal 1/4 skipping. Three pixels are discarded from every four pixels before a histogram is created.</p> <p>The first pixel in the horizontal direction is not discarded but subsequent pixels are discarded (regardless of the histogram detection window). Among the pixels that have not been discarded, only the pixels within the detection window are used to create a histogram.</p>
1, 0	VRATIO[1:0]	00	R/W	<p>Vertical Pixel Skipping Mode for Histogram Detection</p> <p>00: No skipping for vertical pixels.</p> <p>01: Vertical 1/2 skipping. One pixel is discarded from every two pixels before a histogram is created.</p> <p>10: Vertical 1/4 skipping. Three pixels are discarded from every four pixels before a histogram is created.</p> <p>The first pixel in the vertical direction is not discarded but subsequent pixels are discarded (regardless of the histogram detection window). Among the pixels that have not been discarded, only the pixels within the detection window are used to create a histogram.</p>

**28.2.17.4 HGO LB Detection Threshold Register (VI6\_HGO\_LB\_TH)**

Note: See Table 28.15 for details on which RZ/G series products have which registers.

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	BLACK_TH [7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7 to 0	BLACK_TH[7:0]	H'00	R/W	Threshold for Black Level Determination in Letter Box Detection In letter box detection, when all input pixels have the value equal to or smaller than the value specified in these bits, the image data is determined as black. Note that the letter box detection is not affected by the histogram detection window illustrated in Figure 28.46. A value from 0 to 255 can be specified.

### 28.2.17.5 HGO Horizontal Position Register for LB Detection Zone-n (VI6\_HGO\_LBn\_H: n = 0, 1, 2, 3)

Note: See Table 28.15 for details on which RZ/G series products have which registers.

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
29 to 16	HPOS0[13:0]	H'0000	R/W	Horizontal Start Position for Letter Box Detection Zone-n When all pixels on a line (shown in Figure 28.47) in the input image have the value equal to or smaller than the threshold value, the HGO determines that there is a letter box. In these bits, specify the value of hpos0 of the detection zone-n (Figure 28.47) in pixel units. A value from 0 to 8,191 can be specified. $HPOS0 \leq HPOS1$ should be satisfied. These bits are valid for Zone-0 and 1. For Zone-2 and 3, these bits are reserved.
15, 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13 to 0	HPOS1[13:0]	H'0000	R/W	Horizontal End Position for Letter Box Detection Zone-n When all pixels on a line (shown in Figure 28.47) in the input image have the value equal to or smaller than the threshold value, the HGO determines that there is a letter box. In these bits, specify the value of hpos1 of the detection zone-n (Figure 28.47) in pixel units. A value from 0 to 8,191 can be specified. $HPOS0 \leq HPOS1$ should be satisfied.

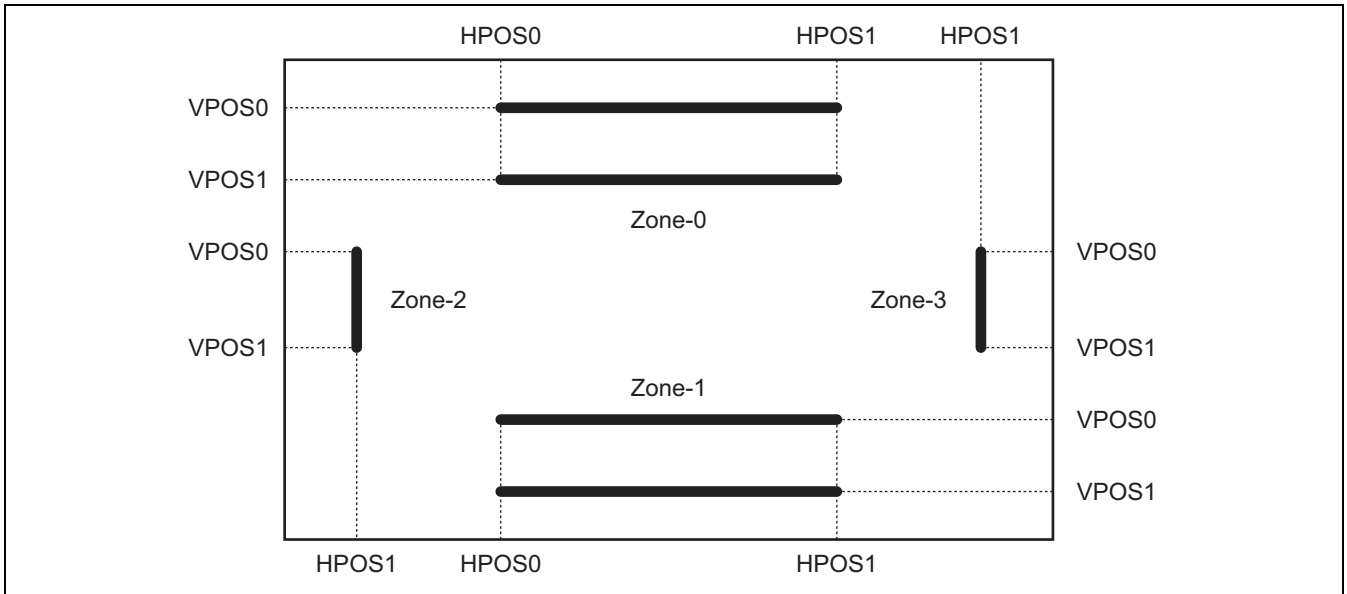

Figure 28.47 Letter Box Detection Position Settings for HGO

### 28.2.17.6 HGO Vertical Position Register for LB Detection Zone-n (VI6\_HGO\_LBn\_V: n = 0, 1, 2, 3)

Note: See Table 28.15 for details on which RZ/G series products have which registers.

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
29 to 16	VPOS0 [13:0]	H'0000	R/W	Vertical Start Position for Letter Box Detection Zone-n When all pixels on a line (shown in Figure 28.47) in the input image have the value equal to or smaller than the threshold value, the HGO determines that there is a letter box In these bits, specify the value of vpos0 of the detection zone-n (Figure 28.47) in pixel units. A value from 0 to 8,191 can be specified. $VPOS0 \leq VPOS1$ should be satisfied.
15, 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13 to 0	VPOS1 [13:0]	H'0000	R/W	Vertical End Position for Letter Box Detection Zone-n When all pixels on a line (shown in Figure 28.47) in the input image have the value equal to or smaller than the threshold value, the HGO determines that there is a letter box. In these bits, specify the value of vpos1 of the detection zone-n (Figure 28.47) in pixel units. A value from 0 to 8,191 can be specified. $VPOS0 \leq VPOS1$ should be satisfied.

### 28.2.17.7 HGO Component-m Histogram Register (VI6\_HGO\_m\_HISTO\_n: m = R, G, B, n = 0 to 63)

Note: See Table 28.15 for details on which RZ/G series products have which registers.

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	HISTOGRAM_n [21:16]					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	HISTOGRAM_n [15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 22	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
21 to 0	HISTOGRAM_n [21:0]	H'00 0000	R	Frequency of Component-m in the value range-n From these bits, the count of the pixels whose component-m value (val) satisfies the following condition within the histogram detection window (Figure 28.46) is read (after pixel skipping is applied when skipping mode is selected). $4 \times n \leq \text{val} < 4 \times (n + 1)$ Counting starts after the HGO is activated. To read the histogram, read these bits after the HGO has completed processing of one screen of data and before the HGO is activated again.

The component-m in a color space is determined by the following table.

Index-m	Color Space			
	RGB		YCbCr	HSV
	VI6_HGO_MODE. MAXRGB = 0	VI6_HGO_MODE. MAXRGB = 1	VI6_HGO_MODE. MAXRGB = 0*1	VI6_HGO_MODE. MAXRGB = 0*1
R	R	n/a*2	Cr	H
G	G	max (R, G, B)*3	Y	S
B	B	n/a*2	Cb	V

- Notes: 1. When color space of input data is in YCbCr or HSV, set VI6\_HGO\_MODE.MAXRGB = 0.  
2. When VI6\_HGO\_MODE.MAXRGB = 1, the histogram of index-R / index-B are not ensured.  
3. max (R, G, B) indicates maximum value of input R, G and B data.

### 28.2.17.8 HGO Component-m Min/Max Value Register (VI6\_HGO\_m\_MAXMIN: m = R, G, B)

Note: See Table 28.15 for details on which RZ/G series products have which registers.

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	MAXVAL [7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

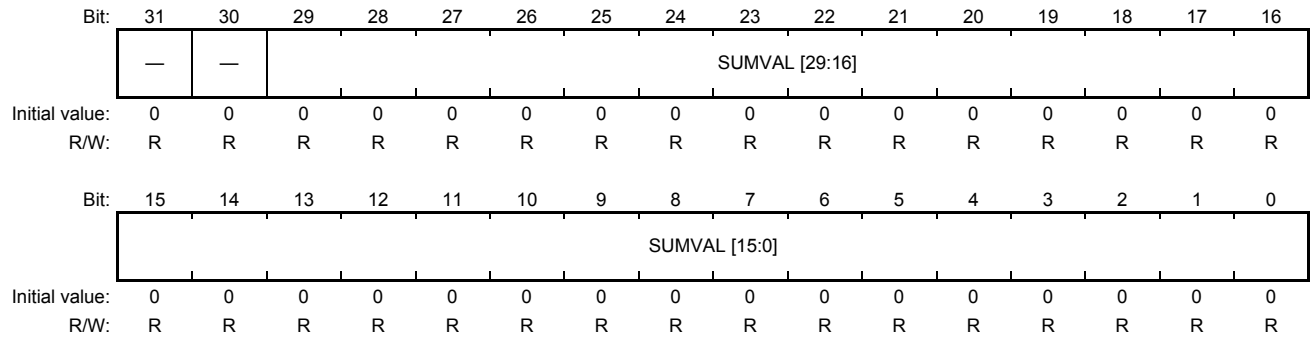

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	MINVAL [7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	MAXVAL[7:0]	H'00	R	Maximum Value of Component-m From these bits, the maximum value of the component-m of the pixels within the histogram detection window (Figure 28.46) is read (after pixel skipping is applied when skipping mode is selected). Maximum value detection starts after the HGO is activated. To read the maximum value, read these bits after the HGO has completed processing of one screen of data and before the HGO is activated again.
15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7 to 0	MINVAL[7:0]	H'00	R	Minimum Value of Component-m From these bits, the minimum value of the component-m of the pixels within the histogram detection window (Figure 28.46) is read (after pixel skipping is applied when skipping mode is selected). Minimum value detection starts after the HGO is activated. To read the minimum value, read these bits after the HGO has completed processing of one screen of data and before the HGO is activated again.

### 28.2.17.9 HGO Component-m Sum Register (VI6\_HGO\_m\_SUM: m = R, G, B)

Note: See Table 28.15 for details on which RZ/G series products have which registers.

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
29 to 0	SUMVAL[29:0]	H'0000 0000	R	Sum of Component-m From these bits, the sum of the component-m of the pixels within the histogram detection window (Figure 28.46) is read (after pixel skipping is applied when skipping mode is selected). Accumulation starts after the HGO is activated. To read the sum, read these bits after the HGO has completed processing of one screen of data and before the HGO is activated again.

### 28.2.17.10 HGO Component-m LB Detection Result Register (VI6\_HGO\_m\_LB\_DET: m = R, G, B)

Note: See Table 28.15 for details on which RZ/G series products have which registers.

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	LTRBO X1	LTRBO X2	SIDE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2	LTRBOX1	0	R	Letter Box Detection Result #1 of Zone-0/1 for Component-m This bit is set to 1 when none of the component-m of the pixels on the lines of zone-0/vpos0 and zone-1/vpos1 (two lines in total) in Figure 28.47 exceeds the threshold (BLACK_TH). If any pixel is greater than the threshold, this bit is set to 0. Read this bit after the HGO has completed processing of one screen of data and before the HGO is activated again. The value read during processing is not guaranteed to be correct.
1	LTRBOX2	0	R	Letter Box Detection Result #2 of Zone-0/1 for Component-m This bit is set to 1 when none of the component-m of the pixels on the four lines of zone-0 and 1 in Figure 28.47 exceeds the threshold (BLACK_TH). If any pixel is greater than the threshold, this bit is set to 0. Read this bit after the HGO has completed processing of one screen of data and before the HGO is activated again. The value read during processing is not guaranteed to be correct.
0	SIDE	0	R	Letter Box Detection Result of Zone-2/3 for Component-m This bit is set to 1 when none of the component-m of the pixels on the two lines of zone-2 and 3 in Figure 28.47 exceeds the threshold (BLACK_TH). If any pixel is greater than the threshold, this bit is set to 0. Read this bit after the HGO has completed processing of one screen of data and before the HGO is activated again. The value read during processing is not guaranteed to be correct.

### 28.2.17.11 HGO Parameter Register Reset (VI6\_HGO\_REGRST)

Note: See Table 28.15 for details on which RZ/G series products have which registers.

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	RCLEA	0	W	Register Reset Writing 1 to this bit resets all read-only registers (sections 28.2.17.7 to 28.2.17.10) to their initial values. This register is write-only and is always read as 0. Note that R/W registers (sections 28.2.17.1 to 28.2.17.6) are not affected by write access to this register.

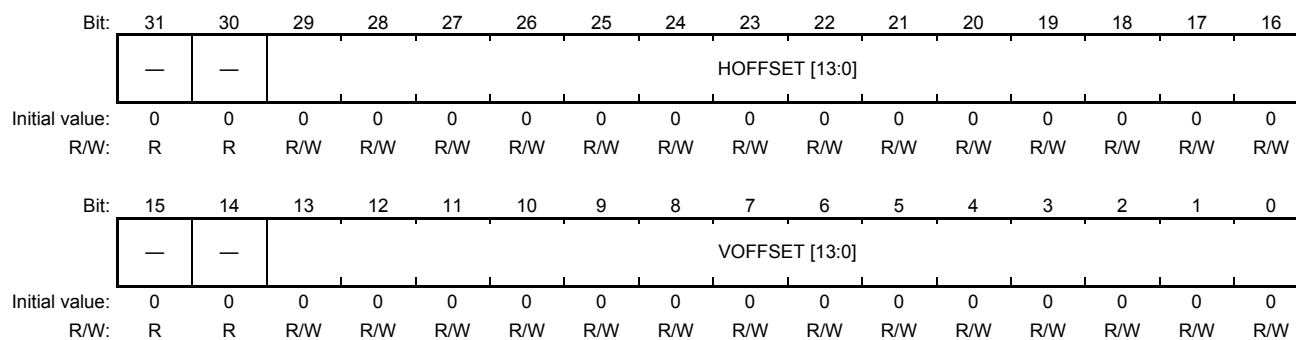

## 28.2.18 HGT Control Registers

### 28.2.18.1 HGT Detection Window Offset Register (VI6\_HGT\_OFFSET)

Note: See Table 28.15 for details on which RZ/G series products have which registers.

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
29 to 16	HOFFSET[13:0]	H'0000	R/W	Horizontal Offset of Histogram Detection Window The HGT creates a histogram for the detection window in the input image (Figure 28.48). In these bits, specify the value of horizontal offset (hoffset shown Figure 28.48) in pixel units. A value from 0 to 8,191 can be specified. The value of HOFFSET shall be smaller than that of the input image size of HGT.
15, 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13 to 0	VOFFSET[13:0]	H'0000	R/W	Vertical Offset of Histogram Detection Window The HGT creates a histogram for the detection window in the input image (Figure 28.48). In these bits, specify the value of vertical offset (voffset shown in Figure 28.48) in pixel units. A value from 0 to 8,191 can be specified. The value of VOFFSET shall be smaller than that of the input image size of HGT.

Figure 28.48 Histogram Detection Window of HGT

**28.2.18.2 HGT Detection Window Size Register (VI6\_HGT\_SIZE)**

Note: See Table 28.15 for details on which RZ/G series products have which registers.

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
29 to 16	HSIZE[13:0]	H'0000	R/W	Horizontal Size of Histogram Detection Window The HGT creates a histogram for the detection window in the input image (Figure 28.48). In these bits, specify the value of horizontal offset (hsize shown in Figure 28.48) in pixel units. A value from 1 to 8,192 can be specified.
15, 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13 to 0	VSIZE[13:0]	H'0000	R/W	Vertical Size of Histogram Detection Window The HGT creates a histogram for the detection window in the input image (Figure 28.48). In these bits, specify the value of vertical offset (vsize shown in Figure 28.48) in pixel units. A value from 1 to 8,192 can be specified.

### 28.2.18.3 HGT Mode Register (VI6\_HGT\_MODE)

Note: See Table 28.15 for details on which RZ/G series products have which registers.

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3, 2	HRATIO[1:0]	00	R/W	Horizontal Pixel Skipping Mode for Histogram Detection 00: No skipping for horizontal pixels. 01: Horizontal 1/2 skipping. One pixel is discarded from every two pixels before a histogram is created. 10: Horizontal 1/4 skipping. Three pixels are discarded from every four pixels before a histogram is created. The first pixel in the horizontal direction is not discarded but subsequent pixels are discarded (regardless of the histogram detection window). Among the pixels that have not been discarded, only the pixels within the detection window are used to create a histogram.
1, 0	VRATIO[1:0]	00	R/W	Vertical Pixel Skipping Mode for Histogram Detection 00: No skipping for vertical pixels. 01: Vertical 1/2 skipping. One pixel is discarded from every two pixels before a histogram is created. 10: Vertical 1/4 skipping. Three pixels are discarded from every four pixels before a histogram is created. The first pixel in the vertical direction is not discarded but subsequent pixels are discarded (regardless of the histogram detection window). Among the pixels that have not been discarded, only the pixels within the detection window are used to create a histogram.

### 28.2.18.4 HGT Hue Area Register (VI6\_HGT\_HUE\_AREA\_n: n = 0 to 5)

Note: See Table 28.15 for details on which RZ/G series products have which registers.

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	HUE_LOWER_n [7:0]	H'00	R/W	Lower Boundary Value for Hue Area - n The HGT creates a two-dimensional histogram of H (hue) and S (saturation) components. Division of hue areas and overlapping of adjacent hue areas can be specified through these bits. In these bits, specify the value of n L (hue_lower n) shown in Figure 28.49. A value from 0 to 255 can be specified. The specified value should satisfy the restrictions shown in Figure 28.49.
15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7 to 0	HUE_UPPER_n [7:0]	H'00	R/W	Upper Boundary Value for Hue Area - n The HGT creates a two-dimensional histogram of H (hue) and S (saturation) components. Division of hue areas and overlapping of adjacent hue areas can be specified through these bits. In these bits, specify the value of n U (hue_upper n) shown in Figure 28.49. A value from 0 to 255 can be specified. The specified value should satisfy the restrictions shown in Figure 28.49.

Figure 28.49 Weighting Histogram Using Hue

### 28.2.18.5 HGT LB Detection Threshold Register (VI6\_HGT\_LB\_TH)

Note: See Table 28.15 for details on which RZ/G series products have which registers.

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	BLACK_TH [7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7 to 0	BLACK_TH[7:0]	H'00	R/W	Threshold for Black Level Determination in Letter Box Detection In letter box detection, when all pixels of the input image data have the value equal to or smaller than the value specified in these bits, the data is determined as black. Note that the letter box detection is not affected by the histogram detection window illustrated in Figure 28.48 A value from 0 to 255 can be specified.

### 28.2.18.6 HGT Horizontal Position Register for LB Detection Zone-n (VI6\_HGT\_LBn\_H: n = 0, 1, 2, 3)

Note: See Table 28.15 for details on which RZ/G series products have which registers.

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
29 to 16	HPOS0[13:0]	H'0000	R/W	Horizontal Start Position for Letter Box Detection Zone-n When all pixels on a line (shown in Figure 28.50) in the input image have the value equal to or smaller than the threshold value, the HGT determines that there is a letter box. In these bits, specify the value of hpos0 of the detection zone-n (Figure 28.50) in pixel units. A value from 0 to 8,191 can be specified. $HPOS0 \leq HPOS1$ should be satisfied. These bits are valid for Zone-0 and 1. For Zone-2 and 3, these bits are reserved.
15, 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13 to 0	HPOS1[13:0]	H'0000	R/W	Horizontal End Position for Letter Box Detection Zone-n When all pixels on a line (shown in Figure 28.50) in the input image have the value equal to or smaller than the threshold value, the HGT determines that there is a letter box. In these bits, specify the value of hpos1 of the detection zone-n (Figure 28.50) in pixel units. A value from 0 to 8,191 can be specified. $HPOS0 \leq HPOS1$ should be satisfied.

Figure 28.50 Letter Box Detection Position Settings for HGT

**28.2.18.7 HGT Vertical Position Register for LB Detection Zone-n (VI6\_HGT\_LBn\_V: n = 0, 1, 2, 3)**

Note: See Table 28.15 for details on which RZ/G series products have which registers.

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
29 to 16	VPOS0[13:0]	H'0000	R/W	Vertical Start Position for Letter Box Detection Zone-n When all pixels on a line (shown in Figure 28.50) in the input image have the value equal to or smaller than the threshold value, the HGT determines that there is a letter box. In these bits, specify the value of vpos0 of the detection zone-n (Figure 28.50) in pixel units. A value from 0 to 8,191 can be specified. $VPOS0 \leq VPOS1$ should be satisfied.
15, 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13 to 0	VPOS1[13:0]	H'0000	R/W	Vertical Position for Letter Box Detection Zone-n When all pixels on a line (shown in Figure 28.50) in the input image have the value equal to or smaller than the threshold value, the HGT determines that there is a letter box. In these bits, specify the value of vpos1 of the detection zone-n (Figure 28.50) in pixel units. A value from 0 to 8,191 can be specified. $VPOS0 \leq VPOS1$ should be satisfied.

### 28.2.18.8 HGT Histogram Register (VI6\_HGT\_HISTO\_m\_n: m = 0 to 5, n = 0 to 31)

Note: See Table 28.15 for details on which RZ/G series products have which registers.

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	HISTOGRAM_m_n [25:16]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	HISTOGRAM_m_n [15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
25 to 0	HISTOGRAM_m_n [25:0]	H'000 0000	R	Weighted Frequency of Hue Area-m and Saturation Area-n From these bits, the count of weighting for the pixels whose H component value is in hue area m (Figure 28.49) and whose S component value (val) satisfies the following condition within the histogram detection window (Figure 28.48) is read (after pixel skipping is applied when skipping mode is selected). $8 \times n \leq \text{val} < 8 \times (n + 1)$ The weight is determined by the H component value as shown in Figure 28.49 and the maximum weight is 16. Counting starts after the HGT is activated. To read the histogram, read these bits after the HGT has completed processing of one screen of data and before the HGT is activated again.

### 28.2.18.9 HGT Max/Min Value Register (VI6\_HGT\_MAXMIN)

Note: See Table 28.15 for details on which RZ/G series products have which registers.

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	MAXVAL [7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	MINVAL [7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	MAXVAL[7:0]	H'00	R	Maximum Value of S Components From these bits, the maximum value of the S components of the pixels within the histogram detection window (Figure 28.48) is read (after pixel skipping is applied when skipping mode is selected). Maximum value detection starts after the HGT is activated. To read the maximum value, read these bits after the HGT has completed processing of one screen of data and before the HGT is activated again.
15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7 to 0	MINVAL[7:0]	H'00	R	Minimum Value of S Components From these bits, the minimum value of the S components of the pixels within the histogram detection window (Figure 28.48) is read (after pixel skipping is applied when skipping mode is selected). Minimum value detection starts after the HGT is activated. To read the minimum value, read these bits after the HGT has completed processing of one screen of data and before the HGT is activated again.

**28.2.18.10 HGT Sum Register (VI6\_HGT\_SUM)**

Note: See Table 28.15 for details on which RZ/G series products have which registers.

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	SUMVAL [29:16]													
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SUMVAL [15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
29 to 0	SUMVAL[29:0]	H'0000 0000	R	Sum of V Components From these bits, the sum of the V components of the pixels within the histogram detection window (Figure 28.48) is read (after pixel skipping is applied when skipping mode is selected). Accumulation starts after the HGT is activated. To read the sum, read these bits after the HGT has completed processing of one screen of data and before the HGT is activated again.

**28.2.18.11 HGT LB Detection Result Register (VI6\_HGT\_LB\_DET)**

Note: See Table 28.15 for details on which RZ/G series products have which registers.

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2	LTRBOX1	0	R	Letter Box Detection Result #1 of Zone-0/1 for V Component This bit is set to 1 when none of the V components of the pixels on the lines of zone-0/VPOS0 and zone-1/VPOS1 (two lines in total) in Figure 28.50 exceeds the threshold (BLACK_TH). If any pixel is greater than the threshold, this bit is set to 0. Read this bit after the HGT has completed processing of one screen of data and before the HGT is activated again. The value read during processing is not guaranteed to be correct.
1	LTRBOX2	0	R	Letter Box Detection Result #2 of Zone-0/1 for V Component This bit is set to 1 when none of the V components of the pixels on the four lines of zone-0 and 1 in Figure 28.50 exceeds the threshold (BLACK_TH). If any pixel is greater than the threshold, this bit is set to 0. Read this bit after the HGT has completed processing of one screen of data and before the HGT is activated again. The value read during processing is not guaranteed to be correct.
0	SIDE	0	R	Letter Box Detection Result of Zone-2/3 for V Component This bit is set to 1 when none of the V components of the pixels on the two lines of zone-2 and 3 in Figure 28.50 exceeds the threshold (BLACK_TH). If any pixel is greater than the threshold, this bit is set to 0. Read this bit after the HGT has completed processing of one screen of data and before the HGT is activated again. The value read during processing is not guaranteed to be correct.

**28.2.18.12 HGT Parameter Register Reset (VI6\_HGT\_REGRST)**

Note: See Table 28.15 for details on which RZ/G series products have which registers.

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	RCLEA	0	W	Register Reset Writing 1 to this bit resets all read-only registers (sections 28.2.18.8 to 28.2.18.11) to their initial values. This register is write-only and is always read as 0. Note that R/W registers (sections 28.2.18.1 to 28.2.18.7) are not affected by write access to this register.

## 28.2.19 LIF Control Registers

### 28.2.19.1 LIF Control Register (VI6\_LIF\_CTRL)

Note: See Table 28.15 for details on which RZ/G series products have which registers.

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	OBTH [10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	CFMT	—	—	REQSE L	LIF_EN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	OBTH [10:0]	All 0	R/W	Buffer Threshold for Start Ready Notification to Display Module When outputting data to the external module, the VSP stores data in the buffer in the LIF. When the amount of data stored in the buffer reaches the value specified in these bits, the VSP notifies the external display module of the start of a frame through an interrupt source (VI6_DISP_IRQ_STA.DST: see section 28.2.5.8). A value from 1 to 1,536 can be specified. Note: The OBTH value should satisfy the following conditions. <ul style="list-style-type: none"> <li>The value should not be larger than the VI6_LIF_CSBTH.HBTH bit setting.</li> <li>When the horizontal and vertical sizes of the image input to the LIF are <math>h_{lif\_in}</math>, and <math>v_{lif\_in}</math>, OBTH should be specified so that the following is satisfied. <math display="block">(&lt; h_{lif\_in} + 1 &gt; / 2) \times v_{lif\_in} - 4 \geq OBTH</math> </li> </ul> The recommended value of OBTH is 128. The LIF input image size ( $h_{lif\_in}$ , and $v_{lif\_in}$ ) is the same as the WPF0 output image size.
15 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	CFMT	0	R/W	Chroma Format This bit selects the output format from the LIF module to the display module. When RGB format is used, this bit shall be set to 0. 0: YCbCr444 or RGB Format 1: Reserved (setting prohibited) Note: ARBG8888 or RGB888 can be used for the DU input format.

---

<b>Bit</b>	<b>Bit Name</b>	<b>Initial Value</b>	<b>R/W</b>	<b>Description</b>
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	REQSEL	0	R/W	External Display Module Selection This bit should always be set to 1. 0: Prohibited. 1: DU is selected as the destination external display module.
0	LIF_EN	0	R/W	Enable/Disable of Data Output to External Display Module Enables or disables data output from the LIF to DU. 0: Data output to the DU is disabled. 1: Data output to the DU is enabled.

---

### 28.2.19.2 LIF Clock Stop Buffer Control Register (VI6\_LIF\_CSBTH)

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	HBTH [10:0]	All 0	R/W	Buffer Threshold for Clock Stop in Dynamic Clock Control When the remaining data amount in the buffer in the LIF reaches the value specified in these bits while data is output from the LIF to the external display module, the VSP clock is stopped. A value from 2 to 1,536 can be specified. The specified value should satisfy HBTH > LBTH. The recommended value of HBTH is 1536.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	LBTH [10:0]	All 0	R/W	Buffer Threshold for Clock Start in Dynamic Clock Control When the remaining data amount in the buffer in the LIF decreases to the value specified in these bits while data is output from the LIF to the external display module and the clock is stopped through the setting in the HBTH bits, the VSP clock supply is restarted. A value from 1 to 1,535 can be specified. The specified value should satisfy LBTH < HBTH. The recommended value of LBTH is 1520.

## 28.2.20 Security Control Registers

### 28.2.20.1 Secure Access Control Register 0 (VI6\_SECURE\_CTRL0)

Note: See Table 28.15 for details on which RZ/G series products have which registers.

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	SCCH3	SCCH2	SCCH1	SCCH0	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	SCWPF3	SCWPF2	SCWPF1	SCWPF0	—	—	—	SCRPF4	SCRPF3	SCRPF2	SCRPF1	SCRPF0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Each bit is used for specifying the secure attribute of the corresponding registers. If a bit is set to 1 (secure), the corresponding registers can be written only by the secure CPU access.

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
27	SCCH3	0	R/W	Secure Attribute for Display List 3 Registers 0: Non-secure 1: Secure
26	SCCH2	0	R/W	Secure Attribute for Display List 2 Registers 0: Non-secure 1: Secure
25	SCCH1	0	R/W	Secure Attribute for Display List 1 Registers 0: Non-secure 1: Secure
24	SCCH0	0	R/W	Secure Attribute for Display List 0 Registers 0: Non-secure 1: Secure
23 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11	SCWPF3	0	R/W	Secure Attribute for WPF3 Registers 0: Non-secure 1: Secure
10	SCWPF2	0	R/W	Secure Attribute for WPF2 Registers 0: Non-secure 1: Secure

Bit	Bit Name	Initial Value	R/W	Description
9	SCWPF1	0	R/W	Secure Attribute for WPF1 Registers 0: Non-secure 1: Secure
8	SCWPF0	0	R/W	Secure Attribute for WPF0 Registers 0: Non-secure 1: Secure
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	SCRPF4	0	R/W	Secure Attribute for RPF4 Registers 0: Non-secure 1: Secure
3	SCRPF3	0	R/W	Secure Attribute for RPF3 Registers 0: Non-secure 1: Secure
2	SCRPF2	0	R/W	Secure Attribute for RPF2 Registers 0: Non-secure 1: Secure
1	SCRPF1	0	R/W	Secure Attribute for RPF1 Registers 0: Non-secure 1: Secure
0	SCRPF0	0	R/W	Secure Attribute for RPF0 Registers 0: Non-secure 1: Secure

### 28.2.20.2 Secure Access Control Register 1 (VI6\_SECURE\_CTRL1)

Note: See Table 28.15 for details on which RZ/G series products have which registers.

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

R/W:	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W

Each bit is used for specifying the secure attribute of the corresponding registers. If a bit is set to 1 (secure), the corresponding registers can be read or written only by the secure CPU access.

Bit	Bit Name	Initial Value	R/W	Description
31 to 15	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
14	SCLIF	0	R/W	Secure Attribute for LIF Registers 0: Non-secure 1: Secure
13	SCHGT	0	R/W	Secure Attribute for HGT Registers 0: Non-secure 1: Secure
12	SCHGO	0	R/W	Secure Attribute for HGO Registers 0: Non-secure 1: Secure
11	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
10	SCBRU	0	R/W	Secure Attribute for BRU Registers 0: Non-secure 1: Secure
9	SCHSI	0	R/W	Secure Attribute for HSI Registers 0: Non-secure 1: Secure
8	SCHST	0	R/W	Secure Attribute for HST Registers 0: Non-secure 1: Secure
7	SCCLU	0	R/W	Secure Attribute for CLU Registers 0: Non-secure 1: Secure

Bit	Bit Name	Initial Value	R/W	Description
6	SCLUT	0	R/W	Secure Attribute for LUT Registers 0: Non-secure 1: Secure
5, 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3	SCUDS2	0	R/W	Secure Attribute for UDS2 Registers 0: Non-secure 1: Secure
2	SCUDS1	0	R/W	Secure Attribute for UDS1 Registers 0: Non-secure 1: Secure
1	SCUDS0	0	R/W	Secure Attribute for UDS0 Registers 0: Non-secure 1: Secure
0	SCSRU	0	R/W	Secure Attribute for SRU Registers 0: Non-secure 1: Secure

## 28.3 Lookup Table Settings

RZ/G1H

RZ/G1N

RZ/G1M

RZ/G1E

### 28.3.1 CLUT or LUT

For a single entry to the CLUT space (see Table 28.37) or LUT space (see Table 28.37) of the VSP1, the CLUT or LUT data is set by a write access in the format shown in Figure 28.51.

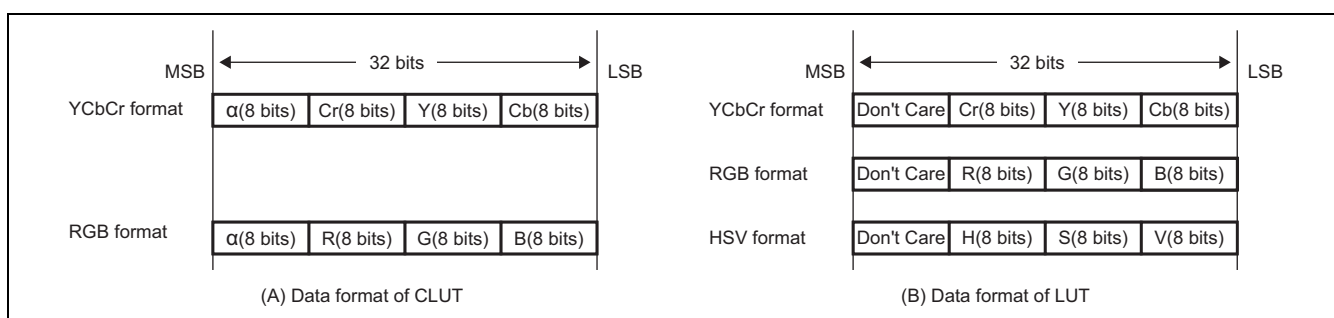

The entry address of each space is (start address of the space) + (entry number counting from the base point  $0 \times 4$ ). For example, the address of entry 7 to the LUT space is  $\$VSP\_BASE + H'7000 + 7 \times 4$  (H'FE92\_701C (VSPR case)).

Table 28.37 shows the spaces for which entries can be made. Note that if the module that references that space is operating, write accesses to the relevant space are prohibited. For example, while RPF2 is operating, accesses to the entire space of VI6\_CLUT2\_TBL are prohibited. When a read access is made to the relevant space during operation of the referencing module, undefined values will be read out.

The operating/stopped state of each module in Table 28.37 is the operating state of the WPF to which each module is connected. Determine whether the module is operating or stopped using each WPF operating status bit in the VI6\_STATUS register.

**Table 28.37 CLUT Space and LUT Space Addresses**

Space Name	Space Addresses	Entry Count	Module that References the Space in the Left Column	RZ/G Series Products			
				RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
VI6_CLUT0_TBL	$\$VSP\_BASE + H'4000$ to $\$VSP\_BASE + H'43FF$	256	RPF0	√	√	√	√
VI6_CLUT1_TBL	$\$VSP\_BASE + H'4400$ to $\$VSP\_BASE + H'47FF$	256	RPF1	√	√	√	√
VI6_CLUT2_TBL	$\$VSP\_BASE + H'4800$ to $\$VSP\_BASE + H'4BFF$	256	RPF2	√	√	√	√
VI6_CLUT3_TBL	$\$VSP\_BASE + H'4C00$ to $\$VSP\_BASE + H'4FFF$	256	RPF3	√	√	√	√
VI6_CLUT4_TBL	$\$VSP\_BASE + H'5000$ to $\$VSP\_BASE + H'53FF$	256	RPF4	√	√	√	√
VI6_LUT_TBL	$\$VSP\_BASE + H'7000$ to $\$VSP\_BASE + H'73FF$	256	LUT	√	√	√	√

**Figure 28.51 VI6\_CLUT\_TBL and VI6\_LUT\_TBL Formats**

### 28.3.2 CLU Table

Data is set in the CLU table in the space shown in Table 28.38 through indirect addressing.

**Table 28.38 CLU Space Addresses**

Space Name	Space Addresses	Module that References the Space in the Left Column	RZ/G Series Products			
			RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
VI6_CLU_TBL	\$VSP_BASE + H'7400 to \$VSP_BASE + H'7407	CLU	√	√	√	√

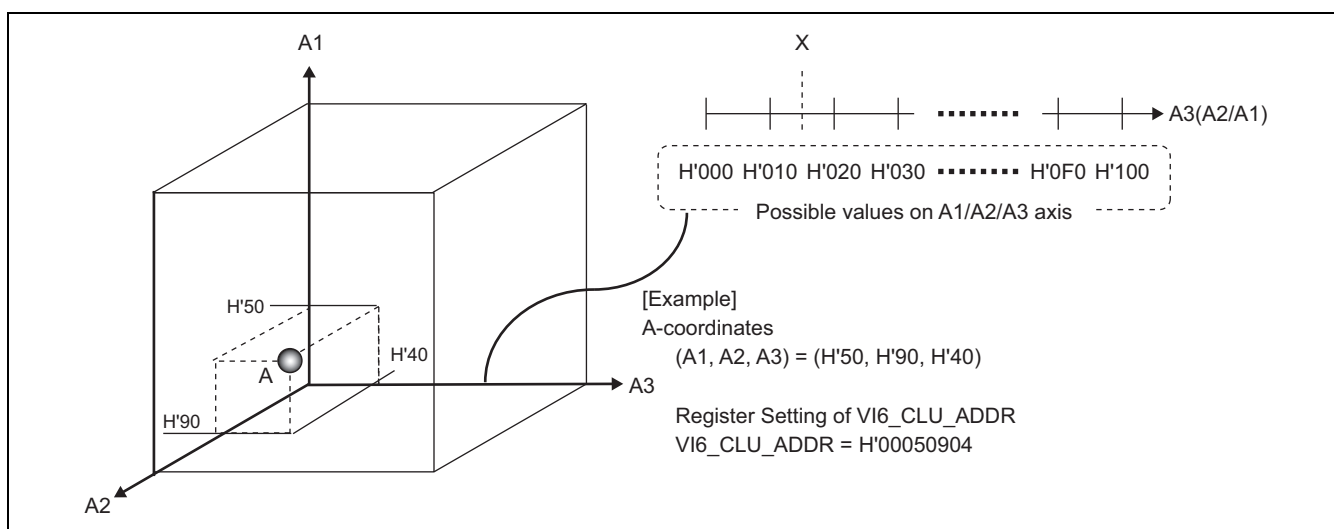

The addresses used in indirect addressing (VI6\_CLU\_ADDR, VI6\_CLU\_DATA) are shown in Table 28.39. The CLU table can be accessed by setting the VI6\_CLU\_ADDR register and then reading from or writing to the VI6\_CLU\_DATA register. To write-access the CLU table continuously, such as when setting data to the CLU table, perform the following.

- (1) Set the first CLU table coordinates in VI6\_CLU\_ADDR.
  - (2) Write the first data to be set in VI6\_CLU\_DATA.
  - (3) Set the next CLU table coordinates in VI6\_CLU\_ADDR.
  - (4) Write the next data to be set in VI6\_CLU\_DATA.
- ... Execute these processes in a similar manner.

Accesses to VI6\_CLU\_ADDR and VI6\_CLU\_DATA registers are repeated in this way. The location where to access the CLU table to write the VI6\_CLU\_DATA contents immediately takes effect after a value is set in the VI6\_CLU\_ADDR register.

To read-access the CLU table continuously, change the write-access operation to the read-access operation in the sequence of processes of (1) to (4) above.

The following describes how to specify VI6\_CLU\_ADDR.

**Figure 28.52 VI6\_CLU\_ADDR Setting**

In the CLU table, a table value should be specified for every increase by H'10 along each of the axes and for every intersection between two axes. For a certain axis, as shown in the top right of Figure 28.52, a value to be set in the table

corresponds to a scale mark at an interval of H'10. The location of a point between two scale marks (for example, point X in Figure 28.52) is calculated through interpolation by the CLU (refer to section 28.2.13.1). Accordingly, the lower four bits of table settings for each axis has no meaning; only the upper-order five bits of the desired coordinate for each component should be specified in VI6\_CLU\_ADDR (which should be shifted to the right by four bits) as shown in Figure 28.52.

**Table 28.39 Address Spaces Used in Indirect Addressing to CLU Table**

Address (Name)	Bit	Initial Value	R/W	Description	RZ/G Series Products			
					RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
\$VSP_BASE + H'7400 (VI6_CLU_ADDR)	31 to 24	All 0	R	Reserved  These bits are always read as 0. The write value should always be 0.	√	√	√	√
	23 to 16	All 0	R/W	Coordinate Value of First Axis  These bits set the coordinate value of the first axis on the three-dimensional space coordinates of the CLU table. A value from 0 to 16 can be specified.	√	√	√	√
	15 to 8	All 0	R/W	Coordinate Value of Second Axis  These bits set the coordinate value of the second axis on the three-dimensional space coordinates of the CLU table. A value from 0 to 16 can be specified.	√	√	√	√
	7 to 0	All 0	R/W	Coordinate Value of Third Axis  These bits set the coordinate value of the third axis on the three-dimensional space coordinates of the CLU table. A value from 0 to 16 can be specified when the CLU is in 3D mode. In 2D mode, these bits must be set to 0.	√	√	√	√
\$VSP_BASE + H'7404 (VI6_CLU_DATA)	31 to 24	Undefined	R	Reserved  These bits are always read as 0. The write value should always be 0.	√	√	√	√
	23 to 16	Undefined	R/W	Component Value of First Axis  These bits set the component value of the first axis on the three-dimensional space coordinates of the CLU table, which is defined by the VI6_CLU_ADDR register.  A value from 0 to 255 can be specified when the CLU is in 3D mode. In 2D mode, these bits must be set to 0.	√	√	√	√

Address (Name)	Bit	Initial Value	R/W	Description	RZ/G Series Products			
					RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
\$VSP_BASE + H'7404 (VI6_CLU_DATA)	15 to 8	Undefined	R/W	Component Value of Second Axis  These bits set the component value of the second axis on the three-dimensional space coordinates of the CLU table, which is defined by the VI6_CLU_ADDR register.  A value from 0 to 255 can be specified.	√	√	√	√
	7 to 0	Undefined	R/W	Component Value of Third Axis  These bits set the component value of the third axis on the three-dimensional space coordinates of the CLU table, which is defined by the VI6_CLU_ADDR register.  A value from 0 to 255 can be specified when the CLU is in 3D mode. In 2D mode, these bits must be set to 0.	√	√	√	√

## 28.4 Operation Linked with Display Unit (DU)

RZ/G1H

RZ/G1N

RZ/G1M

RZ/G1E

### 28.4.1 Starting LCD Display

Use the following procedure to display images on the LCD by operating the VSP1 and DU together.

To display images on the LCD by inputting VSYNC to the DU:

- (1) Activate the VSP1.
- (2) After the VSP1 starts operation, wait until a VI6\_DISP\_IRQ\_STA.DST interrupt source is generated.
- (3) After a VI6\_DISP\_IRQ\_STA.DST interrupt source is generated, activate the DU.

To display images on the LCD with VSYNC being output from the DU:

- (1) Activate the VSP.
- (2) After that, activate the DU.

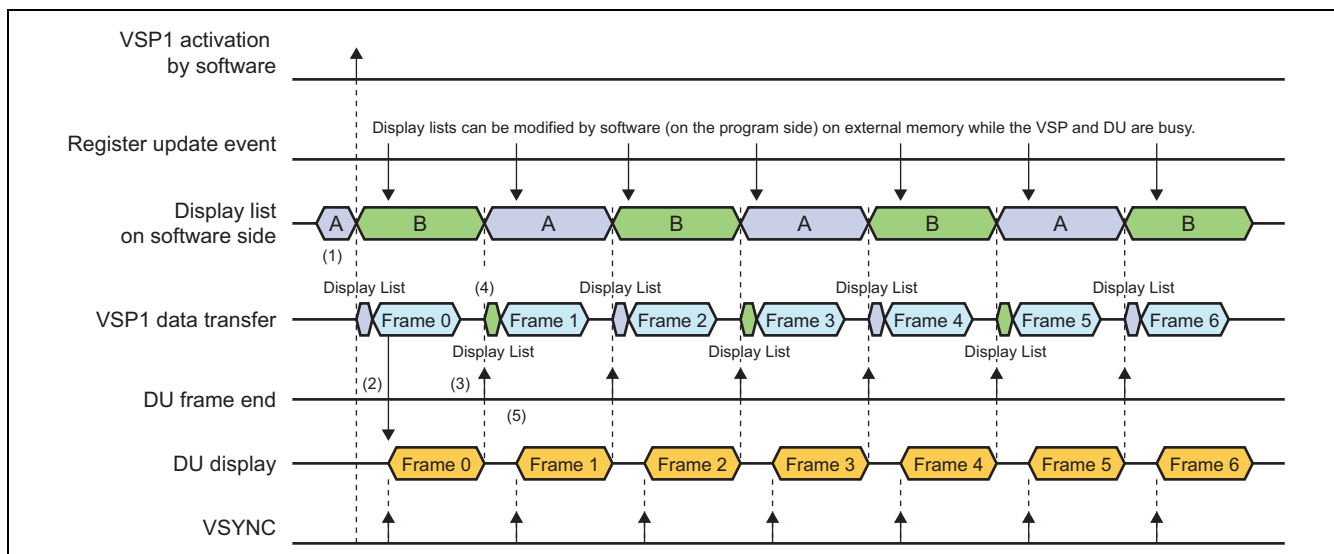

### 28.4.2 Stopping LCD Display

To stop the image display on the LCD while the VSP1 and DU work together to display images, stop the DU first by a software reset or the like (refer to section 21, Display Unit (DU) for the software reset of the DU). After checking that the DU has stopped, apply software reset to the VSP1. After both the DU and VSP1 software reset processes are complete, the LCD display stop process ends.

### 28.4.3 Entire Operation Flow

The VSP1 operation is linked with the DU operation. As the DU operates in real-time, the VSP1 also operates in real-time. However, the VSP1 only provides one plane of registers. Accordingly, modifying registers between frames should be done within the short blanking period between the end of one-frame display (VI6\_WPFn\_IRQ\_STA.FRE interrupt) and the start of the next frame display (VSYNC). To do this, use the display list function of the VSP1 (see section 28.1.8 (3)) to implement two virtual register planes and ensure the one-frame time for modifying registers by software (see section 28.4.4). When using the display list function, make the current-frame settings in a register plane and store the next-frame settings as a display list in external memory such as SDRAM. In this way, the next-frame settings can be modified in the display list in external memory until the end of the current frame processing.

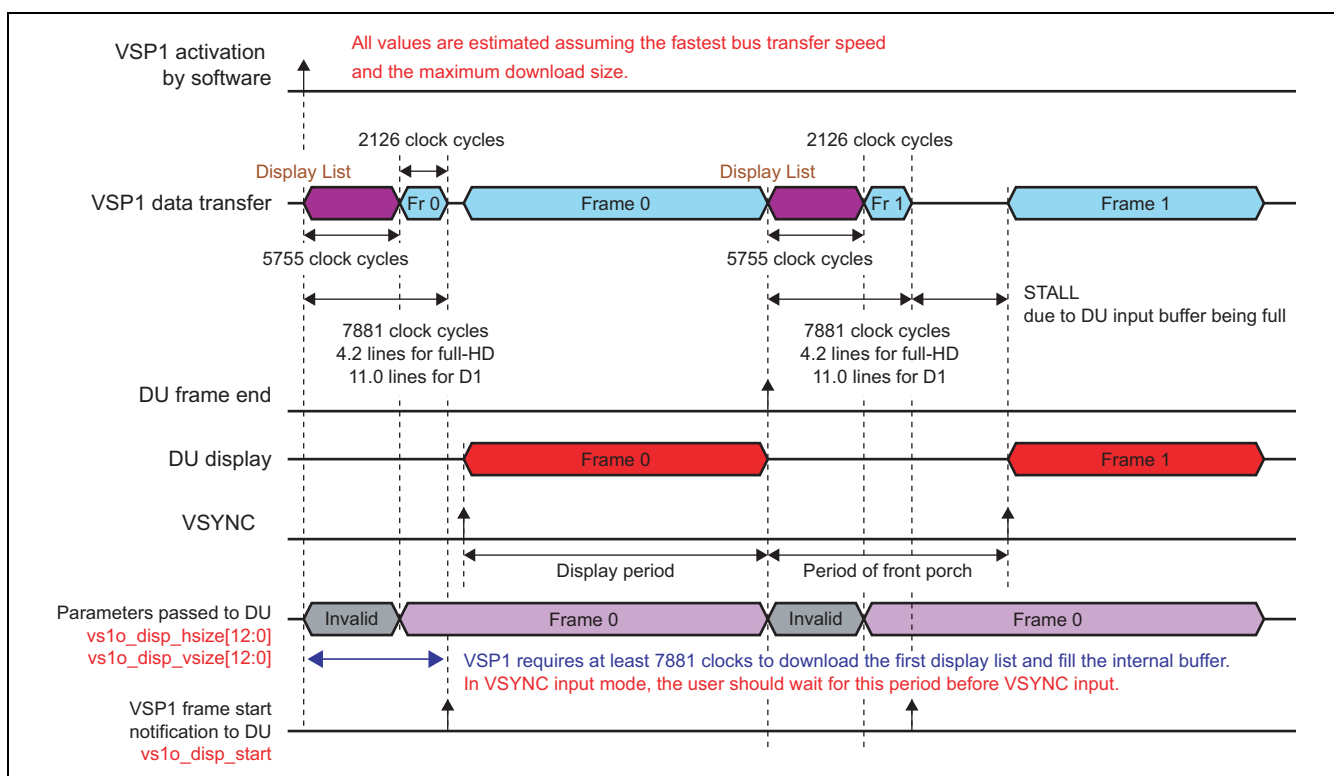

The timing chart of this procedure is shown in Figure 28.53

**Figure 28.53 Timing when VSP1 Operation is linked with DU**

- (1) The VSP1 is activated by software, and then the VSP1 downloads a display list.
- (2) The VSP1 informs the ready state to the DU, and then the DU starts the display process.
- (3) The DU generates a frame end interrupt.
- (4) The VSP updates its register settings by downloading the next display list. After that, the VSP reads the next frame data.
- (5) The DU generates VSYNC for the next frame and starts transfer of display data.

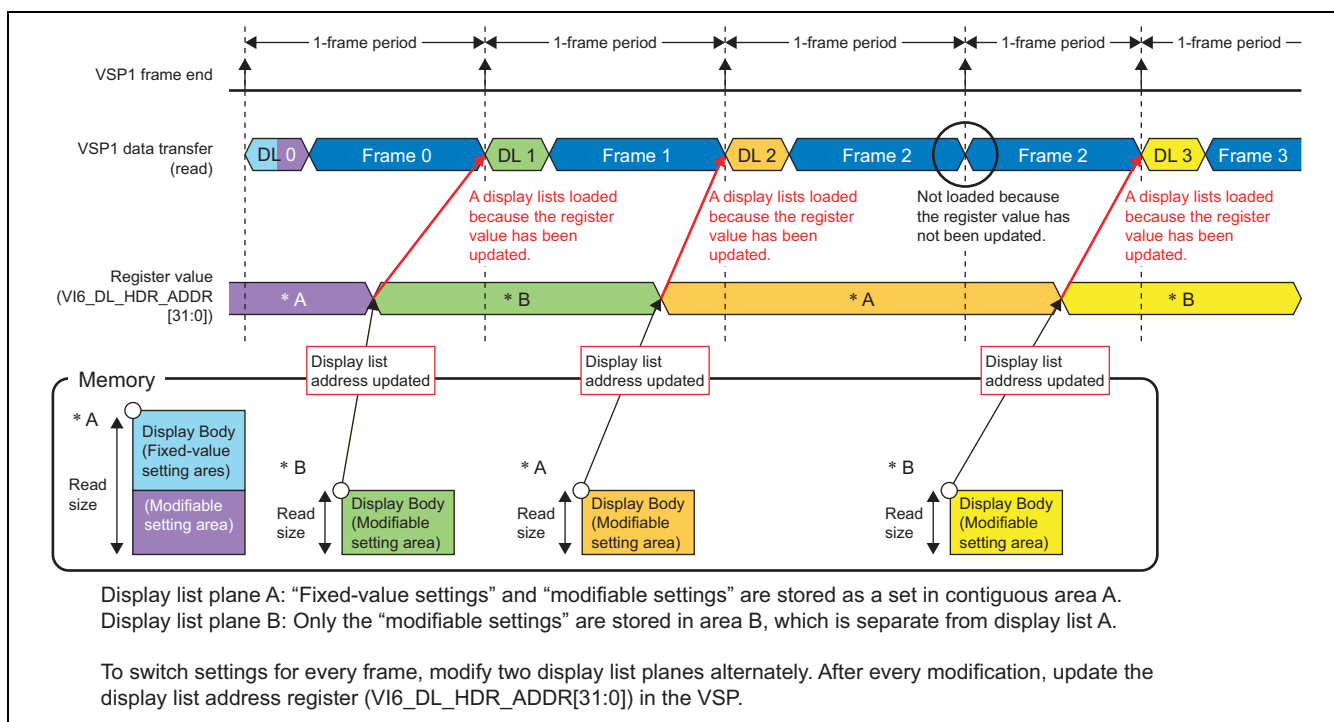

Figure 28.53 shows the detailed timing of frame switching. The number of VSP1 operating clock cycles necessary for each timing is shown as a reference value in Figure 28.54 where it is assumed that the bus transfer is at the logically fastest speed and the size of the display list to be downloaded is the worst case (downloading of data for all registers and tables in the VSP1).

**Figure 28.54 Detailed Timing of Frame Switching**

### 28.4.4 Controlling Two Register Planes Using Display Lists

Figure 28.55 shows the control of two register planes using header-less display lists (see section 28.1.8 (3)) and its timing. In the description hereafter, the use of header-less display lists is always assumed and they are simply called display lists.

**Figure 28.55 Controlling Two Register Planes Using a Display List**

The VSP1 downloads a display list immediately after activation. In the start frame, download the display list that contains all necessary settings. From the next frame on, only the necessary register or table values should be specified in a display list.

Only when the destination address (VI6\_DL\_HDR\_ADDR0; see section 28.2.6.2) or the display body size (VI6\_DL\_BODY\_SIZE0; see section 28.2.6.5) has been written to, the VSP1 downloads a new display list at the start of the next frame. When the update flag of VI6\_DL\_BODY\_SIZE0.UPD0 is set to 0, the register settings acquired from the display list previously downloaded are retained and used for the next operation without downloading a new display list.

## 28.5 Assignment in Memory Space

RZ/G1H	RZ/G1N
RZ/G1M	RZ/G1E

Make sure that VSP1 memory space shall be mapped to Non-Cache region.

## 29. Image Extraction Direct Memory Access Controller (2D-DMAC)

RZ/G1H

RZ/G1N

RZ/G1M

RZ/G1E

This LSI has an image extraction direct memory access controller (2D-DMAC). This module reads the image data in the frame buffer memory, performs image extraction/shift/simple magnification and format conversion, and then rewrites the processed image data to the frame buffer memory.

### 29.1 Features

- Image extraction  
2D-DMAC extracts an image in the rectangular area from a point (Sx, Sy) shifting from the source image data origin to a point in the frame memory, and then writes the extracted image data to another frame memory. Extraction of data is possible in two-pixel units for YCbCr formats and in one-pixel units for RGB formats. This function is available for image clipping and image motion compensation.
- Image rotation/inversion  
Vertical/horizontal inversion and the 90°/270° rotation can be performed.
- Simple enlargement  
When writing a destination image, it can simply be enlarged twice in the X and Y directions.
- Format conversion  
RGB formats can be converted to each other.  
YCbCr formats (YCbCr4:2:0 and YCbCr4:2:2) can be converted to each other.  
No format conversion is possible between RGB and YCbCr.  
The format conversion method is equivalent to that of VSP.
- Channels  
Settings for eight channels are enabled. For the YCbCr formats, settings for one channel for each Y plane and C plane are enabled. Therefore, concurrent processing is possible for up to four planes (YCbCr formats) or up to eight planes (RGB formats).  
Provided with an outstanding buffer for each channel, even if data transfer of a channel is blocked, 2D-DMAC can continue operation of other channels. Transition of processing between channels is performed upon completion of each line processing.
- Interrupt  
Each channel has interrupt request signals that can be output at the time of data transfer half end and data transfer end respectively.

Figure 29.1 shows a block diagram of 2D-DMAC and Figure 29.2 shows a flow for the pixel processing block.

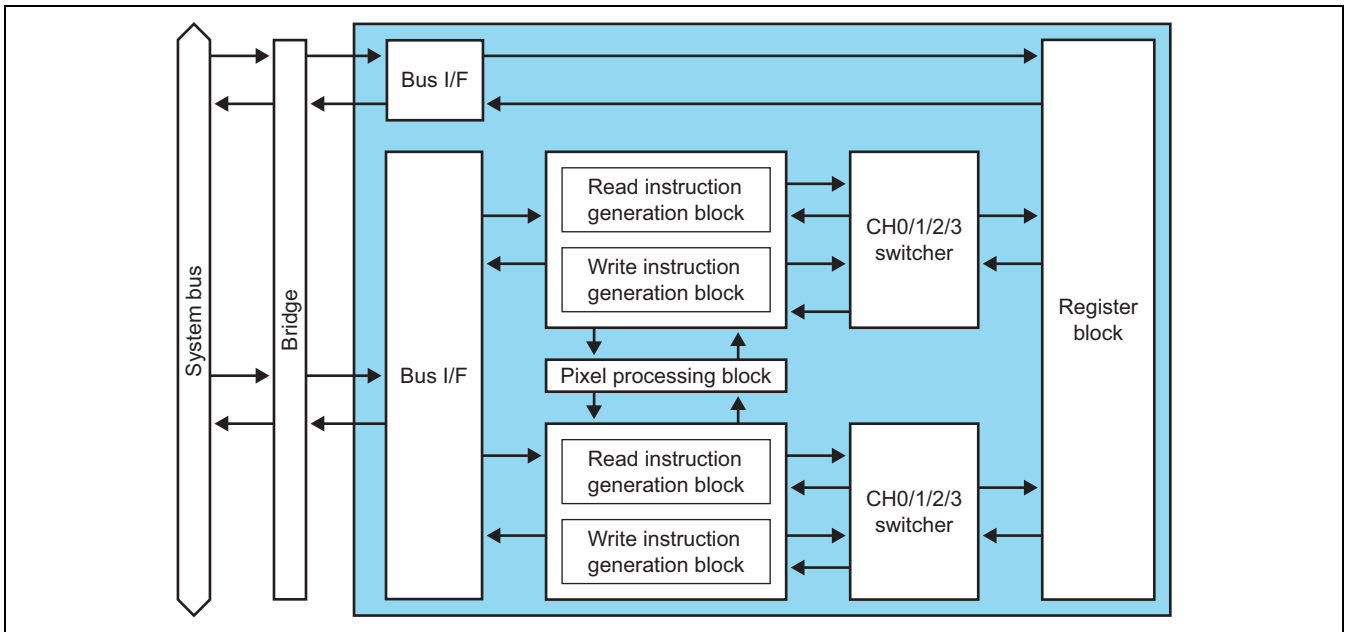

Figure 29.1 Block Diagram of 2D-DMAC

Figure 29.2 Block Flow of Pixel Block

## 29.2 Register Descriptions

Table 29.1 lists the registers used in 2D-DMAC. Table 29.2 shows the register status in each processing mode.

**29.2.1 Transaction Control Register (CHTCTRL)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

CHTCTRL register is a 32-bit readable/writeable register that controls bus transaction among all channels.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	OUT	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
5	OUT	0	R/W	Transaction control When operating 2D-DMAC, this bit should always be 1.
4 to 0	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.

### 29.2.2 Control Registers (CHnCTRL)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

CHnCTRL (n = 0 to 7) is a 32-bit readable/writable register that controls transfer mode.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	HMRR	VMRR	ROTL	ROTR	—	MX	—	MY	HIE	HE	TIE	TE	LINK[1] /—	LINK[0] /—	STP	DMAE N
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15	HMRR	0	R/W	Horizontal Inversion (symmetric to the vertical axis) The source image inverted horizontally is output. See Table 29.5 for details on the relations between this bit and inversion/rotation. 0: Horizontal inversion is not performed. 1: Inverted horizontally source image is output.
14	VMRR	0	R/W	Vertical Inversion (symmetric to the horizontal axis) The source image inverted vertically is output. See Table 29.5 for details on the relations between this bit and inversion/rotation. 0: Vertical inversion is not performed. 1: Inverted vertically source image is output.
13	ROTL	0	R/W	270° Rotation (clockwise) The source image rotated 270° is output. When this bit is 1, set the ROTR bit to 0. See Table 29.5 for details on the relations between this bit and inversion/rotation. 0: 270° rotation is not performed. 1: Rotated 270° source image is output.
12	ROTR	0	R/W	90° Rotation (clockwise) The source image rotated 90° is output. When this bit is 1, set the ROTR bit to 0. See Table 29.5 for details on the relations between this bit and inversion/rotation. 0: 90° rotation is not performed. 1: Rotated 90° source image is output.
11	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
10	MX	0	R/W	Magnify X Direction 0: No magnification 1: Outputs with double magnification in the X direction. When ROTR or ROTL is 1, set this bit to 0.

Bit	Bit Name	Initial Value	R/W	Description
9	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
8	MY	0	R/W	Magnify Y Direction 0: No magnification 1: Outputs with double magnification in the Y direction. When ROTR or ROTL is 1, set this bit to 0.
7	HIE	0	R/W	Half End Interrupt Enable Specifies whether to output the half end flag as an interrupt request. 0: A half end interrupt is disabled. 1: A half end interrupt is enabled.
6	HE	0	R/W	Half End Indicates that data transfer for half the setting lines has been completed. This bit is set to 1 when the DVPXLE bit in CHnDPXLE becomes half (a value of 1-bit right shift) of the DVPXL bit value in CHnDPXL that was set before starting transfer. If CHnCTRL.ROTR = 1 or CHnCTRL.ROTL = 1, this bit is set to 1 when the DHPXLE bit in CHnDPXLE becomes half of the DHPXL bit value in CHnDPXL that was set before starting transfer. Only clearing to 0 after reading 1 is enabled. Clearing by the CHSTCLR register is also enabled.
5	TIE	0	R/W	Transfer End Interrupt Enable Specifies whether to output the transfer end flag as an interrupt request. 0: A transfer end interrupt is disabled. 1: A transfer end interrupt is enabled.
4	TE	0	R/W	Transfer End This bit is set to 1 when the DVPXL bit in CHxDPXL that was set by the DVPXLE bit in CHxDPXLE before starting transfer and the entire DMA transfer are completed. When this bit is set to 1, the DMAEN bit is automatically cleared. Only clearing to 0 after reading 1 is enabled. Clearing by the CHSTCLR register is also enabled.

Bit	Bit Name	Initial Value	R/W	Description
3, 2	LINK[1:0] (n = 0, 2, 4, 6) — (n = 1, 3, 5, 7)	00	R/W  R  R	<p>(n = 0, 2, 4, 6) Link Transfer Mode</p> <p>This mode enables alternate block line transfers between a master channel (CHn) and a slave channel (CHn+1). When these bits are set to 10, specify the DVPXL bit in CH(n+1)DPXL equal to half of the DVPXL in CHnDPXL. When these bits are set to 11, specify the DVPXL bit in CH(n+1)DPXL equal to the DVPXL in CHnDPXL.</p> <p>In this mode, start the transfer of the master channel before that of the slave channel.</p> <p>00: Link transfer mode is disabled. 01: Setting prohibited. 10: A block line transfer of a slave channel is performed every two block line transfers of a master channel. 11: Alternate transfers are performed.</p> <p>(n = 1, 3, 5, 6) Reserved</p> <p>These bits are always read as 0. The write value should always be 0.</p>
1	STP	0	R/W	<p>Transfer Stop</p> <p>Stops DMA transfer temporarily. When this bit is set to 1, DMA transfer is suspended upon completion of the line that is being transferred, and the DMAEN bit is cleared to 0. At this time, this bit is also cleared.</p> <p>To restart DMA transfer after that, set the DMAEN bit to 1. To reset the operation of a channel, rewrite data to the SAR, DAR, and DPXL registers of the channel.</p> <p>[Writing] 0: NOP 1: Stops DMA transfer temporarily.</p> <p>[Reading] 0: Transfer is in progress or suspended. 1: Pending until the line being transferred is completed</p>
0	DMAEN	0	R/W	<p>DMA Transfer Enable</p> <p>Enables DMA transfer. Only writing 1 is enabled. This bit shows 1 during transfer, and is automatically cleared when a DMA transfer is completed.</p> <p>Writing 0 to this bit is disabled. A DMA transfer can be suspended by setting the STP bit to 1.</p> <p>[Writing] 0: NOP 1: Performs DMA transfer.</p> <p>[Reading] 0: No DMA transfer is in progress. 1: A DMA transfer is in progress.</p>

**29.2.3 Input/Output Swap Register (CHnSWAP)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

CHnSWAP (n = 0 to 7) controls 64-bit data swapping in the data input/output section of 2D-DMAC.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	OLS	OWS	OBS	—	ILS	IWS	IBS
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 7	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
6	OLS	0	R/W	Output Longword Swap Setting In the output section of 2D-DMAC, 64 bits of data are swapped with 32 bits of the MSB and 32 bits of the LSB in longword units. 0: Output longword swap is not performed. 1: Output longword swap is performed.
5	OWS	0	R/W	Output Word Swap Setting In the output section of 2D-DMAC, 64 bits of data are swapped with 32 bits of the MSB and 32 bits of the LSB in word units. 0: Output word swap is not performed. 1: Output word swap is performed.
4	OBS	0	R/W	Output Byte Swap Setting In the output section of 2D-DMAC, 64 bits of data are swapped with 16-bit groups in byte units. 0: Output byte swap is not performed. 1: Output byte swap is performed.
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2	ILS	0	R/W	Input Longword Swap Setting In the input section of 2D-DMAC, 64 bits of data are swapped with 32 bits of the MSB and 32 bits of the LSB in longword units. 0: Input longword swap is not performed. 1: Input longword swap is performed.
1	IWS	0	R/W	Input Word Swap Setting In the input section of 2D-DMAC, 64 bits of data are swapped with 32 bits of the MSB and 32 bits of the LSB in word units. 0: Input word swap is not performed. 1: Input word swap is performed.

Bit	Bit Name	Initial Value	R/W	Description
0	IBS	0	R/W	Input Byte Swap Setting In the input section of 2D-DMAC, 64 bits of data are swapped with 16-bit groups in byte units. 0: Input byte swap is not performed. 1: Input byte swap is performed.

When the system is operated in little-endian mode, this register should be used to select the swapping method conforming to the input/output format. The data relationships available when swapping methods are set are shown in Figures 29.3, 29.4, and 29.5.

Figure 29.3 Data Relationship Before and After Longword Swapping

Figure 29.4 Data Relationship Before and After Word Swapping

Figure 29.5 Data Relationship Before and After Byte Swapping

### 29.2.4 Source Format Registers (CHnSFMT)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

CHnSFMT (n = 0 to 7) is a 32-bit readable/writable register for setting the source image.

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	HWTH[15:0]	H'0000	R/W	Source Image Horizontal Byte Size Specify the one-line width of the source image in units of bytes. This value should be a multiple of the pack size. When ROTR or ROTL is 1, set these bits to 16n.
15 to 7	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
6, 5	MD[1:0]	00	R/W	Source Image Format 00: RGB data 01: Y data 10: CbCr data (YCbCr4:2:0) 11: CbCr data (YCbCr4:2:2)
4 to 0	PKF[4:0]	00000	R/W	Source Image RGB Data Packed Format Specify the packed format for source image data in the RGB format. These bits are available only when MD = 00. Table 29.3 shows the packed RGB formats.

**Table 29.3 Packed RGB Formats**

**29.2.5 Source Address Registers (CHnSAR)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

CHnSAR (n = 0 to 7) is a 32-bit readable/writable register for setting the transfer start address of the source image.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SAR[31:0]	H'00000000	R/W	Source Image Extraction Start Address Specify the address of the extraction start pixel in the source image data.

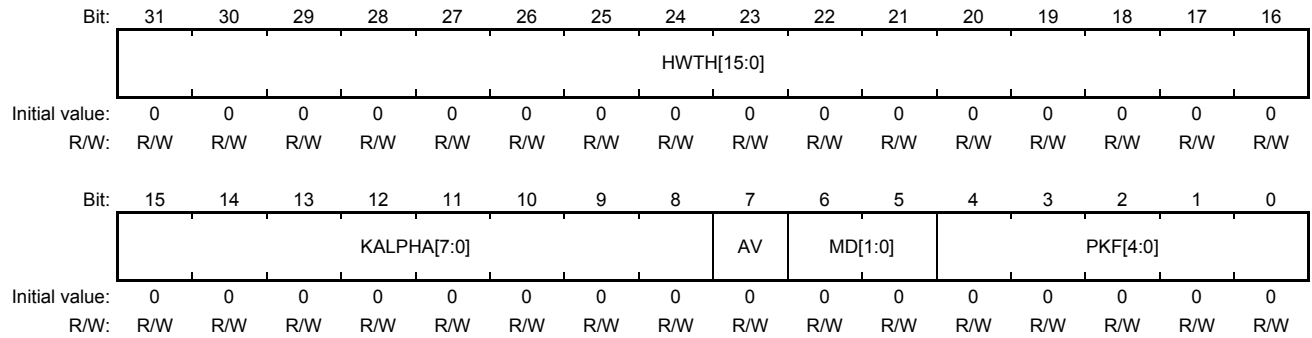

When the source image fills CHnSAR ≠ 16n and cutting out effective pixel bytes number ≤ 16-byte, line finality access = address where line terminal address is rounded up to 16n + 16-byte.

Address where source image final pixel address of cutting out object is rounded up to 16n + 16, secure it as an input image area.

### 29.2.6 Destination Format Registers (CHnDFMT)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

CHnDFMT (n = 0 to 7) is a 32-bit readable/writable register for setting a destination image format and so on.

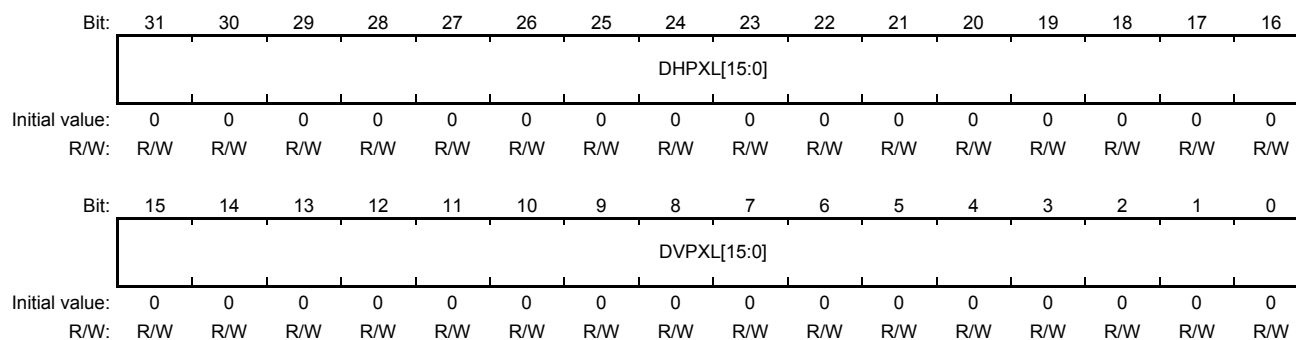

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	HWTH[15:0]	H'0000	R/W	Destination Image Horizontal Byte Size Specify the one-line width of the destination image in units of bytes. Set a multiple of 16. When CTRL.MX is 1, set a value after magnification.
15 to 8	KALPHA[7:0]	H'00	R/W	Alpha Value Specify an alpha value used for output if the source image is in a format without alpha or the AV bit is set to 0.
7	AV	0	R/W	Alpha Enable 0: Disables the alpha value when the source image is in a format with alpha. When the output is in a format with alpha, the KALPHA value is output. 1: Enables the alpha value when the source image is in a format with alpha, and outputs the alpha value when the output is in a format with alpha.
6, 5	MD[1:0]	00	R/W	Destination Image Format 00: RGB data 01: Y data 10: CbCr data (YCbCr4:2:0) 11: CbCr data (YCbCr4:2:2)
4 to 0	PKF[4:0]	00000	R/W	Destination Image RGB Data Packed Format Specify the packed format for destination image data in the RGB format. These bits are available only when MD = 00. Table 29.3 shows the packed RGB formats.

### 29.2.7 Destination Pixel Registers (CHnDPXL)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

CHnDPXL (n = 0 to 7) is a 32-bit readable/writable register for setting the horizontal pixel size and vertical pixel size of the destination image.

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	DHPXL[15:0]	H'0000	R/W	<p>Destination Image Horizontal Pixel Size</p> <p>Specify the horizontal pixel size of the destination image. When the MX bit in CTRL is 1, set a value before magnification.</p> <p>For the CbCr plane in YCbCr4:2:2 or YCbCr4:2:0, set a value of half of the number of pixels.</p> <p>The minimum pixel size will be 1; set 1 or a larger value.</p>
15 to 0	DVPXL[15:0]	H'0000	R/W	<p>Destination Image Vertical Pixel Size</p> <p>Specify the vertical pixel size of the destination image. When the MY bit in CTRL is 1, set a value before magnification.</p> <p>For the CbCr plane in YCbCr4:2:0, set a value of half of the number of lines.</p> <p>The minimum pixel size will be 1; set 1 or a larger value.</p>

### 29.2.8 Destination Address Registers (CHnDAR)

CHnDAR (n = 0 to 7) is a 32-bit readable/writable register for setting the transfer start address of the destination image.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DAR[31:0]	H'00000000	R/W	Specify the start address of the destination image. Only a multiple of 16 can be set.  The specified address point is to be changed according to the settings to the VMRR, HMRR, ROTR, ROTL, and MY bits. For details, see section 29.3.2, Image Rotation/Inversion.

### 29.2.9 Source Line Address Registers (CHnSARE)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

CHnSARE (n = 0 to 7) is a 32-bit read-only register that shows the start address of the line in processing of the source image.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SARE[31:0]	H'00000000	R	This read-only register used for internal processing shows the start address of the line in processing of the source image.

### 29.2.10 Destination Line Address Registers (CHnDARE)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

CHnDARE (n = 0 to 7) is a 32-bit read-only register that shows the start address of the line in processing of the destination image.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DARE[31:0]	H'00000000	R	This read-only register used for internal processing shows the start address of the line in processing of the destination image.

**29.2.11 Destination Pixel Processing Registers (CHnDPXLE)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

CHnDPXLE (n = 0 to 7) is a 32-bit read-only register that shows the number of unprocessed lines of the destination image.

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	DHPXLE[15:0]	H'0000	R	This read-only register used for internal processing shows the number of unprocessed horizontal lines of the destination image.
15 to 0	DVPXLE[15:0]	H'0000	R	This read-only register used for internal processing shows the number of unprocessed vertical lines of the destination image.

### 29.2.12 Interrupt Status Clear Register (CHSTCLR)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

CHSTCLR is a register that indicates the status of HE and TE bits in each channel. By writing 1 in a bit in CHSTCLR, HE or TE bit in the corresponding channel is to be cleared.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CHnHE[7:0]							CHnTE[7:0]								
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 8	CHnHE[7:0]	H'00	R/W	Indicates the status of the HE bit in CHnCTRL (n = 0 to 7). Writing 1 in this bit, the HE bit in corresponding channel is to be cleared. [Writing] 0: NOP 1: HE bit is cleared. [Reading] 0: 0 is set in the HE bit. 1: 1 is set in the HE bit.
7 to 0	CHnTE[7:0]	H'00	R/W	Indicates the status of the TE bit in CHnCTRL (n = 0 to 7). Writing 1 in this bit, the TE bit in corresponding channel is to be cleared. [Writing] 0: NOP 1: TE bit is cleared. [Reading] 0: 0 is set in the TE bit. 1: 1 is set in the TE bit.

## 29.3 Operation

RZ/G1H

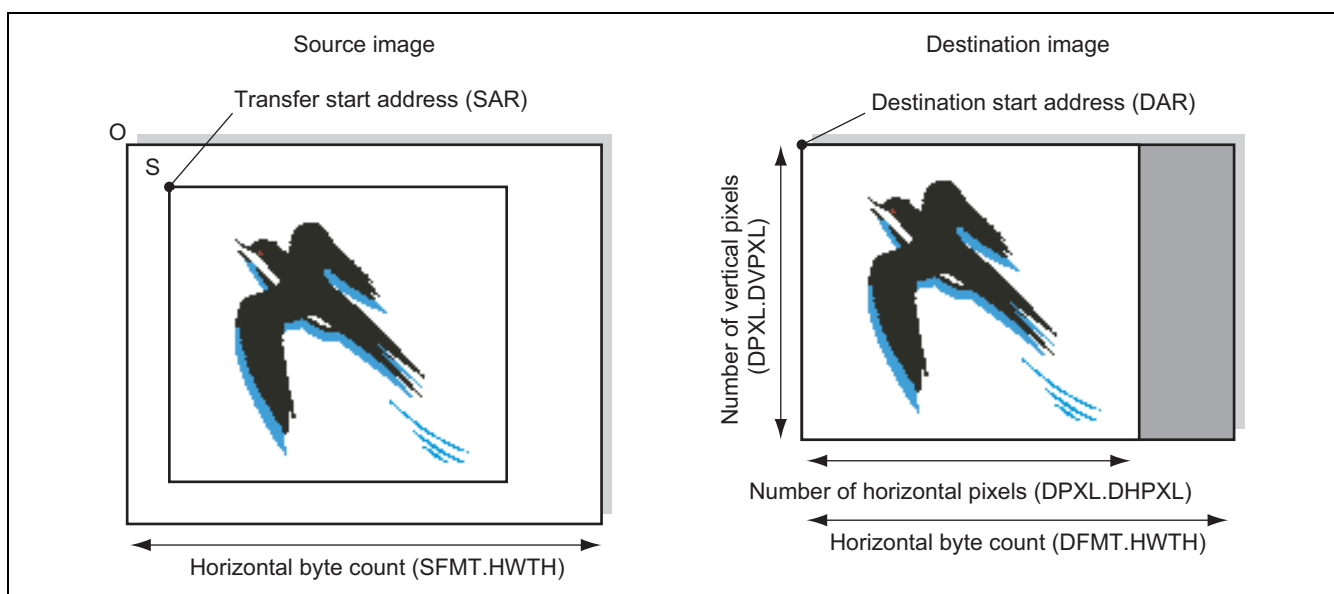

RZ/G1N

RZ/G1M

RZ/G1E

This module can extract image data of required size from the source image and store it as a destination image, and also can convert the format, rotation/inversion, and magnify the image at that time.

### 29.3.1 Image Extraction

**Figure 29.6 Schematic Diagram of Image Extraction**

Figure 29.6 shows a schematic diagram of image extraction.

The image format conforms to the YCbCr4:2:0, YCbCr4:2:2, and RGB formats. Extraction of data is possible in two-pixel units for YCbCr formats and in one-pixel units for RGB formats. However, since the Y data and C data are independently stored in the memory in the YCbCr format, set them in different channels respectively.

For source images, the address of extraction start coordinates S and the horizontal byte size must be set in respective registers. Set the start address of the extraction start pixel in SAR. If the X coordinate of extraction start coordinates S (SAR) is an odd number with origin O in the YCbCr format, a deviation is generated between Y data and C data in the horizontal direction. Furthermore, in the YCbCr4:2:0 format, if the Y coordinate of extraction start coordinates S is an odd number with origin O, a deviation is generated between Y data and C data in the vertical direction. For each case, extract image data from the even pixel coordinates where truncation is made.

For destination images, destination start address, numbers of horizontal and vertical pixels, and the horizontal byte size must be set. Set an integer multiple of 16 ( $\geq$  DHPXL in DPXL x bytes per pixel) for the horizontal byte size (HWTH in DFMT). Discard the gray area in Figure 29.6 as invalid data. For YCbCr formats, set an even number for the number of Y data horizontal pixels. In addition, for the YCbCr4:2:0 format, the number of vertical pixels must also be set to an even number.

Table 29.4 lists these restrictions.

**Table 29.4 Restrictions for Each Format**

Format	Item	Restrictions
Common	Destination image horizontal byte size (CHnDFMT.HWTH)	Set an integer multiple of 16.
Y data (YCbCr4:2:2)	Source image horizontal extraction start position (CHnSAR.SAR)	In a case that the X-coordinate of starting coordinate-S (SAR) relative to the coordinate origin 0 of source image is odd number, a deviation is generated between Y data and C data in the horizontal direction.
	Destination image horizontal pixel size (CHnDPXL.DHPXL)	In a case that the horizontal pixel size is odd number of the destination image, the invalid data might be generated right side in the image.
Y data (YCbCr4:2:0)	Source image horizontal extraction start position (CHnSAR.SAR)	In a case that the X-coordinate of starting coordinate-S (SAR) relative to the coordinate origin 0 of source image is odd number, a deviation is generated between Y data and C data in the horizontal direction.
	Source image vertical extraction start position (CHnSAR.SAR)	In a case that the Y-coordinate of starting coordinate-S (SAR) relative to the coordinate origin 0 of source image is odd number, the vertical throw between Y and CbCr is to be generated.
	Destination image horizontal pixel size (CHnDPXL.DHPXL)	In a case that the horizontal pixel size is odd number of the destination image, the invalid data might be generated right side in the image.
	Destination image vertical pixel size (CHnDPXL.DVPXL)	In a case that the vertical pixel size is odd number of the destination image, the invalid data might be generated bottom in the image.

### 29.3.2 Image Rotation/Inversion

**Table 29.5 The Combination of the Bits, VMRR, HMRR, ROTL, and ROTR and the Rotation/Inversion**

VMRR bit	HMRR bit	ROTL bit	ROTR bit	DAR specified point	Rotation/Inversion Performance
0	0	0	0	A	Rotation/Inversion is not performed
0	0	0	1	C	Clockwise 90 degrees rotation
0	0	1	0	B	Clockwise 270 degrees rotation
0	1	0	1	A	After rotating clockwise 90 degrees, inverse horizontally
1	0	1	0		(After rotating clockwise 270 degrees, inverse vertically)
1	0	0	1	D	After rotating clockwise 90 degrees, inverse vertically
0	1	1	0		(After rotating clockwise 270 degrees, inverse horizontally)
0	1	0	0	C	Inversing horizontally
1	0	0	0	B	Inversing vertically
1	1	0	0	D	180 degrees rotation
Others				—	Setting prohibited

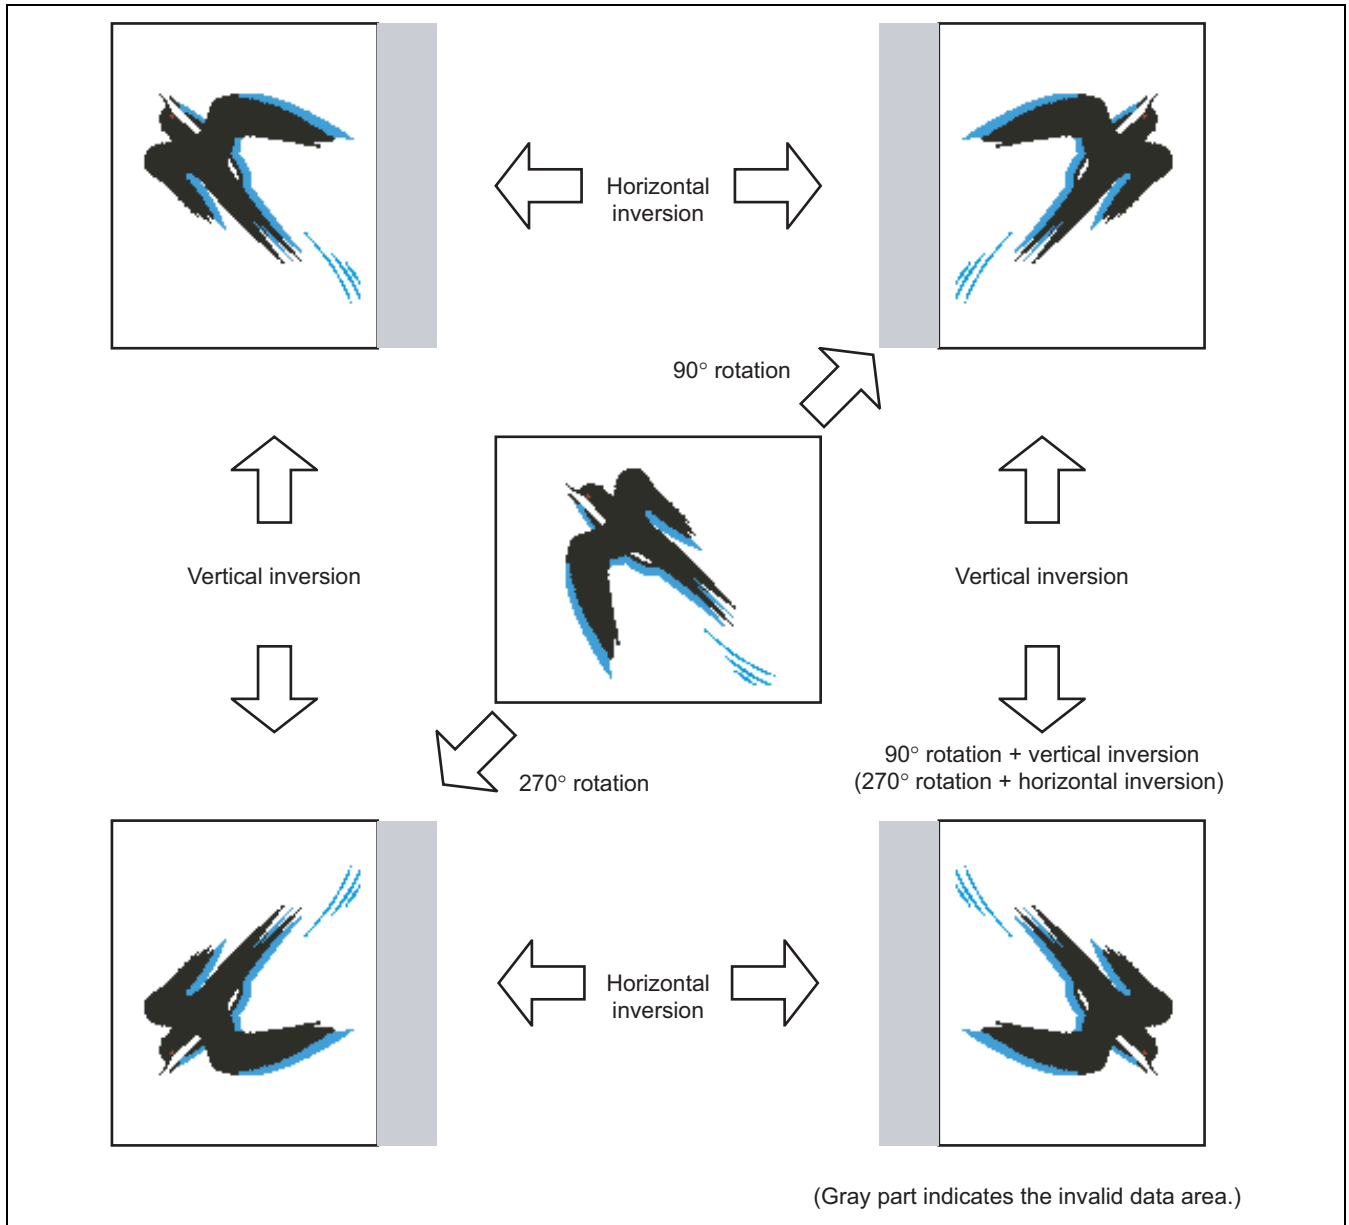

The rotation/inversion performance in 90 degrees units can be executed arbitrarily effects of combination of the bits, VMRR, HMRR, ROTR, and ROTL as shown in Table 29.5. Figure 29.7 shows the relations between the source image and the destination image in operating with rotation/inversion performance and Figure 29.8 shows only with inversion performance.

During the rotation/ inversion operating, the address specified point setting in CHnDAR is to be changed according to the setting of the bits, VMRR, HMRR, ROTR, and ROTL. See Figure 29.9 for details on the specified address point corresponding to the processing respectively.

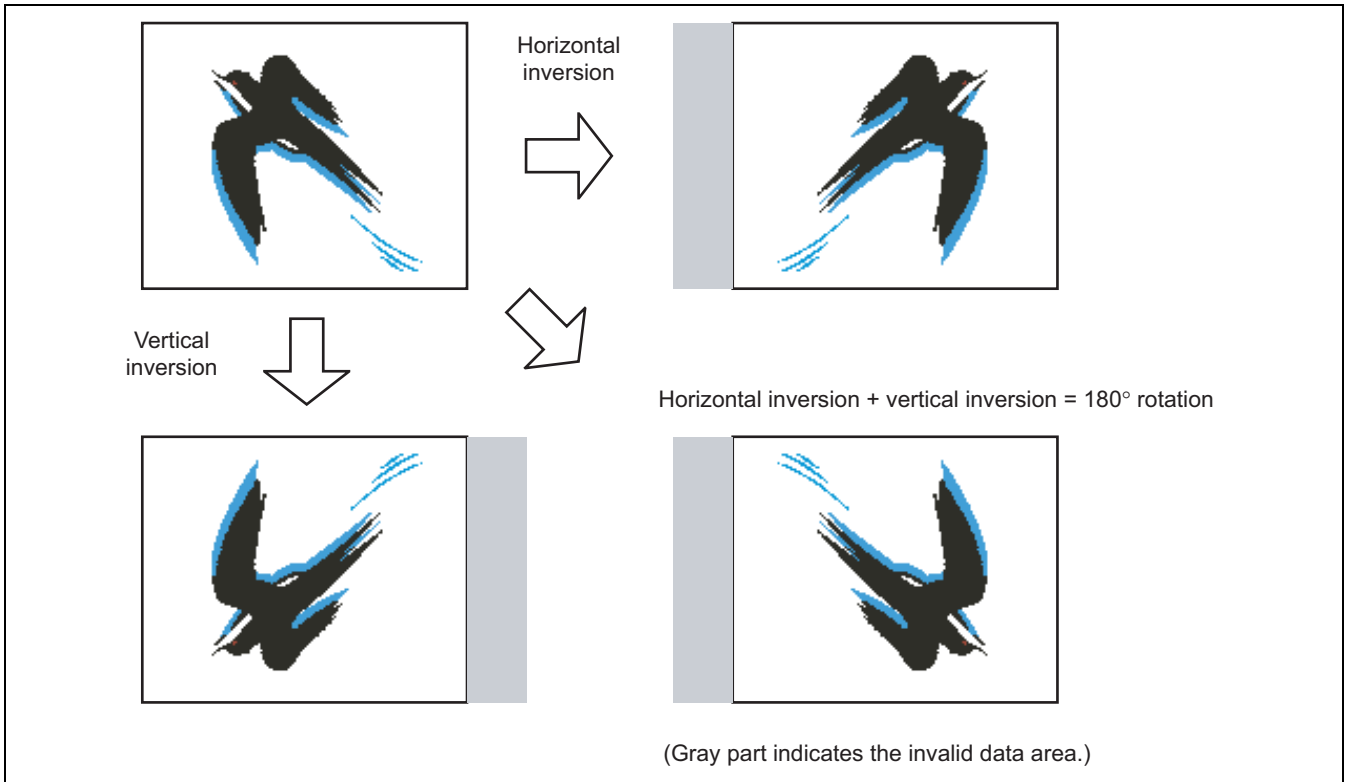

Lists the formulas for the address settings as follows.

offset\_add      Address at the left above end of the destination image.  
 dest\_hwidth    Horizontal byte size of the destination image (CHnDFMT.DHWTH)  
 dest\_vpxl      Vertical pixel size of the destination image (CHnDPXL.DVPXL)

- A     $DAR = offset\_add$
- B     $DAR = offset\_add + (dest\_hwidth \times (dest\_vpxl - 1))$
- C     $DAR = offset\_add + dest\_hwidth$
- D     $DAR = offset\_add + (dest\_hwidth \times dest\_vpxl)$

**Figure 29.7 Relations between the Source Image and the Destination Image in Operating with Rotation/Inversion Performance**

**Figure 29.8 Relations between the Source Image and the Destination Image in Operating with Inversion Performance**

**Figure 29.9 The specified Address point of CHnDAR**

### 29.3.3 Format Conversion

Conversions are possible between RGB formats and between YCbCr formats (YCbCr4:2:0 and YCbCr4:2:2). For available RGB formats, see Table 29.3. However, no format conversion is possible between RGB and YCbCr.

### 29.3.4 Simple Magnification

Setting the MX and MY bits in CTRL allows enlarged output in the X and Y directions respectively.

Simple magnification method is used for the magnification processing where the pixels in the source image are copied in the X and Y directions and are then output.

Figure 29.10 is a schematic diagram of simple magnification of pixels.

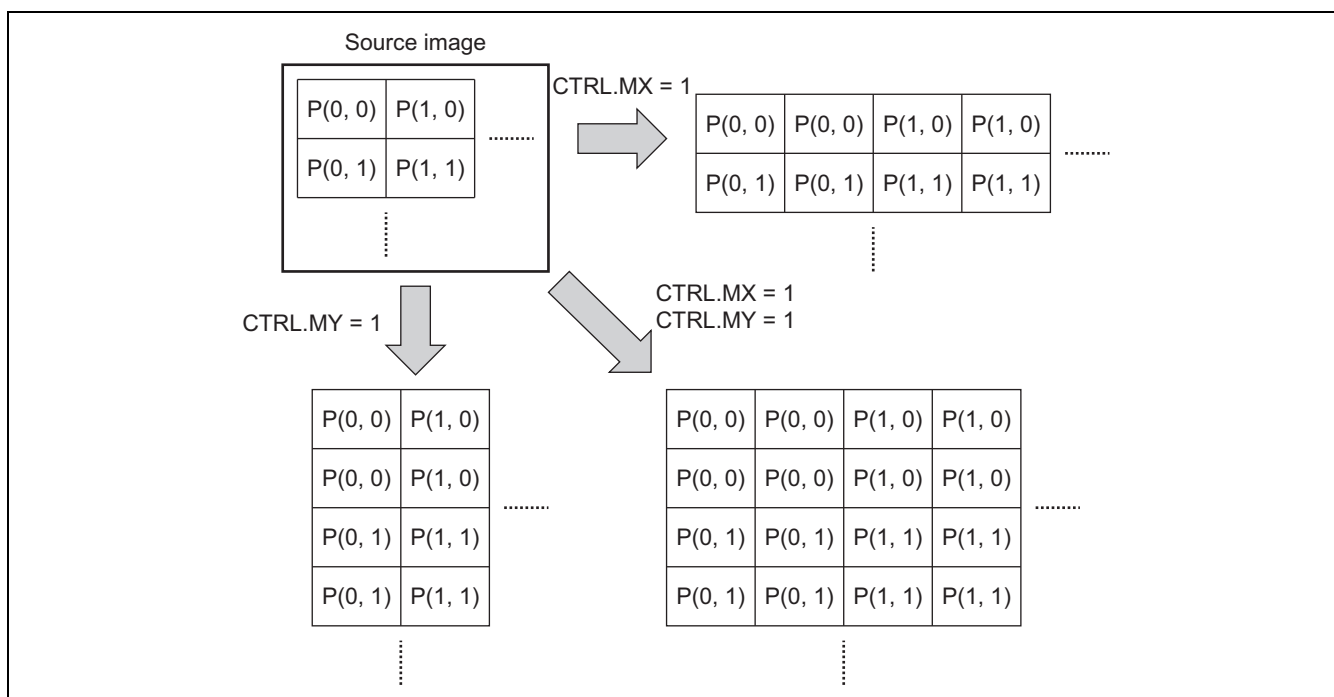

Figure 29.10 Enlarged Output of Pixels

29.4 Transfer Flow

RZ/G1H	RZ/G1N
RZ/G1M	RZ/G1E

Figure 29.11 shows a flowchart of DMAC transfer using 2D-DMAC.

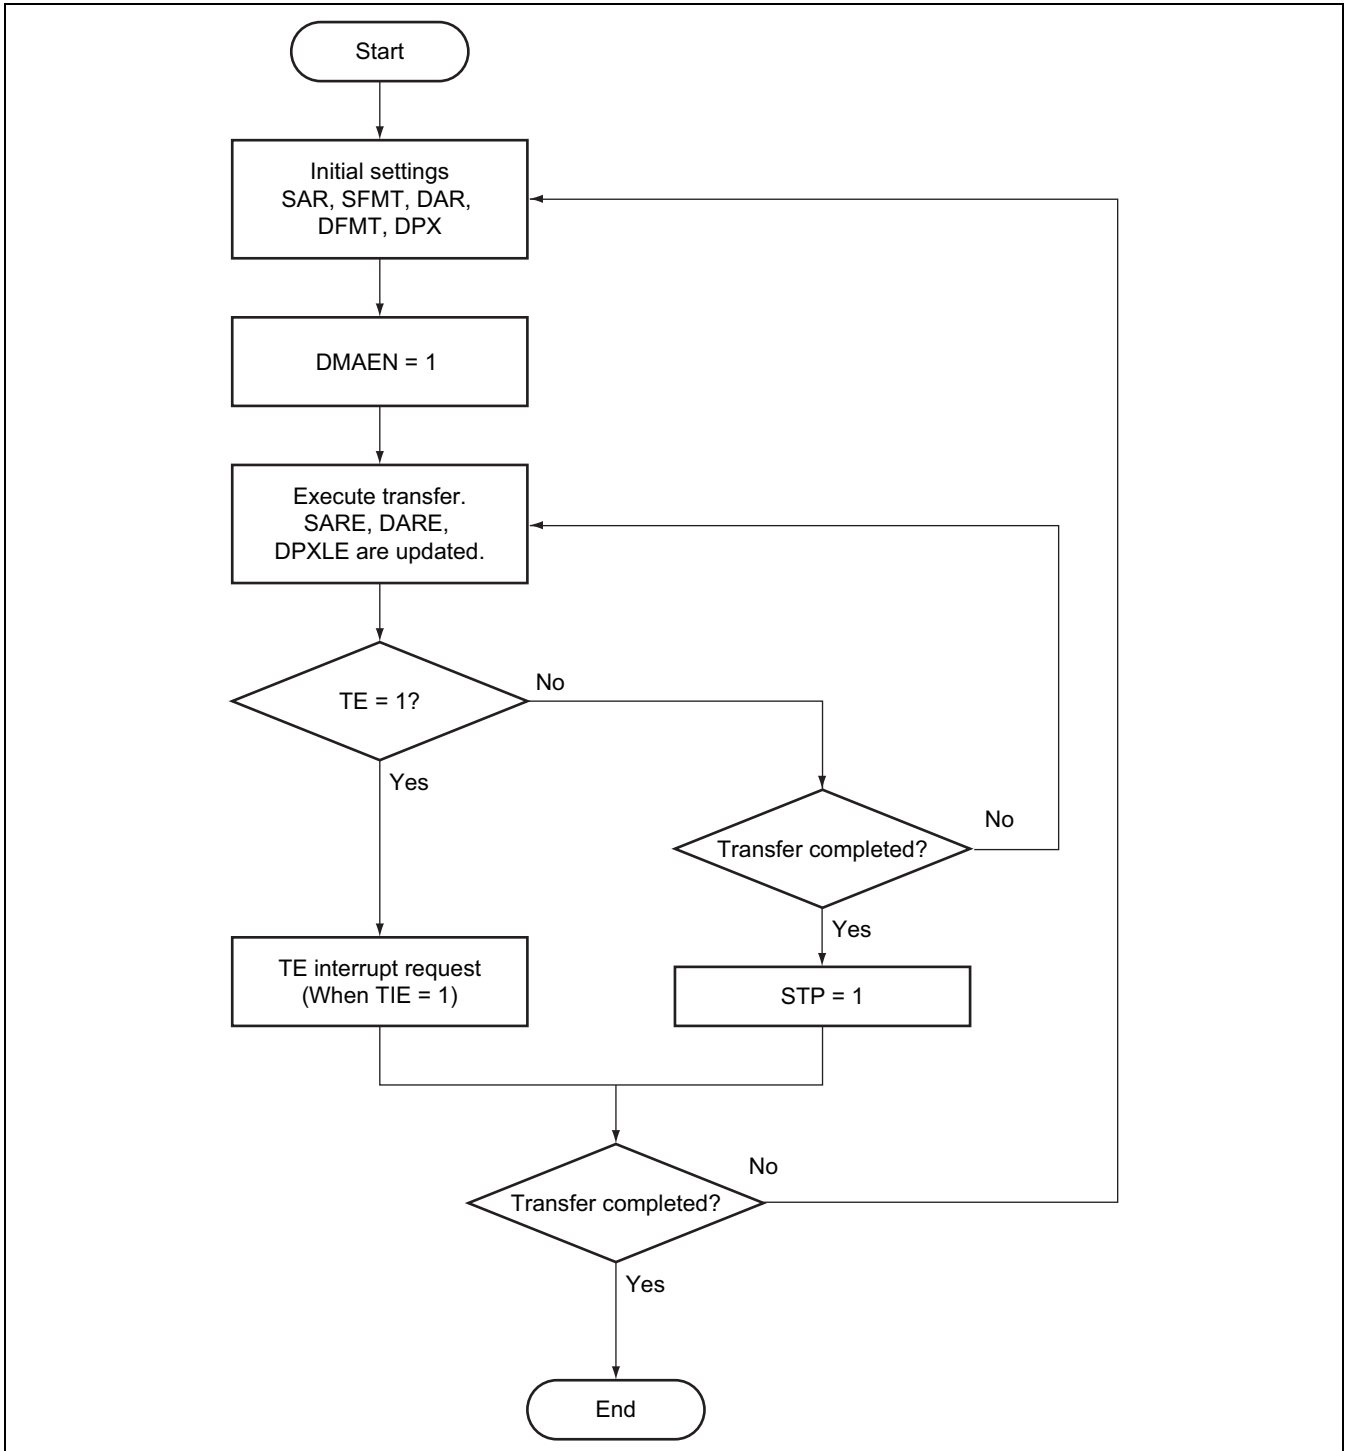

Figure 29.11 Flowchart of DMAC Transfer Using 2D-DMAC

## 29.5 Handling Interrupts from the 2D-DMAC

RZ/G1H

RZ/G1N

RZ/G1M

RZ/G1E

The 2D-DMAC module issues an interrupt (TEI = 1) when it completes data output without receiving a confirmation of completion of the data transaction with external memory. This raises the possibility of unexpected (out-of-date) data being read from external memory when a request for access from any module reaches external memory ahead of the 2D-DMAC's interrupt request. This behavior will only appear if the module is accessing 2D-DMAC output data for the part of the bottom line in the right corner (e.g. the CPU is reading image data for 180-degree image rotation.). Avoiding this behavior requires either of the procedures described below.

### 1. Dummy transaction

After detecting the TE interruption, set up a dummy transfer with the below conditions:

Stride size of source image: 2048 bytes

Output image size: W: 128, H: 32

Image format: ARGB8888 (PKF = B'00000)

No image rotation and scaling

The TE interrupt in response to the dummy transfer guarantees the completion of data output for the target transaction to external memory.

### 2. Insertion of a wait period

After detecting the TE interrupt, insert 20  $\mu$ s of waiting to guarantee completion of the data transaction with external memory.

## 30. TS Interface (TSIF)

The transport stream interface (TSIF) is a module for receiving the MPEG2 transport stream (TS) used in a segment broadcasting implemented as part of the digital terrestrial broadcasting services. The TSIF extracts packet data and controls PCR, which are required to decode the system layer of the MPEG2 standard.

### 30.1 Features

The TSIF has the following features.

- Serial data input
- Support for TS data transfer by DMA auto request
- Acquisition of TS packets
  - Filters 67 kinds of PIDs (packet ID) in total (the PID values of PAT and CAT packets are fixed. For PCR, video, and audio packets, the PID values are predefined).
  - Supports all valid packet receive mode (null packet is deleted).
  - Supports all packet receive mode including null packet.
  - Supports duplicate packet delete mode.
  - Capable of specifying the endian type when TS packet data is read.
  - Supports timestamping TS packet data with timing of obtaining it.
- TS data analysis
  - Detects random access indicator.
  - Detects discontinuity indicator.
  - Detects video start code and short header.
- Extraction of PCR information
- Support for system clock generation

[Legend]

MPEG:	Moving picture expert group
TS:	Transport stream
PID:	Packet ID
PAT:	Program association table
CAT:	Conditional access table
PCR:	Program clock reference
ES:	Elementary stream

Figure 30.1 shows a block diagram of the TSIF.

The signals to transfer or control TS data are input as an input signal, and the TS packet data filtered by this module will be output as an output signal.

The serially input TS data is converted into 8-bit parallel data and the header of the TS packet is detected by the TS synchronous detection circuit. The TS filter circuit then determines and filters the PID of the TS packet according to the predefined PID table and stores the TS packet in the buffer for TS packets. Following these processes, only predefined TS packets are stored in the buffer and transferred to memories via a bus interface.

The analysis circuit of a TS header is a block that analyses the header of a TS packet, acquires the header information, and generates a trigger signal sent to other blocks. The ES data search circuit searches the start code and short header of an elementary stream (ES) contained in a TS packet. This result can be used as supplementary data to control the start timing of image decoding through the upper-level software that controls image decoding.

Based on the PCR information extracted from the TS packet, the PCR control unit outputs information needed for system clock control.

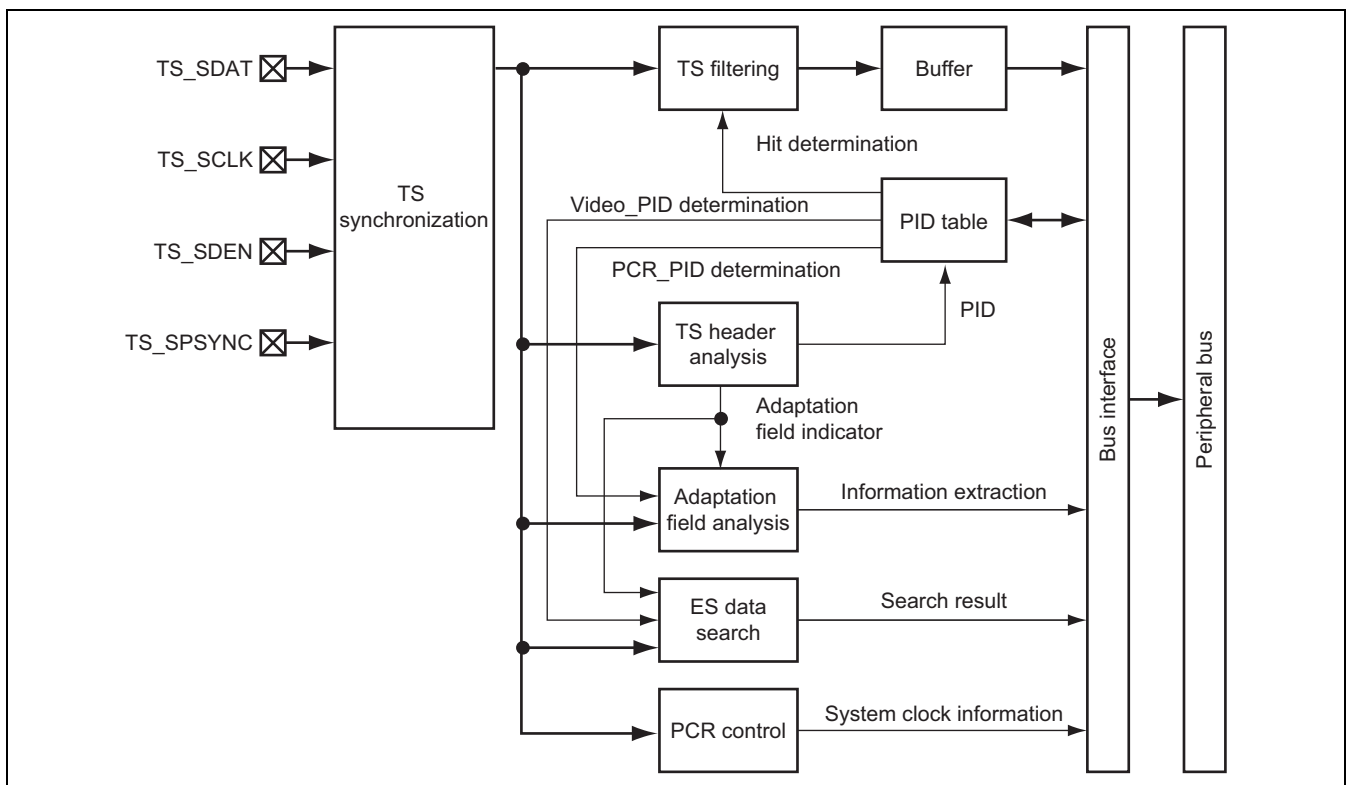

Figure 30.1 TSIF Block Diagram [RZ/G1M]

## 30.2 Input/Output Pins

Table 30.1 shows the pin configuration.

**Table 30.1 Pin Configuration**

Pin Name	Function	I/O	Description	RZ/G Series Products			
				RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
TS_SDAT0	TS serial data	Input	Serial Input Pin of TS Packet Data Polarity inversion is enabled by register setting.	—	√	—	—
TS_SCK0	TS serial clock	Input	Serial Input Clock Pin Polarity inversion is enabled by register setting. The initial value is synchronized with the rising edge.	—	√	—	—
TS_SDEN0	TS data enable	Input	Serial Input Enable Signal Pin Polarity inversion and on/off setting are enabled by register setting. The initial value is on and enabled after the TS_SDEN signal is driven high.	—	√	—	—
TS_SPSYNC0	TS data synchronization	Input	Byte Boundary Signal Pin Polarity inversion is enabled by register setting. The initial value is set on a byte boundary at the rising edge. If an LSI that does not have the TS_SPSYNC signal is connected, follow the method of handling synchronization signals in the LSI. Signals that have the same waveform of the TS_SDEN signal described in this section can be connected to this pin.	—	√	—	—

### 30.3 Register Descriptions

Table 30.2 shows the TSIF register configuration. Table 30.3 shows the register states in each operating mode.

Base address is listed below.

TSIF0: H'FFE8 0000

### 30.3.1 TSIF Control Register (TSCTLR)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
—	√	—	—

TSCTLR is a register for controlling the TSIF.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	PLNGT H	TSDAT P	TSCLK P	TSVLD P	—	PSYCP	—	—	SDENE	—	—	BUF4	TFA	DPDM D	DREQ MD
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R/W	R	R/W	R	R	R/W	R	R	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	EN	PCRM D	FRCM D	FRCSE L	FRCLA TCH	FRCADD[1:0]	FRCST R	FRCPSC[7:0]								
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
30	PLNGTH	0	R/W	Byte Configuration Set of TS Packet Data 0: TS packet is 204-byte configuration. 1: TS packet is 188-byte configuration.
29	TSDATP	0	R/W	Input Polarity Set of TS Packet Data 0: TS data input is positive polarity. 1: TS data input is negative polarity (used after polarity inversion).
28	TSCLKP	0	R/W	Input Polarity Set of TS Clock 0: TS data clock input is positive polarity (TS data is received at the rising edge). 1: TS data clock input is negative polarity (TS data is received at the falling edge).
27	TSVLDP	0	R/W	Input Polarity Set of TS Packet Data Enable Signal 0: The TS_SDEN signal from the TS decoder is positive polarity (enabled at high). 1: The TS_SDEN signal from the TS decoder is negative polarity (enabled at low).
26	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
25	PSYCP	0	R/W	Input Polarity Set of TS Packet Data Sync Signal 0: TS packet sync signal TS_SPSYNC is positive polarity (sync byte at high). 1: TS packet sync signal TS_SPSYNC is negative polarity (sync byte at low).
24, 23	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
22	SDENE	0	R/W	TS Packet Data Enable Signal Enabled/Disabled 0: The TS_SDEN signal from the TS decoder is enabled. 1: The TS_SDEN signal from the TS decoder is disabled.

Bit	Bit Name	Initial Value	R/W	Description
21, 20	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
19	BUF4	0	R/W	Buffer Area Number Set 0: 2 areas 1: 4 areas
18	TFA	0	R/W	Software Reset Signal in the TSIF This bit automatically enters the reset state on startup. Writing 1 releases the reset. The TSIF internal registers are not initialized with this bit. When a reset is issued, confirm that this bit is set to 0 before releasing the reset. Note: Set this bit to 1 after eight cycles or more of TS_SCK is input. 0: The TSIF is reset internally (except internal registers). 1: Reset is released.
17	DPDMD	0	R/W	Duplicate Data of Consecutive TS Packets (Duplicate Packets) Delete When the PID of the previous consecutive packet matches continuity_counter, the data is deleted. However, when adaptation_field_control = x0 (x: don't care), the data is not deleted. 0: Duplicate data valid mode Even when the PID of the consecutive packet and continuity_counter match, the data is not deleted. 1: Duplicate data delete mode When the PID of the previous consecutive packet and continuity_counter match, the data is deleted. Note that this is valid only when adaptation_field_control = x1 (x: don't care).
16	DREQMD	0	R/W	After one packet (188 or 192 bytes) of TS data transfer by DMAC, selects whether the PEC bit in TSBUFFCLRR is set to 1 automatically. 0: DMA interrupt transfer mode After one packet (188 or 192 bytes) of TS data transfer, the PEC bit is not set to 1. 1: DMA auto-transfer mode After one packet (188 or 192 bytes) of TS data transfer, the PEC bit is set to 1 and the internal buffer is cleared.
15	EN	0	R/W	Specifies the endian type for reading TS packet data from TSTSDR. 0: Big endian 1: Little endian
14	PCRMD	0	R/W	Specifies settings for displaying time indicated by TSPCRADCR and TSTRPCRADCR. 0: Displays the time in 90 kHz units. 1: Displays the time in 45 kHz units.
13	FRCMD	0	R/W	Clock Setting of TSFRC 0: Displays the time in 90 kHz units. 1: Displays the time in 45 kHz units. This setting is only effective if FRCSEL = 1. It is ineffective if FRCSEL = 0.
12	FRCSEL	0	R/W	Setting of Base Clock of TSFRC 0: The divider clock set in FRCPSC is used. 1: The internal prescaler (TSFSCALER) is used.

Bit	Bit Name	Initial Value	R/W	Description
11	FRCLATCH	0	R/W	<p>Snapshot Setting of the Internal Free-Run Counter</p> <p>This bit acts as the trigger for taking a snapshot of the internal free-running counter's value.</p> <p>The value retained is readable from TSFRCL and TSFRCH.</p> <p>The snapshot is updated by again writing 1 to this bit.</p> <p>The FRCSTR bit is used to start or stop the internal free-running counter.</p> <p>0: The snapshot setting of TSFRCL/TSFRCH is off.</p> <p>1: The snapshot setting of TSFRCL/TSFRCH is on (the snapshot is updated when 1 is again written to this bit).</p>
10, 9	FRCADD [1:0]	00	R/W	<p>Determines whether to append a TSFRC value (as a timestamp) at the times of PID matches.</p> <p>00: TSFRC values are not appended to TSTSDR (TSTSDR reads 188-byte TS packet data).</p> <p>01: TSFRC values are appended to the 189th to 192nd bytes of TSTSDR (TSTSDR reads 188-byte TS packet data plus the 4-byte TSFRC value).</p> <p>10: Reserved</p> <p>11: 64-bit TSFRC values are appended to the 189th to 196th bytes of TSTSDR (TSTSDR reads 188-byte TS packet data plus the 8-byte TSFRC value).</p>
8	FRCSTR	0	R/W	<p>Specifies stopping or operation of the TSFRC.</p> <p>0: Stops counting by the TSFRC.</p> <p>1: The TSFRC counts up.</p>
7 to 0	FRCPSC [7:0]	H'00	R/W	<p>Sets a division clock for TSFRC.</p> <p>To set the clock to <math>HP\phi</math> divided by <math>n</math>, set FRCPSC to <math>n - 1</math>.</p> <p>Example:</p> <p>To set the clock to 1 MHz (divided by 130) while <math>HP\phi</math> is 130 MHz, set FRCPSC[7:0] to 129 (H'81).</p> <p>This setting is only effective when the setting of FRCSEL is 0.</p> <p>It is ineffective when FRCSEL = 1.</p>

The table below shows the conditions where the TFA bit is reflected in the TSIF.

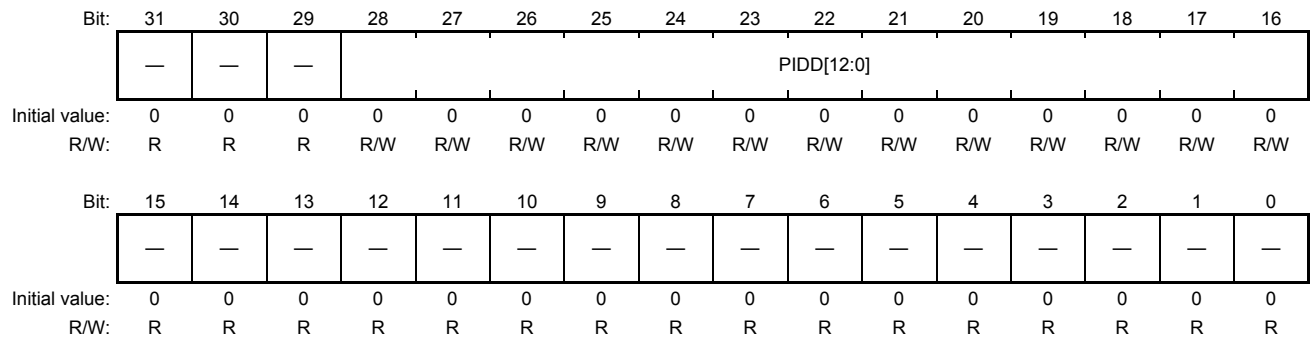

The TFA bit is reflected in the TSIF depending on the condition of the DREQMD bit with the following timing.

DREQMD Bit	TFA Bit	Reflection Timing
0	0 → 1	Reflected accordingly by register setting
	1 → 0	Reflected accordingly by register setting
1	0 → 1	Reflected accordingly by register setting
	1 → 0	Timing when the PEC bit is automatically set to 1

### 30.3.2 TSIF PID Data Register (TSPIDR)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
—	√	—	—

TSPIDR is a register used to set the PID value that sets the section table of the PID filter. The settings of PIDD can be reflected by writing to TSCMDR after this register is written to.

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28 to 16	PIDD[12:0]	H'0000	R/W	Byte Configuration Set of TS Packet Data These bits set the PID value that sets the section table of the PID filter. The setting of this register can be reflected by writing to TSCMDR after setting PIDD.
15 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

### 30.3.3 TSIF Command Register (TSCMDR)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
—	√	—	—

TSCMDR is a register that sets the value set by TSPIDR in the PID table.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	PT[5]	—	—	ALLPID MD	PIDMD	TFE	—	PPS	PT[4:0]				
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	PT[5]	0	R/W	Selects a section for setting the PID table (see Table 30.4). This bit is valid only when the PIDMD bit and the TFE bit are 0.
27, 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
25	ALLPIDMD	0	R/W	PID Filter Mode Set ALLPIDMD PIDMD 0 0: A value set in the PID table is valid (PID filter mode).
24	PIDMD	0	R/W	0 1: All PIDs other than null packet (PID = H'1FFF) are valid (all valid packet receive mode). 1 *: All PIDs including null packet (PID = H'1FFF) are valid (all packet receive mode).
23	TFE	0	R/W	Content of the PID Table Cleared 0: — 1: The content of the PID table is cleared.
22	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
21	PPS	0	R/W	Select a section for setting the PID table (see Table 30.4).
20 to 16	PT[4:0]	H'00	R/W	These bits are valid only when the PIDMD bit and the TFE bit are 0.
15 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Write a value to be set in the section table of the PID filter for TSPIDR while the PIDMD bit is 0. Then, writing one of the following values in Table 30.4 sets a PID value in the specified select section.

In addition to the PID value set above, PIDs for PAT (fixed to H'0000) and CAT (fixed to H'0001) are set.

### 30.3.4 TSIF Interrupt Status Register (TSSTR)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
—	√	—	—

TSSTR is a register that indicates the internal status of the TSIF. Each bit in TSSTR can be cleared by writing 0. Bits other than the SYNCF bit are set when a packet is received. Each bit in TSSTR (except for the SYNCF bit) is initialized by the TFA bit in TSCTLR.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R	R	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28 to 16	PID[12:0]	H'0000	R/W	These bits indicate the PID of the TS packet input immediately before.
15, 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13	CM1MF	0	R/W	COMPARE MATCH1 Matching Flag This is a flag to indicate that the compare match counter has counted down from the value set in TSCMCOR1 and reached 0. Software is not able to write 1 to this bit. 0: The value of TSCMCNT1 hasn't reached H'0000 0000. 1: The value of TSCMCNT1 has reached H'0000 0000. [Clearing condition] 0 being written to CM1MF.
12	CM0MF	0	R/W	COMPARE MATCH0 Matching Flag This is a flag to indicate that the compare match counter has counted down from the value set in TSCMCOR0 and reached 0. Software is not able to write 1 to this bit. 0: The value of TSCMCNT0 hasn't reached H'0000 0000. 1: The value of TSCMCNT0 has reached H'0000 0000. [Clearing condition] 0 being written to CM0MF.
11	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
10	ADCF	0	R/W	0: — 1: Indicates that PCRADC was updated (the PCR packet was input).

Bit	Bit Name	Initial Value	R/W	Description
9	PIDF	0	R/W	0: — 1: Indicates that the set PID packet was received in the PID filter mode (ALLPIDMD = 0 and PIDMD = 0).
8	STOF	0	R/W	0: — 1: Indicates that the interrupt in response to the completion of a next packet has been generated and that other bits have been updated.
7	RANDF	0	R/W	0: — 1: Indicates that random_access_indicator of the TS packet input immediately before is 1.
6	DISCF	0	R/W	0: — 1: Indicates that discontinuity_indicator of the PCR packet input immediately before shows the PCR discontinuous state.
5	SYNCF	1	R	Internal Synchronous/Asynchronous Mode State Caused by Detection of the TS Packet Sync Signal When the sync signal (H'47) is detected three times consecutively in asynchronous mode, the TSIF enters the synchronous mode. When the sync signal is not detected four times consecutively in synchronous mode, it enters the asynchronous mode. The write value should always be 0. 0: Indicates that the TSIF is in synchronous mode (the TS packet is synchronized). 1: Indicates that the TSIF is in asynchronous mode (the TS packet is not synchronized).
4	OFEF	0	R/W	TSIF Internal Buffer Overflow 0: — 1: Indicates that an overflow error occurred in the internal buffer.
3	—	Undefined	R	Reserved The write value should always be 0.
2	VSCF	0	R/W	Video Packet Start Code Detection Flag 0: — 1: Indicates that the TS packet input immediately before is a video packet and its payload contains a start code (B'0000 0000 0000 0000 0000 0001 xxxx xxxx).
1	VSHF	0	R/W	Video Packet Short Header Detection Flag 0: — 1: Indicates that the TS packet input immediately before is a video packet and its payload contains a short header (B'0000 0000 0000 0000 1000 00xx xxxx xxxx).
0	TSIFINTF	0	R/W	TSIF Transfer Request Flag Indicates that the internal buffer contains one packet (188 bytes) of TS data. 0: — 1: Indicates that the internal buffer contains one packet of TS data.

### 30.3.5 TSIF TS Data Register (TSTSDR)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
—	√	—	—

TSTSDR is a register to read TS packet data extracted by the set PID. Setting the EN bit in TSCTLR specifies the endian type.

When FRCADD[1:0] in TSCTLR is B'01, the TSFRC value (timestamp), which is recorded at the times of PID matches, is stored in the 189th to 192nd bytes. This value can be used as packet management data.

The timestamp is stored in the 189th to 196th bytes when of FRCADD[1:0] = B'11.

After reading one packet (188 bytes) of TS data from this register, the PEC bit in TSBUFCLRR should be set to 1 (unless it is in DMA auto-transfer mode).

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	TSD[31:0]	H'0000 0000	R	FRCADD in TSCTLR = 00: 1 to 188 bytes: TS packet data extracted by the set PID FRCADD in TSCTLR = 01: 1 to 188 bytes: TS packet data extracted by the set PID 189 to 192 bytes: TSFRC value recorded at the times of PID matches FRCADD in TSCTLR = 11: 1 to 188 bytes: TS packet data extracted by the set PID 189 to 196 bytes: TSFRC (H/L) value recorded at the times of PID matches

• TS packet data format

[Big endian] EN bit in TSCTLR = 0:

[Little endian] EN bit in TSCTLR = 1:

Note: Since the TSFRC (H/L) value, which is recorded at the times of PID matches and is in the 189th to 192nd (196th) bytes, is a 32-bit counter value, it is always read as longword data.

Bit: 31

0

### 30.3.6 TSIF Buffer Clear Register (TSBUFCLRR)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
—	√	—	—

TSBUFCLRR is a register that clears the internal buffer of the TSIF after TS packet data is read.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PEC
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	PEC	0	R/W	Internal Buffer Clear This bit should be set to 1 immediately after TS packet data is read. When one packet of TS data is discarded because of a transfer error or such, this bit should be set to 1. This bit is automatically cleared to 0 after it has been set to 1. Do not access this register, while the DREQMD bit in TSCTLR is set to 1, or after TS packet data is read. 0: — 1: Clears the internal buffer after the TS packet is transferred (automatically returns to 0 after 1 is set). When one packet of data transferred is discarded because of a transfer error or such, 1 should always be set.

### 30.3.7 TSIF Interrupt Enable Register (TSINTER)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
—	√	—	—

TSINTER is a register that controls an interrupt request from the TSIF.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	CM1ME	CM0ME	—	ADCE	PIDE	STOE	RANDE	DISCE	SYNCE	OFEE	—	VSCE	VSHE	TSIFINTF
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13	CM1ME	0	R/W	0: — 1: Generates an interrupt when TSCMCNT1 counts down and a value reaches H'0000 0000.
12	CM0ME	0	R/W	0: — 1: Generates an interrupt when TSCMCNT0 counts down and a value reaches H'0000 0000.
11	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
10	ADCE	0	R/W	0: — 1: Generates an interrupt when PCRADC is updated (PCR packet is input).
9	PIDE	0	R/W	0: — 1: Generates an interrupt when the set PID packet is received in PID filter mode.
8	STOE	0	R/W	0: — 1: Generates an interrupt when the interrupt in response to the completion of a next packet is generated and the status is updated (interrupt time is over).
7	RANDE	0	R/W	0: — 1: Generates an interrupt when random_access_indicator of the TS packet input immediately before is 1.
6	DISCE	0	R/W	0: — 1: Generates an interrupt when discontinuity_indicator of the PCR packet input immediately before indicates PCR discontinuity.
5	SYNCE	0	R/W	0: — 1: Generates an interrupt when the TSIF is in asynchronous mode.

Bit	Bit Name	Initial Value	R/W	Description
4	OFEE	0	R/W	0: — 1: Generates an interrupt when an overflow error occurs in the internal buffer.
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2	VSCE	0	R/W	0: — 1: Generates an interrupt when the start code of a video packet is detected in the TS packet input immediately before.
1	VSHE	0	R/W	0: — 1: Generates an interrupt when the short header of a video packet is detected in the TS packet input immediately before.
0	TSIFINTE	0	R/W	0: — 1: Generates an interrupt when the internal buffer contains one packet (188 bytes) of TS data.

### 30.3.8 TSIF PSCALE Register (TSPSCALER)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
—	√	—	—

TSPSCALER is a register that sets counter values 1 and 2 of the internal prescaler. When EXT\_MODE = 0, set the value of the PSCALE2 bit so that the value is equivalent to the value of the PSCALE1 bit plus 1.

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
27 to 16	PSCALE2 [11:0]	H'000	R/W	These bits set counter value 2 of the internal prescaler.
15 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 0	PSCALE1 [11:0]	H'000	R/W	These bits set counter value 1 of the internal prescaler.

### 30.3.9 TSIF PSCALE\_R Register (TSPSCALERR)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
—	√	—	—

TSPSCALERR is a register that sets the ratio of counter values 1 and 2 of the internal prescaler.

When EXT\_MODE = 0, set the values of the PSCALE\_R1 bit and the PSCALE\_R2 bit so that the sum of these two bits is 9.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	PSCALE_R2[3:0]			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	PSCALE_R1[3:0]			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
19 to 16	PSCALE_R2 [3:0]	H'0	R/W	These bits set the ratio of counter value 2 of the internal prescaler.
15 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3 to 0	PSCALE_R1 [3:0]	H'0	R/W	These bits set the ratio of counter value 1 of the internal prescaler.

After setting TSPSCALERR while TSPSCALER is H'0000 0000, set TSPSCALER.

When EXT\_MODE = 0, set TSPSCALER and TSPSCALERR so that the following equation is satisfied.

$$\left\{ \frac{\text{PSCALE\_R1} + \text{PSCALE\_R2}}{\text{PSCALE1} \times \text{PSCALE\_R1} + \text{PSCALE2} \times \text{PSCALE\_R2}} \right\} \times \text{HP}\phi = 90 \text{ kHz}$$

$$\text{PSCALE\_R1} + \text{PSCALE\_R2} = 9$$

$$\text{PSCALE2} = \text{PSCALE1} + 1$$

The examples below show register settings of TSPSCALER and TSPSCALERR corresponding to each operating frequency of the TSIF. When EXT\_MODE = 1, operating frequencies listed in Table 30.5 are only supported.

**Table 30.5 Setting Example of TSPSCALER and TSPSCALERR Corresponding to Each Operating Frequency**

- EXT\_MODE = 0

Operating Frequency [MHz]	PSCALE2	PSCALE1	PSCALE_R2	PSCALE_R1
10.0	H'070	H'06F	H'1	H'8

R/W:	R	R	R	R	R	R	R	R	R	R	R/W	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5	EXT_MODE	0	R/W	Sets whether PCR_extension is included in the calculation of D_PCRADC. The EXT_MODE bit can be set to 1 only when this block operates at (13.5 × n) MHz (n = 1, 2, 3, 4). 0: PCR_extension is not included in the D_PCRADC calculation. 1: PCR_extension is included in the D_PCRADC calculation.
4	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
3 to 0	TR_SEL[3:0]	H'0	R/W	These bits select a trigger signal for PCRADC to be input to the TSIF. 0000: A trigger signal is not selected. Other than above: Setting prohibited

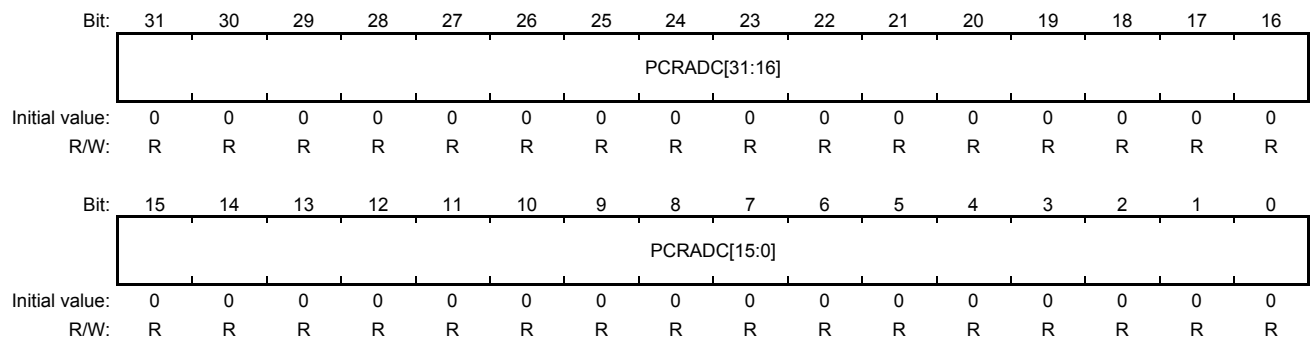

### 30.3.11 TSIF PCRADC Register (TSPCRADCR)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
—	√	—	—

TSPCRADCR is a register that indicates the PCR value incremented by the internal clock (indicates time in a unit of 90 kHz).

After a reset is released, inputting a PCR packet starts counting up. Then, the counter value is corrected by using the PCR value in the stream each time a PCR packet is input.

This register is also updated in the packet asynchronous state.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	PCRADC [31:0]	H'0000 0000	R	These bits indicate the PCR value incremented by the internal clock. PCRMD in TSCTLR = 0: These bits indicate time in 90-kHz units. PCRMD in TSCTLR = 1: These bits indicate time in 45-kHz units.

**30.3.12 TSIF TR\_PCRADC Register (TSTRPCRADCR)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
—	√	—	—

TSTRPCRADCR indicates the value of PCRADC read by a trigger signal for PCRADC selected by the TR\_SEL bit (indicates time in a unit of 90 kHz).

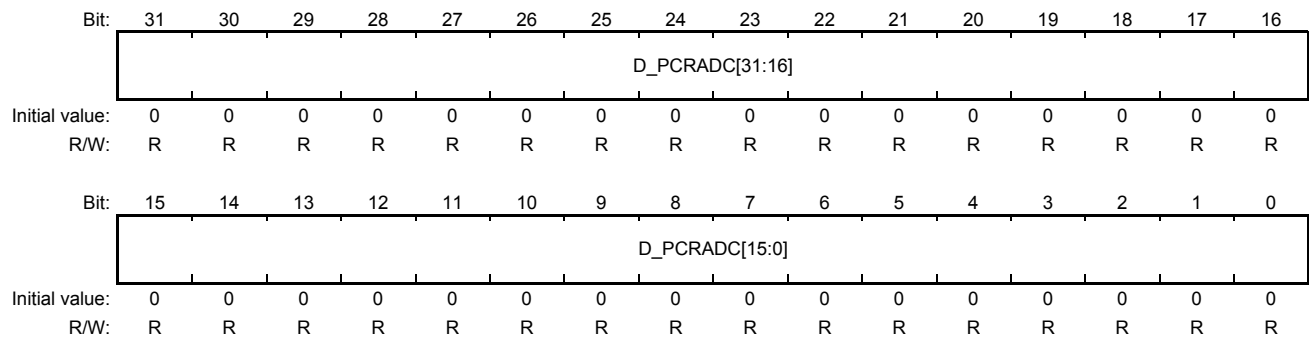

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	TR_PCRADC [31:0]	H'0000 0000	R	These bits indicate the PCRADC value read by a trigger signal for PCRADC selected by the TR_SEL bit. PCRMD in TSCTLR = 0: These bits indicate time in 90-kHz units. PCRMD in TSCTLR = 1: These bits indicate time in 45-kHz units.

**30.3.13 TSIF D\_PCRADC Register (TSDPCRADC)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
—	√	—	—

TSDPCRADC indicates the value of the stream PCR minus PCRADC. After a reset is released and a second packet is input, the value of this register is valid.

When the value of the stream PCR minus PCRADC is greater than 32767 or smaller than -32768, the bits D\_PCRADC[31:16] indicate H'8000. (The setting of PCRMD in TSCTLR does not affect D\_PCRADC. D\_PCRADC[31:16] and D\_PCRADC[15:0] indicate a clock difference in a unit of 90 kHz and 27 MHz, respectively.)

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	D_PCRADC [31:0]	H'0000 0000	R	These bits indicate the value of the stream PCR minus PCRADC.

### 30.3.14 TSIF Free Run Counter L (TSFRCL)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
—	√	—	—

TSFRCL is a 32-bit free-running counter that counts up cycles of the clock set by FRCPSC[7:0] in TSCTLR or the clock from the internal prescaler.

This counter starts counting up after the clock signal selected by the FRCSEL and FRCPSC bits in TSCTLR is set to 1.

TSFRCL is initialized to H'00000000 by a power-on reset or manual reset. Setting TFA in TSCTLR to 0 does not initialize this counter.

Setting FRCADD in TSCTLR to B'01 stores the TSFRCL value (timestamp), which is recorded at the times of PID matches, in the 189th to 192nd bytes of TSTDR.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	TSFRC[31:0]	H'0000 0000	R/W	Indicate the value of the free-running counter (lower).

### 30.3.15 TSIF Free Run Counter H (TSFRCH)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
—	√	—	—

TSFRCH is cascade-connectable to TSFRCL (both are 32-bit free-running counters) to function as a 64-bit free-running counter.

Obtaining operation as a 64-bit counter requires setting the FRCADD bits in TSCTLR to B'11.

This counter starts counting up once the clock signal selected by the FRCSEL and FRCPSC bits in TSCTLR is set to 1.

TSFRCH is initialized to H'00000000 by a power-on reset or manual reset. Setting TFA in TSCTLR to 0 does not initialize this counter.

Setting FRCADD in TSCTLR to B'11 stores the TSFRC (H/L) value (timestamp), which is recorded at the times of PID matches, in the 189th to 196th bytes of TSTDR.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	TSFRC[63:32]	H'0000 0000	R/W	Indicate the value of the free-running counter (upper).

### 30.3.16 TSIF FSCALE Register (TSFSCALER)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
—	√	—	—

TSFSCALER is a register that sets counter values 1 and 2 of the internal prescaler used in TSFRC. Set the value of the FSCALE2 bit so that the value is equivalent to the value of the FSCALE1 bit plus 1.

The specifications of the setting follow TSFSCALER.

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
27 to 16	FSCALE2 [11:0]	H'000	R/W	These bits set counter value 2 of the internal prescaler used in TSFRC.
15 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 0	FSCALE1 [11:0]	H'000	R/W	These bits set counter value 1 of the internal prescaler used in TSFRC.

**30.3.17 TSIF FSCALE\_R Register (TSFSCALERR)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
—	√	—	—

TSFSCALERR is a register that sets the ratio of counter values 1 and 2 of the internal prescaler used in TSFRC.

Set the values of the FSCALE\_R1 bit and the FSCALE\_R2 bit so that the sum of these two bits is 9.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	FSCALE_R2[3:0]			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	FSCALE_R1[3:0]			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
19 to 16	FSCALE_R2 [3:0]	H'0	R/W	These bits set the ratio of counter value 2 of the internal prescaler used in TSFRC.
15 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3 to 0	FSCALE_R1 [3:0]	H'0	R/W	These bits set the ratio of counter value 1 of the internal prescaler used in TSFRC.

**30.3.18 TSIF Compare Match Control Register (TSCMCTLR)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
—	√	—	—

TSCMCTLR chooses running or stopping of TSIF compare match counter 0 and TSIF compare match counter 1.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PIDEX	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	CM1GO	—	—	—	CM0GO
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	PIDEX	0	R/W	This bit chooses use or not use from select sections PID_34 to PID_64. 0: Not use 1: Use
30 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	CM1GO	0	R/W	This bit chooses running or stopping of TSIF compare match counter 1 (TSCMCNT1). 0: TSCMCNT1 stops counting. 1: TSCMCNT1 starts counting.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	CM0GO	0	R/W	This bit chooses running or stopping of TSIF compare match counter 0 (TSCMCNT0). 0: TSCMCNT0 stops counting. 1: TSCMCNT0 starts counting.

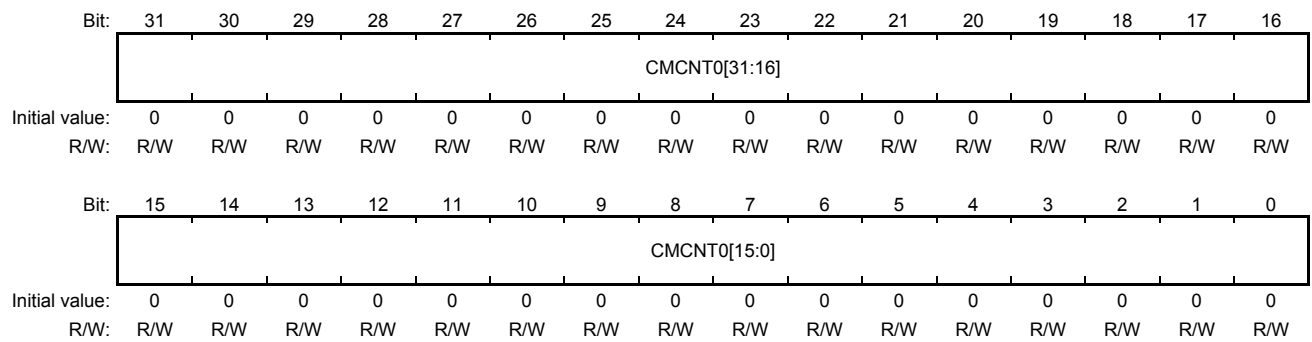

### 30.3.19 TSIF Compare Match Counter 0 (TSCMCNT0)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
—	√	—	—

TSCMCNT0 is a 32-bit free-running counter that counts down cycles of the clock set by TSCTLR.FRCPSC[7:0] or the clock from the internal prescaler used in TSFRC.

This counter starts counting down after the CM0GO bit in TSCMCTLR is set to 1.

TSCMCNT0 then counts down from the value set in TSCMCOR0, and if the setting of CM0GO is still 1 after the value of TSCMCNT0 reaches H'0000\_0000, TSCMCNT0 again starts counting down from the value set in TSCMCOR0.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CMCNT0 [31:0]	H'0000 0000	R/W	These bits show a value of the TSIF compare match counter 0.

### 30.3.20 TSIF Compare Match Counter 1 (TSCMCNT1)

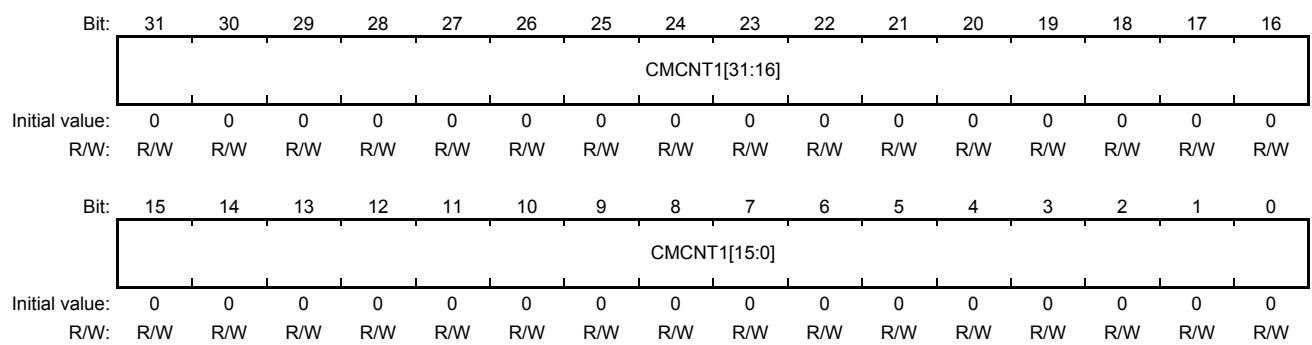

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
—	√	—	—

TSCMCNT1 is a one-shot (i.e., not cyclic) 32-bit counter that counts down cycles of the clock set in TSCTLR.FRCPSC[7:0] or the clock from the internal prescaler used in TSFRC.

This counter starts counting down after the CM1GO bit in TSCMCTLR is set to 1.

TSCMCNT1 stops after the value has reached H'0000\_0000.

To make the counter run again, write 0 and then 1 to CM1GO.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CMCNT1 [31:0]	H'0000 0000	R/W	These bits show a value of the TSIF compare match counter 1.

### 30.3.21 TSIF Compare Match Constant Register 0 (TSCMCOR0)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
—	√	—	—

TSCMCOR0 sets a value when TSIF compare match counter 0 (TSCMCNT0) starts counting down..

A value of TSCMCOR0 is loaded to TSCMCNT0 after the CM0GO bit in TSCMCTLR is set to 1.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	TSCOR0 [31:0]	H'0000 0000	R/W	These bits set a value when the TSIF compare match counter 0 starts counting down.

### 30.3.22 TSIF Compare Match Constant Register 1 (TSCMCOR1)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
—	√	—	—

TSCMCOR1 sets a value when TSIF compare match counter 1 (TSCMCNT1) starts counting down..

A value of TSCMCOR1 is loaded to TSCMCNT1 after the CM1GO bit in TSCMCTLR is set to 1.

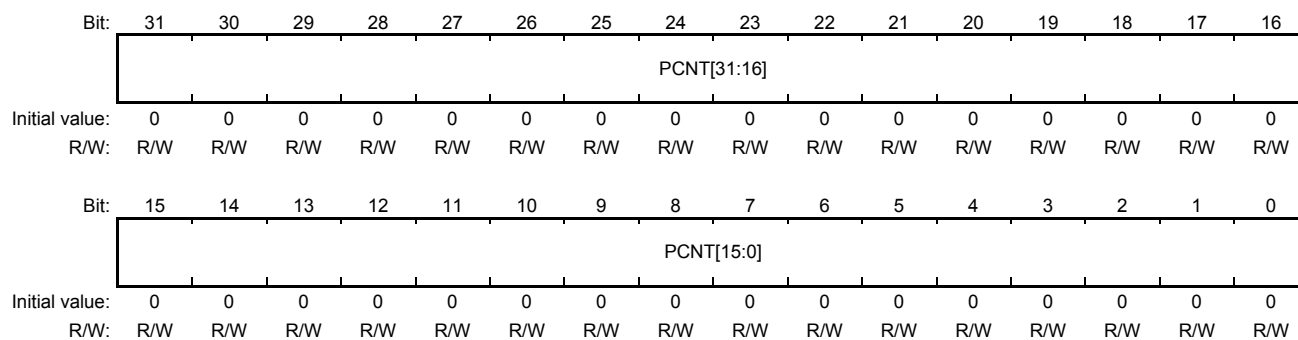

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	TSCOR1 [31:0]	H'0000 0000	R/W	These bits set a value when the TSIF compare match counter 1 starts counting down.

### 30.3.23 TSIF TS Packet Count Register (TSPCNT)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
—	√	—	—

TSPCNT is a 32-bit register showing the number of TS packets to be read by DMA from TSTSDR.

Writing 1 to TSPCNTPSH.PCTPH initializes TSPCNT to H'0000\_0000.

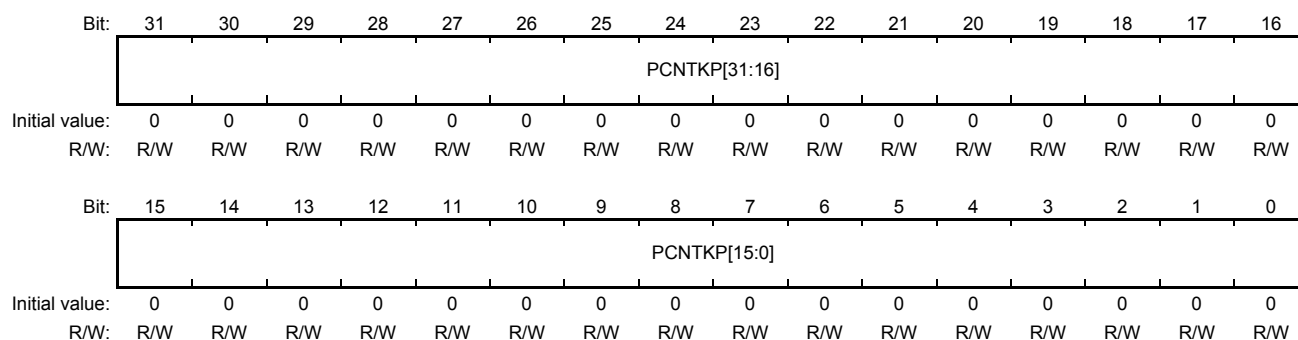

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	PCNT[31:0]	H'0000 0000	R/W	These bits show a TS packet number read by DMA from TSTSDR. Counting up stops when the value has reached H'FFFF FFFF.

### 30.3.24 TSIF TS Packet Count Keep Register (TSPCNTKP)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
—	√	—	—

TSPCNTKP is a 32-bit register.

TSPCNTKP retains the number of TS packets indicated by TSPCNT when 1 is written to TSPCNTPSH.PCTPH.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	PCNTKP [31:0]	H'0000 0000	R/W	After writing 1 to TSPCNTPSH.PCTPH, these bits indicate the number of TS packet read by DMA from TSTSDR at that time.

**30.3.25 TSIF TS Packet Count Push Register (TSPCNTPSH)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
—	√	—	—

TSPCNTPSH is a 32-bit register.

Writing 1 to PCTPH causes copying of the TSPCNT value at that time to TSPCNTKP, which retains that value.

The PCTPH bit must be cleared whenever you want to copy the retained value again.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PCTPH
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	PCTPH	0	R/W	Writing 1 to this bit causes copying of the TSPCNT value at that time to TSPCNTKP. The PCTPH bit must be cleared whenever you want to copy the retained value again.

## 30.4 Operation

RZ/G1H	RZ/G1N
RZ/G1M	RZ/G1E

### 30.4.1 TS Data Protocol

The TS packet supported by this LSI consists of 188-byte execution data including the sync byte and 16-byte Reed-Solomon code (parity data) for an error correction, with configuration of 204 bytes in total (Figure 30.2). The TSIF supports 188 bytes (without parity) and 204 bytes (with parity) of TS data formats.

The data input pins consist of the following.

- Serial data (TS\_SDAT) input
- Serial data clock (TS\_SCK) input
- Synchronous (TS\_SPSYNC) input
- Enable (TS\_SDEN) input

Depending on the specifications of the LSI to be connected, the polarity of these pins can be switched by software (Figure 30.3).

**Figure 30.2 MPEG2-TS Packet Configuration**

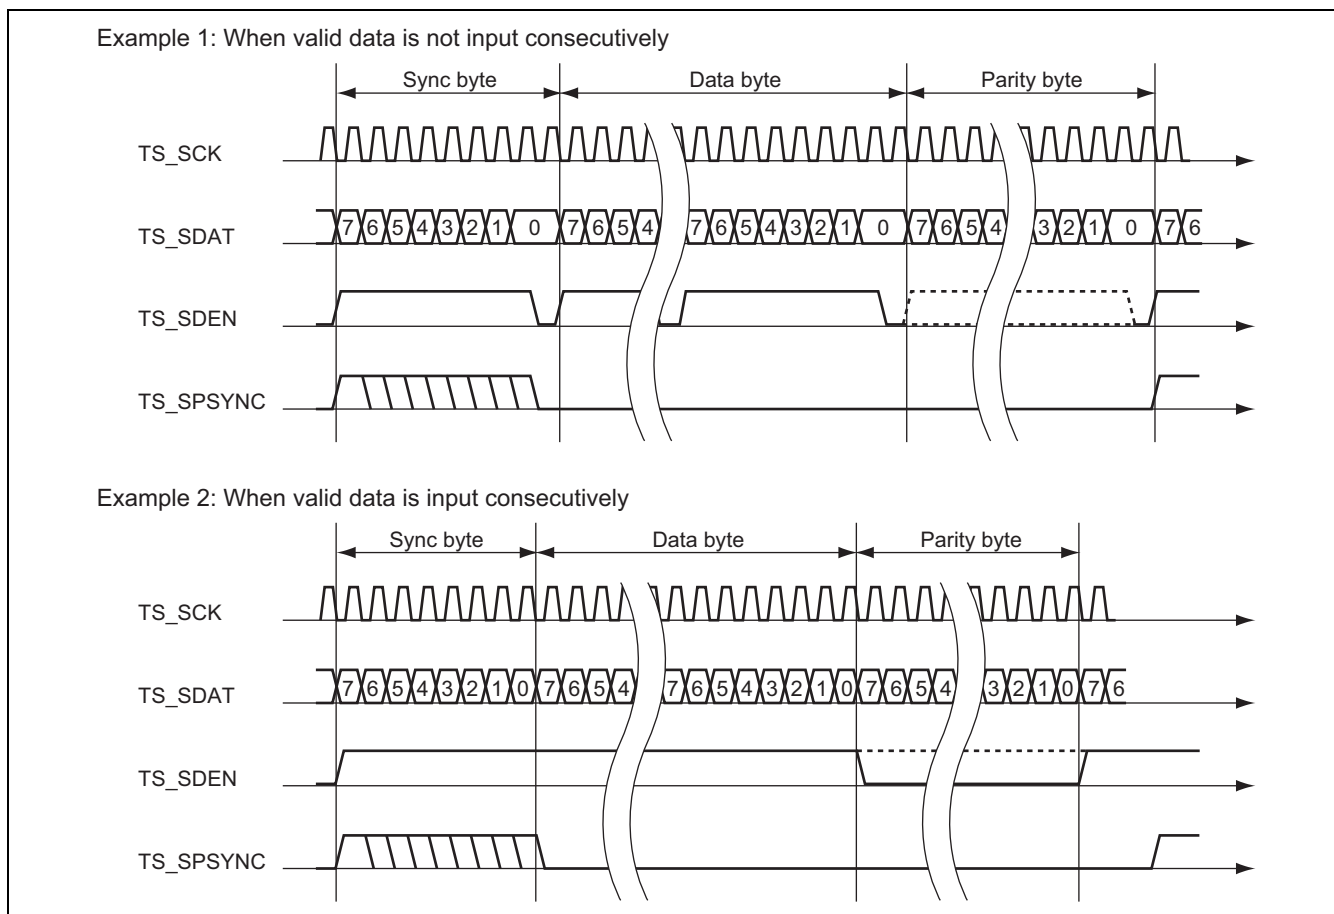

Figure 30.3 Timing of TS Data Serial Input

### 30.4.2 Synchronous Processing Unit

The function of synchronous processing is to synchronize packets for carrying out the subsequent PID filtering and such.

The TS packet data is constantly sent from a terrestrial station. The receiving terminal starts receiving the data regardless of the timing of the sender. This causes the receiving terminal to receive an incomplete packet. The synchronous processing is essential to identify the start of TS packet data that are not played from the start and accurately process various data in the packet.

Moreover, as the signal quality of input data may deteriorate according to the transmission status, the TS packet data received via a tuner, OFDM demodulator, and the like may contain errors. The synchronous processing includes protection against such errors.

When the receiving terminal is started up, it searches for the sync byte (H'47). If the sync byte is detected, the receiving terminal checks whether or not the sync byte will appear again after one packet cycle (188 bytes or 204 bytes). If the sync byte appears twice consecutively, synchronization is confirmed. Once synchronized, even when the sync byte does not appear at a fixed position, an error is not generated immediately and the regular processing is continued.

When the sync byte has not appeared 4 times consecutively, the receiving terminal determines that synchronization is lost. Once synchronization is lost, the process for synchronization starts in the same way as when the receiving terminal is started up.

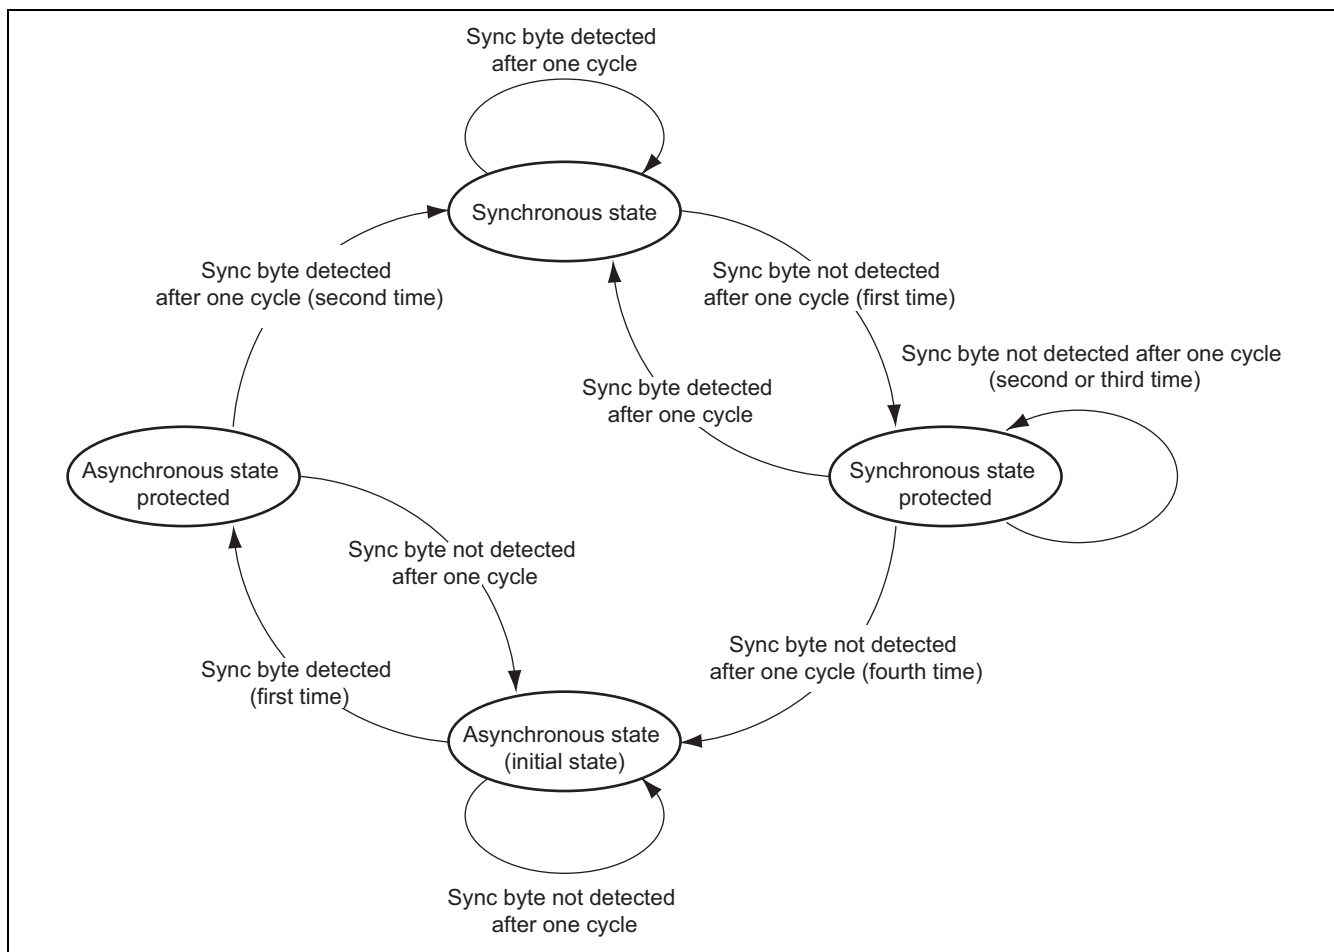

Figure 30.4 Detection State Configuration of Sync Byte

### 30.4.3 PID Filter Unit

PID filtering checks the PIDs of TS packets. If they match the predefined PID table values, the packets are stored in the buffer.

A total of 67 values can be registered as PID values. However, the values for PAT (H'0000) and CAT (H'0001) are fixed and not changeable. Even though the PID values for the PCR packet, video packet, and audio packet should be specified in the dedicated sections, respectively, another 62 PID values can be specified in any of the sections.

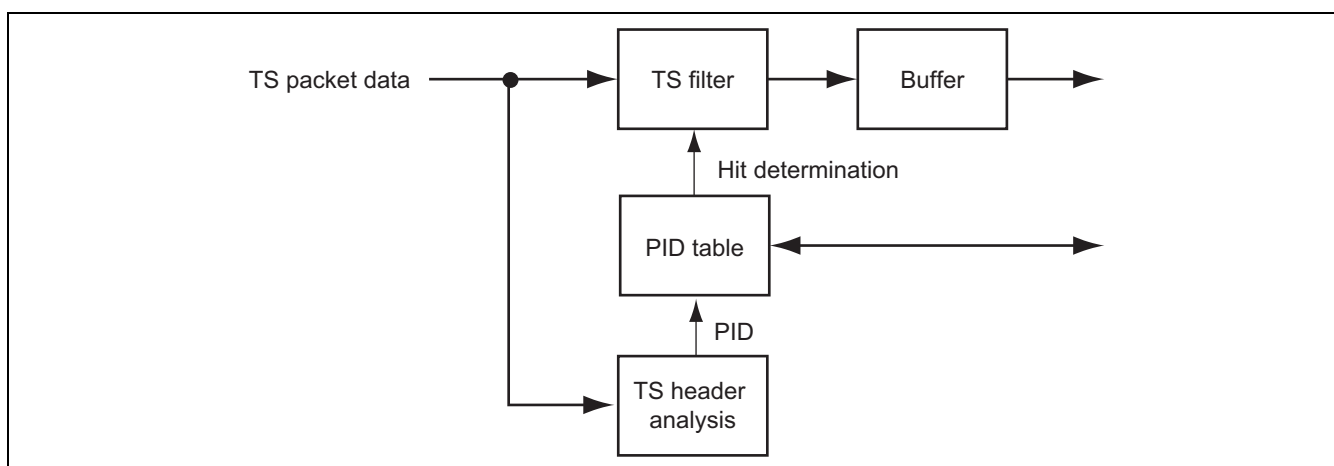

Figure 30.5 Block Diagram of PID Filtering

### 30.4.4 Bitstream Search Unit

The function of the bitstream search unit is to check the contents of the PCR and video packets to reduce the load of software. The functions listed below are available.

1. PCR discontinuity check

PCR discontinuity (discontinuity-indicator) is automatically detected and reflected in the status register. This is to reduce the delay in software processing if a PCR packet is input. PCR is a reference clock sent from a base station (broadcasting station) and may be switched to another PCR because of program changes and so on.

2. PCR\_flag detection

The PCR\_flag is detected from the adaptation\_field of the TS packet and reflected in the status register.

3. random\_access\_indicator detection

The random\_access\_indicator is detected from the adaptation\_field of the TS packet and reflected in the status register.

4. Duplicate packet delete

The PID and continuity\_counter are checked from consecutive TS packets to prevent duplicate TS data from being stored in the buffer.

5. Start code check

When a start code (H'0000 01xx) is contained in a video stream, it is reflected in the status register. The start code marks the boundary in image data of the MPEG standard and is applied at the start of a sequence, image, and such.

6. Short header check

When a short header (B'0000 0000 0000 0000 1000 00xx xxxx xxxx) is contained in a video stream, it is reflected in the status register.

These processes are performed in the adaptation field analysis unit and the ES data search unit.

At the time of TS header analysis for PID filtering, the presence of an adaptation field is analyzed. When hit information of a PCR packet or video packet in the PID table is input, the necessary process at each block is initiated.

Each result is reflected in the status register.

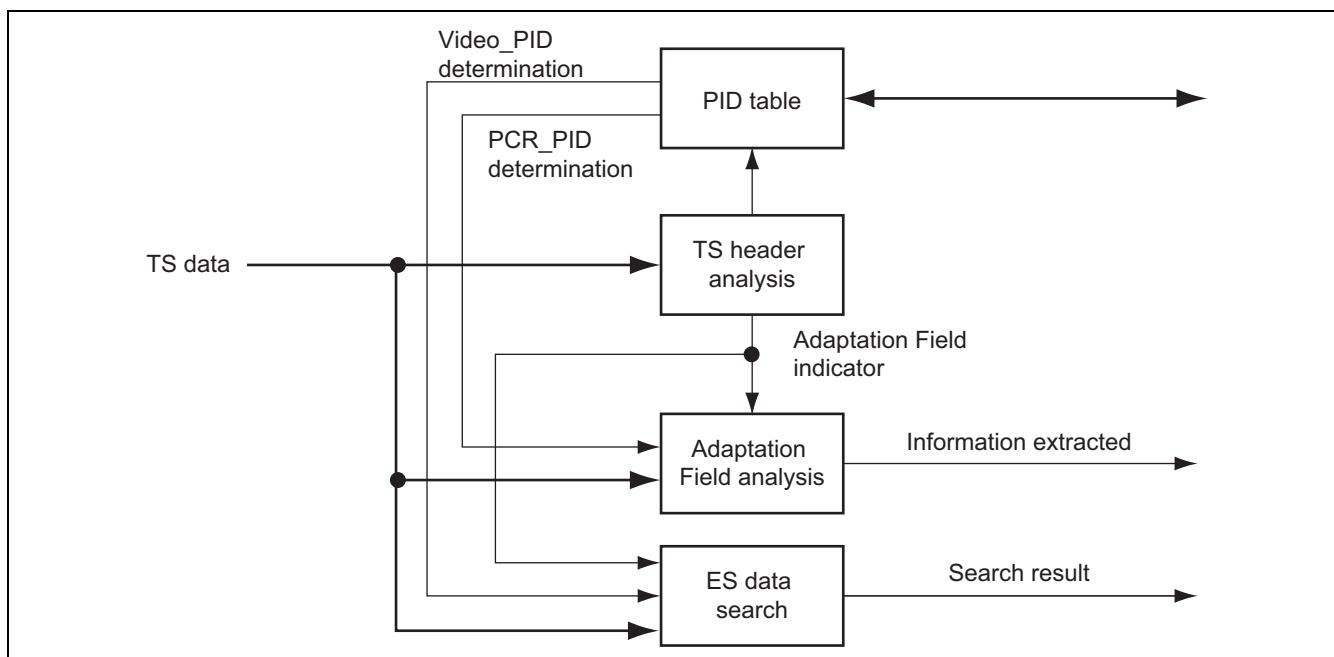

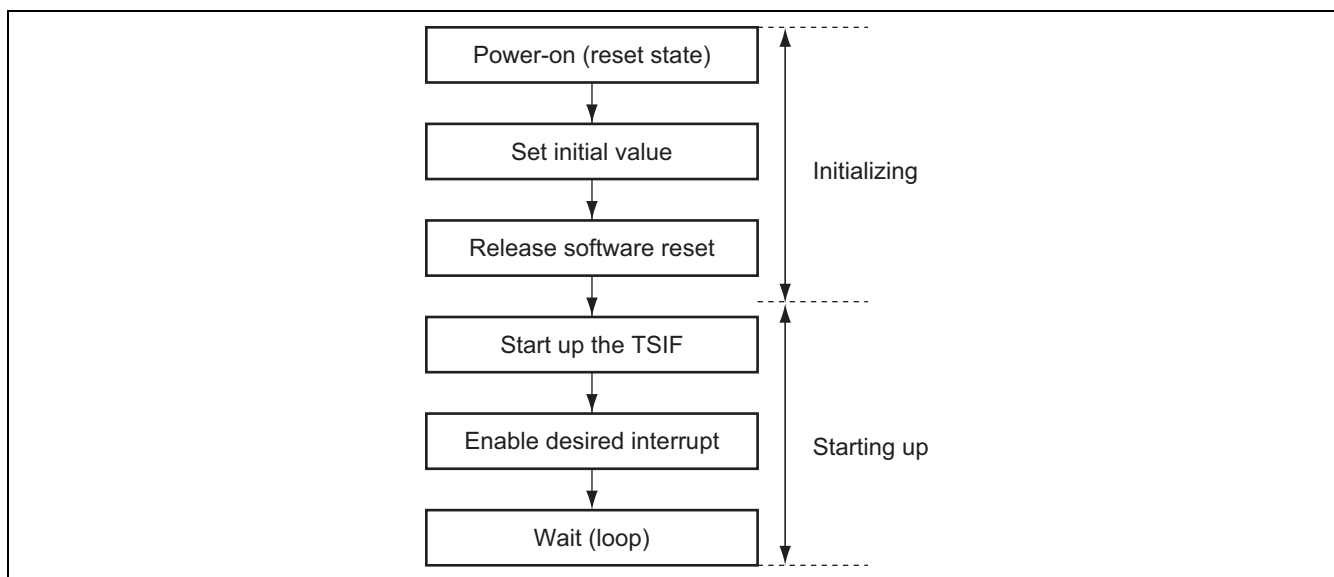

Figure 30.6 Block Diagram of Stream Search Unit

### 30.4.5 Process Flow

Figure 30.7 shows an outline of the process flow in the TSIF module.

Since the TSIF is in the reset state at power-on, it does not generate any signals until the initialization is completed. A TS packet ID (PID) to be extracted by the TSIF is set in the PID table. After other necessary settings have been completed, software reset is released and the TSIF is started up while a desired interrupt is allowed at the same time. After this, the TSIF waits until the necessary TS packet is extracted.

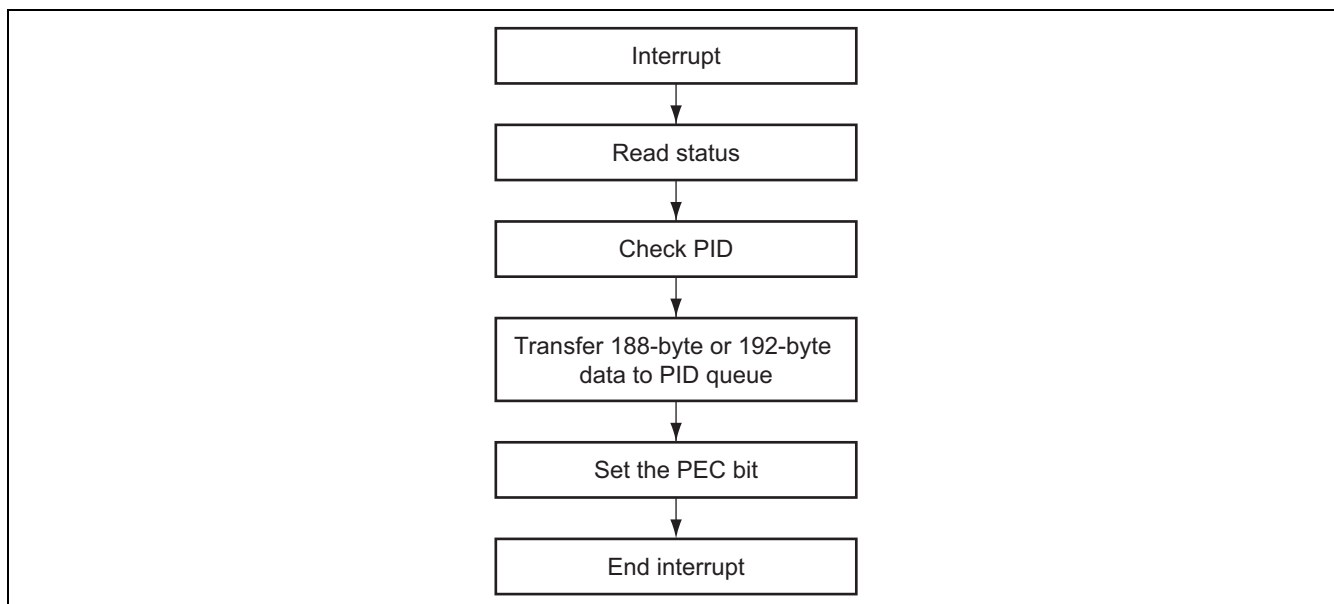

**Figure 30.7 TSIF Process Flow**

Two types of TS packet transfer are available as described below.

#### (1) DMA interrupt transfer mode (Figure 30.8)

The interrupt routine transfers the packet data stored in the buffer to a queue created in memory. Multiple queues must be created depending on the values of PIDs (e.g., video or audio). When an interrupt is generated, the TSSTR register is read first. If a status error is detected during reading, and the packet data is going to be discarded, the PEC bit in the TSBUFCLRR register should be set. The value of the PID bit in the TSSTR register should then be checked.

For example, if the packet is a video packet, it will be transferred to a video packet queue by DMA and so on. After 188-byte data is transferred or TS data plus TSFRC (192 bytes or 196 bytes) is transferred, the PEC bit must be set to clear the internal buffer.

**Figure 30.8 TSIF Interrupt Process Flow**

## (2) DMA auto-transfer mode

To use this mode, the necessary setting should be made in the DMAC block before starting up the TSIF. When a single TS packet (188 bytes) is input or a single TS packet plus TSFRC (192 bytes or 196 bytes) is input, the TSIF automatically issues a transfer request signal to the DMA and starts DMA transfer. Using this mode reduces the frequency of interrupts.

2. Used only by DMADAR.

### 31.1.4 Data Format on Audio Local Bus

Figure 31.3 shows the data formats handled in the audio local bus. When writing or reading data through the Audio-DMAC, align data to match the appropriate data format from those in Figure 31.3.

24-bit stereo data or multichannel data	
17- to 23-bit stereo data or multichannel data	
16-bit stereo data or multichannel data	
9- to 15-bit stereo data or multichannel data	
8-bit stereo data	
16-bit monaural data	
8-bit monaural data	

**Figure 31.3 Data Format**

- Notes: 1 Write 0 to the \* bits in the figure when writing data. When reading data, ignore the values read from these bits.
2. In the 8-bit stereo data format, (Lch/1) and (Rch/1) indicate the data pair to be processed first and (Lch/2) and (Rch/2) indicate the next data pair to be processed.
3. Only the MSB-first data formats can be used.
4. In the data formats of 16-bit stereo data or multichannel data and 9- to 15-bit stereo data or multichannel data, set SSI\_MODE0.ind\_word\_swap\* (\* = 0 to 9) in setting up of an independent SSI transmission (SSI\_MODE0.ind\* (\* = 0 to 9) = 1) in the SSIU module.

### 31.1.5 Rearranging the Order of Data

For the audio modules (SSI, and SCU), rearranging the order of data is possible in the channel unit. Places of data in each data format are defined as in Tables 31.2 to 31.4.

**Table 31.2 Definition of Data Places in Each Data Format (1)**

SSI · Stereo (2 channels)	SSI_WS0129  SSI_SDATA0 
SSI · Stereo x 3 (6 channels)	SSI_WS0129  SSI_SDATA0  SSI_SDATA1  SSI_SDATA2 
SSI · TDM (6 channels)	SSI_WS0129  SSI_SDATA0 
SSI · Stereo x 4 (8 channels)	SSI_WS0129  SSI_SDATA0  SSI_SDATA1  SSI_SDATA2  SSI_SDATA9 
SSI · TDM (8 channels)	SSI_WS0129  SSI_SDATA0

### 31.1.6 Transfer Flow

When data transfer is performed between the audio modules which are used in a set of audio routing, use the Audio-DMAC and Audio-DMAC-Peripheral-Peripheral to perform settings in accord with the transfer flow shown in Figure 31.4.

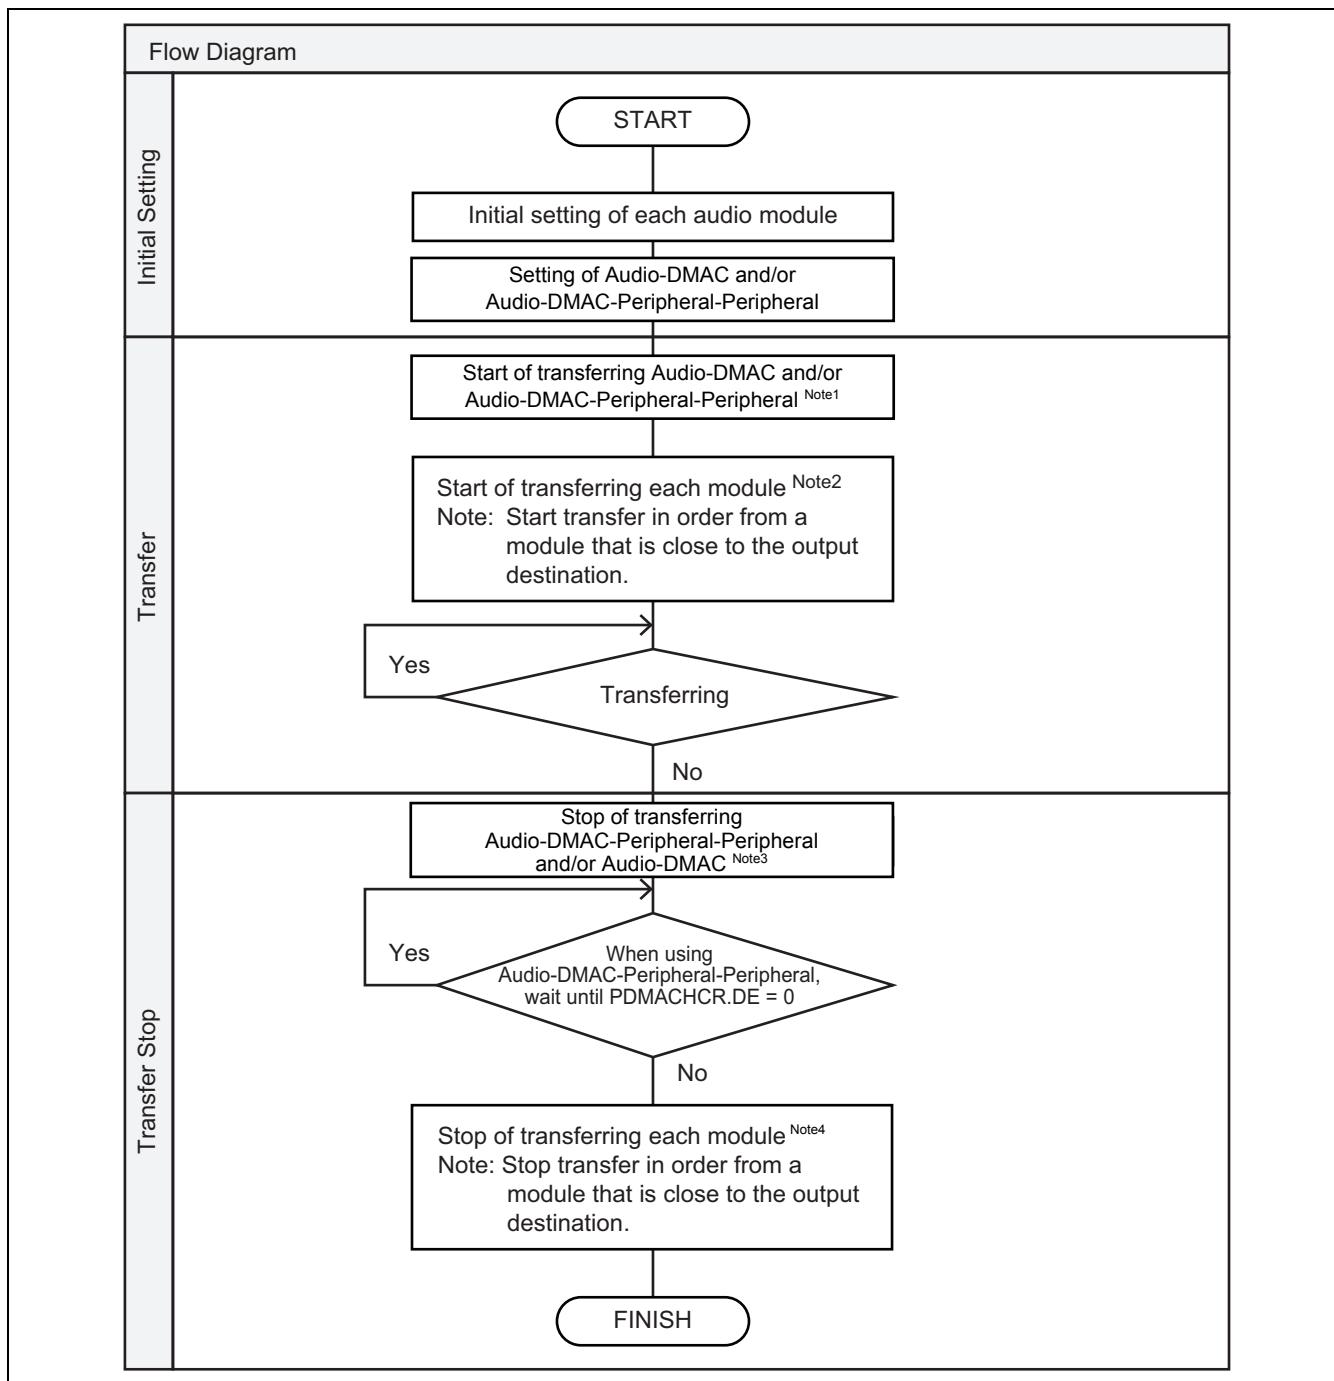

Figure 31.4 Transfer Flow

Notes: 1. For Audio-DMAC, set DMACHCR.DE.

For Audio-DMAC-Peripheral-Peripheral, set PDMACHCR.DE.

Set up registers except the above in "Setting of Audio-DMAC and/or Audio-DMAC-Peripheral-Peripheral".

2. For SSI (except for the case when TDM split mode, SSI independent transfer, SSI0, SSI1, SSI2, or SSI9, and SSI3 or SSI4 are used at the same time), when transmitting (from the external device to SSI), set

SSIq/r\_CONTROL.start after setting SSICR.en/dmen. When receiving (from SSI to the external device), set SSICR.en/dmen after setting SSIq/r\_CONTROL.start.

For SSI (In the case of TDM split mode), regardless of transmission and reception, set SSIq/r\_CONTROL.start after setting SSICR.en/dmen.

For SSI (In the case of SSI independent transfer), set SSICR.en/dmen.

For SSI (When using SSI0, SSI1, SSI2, or SSI9 and SSI3 or SSI4 at the same time), when transmitting (from the external device to SSI) set SSIq/r\_CONTROL.start after setting SSI\_CONTROL. When receiving (from SSI to the external device), set SSI\_CONTROL after setting SSIq/r\_CONTROL.start. (Set SSICR.dmen at the time of the initial setting.)

For SCU, Set SRCm\_CONTROL and CMDn\_CONTROL.

Set up registers except the above in "Initial setting of each audio module".

3. For Audio-DMAC-Peripheral-Peripheral, clear PDMACHCR.DE. (mandatory)  
For Audio-DMAC, clear DMACHCR.DE. Clear processing of Audio-DMAC can be cleared anywhere in a TransferStop sequence.
4. For SSI (except for the case when TDM split mode, SSI independent transfer, SSI0, SSI1, SSI2, or SSI9, and SSI3 or SSI4 are used at the same time), when transmitting (from the external device to SSI), clear SSIq/r\_CONTROL.start after clearing SSICR.en/dmen. When receiving (from SSI to the external device), clear SSICR.en/dmen after clearing SSIq/r\_CONTROL.start.

For SSI (In the case of TDM split mode), regardless of transmission and reception, clear all SSIq/r\_CONTROL.start of the relevant channels to clear SSICR.en/dmen.

For SSI (In the case of SSI independent transfer), clear SSICR.en/dmen.

For SSI (When using SSI0, SSI1, SSI2, or SSI9 and SSI3 or SSI4 at the same time), when transmitting (from the external device to SSI) clear SSIq/r\_CONTROL.start after clearing SSICR.dmen of each module and SSI\_CONTROL. When receiving (from SSI to the external device), clear SSICR.dmen of each module and SSI\_CONTROL after clearing SSIq/r\_CONTROL.start.

For SCU, Clear SRCm\_CONTROL and CMDn\_CONTROL.

### 31.1.7 Module Standby Function

For the register settings to make a transition to or from module standby mode, refer to section 7A, Module Standby and Software Reset.

#### (1) Transition to Module Standby Mode

To make a transition to module standby mode by the module standby function, refer to the following transition procedure for each module.

##### (a) SSIU/SSI

1. Check the following registers' settings.

[SSIU]

- All bits in the SSIq control register (SSIq\_CONTROL) (q = 0-0, 1-0, 2-0, or 9-0) are cleared to 0 (data transfer stopped).
- All bits in the SSIr control register (SSIr\_CONTROL) (r = 3 to 8) are cleared to 0 (data transfer stopped).
- All bits in the SSIq interrupt enable register (SSIq\_INT\_ENABLE\_MAIN) (q = 0-0, 1-0, 2-0, or 9-0) are cleared to 0 (interrupt disabled).
- All bits in the SSIr interrupt enable register (SSIr\_INT\_ENABLE\_MAIN) (r = 3 to 8) are cleared to 0 (interrupt disabled).
- All bits in the SSI control register (SSI\_CONTROL) are cleared to 0 (data transfer stopped)

[SSI]

- The DMEN and EN bits in the control register (SSICRn) (n = 0 to 9) are cleared to 0 (disabled).
- The IDST bit in the status register (SSISRn) (n = 0 to 9) is set to 1.
- The CONT bit in the WS mode register (SSIWSRn) (n = 0 to 9) is cleared to 0 (disabled).

2. Set the MSTP1005 to MSTP1015 bits in the module stop control register (SMSTPCR10)

Note: The above bits should be set while the module operation has been completed and is placed in the idle state in which the module cannot be activated by external pins or other modules.

##### (b) SCU

1. Check the following registers' settings.

- All bits in the SRCm control register (SRCm\_CONTROL) (m = 0 to 9 / (1 to 6)\*) are cleared to 0 (data transfer stopped).
- All bits in the CMDn control register (CMDn\_CONTROL) (n = 0, 1) are cleared to 0 (data transfer stopped).
- All bits in the SRCm interrupt enable register 0 (SRCm\_INT\_ENABLE0) (m = 0 to 5 / (1 to 5)\*) are cleared to 0 (interrupt disabled).
- All bits in the SRCn interrupt enable register 0 (SRCn\_INT\_ENABLE0) (n = 6 to 9 / 6\*) are cleared to 0 (interrupt disabled).

2. Set the MSTP1017 to MSTP1031 bits (MSTP1017 to MSTP1021 and MSTP1025 to MSTP1030 bits)\* in the module stop control register (SMSTPCR10)

Notes: The above bits should be set while the module operation has been completed and is placed in the idle state in which the module cannot be activated by external pins or other modules.

\* Applicable to the RZ/G1E

**(2) Releasing and Restarting from Module Standby Mode**

After the transition to module standby mode, modules can be released from module standby mode by a power-on reset or the appropriate procedure from the list below.

**(a) SSIU/SSI**

1. Supply the clock signal to the ADG and SSIU/SSI modules.
2. Clear the MSTP1005 to MSTP1015 bits in the module stop control register (SMSTPCR10).

**(b) SCU**

1. Clear the MSTP1017 to MSTP1031 (MSTP1017 to MSTP1021 and MSTP1025 to MSTP1030 bits)\* bits in the module stop control register (SMSTPCR10).

Note: \* Applicable to the RZ/G1E

## 31.2 Usage Notes

RZ/G1H

RZ/G1N

RZ/G1M

RZ/G1E

### 31.2.1 Notes on Route Switching and Setting Changes

When switching the transfer route, stop the current transfer, specify the new transfer route, and then start transfer. Also, when changing the quantization bit count or the formats, once stop transfer, and then start transfer again after resetting. If this procedure is not followed, correct operation is not guaranteed.

### 31.2.2 Use of SSI3 and SSI4

Table 31.5 shows the combinations of SSI3 and SSI4 usage and register settings.

**Table 31.5 Combinations of SSI3 and SSI4 Usage and Register Settings**

	SSI_MODE1 Register Settings		Bit Used to Control Start or Stop Operation
	ssi34_sync	ssi4_pin	
Operating SSI3 and SSI4 independently	0	00	SSICRn.EN (n = 3 and 4)
Operating SSI4 with the SCK and WS signals of SSI3 being <u>shared by</u> both SSI3 and SSI4	0	01 or 10	SSICRn.EN (n = 3 and 4)
<u>Synchronizing</u> serial data of SSI3 and SSI4	1	01 or 10	SSI_CONTROL.ssi34

### 31.2.3 Notes on CMD Block Usage

When a single sound source is split into two routes, CMD0 and CMD1, and output to SSI3 and SSI4, use the settings for "Synchronizing serial data of SSI3 and SSI4" in Table 31.5, Combinations of SSI3 and SSI4 Usage and Register Settings. The quantization bit count and sampling frequency settings should be the same between SSI3 and SSI4. Note that only the stereo format can be specified for SSI3 and SSI4. For example, it is not possible to output TDM-format data from SSI3 and stereo-format data from SSI4. The reverse combination is not possible either (stereo-format data from SSI3 or TDM-format data from SSI4).

### 31.2.4 Note when SSI0, SSI1, and SSI2, or SSI0, SSI1, SSI2, and SSI9 are Used for Single-Source Audio Data

When SSI0, SSI1, and SSI2, or SSI0, SSI1, SSI2, and SSI9 are used for single-source audio data, specifying eight-bit quantization and six- or eight-channel operation at the same time is not possible.

### 31.2.5 Note on Transfer

When an underflow or an overflow occurs in any audio module, stop the transfer.

### 31.2.6 Note on Usage of the SCU Module

Before starting data transfer, the input and output data timing signals must be input to the SCU module.

Otherwise, the SCU does not operate correctly.

Set SSIWSRn.CONT to 1 when the SSI module operates in master mode and the WS signal is used as an input or output timing signal for the SRC.

## 32. Serial Sound Interface Unit (SSIU)

RZ/G1H

RZ/G1N

RZ/G1M

RZ/G1E

### 32.1 Overview

The SSIU, incorporating ten SSI modules, allows independent operation of SSI modules, operation of multiple SSI modules sharing the same serial clock, and connection or split of multichannel data.

Note: Configure the system so that connected external devices can operate on the same clock source.

#### 32.1.1 Features

- Incorporates ten SSI modules.
- Supports 6 channels/1 sound source with three SSI modules (SSI0, SSI1, and SSI2).
- Supports 8 channels/1 sound source with four SSI modules (SSI0, SSI1, SSI2, and SSI9).
- Operation of multiple modules on the same serial clock (SSI0/SSI1/SSI2/SSI9, SSI3/SSI4, or SSI7/SSI8).
- TDM format (normal) corresponds to 4-, 6-, or 8-channel data.
- Handles 8-channel data on the serial bus and 6-channel data in the RZ/G (TDM extend mode).
- Handles 6-channel data on the serial bus and 8-channel data in the RZ/G (TDM extend mode).
- Connects monaural or stereo data to output TDM format data (TDM split mode).
- Splits TDM format input data into monaural or stereo data (TDM split mode).
- The frequency range of SCK signal is from 297.3 kHz to 12.5MHz at master mode, and from 297.3 kHz to 15.1 MHz at slave mode.

### 32.1.2 Block Diagram

Figures 32.1 to 32.2 show the SSIU block diagrams.

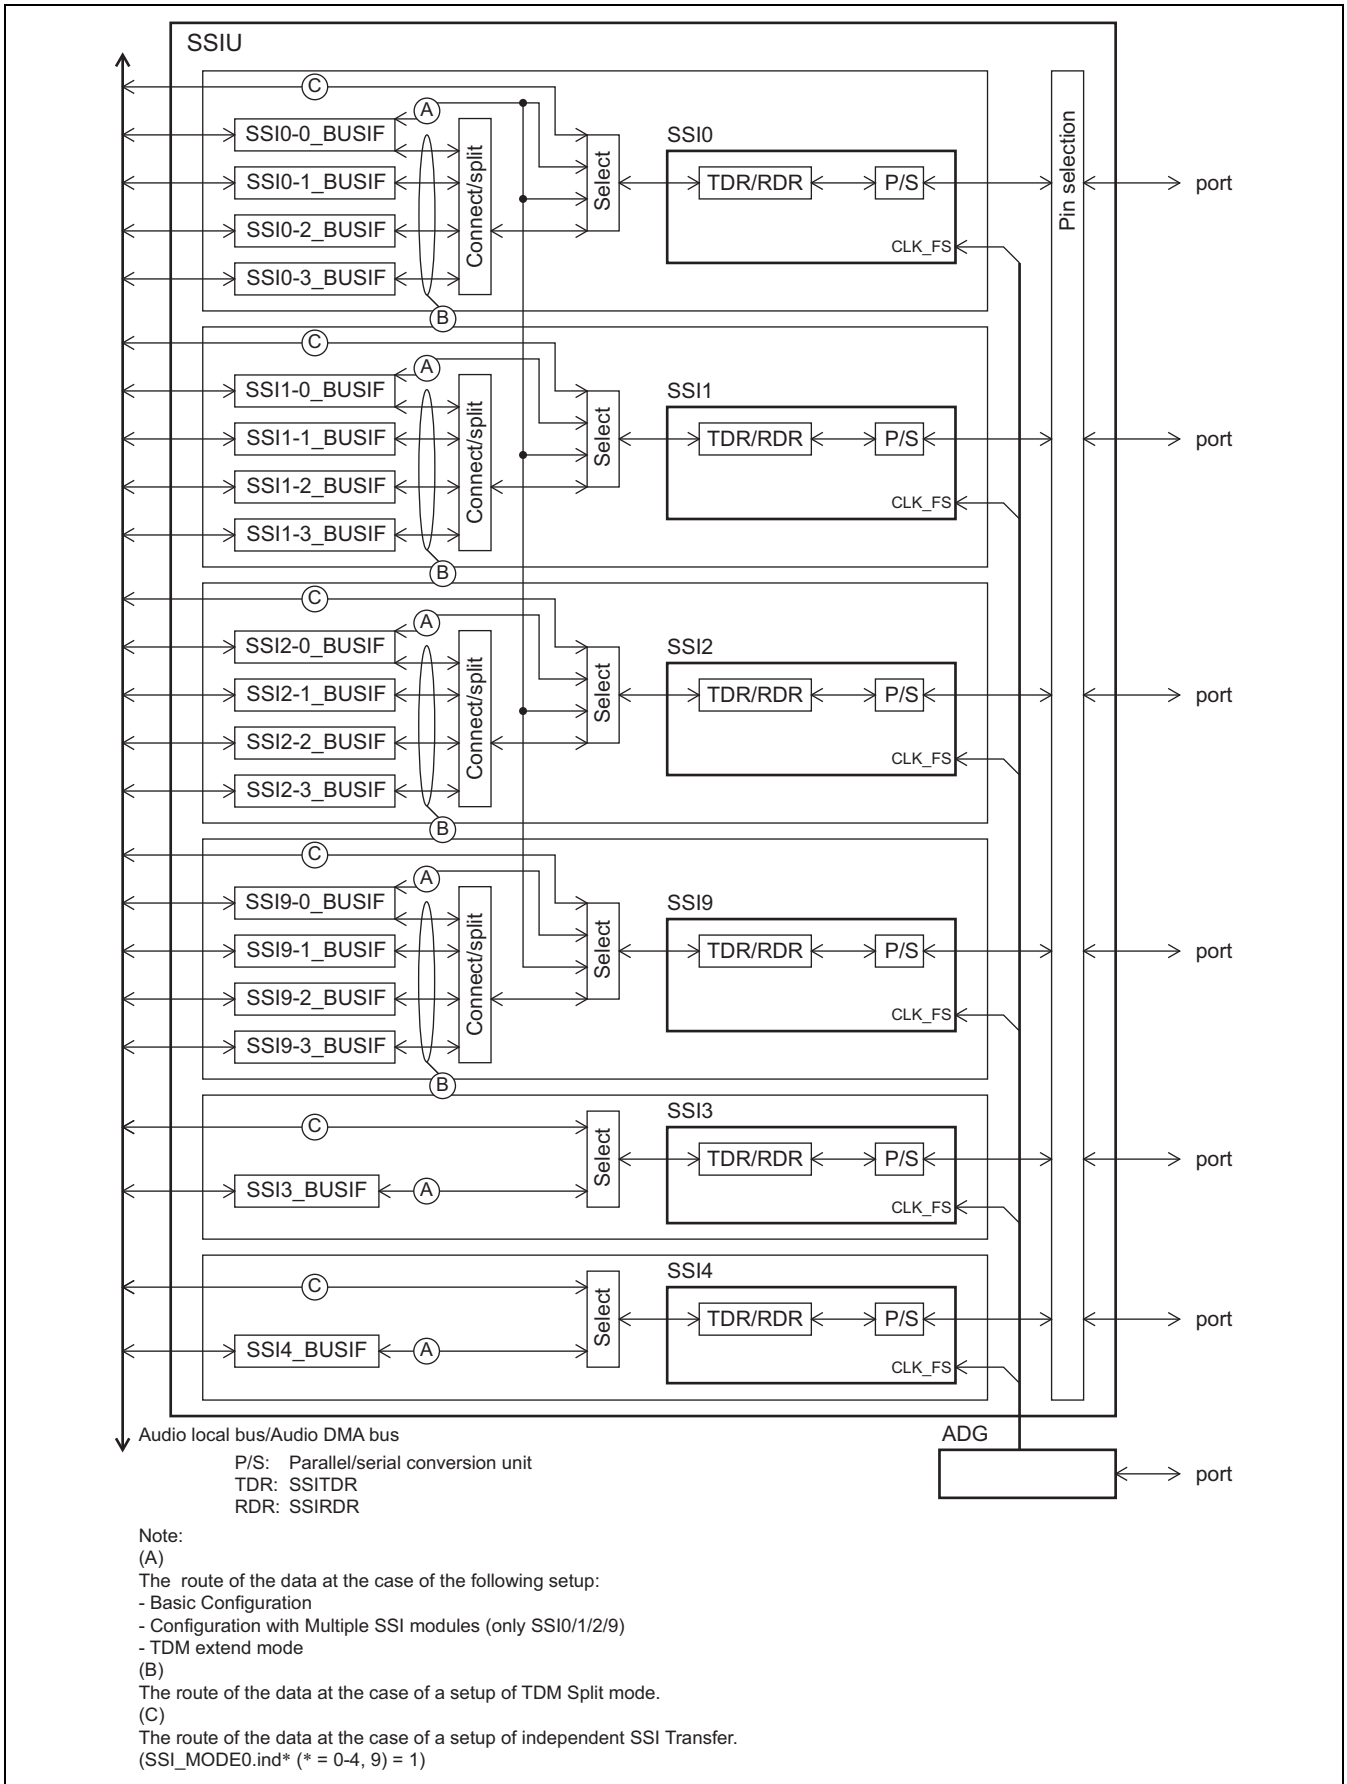

Figure 32.1 Block Diagram of SSIU (SSI0, SSI1, SSI2, SSI3, SSI4, and SSI9)

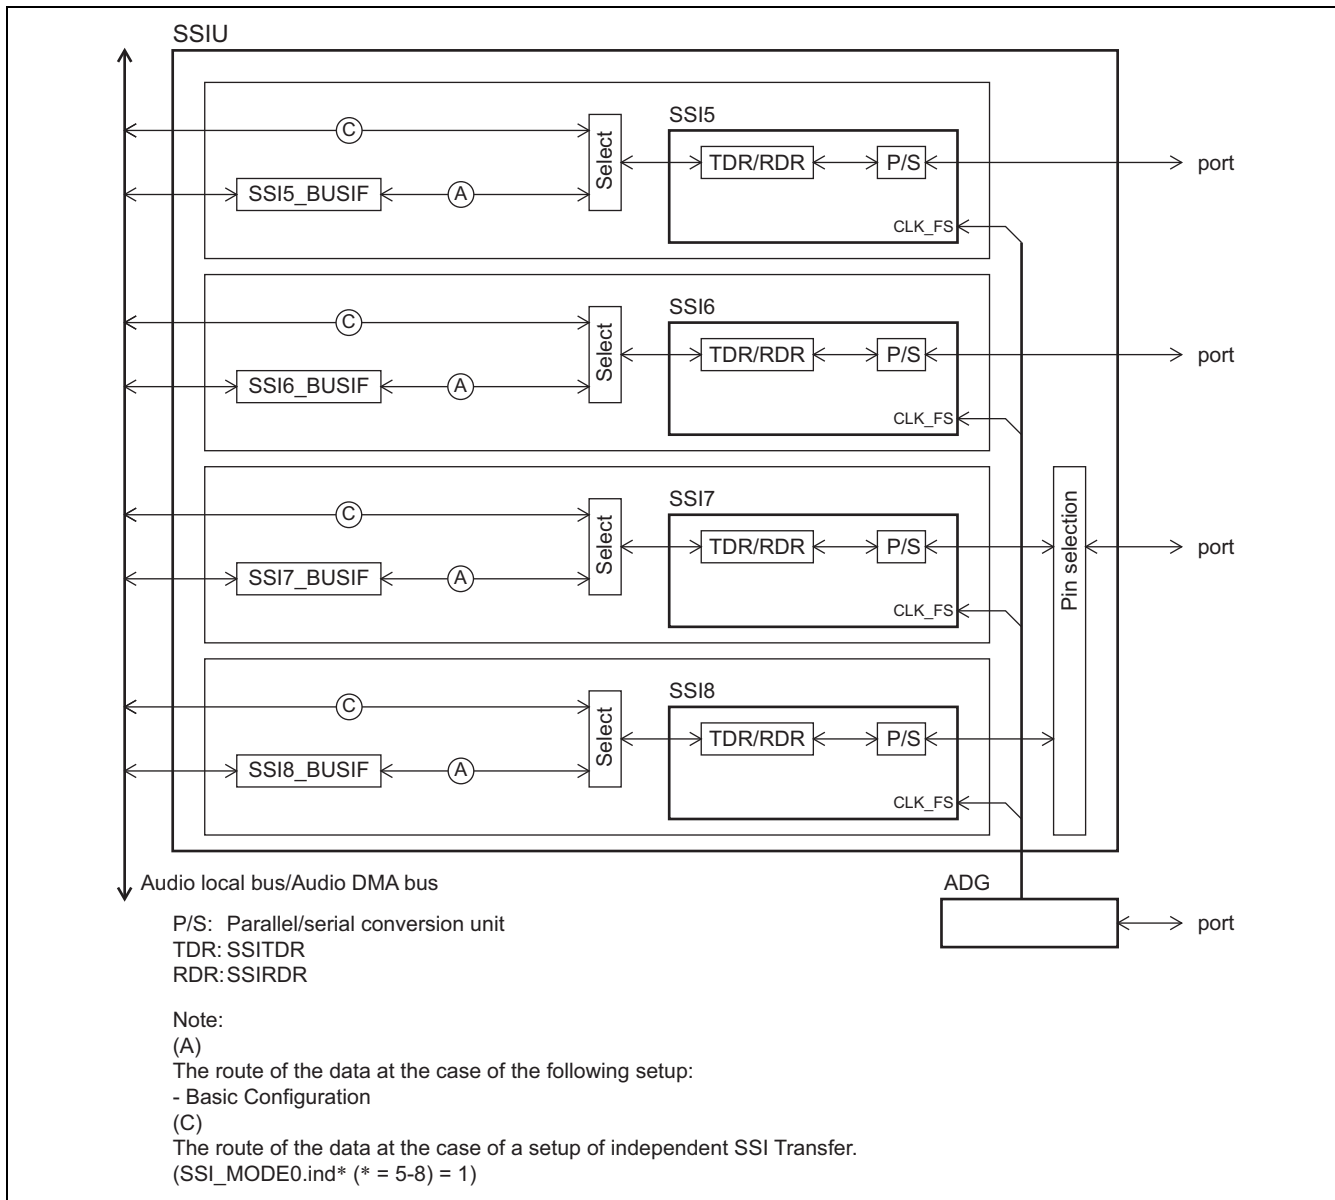

Figure 32.2 Block Diagram of SSIU (SSI5, SSI6, SSI7, and SSI8)

### 32.1.3 Input/Output Pins

Table 32.1 shows the pin configuration.

**Table 32.1 Pin Configuration**

Name	Pin Name	I/O	Function	RZ/G Series Products			
				RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
Serial clock pin for SSI0, SSI1, SSI2, SSI3 and SSI9	SSI_SCK0129 (SSI_SCK01239)	I/O	Serial clock (SSI0 only or combination of SSI0, SSI1, SSI2, SSI3, and SSI9)	√	√	√	√

---

**RZ/G Series  
Products**

---

Name	Pin Name	I/O	Function	RZ/G Series Products			
				RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
Word select pin for SSI9	SSI_WS9	I/O	Word select	√	√	√	√
Serial data pin for SSI9	SSI_SDATA9	I/O	Serial data	√	√	√	√

Note: Although each SSI is multiplexed on multiple LSI pins, the combinations of pins in use must be from the same group. For Example, the use of combinations such as SSI\_SCK78, SSI\_WS78, and SSI\_SDATA8\_B is prohibited. Please refer to section 5, Pin Function Controller (PFC) for details.

### 32.1.4 Register Configuration

Table 32.2 shows the register configuration. Do not write to any addresses other than listed below. Operations cannot be guaranteed if writing is attempted. Values read from addresses other than those listed below are undefined. Access the register as a longword (32 bits). Operation cannot be guaranteed if the register is not accessed as a longword.

**Table 32.2 Register Configuration**

Name	Abbreviation	R/W	Address	Initial Value	Access Size	RZ/G Series Products

Note: \* Address H'EC10 XXXX is used for data transfer with the audio-DMAC. Address H'EC40 XXXX is used for data transfer with the audio-DMAC (peripheral-peripheral).

## 32.2 Register Description

### Legend for Register Description

Initial value: Register value after a reset. H'xxxx represents a hexadecimal number. Others are represented in binary numbers.

—: Undefined value

R/W: Readable/writable. The written value can be read.

R: Read-only. The write value should always be 0.

R/WC0: Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.

R/WC1: Readable/writable. Writing 1 initializes the bit. Writing 0 is ignored.

W: Write-only. Reading this bit is prohibited. When the bit is reserved, the write value should always be 0.

—/W: Write-only. The read value is undefined.

All access to registers is made in longword units.

### 32.2.1 SSIn BUSIF Mode Register (SSIn\_BUSIF\_MODE)

Note: n = 0-0 to 0-3, 1-0 to 1-3, 2-0 to 2-3, 3 to 8, or 9-0 to 9-3

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: SSIn\_BUSIF\_MODE determines the initial settings of the bus interface.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	
	—	—	—	—	—	—	—	—	—	—	—	sft_dir	sft_num				
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
	—	—	—	—	—	—	—	word_s wap	—	—	—	—	—	—	—	—	dma
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20	sft_dir	0	R/W	ssin_busif_shift_dir Selects the bit-shift direction for valid bit position adjustment in the SSIn_BUSIF input and output data. 0: Shift to left. 1: Shift to right.
19 to 16	sft_num	0000	R/W	ssin_busif_shift_num Selects the bit-shift count for valid bit position adjustment in the SSIn_BUSIF input and output data. 0000: 0 bit 0001: 1 bit 0010: 2 bits 0011: 3 bits 0100: 4 bits 0101: 5 bits 0110: 6 bits 0111: 7 bits 1000: 8 bits 1001: 9 bits 1010: 10 bits 1011: 11 bits 1100: 12 bits 1101: 13 bits 1110: 14 bits 1111: 15 bits
15 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
8	word_swap	0	R/W	word_swap_en Swaps the word order in SSI $n$ _BUSIF. 0: Word order is not swapped. 1: Word order is swapped. Note: Select this function only when the data length is 16 bits.
7 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	dma	1	R/W	ssi $n$ _dma Selects the access type for SSI $n$ _BUSIF. 0: PIO access (setting prohibited) 1: DMA access Be sure to specify the DMA access.

### 32.2.2 SSIm BUSIF Audio Information Register (SSIm\_BUSIF\_ADINR)

Note: m = 0-0, 1-0, 2-0, 3 to 8, or 9-0

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: SSIm\_BUSIF\_ADINR is a 32-bit readable/writable register that selects channel number and bit length of output audio data.

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20 to 16	OTBL[4:0]	00000	R/W	Bit Length of Output Audio Data. These bits set the bit length of output audio data. 00000: 24 bits 00001: Reserved 00010: 22 bits 00011: Reserved 00100: 20 bits 00101: Reserved 00110: 18 bits 00111: Reserved 01000: 16 bits 01001 to 01111: Reserved 10000: 8 bits 10001 to 11111: Reversed
15 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

---

Bit	Bit Name	Initial Value	R/W	Description
3 to 0	CHNUM[3:0]	0000	R/W	Channel Number
				These bits set the channel number.
				0000: 0 (None)
				0001: 1 channel
				0010: 2 channels
				0011: Reserved
				0100: 4 channels
				0101: Reserved
				0110: 6 channels
				0111: Reserved
				1000: 8 channels
				1001 to 1111: Reserved

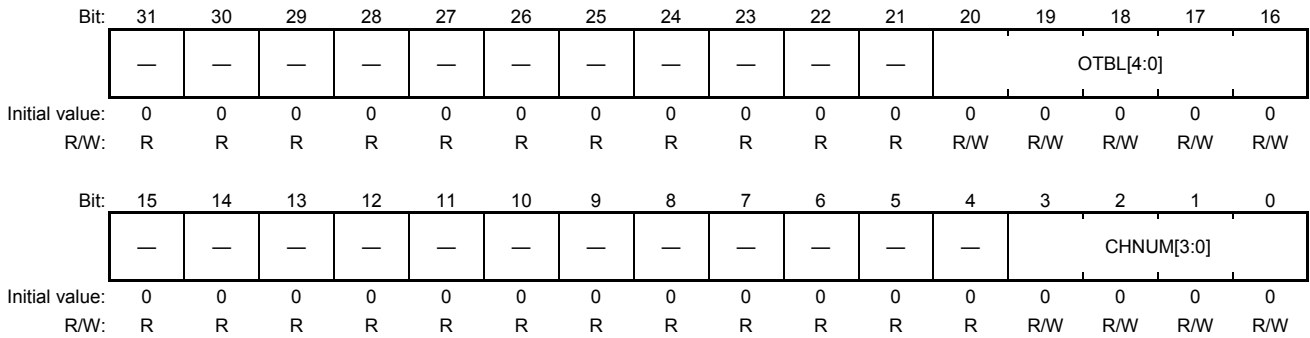

---

### 32.2.3 SSIP BUSIF Audio Information Register (SSIP\_BUSIF\_ADINR)

Note: p = 0-1 to 0-3, 1-1 to 1-3, 2-1 to 2-3, or 9-1 to 9-3

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: SSIP\_BUSIF\_ADINR is a 32-bit readable/writable register that selects channel number and bit length of output audio data.

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20 to 16	OTBL[4:0]	00000	R/W	Bit Length of Output Audio Data. These bits set the bit length of output audio data. 00000: 24 bits 00001: Reserved 00010: 22 bits 00011: Reserved 00100: 20 bits 00101: Reserved 00110: 18 bits 00111: Reserved 01000: 16 bits 01001 to 11111: Reserved
15 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3 to 0	CHNUM[3:0]	0000	R/W	Channel Number These bits set the channel number. 0000: 0 (none) 0001: 1 channel 0010: 2 channels 0011 to 1111: Reserved

### 32.2.4 SSIm BUSIF Data Align Register (SSIm\_BUSIF\_DALIGN)

Note: m = 0-0, 1-0, 2-0, 3 to 8, or 9-0

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: SSIm\_BUSIF\_DALIGN determines the initial settings of the SSIm route.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	place7			—	place6			—	place5			—	place4		
Initial value:	0	1	1	1	0	1	1	0	0	1	0	1	0	1	0	0
R/W:	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	place3			—	place2			—	place1			—	place0		
Initial value:	0	0	1	1	0	0	1	0	0	0	0	1	0	0	0	0
R/W:	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
30 to 28	place7	111	R/W	Changes the stream data order. These bits are used for the 8-channel setting. <b>For the 6- or less channel setting or TDM split mode setting (tdm_split = 1), the initial value should not be changed.</b> The data order is changed between the SSI and bus interface. Selects the input-side data to be output to place 7 on the output side. 000: Data at input-side place 0 is sent to output-side place 7. 001: Data at input-side place 1 is sent to output-side place 7. 010: Data at input-side place 2 is sent to output-side place 7. 011: Data at input-side place 3 is sent to output-side place 7. 100: Data at input-side place 4 is sent to output-side place 7. 101: Data at input-side place 5 is sent to output-side place 7. 110: Data at input-side place 6 is sent to output-side place 7. 111: Data at input-side place 7 is sent to output-side place 7.
27	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
26 to 24	place6	110	R/W	<p>Changes the stream data order. These bits are used for the 8-channel setting. <b>For the 6- or less channel setting or TDM split mode setting (tdm_split = 1), the initial value should not be changed.</b></p> <p>The data order is changed between the SSI and bus interface.</p> <p>Selects the input-side data to be output to place 6 on the output side.</p> <p>000: Data at input-side place 0 is sent to output-side place 6.            001: Data at input-side place 1 is sent to output-side place 6.            010: Data at input-side place 2 is sent to output-side place 6.            011: Data at input-side place 3 is sent to output-side place 6.            100: Data at input-side place 4 is sent to output-side place 6.            101: Data at input-side place 5 is sent to output-side place 6.            110: Data at input-side place 6 is sent to output-side place 6.            111: Data at input-side place 7 is sent to output-side place 6.</p>
23	—	0	R	<p>Reserved</p> <p>This bit is always read as 0. The write value should always be 0.</p>
22 to 20	place5	101	R/W	<p>Changes the stream data order. These bits are used for the 6- or more channel setting. <b>For the 4- or less channel setting or TDM split mode setting (tdm_split = 1), the initial value should not be changed.</b></p> <p>The data order is changed between the SSI and bus interface.</p> <p>Selects the input-side data to be output to place 5 on the output side.</p> <p>000: Data at input-side place 0 is sent to output-side place 5.            001: Data at input-side place 1 is sent to output-side place 5.            010: Data at input-side place 2 is sent to output-side place 5.            011: Data at input-side place 3 is sent to output-side place 5.            100: Data at input-side place 4 is sent to output-side place 5.            101: Data at input-side place 5 is sent to output-side place 5.            110: Data at input-side place 6 is sent to output-side place 5.            111: Data at input-side place 7 is sent to output-side place 5.</p>
19	—	0	R	<p>Reserved</p> <p>This bit is always read as 0. The write value should always be 0.</p>
18 to 16	place4	100	R/W	<p>Changes the stream data order. These bits are used for the 6- or more channel setting. <b>For the 4- or less channel setting or TDM split mode setting (tdm_split = 1), the initial value should not be changed.</b></p> <p>The data order is changed between the SSI and bus interface.</p> <p>Selects the input-side data to be output to place 4 on the output side.</p> <p>000: Data at input-side place 0 is sent to output-side place 4.            001: Data at input-side place 1 is sent to output-side place 4.            010: Data at input-side place 2 is sent to output-side place 4.            011: Data at input-side place 3 is sent to output-side place 4.            100: Data at input-side place 4 is sent to output-side place 4.            101: Data at input-side place 5 is sent to output-side place 4.            110: Data at input-side place 6 is sent to output-side place 4.            111: Data at input-side place 7 is sent to output-side place 4.</p>

Bit	Bit Name	Initial Value	R/W	Description
15	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
14 to 12	place3	011	R/W	Changes the stream data order. These bits are used for the 4- or more channel setting. <b>For the 2- or less channel setting or TDM split mode setting (tdm_split = 1), the initial value should not be changed.</b> The data order is changed between the SSI and bus interface. Selects the input-side data to be output to place 3 on the output side. 000: Data at input-side place 0 is sent to output-side place 3. 001: Data at input-side place 1 is sent to output-side place 3. 010: Data at input-side place 2 is sent to output-side place 3. 011: Data at input-side place 3 is sent to output-side place 3. 100: Data at input-side place 4 is sent to output-side place 3. 101: Data at input-side place 5 is sent to output-side place 3. 110: Data at input-side place 6 is sent to output-side place 3. 111: Data at input-side place 7 is sent to output-side place 3.
11	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
10 to 8	place2	010	R/W	Changes the stream data order. These bits are used for the 4- or more channel setting. <b>For the 2- or less channel setting or TDM split mode setting (tdm_split = 1), the initial value should not be changed.</b> The data order is changed between the SSI and bus interface. Selects the input-side data to be output to place 2 on the output side. 000: Data at input-side place 0 is sent to output-side place 2. 001: Data at input-side place 1 is sent to output-side place 2. 010: Data at input-side place 2 is sent to output-side place 2. 011: Data at input-side place 3 is sent to output-side place 2. 100: Data at input-side place 4 is sent to output-side place 2. 101: Data at input-side place 5 is sent to output-side place 2. 110: Data at input-side place 6 is sent to output-side place 2. 111: Data at input-side place 7 is sent to output-side place 2.
7	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
6 to 4	place1	001	R/W	<p>Changes the stream data order. ### 32.2.5 SSIP BUSIF Data Align Register (SSIP\_BUSIF\_DALIGN)

Note: p = 0-1 to 0-3, 1-1 to 1-3, 2-1 to 2-3, or 9-1 to 9-3

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: SSIP\_BUSIF\_DALIGN determines the initial settings of the SSIP route.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	place1	—	—	—	place0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	place1	1	R/W	Changes the stream data order. The data order is changed between the SSI and bus interface. Selects the input-side data to be output to place 1 on the output side. 0: Data at input-side place 0 is sent to output-side place 1. 1: Data at input-side place 1 is sent to output-side place 1.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	place0	0	R/W	Changes the stream data order. The data order is changed between the SSI and bus interface. Selects the input-side data to be output to place 0 on the output side. 0: Data at input-side place 0 is sent to output-side place 0. 1: Data at input-side place 1 is sent to output-side place 0.

### 32.2.6 SSIIq Mode Register (SSIIq\_MODE)

Note:  $q = 0-0, 1-0, 2-0, \text{ or } 9-0$

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: SSIIq\_MODE determines the initial settings of the SSIIq route.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	fs_mod e	—	—	—	—	tdm_spl it	—	—	—	—	—	—	—	tdm_ext
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R	R	R	R	R/W	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13	fs_mode	0	R/W	ssii_fs_mode ( $i = 0, 1, 2, \text{ or } 9$ ) Selects fs to be used with TDM split mode for ssii. 0: ssii TDM split mode is used with 256 fs (stereo x 4). 1: ssii TDM split mode is used with 128 fs (monaural x 4).
12 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	tdm_split	0	R/W	ssii_tdm_split ( $i = 0, 1, 2, \text{ or } 9$ ) Selects whether or not TDM split mode is used for ssii. 0: TDM split mode is not used for ssii (only ssii-0_BUSIF is used). 1: TDM split mode is used for ssii (ssii-1_BUSIF to ssii-3_BUSIF are also used).
7 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	tdm_ext	0	R/W	ssii_tdm_ext ( $i = 0, 1, 2, \text{ or } 9$ ) Selects whether or not TDM extend mode is used for ssii. 0: ssii TDM extend mode is not used. 1: ssii TDM extend mode is used.

Note: Bit 0 (tdm\_ext) and bit 8 (tdm\_split) cannot be set to 1 at the same time.

**32.2.7 SSIr Mode Register (SSIr\_MODE)**

Note: r = 3 or 4

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: SSIr\_MODE determines the initial settings of the SSIr route.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	tdm_ext
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	tdm_ext	0	R/W	ssir_tdm_ext Selects whether or not TDM extend mode is used for ssir. 0: ssir TDM extend mode is not used. 1: ssir TDM extend mode is used.

### 32.2.8 SSIIq Control Register (SSIIq\_CONTROL)

Note: q = 0-0, 1-0, 2-0, or 9-0

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: SSIIq\_CONTROL controls the start and stop of data transfer.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	start_3	—	—	—	start_2	—	—	—	start_1	—	—	—	start_0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12	start_3	0	R/W	SSII-3_start_flag (i = 0 to 2, 9) Starts or stops data transfer through SSII-3. 0: Transfer is stopped. 1: Transfer is started.
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	start_2	0	R/W	SSII-2_start_flag (i = 0 to 2, 9) Starts or stops data transfer through SSII-2. 0: Transfer is stopped. 1: Transfer is started.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	start_1	0	R/W	SSII-1_start_flag (i = 0 to 2, 9) Starts or stops data transfer through SSII-1. 0: Transfer is stopped. 1: Transfer is started.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	start_0	0	R/W	SSII-0_start_flag (i = 0 to 2, 9) Starts or stops data transfer through SSII-0. 0: Transfer is stopped. 1: Transfer is started.

Note: If only SSII-0 is used and TDM split mode is not used, SSII-1\_start flag to SSII-3\_start flag should be set to 0 (transfer stopped).

### 32.2.9 SSIr Control Register (SSIr\_CONTROL)

Note: r = 3 to 8

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: SSIr\_CONTROL controls the start and stop of data transfer.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	start
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	start	0	R/W	SSIr_start_flag Starts or stops data transfer through SSIr. 0: Transfer is stopped. 1: Transfer is started.

### 32.2.10 SSIq Status Register (SSIQ\_STATUS)

Note: q = 0-0, 1-0, 2-0, 9-0

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: SSIq\_STATUS indicates the internal buffer state. When a bit in this register is set, its status is indicated by the corresponding interrupt signal. However, when the interrupt output is masked by the SSIq interrupt enable register, the interrupt signal is not output.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	FCST	DTST	UIRQ	OIRQ	IIRQ	DIRQ	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	uf_3	uf_2	uf_1	uf_0	of_3	of_2	of_1	of_0	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
29	FCST	0	R	SSII_FCST (i = 0 to 2, 9) Indicates the state of SSIFSRi_FCST. 0: — 1: The WS signal has stopped.
28	DTST	0	R	SSII_DTST (i = 0 to 2, 9) Indicates the state of SSIFSRi_DTST. 0: — 1: The frequency switching has been detected.
27	UIRQ	0	R	SSII_UIRQ (i = 0 to 2, 9) Indicates the state of SSISRi_UIRQ. 0: — 1: An underflow has occurred. Note: Not indicated by the interrupt signal when SSCRi.UIEN = 0.
26	OIRQ	0	R	SSII_OIRQ (i = 0 to 2, 9) Indicates the state of SSISRi_OIRQ. 0: — 1: An overflow has occurred. Note: Not indicated by the interrupt signal when SSCRi.OIEN = 0.
25	IIRQ	0	R	SSII_IIRQ (i = 0 to 2, 9) Indicates the state of SSISRi_IIRQ. 0: — 1: Idle state Note: Not indicated by the interrupt signal when SSCRi.IIEN = 0.

Bit	Bit Name	Initial Value	R/W	Description
24	DIRQ	0	R	<p>SSI<math>i</math>_DIRQ (i = 0 to 2, 9)</p> <p>Indicates the state of SSISR<math>i</math>_DIRQ.</p> <p>0: —</p> <p>1: When SSICR<math>i</math>.TRMD is 0, DIRQ = 1 indicates that there are unread data in SSIRDR. When SSICR<math>i</math>.TRMD is 1, DIRQ = 1 indicates that data can be written to SSITDR.</p> <p>Note: Not indicated by the interrupt signal when SSICR<math>i</math>.DIEN = 0.</p>
23 to 16	—	All 0	R	<p>Reserved</p> <p>These bits are always read as 0. The write value should always be 0.</p>
15	uf_3	0	R	<p>buf_under_flow<math>i-3</math> (i = 0 to 2, 9)</p> <p>Indicates the state of SSI_SYSTEM_STATUS2/3.uf<math>i-3</math>.</p> <p>0: —</p> <p>1: An underflow has occurred.</p> <p>Note: Not indicated by the interrupt signal when SSI_SYSTEM_INT_ENABLE2/3.uf<math>i-3</math>_ie = 0.</p>
14	uf_2	0	R	<p>buf_under_flow<math>i-2</math> (i = 0 to 2, 9)</p> <p>Indicates the state of SSI_SYSTEM_STATUS2/3.uf<math>i-2</math>.</p> <p>0: —</p> <p>1: An underflow has occurred.</p> <p>Note: Not indicated by the interrupt signal when SSI_SYSTEM_INT_ENABLE2/3.uf<math>i-2</math>_ie = 0.</p>
13	uf_1	0	R	<p>buf_under_flow<math>i-1</math> (i = 0 to 2, 9)</p> <p>Indicates the state of SSI_SYSTEM_STATUS2/3.uf<math>i-1</math>.</p> <p>0: —</p> <p>1: An underflow has occurred.</p> <p>Note: Not indicated by the interrupt signal when SSI_SYSTEM_INT_ENABLE2/3.uf<math>i-1</math>_ie = 0.</p>
12	uf_0	0	R	<p>buf_under_flow<math>i-0</math> (i = 0 to 2, 9)</p> <p>Indicates the state of SSI_SYSTEM_STATUS2/3.uf<math>i-0</math>.</p> <p>0: —</p> <p>1: An underflow has occurred.</p> <p>Note: Not indicated by the interrupt signal when SSI_SYSTEM_INT_ENABLE2/3.uf<math>i-0</math>_ie = 0.</p>
11	of_3	0	R	<p>buf_over_flow<math>i-3</math> (i = 0 to 2, 9)</p> <p>Indicates the state of SSI_SYSTEM_STATUS2/3.of<math>i-3</math>.</p> <p>0: —</p> <p>1: An overflow has occurred.</p> <p>Note: Not indicated by the interrupt signal when SSI_SYSTEM_INT_ENABLE2/3.of<math>i-3</math>_ie = 0.</p>
10	of_2	0	R	<p>buf_over_flow<math>i-2</math> (i = 0 to 2, 9)</p> <p>Indicates the state of SSI_SYSTEM_STATUS2/3.of<math>i-2</math>.</p> <p>0: —</p> <p>1: An overflow has occurred.</p> <p>Note: Not indicated by the interrupt signal when SSI_SYSTEM_INT_ENABLE2/3.of<math>i-2</math>_ie = 0.</p>

Bit	Bit Name	Initial Value	R/W	Description
9	of_1	0	R	buf_over_flow <i>i</i> -1 (i = 0 to 2, 9) Indicates the state of SSI_SYSTEM_STATUS2/3.of <i>i</i> -1. 0: — 1: An overflow has occurred. Note: Not indicated by the interrupt signal when SSI_SYSTEM_INT_ENABLE2/3.of <i>i</i> -1_ie = 0.
8	of_0	0	R	buf_over_flow <i>i</i> -0 (i = 0 to 2, 9) Indicates the state of SSI_SYSTEM_STATUS2/3.of <i>i</i> -0. 0: — 1: An overflow has occurred. Note: Not indicated by the interrupt signal when SSI_SYSTEM_INT_ENABLE2/3.of <i>i</i> -0_ie = 0.
7 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

### 32.2.11 SSIR Status Register (SSIR\_STATUS)

Note:  $r = 3$  to 8

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: SSIR\_STATUS indicates the internal buffer state. When a bit in this register is set, its status is indicated by the corresponding interrupt signal. However, when the interrupt output is masked by the SSIR interrupt enable register, the interrupt signal is not output.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	FCST	DTST	UIRQ	OIRQ	IIRQ	DIRQ	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
29	FCST	0	R	SSIR <sub>i</sub> _FCST ( $i = 3$ to 8) Indicates the state of SSIFSR <sub>i</sub> _FCST. 0: — 1: The WS signal has stopped.
28	DTST	0	R	SSIR <sub>i</sub> _DTST ( $i = 3$ to 8) Indicates the state of SSIFSR <sub>i</sub> _DTST. 0: — 1: The frequency switching has been detected.
27	UIRQ	0	R	SSIR <sub>i</sub> _UIRQ ( $i = 3$ to 8) Indicates the state of SSISR <sub>i</sub> _UIRQ. 0: — 1: An underflow has occurred. Note: Not indicated by the interrupt signal when SSICR <sub>i</sub> .UIEN = 0.
26	OIRQ	0	R	SSIR <sub>i</sub> _OIRQ ( $i = 3$ to 8) Indicates the state of SSISR <sub>i</sub> _OIRQ. 0: — 1: An overflow has occurred. Note: Not indicated by the interrupt signal when SSICR <sub>i</sub> .OEN = 0.
25	IIRQ	0	R	SSIR <sub>i</sub> _IIRQ ( $i = 3$ to 8) Indicates the state of SSISR <sub>i</sub> _IIRQ. 0: — 1: Idle state Note: Not indicated by the interrupt signal when SSICR <sub>i</sub> .IEN = 0.

Bit	Bit Name	Initial Value	R/W	Description
24	DIRQ	0	R	<p>SSI<math>i</math>_DIRQ (<math>i = 3</math> to <math>8</math>)</p> <p>Indicates the state of SSISR<math>i</math>_DIRQ.</p> <p>0: —</p> <p>1: When SSICR<math>i</math>.TRMD is 0, DIRQ = 1 indicates that there are unread data in SSIRDR. When SSICR<math>i</math>.TRMD is 1, DIRQ = 1 indicates that data can be written to SSITDR.</p> <p>Note: Not indicated by the interrupt signal when SSICR<math>i</math>.DIEN = 0.</p>
23 to 0	—	All 0	R	<p>Reserved</p> <p>These bits are always read as 0. The write value should always be 0.</p>

### 32.2.12 SSIq Interrupt Enable Register (SSIq\_INT\_ENABLE\_MAIN)

Note: q = 0-0, 1-0, 2-0, or 9-0

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: SSIq\_INT\_ENABLE\_MAIN enables or disables output of interrupts corresponding to the states indicated in the SSIq status register.

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
25	ind_word_swap9	0	R/W	ind_word_swap_en9 Swaps the word order (only for access to SSITDR or SSIRDR). 0: Word order is not swapped. 1: Word order is swapped. Note: Select this function only when the data length is 16 bits.
24	ind_word_swap8	0	R/W	ind_word_swap_en8 Swaps the word order (only for access to SSITDR or SSIRDR). 0: Word order is not swapped. 1: Word order is swapped. Note: Select this function only when the data length is 16 bits.
23	ind_word_swap7	0	R/W	ind_word_swap_en7 Swaps the word order (only for access to SSITDR or SSIRDR). 0: Word order is not swapped. 1: Word order is swapped. Note: Select this function only when the data length is 16 bits.
22	ind_word_swap6	0	R/W	ind_word_swap_en6 Swaps the word order (only for access to SSITDR or SSIRDR). 0: Word order is not swapped. 1: Word order is swapped. Note: Select this function only when the data length is 16 bits.
21	ind_word_swap5	0	R/W	ind_word_swap_en5 Swaps the word order (only for access to SSITDR or SSIRDR). 0: Word order is not swapped. 1: Word order is swapped. Note: Select this function only when the data length is 16 bits.

Bit	Bit Name	Initial Value	R/W	Description
20	ind_word_swap4	0	R/W	ind_word_swap_en4 Swaps the word order (only for access to SSITDR or SSIRDR). 0: Word order is not swapped. 1: Word order is swapped. Note: Select this function only when the data length is 16 bits.
19	ind_word_swap3	0	R/W	ind_word_swap_en3 Swaps the word order (only for access to SSITDR or SSIRDR). 0: Word order is not swapped. 1: Word order is swapped. Note: Select this function only when the data length is 16 bits.
18	ind_word_swap2	0	R/W	ind_word_swap_en2 Swaps the word order (only for access to SSITDR or SSIRDR). 0: Word order is not swapped. 1: Word order is swapped. Note: Select this function only when the data length is 16 bits.
17	ind_word_swap1	0	R/W	ind_word_swap_en1 Swaps the word order (only for access to SSITDR or SSIRDR). 0: Word order is not swapped. 1: Word order is swapped. Note: Select this function only when the data length is 16 bits.
16	ind_word_swap0	0	R/W	ind_word_swap_en0 Swaps the word order (only for access to SSITDR or SSIRDR). 0: Word order is not swapped. 1: Word order is swapped. Note: Select this function only when the data length is 16 bits.
15 to 10	—	0	R	Reserved These bits are always read as 0. The write value should always be 0.
9	ind9	0	R/W	Independent SSI9 transfer setting 0: Independent SSI9 transfer is not performed. 1: Independent SSI9 transfer is performed.
8	ind8	0	R/W	Independent SSI8 transfer setting 0: Independent SSI8 transfer is not performed. 1: Independent SSI8 transfer is performed.
7	ind7	0	R/W	Independent SSI7 transfer setting 0: Independent SSI7 transfer is not performed. 1: Independent SSI7 transfer is performed.
6	ind6	0	R/W	Independent SSI6 transfer setting 0: Independent SSI6 transfer is not performed. 1: Independent SSI6 transfer is performed.
5	ind5	0	R/W	Independent SSI5 transfer setting 0: Independent SSI5 transfer is not performed. 1: Independent SSI5 transfer is performed.

Bit	Bit Name	Initial Value	R/W	Description
4	ind4	0	R/W	Independent SSI transfer setting
3	ind3	0	R/W	0: Independent SSI transfer is not performed. 1: Independent SSI transfer is performed. These bits correspond to the SSI modules as follows. SSI3 = ssi_ind3 SSI4 = ssi_ind4
2	ind2	0	R/W	Independent SSI2 transfer setting 0: Independent SSI2 transfer is not performed. 1: Independent SSI2 transfer is performed.
1	ind1	0	R/W	Independent SSI1 transfer setting 0: Independent SSI1 transfer is not performed. 1: Independent SSI1 transfer is performed.
0	ind0	0	R/W	Independent SSI0 transfer setting 0: Independent SSI0 transfer is not performed. 1: Independent SSI0 transfer is performed.

### 32.2.15 SSI Mode Register 1 (SSI\_MODE1)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: SSI\_MODE1 specifies the SSI pin modes.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	ssi34_s ync	—	—	ssi4_pin	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	ssi012_ 3mod	ssi2_pin		ssi1_pin	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20	ssi34_sync	0	R/W	ssi34_sync_mode Selects whether to synchronize SSI3 and SSI4. 0: SSI3 and SSI4 are not synchronized. 1: SSI3 and SSI4 are synchronized. This bit can be set to 1 only when the ssi4_pin_mode bits are set to 01 or 10.
19, 18	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
17, 16	ssi4_pin	00	R/W	ssi4_pin_mode Select the connections of the SSI_SCK4 and SSI_WS4 pins. 00: SSI3 and SSI4 use their own pins independently. 01: The SSI3 pins are used in common by SSI3 and SSI4. Both modules work as slaves. The SSI_WS and SSI_SCK pins of SSI3 are used. 10: The SSI3 pins are used in common by SSI3 and SSI4. SSI3 works as the master and SSI4 works as a slave. The SSI_WS and SSI_SCK pins of SSI3 are used. 11: Setting prohibited
15 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
4	ssi012_3module_mode	0	R/W	<p>ssi012_3module_mode</p> <p>Selects whether to use three modules (SSI0, SSI1, and SSI2) together as six channels.</p> <p>0: SSI0, SSI1, and SSI2 are not used as six channels.</p> <p>1: SSI0, SSI1, and SSI2 are used as six channels.</p> <p>This bit should be cleared to 0 when the ssi1_pin_mode or ssi2_pin_mode bits are set to 00.</p> <p>It can be set to 1 only when the ssi1_pin_mode and ssi2_pin_mode bits are set to 01 or when the ssi1_pin_mode and ssi2_pin_mode bits are set to 10.</p> <p>Either ssi012_3module_mode or ssi0129_4module_mode must be set to 1.</p>
3, 2	ssi2_pin	00	R/W	<p>ssi2_pin_mode</p> <p>Select the connections of the SSI_SCK2 and SSI_WS2 pins.</p> <p>00: SSI0 and SSI2 use their own pins independently.</p> <p>01: The SSI0 pins are used in common by SSI0 and SSI2. Both modules work as slaves. The SSI_WS and SSI_SCK pins of SSI0 are used.</p> <p>10: The SSI0 pins are used in common by SSI0 and SSI2. SSI0 works as the master and SSI2 works as a slave. The SSI_WS and SSI_SCK pins of SSI0 are used.</p> <p>11: Setting prohibited</p>
1, 0	ssi1_pin	00	R/W	<p>ssi1_pin_mode</p> <p>Select the connections of the SSI_SCK1 and SSI_WS1 pins.</p> <p>00: SSI0 and SSI1 use their own pins independently.</p> <p>01: The SSI0 pins are used in common by SSI0 and SSI1. Both modules work as slaves. The SSI_WS and SSI_SCK pins of SSI0 are used.</p> <p>10: The SSI0 pins are used in common by SSI0 and SSI1. SSI0 works as the master and SSI1 works as a slave. The SSI_WS and SSI_SCK pins of SSI0 are used.</p> <p>11: Setting prohibited</p>

**32.2.16 SSI Mode Register 2 (SSI\_MODE2)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: SSI\_MODE2 specifies the SSI pin modes.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	ssi0129_4mod	—	ssi9_pin		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	ssi0129_4mod	0	R/W	ssi0129_4module_mode Selects whether to use four modules (SSI0, SSI1, SSI2, and SSI9) together as eight channels. 0: SSI0, SSI1, SSI2, and SSI9 are not used as eight channels. 1: SSI0, SSI1, SSI2, and SSI9 are used as eight channels. This bit should be cleared to 0 when the ssi1_pin_mode or ssi2_pin_mode bits are set to 00, or when ssi9_pin_mode bits are set to 000. It can be set to 1 only when the ssi1_pin_mode and ssi2_pin_mode bits are set to 01 and the ssi9_pin_mode bits are set to 001, or when the ssi1_pin_mode and ssi2_pin_mode bits are set to 10 and the ssi9_pin_mode bits are set to 010. Either ssi0129_4module_mode or ssi012_3module_mode must be set to 1.
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
2 to 0	ssi9_pin	000	R/W	<p>ssi9_pin_mode</p> <p>Selects the connections of the SSI_SCK9 and SSI_WS9 pins.</p> <p>000: SSI0 and SSI9 use their own pins independently.</p> <p>001: The SSI0 pins are used in common by SSI0 and SSI9. Both modules work as slaves. The SSI_WS and SSI_SCK pins of SSI0 are used.</p> <p>010: The SSI0 pins are used in common by SSI0 and SSI9. SSI0 works as the master and SSI9 works as a slave. The SSI_WS and SSI_SCK pins of SSI0 are used.</p> <p>011: Setting prohibited</p> <p>100: Setting prohibited</p> <p>101: The SSI3 pins are used in common by SSI3 and SSI9. Both modules work as slaves. The SSI_WS and SSI_SCK pins of SSI3 are used.</p> <p>110: The SSI3 pins are used in common by SSI3 and SSI9. SSI3 works as the master and SSI9 works as a slave. The SSI_WS and SSI_SCK pins of SSI3 are used.</p> <p>111: Setting prohibited</p>

**32.2.17 SSI Mode Register 3 (SSI\_MODE3)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: SSI\_MODE3 specifies the SSI pin modes.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ssi3_pin
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	ssi3_pin	00	R/W	ssi3_pin_mode Select the connections of the SSI_SCK3 and SSI_WS3 pins. 00: SSI0 and SSI3 use their own pins independently. 01: The SSI0 pins are used in common by SSI0 and SSI3. Both modules work as slaves. The SSI_WS and SSI_SCK pins of SSI0 are used. 10: The SSI0 pins are used in common by SSI0 and SSI3. SSI0 works as the master and SSI3 works as a slave. The SSI_WS and SSI_SCK pins of SSI0 are used. 11: Setting prohibited When setting these bits to use the pins in common by SSI0 and SSI3, ssi4_pin_mode should be 00 and ssi9_pin_mode should be 000, 001, or 010 (selection of the SSI3 pins is prohibited).

### 32.2.18 SSI Control Register (SSI\_CONTROL)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: SSI\_CONTROL controls the startup of the SSI modules when multiple SSI modules are used at the same time.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	ssi34	—	—	—	ssi0129
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	ssi34	0	R/W	ssi34_enable Starts or stops data transfer through two SSI modules (SSI3 and SSI4) at the same time. 0: Transfer through SSI3 and SSI4 is stopped. 1: Transfer through SSI3 and SSI4 is started.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	ssi0129	0	R/W	ssi0129_enable <ul style="list-style-type: none"> <li>When ssi0129_4module_mode is 0 Starts or stops data transfer through three SSI modules (SSI0, SSI1, and SSI2) at the same time. 0: Transfer through SSI0, SSI1, and SSI2 is stopped. 1: Transfer through SSI0, SSI1, and SSI2 is started.</li> <li>When ssi0129_4module_mode is 1 Starts or stops data transfer through four SSI modules (SSI0, SSI1, SSI2, and SSI9) at the same time. 0: Transfer through SSI0, SSI1, SSI2, and SSI9 is stopped. 1: Transfer through SSI0, SSI1, SSI2, and SSI9 is started.</li> </ul>

Note: This function should be used only when data is transferred through multiple SSI modules in synchronization. When using each SSI module independently, use the EN bit of SSICRn (n = 0 to 4 and 9) for the SSI module to control the transfer.

**32.2.19 SSI SYSTEM Status Register 0 (SSI\_SYSTEM\_STATUS0)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: SSI\_SYSTEM\_STATUS0 indicates the internal buffer state. When a bit in this register is set, its status is indicated by the corresponding interrupt signal. However, when the interrupt output is masked by the SSI\_SYSTEM interrupt enable register 0, the interrupt signal is not output.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

### 32.3.1 Module Specifications

Table 32.3 shows the correspondences between the modules and functions.

**Table 32.3 Function Correspondences**

		External Interface	Format		
			Normal	TDM Extend Mode	TDM Split Mode
1	SSI0 SSI1 SSI2 SSI9	I2S	Supported	Not supported	Not supported
2	SSI0 SSI1 SSI2 SSI9	TDM	Supported	Supported	Supported
3	SSI0 SSI1 SSI2	I2S × 3 (multichannel)	Supported	Not supported	Not supported
4	SSI0 SSI1 SSI2 SSI9	I2S × 4 (multichannel)	Supported	Not supported	Not supported
5	SSI3 SSI4	I2S	Supported	Not supported	Not supported
6	SSI3 SSI4	TDM	Supported	Supported	Not supported
7	SSI5 SSI6 SSI7 SSI8	I2S	Supported	Not supported	Not supported
8	SSI5 SSI6 SSI7 SSI8	TDM	Not supported	Not supported	Not supported

### 32.3.2 Basic Configuration

Data transfer is performed between the SSIU and other audio modules or external memories via BUSIF connected to the audio local bus and the audio DMA bus. Figure 32.3 shows the data transfer of SSI0. As shown in Figure 32.3, SSI0\_1\_BUSIF, SSI0\_2\_BUSIF, and SSI0\_3\_BUSIF are not used. This basic configuration is also applied to SSI1, SSI2, and SSI9. Figure 32.4 shows the data transfer of SSI3, which is also applied to SSI4 to SSI8.

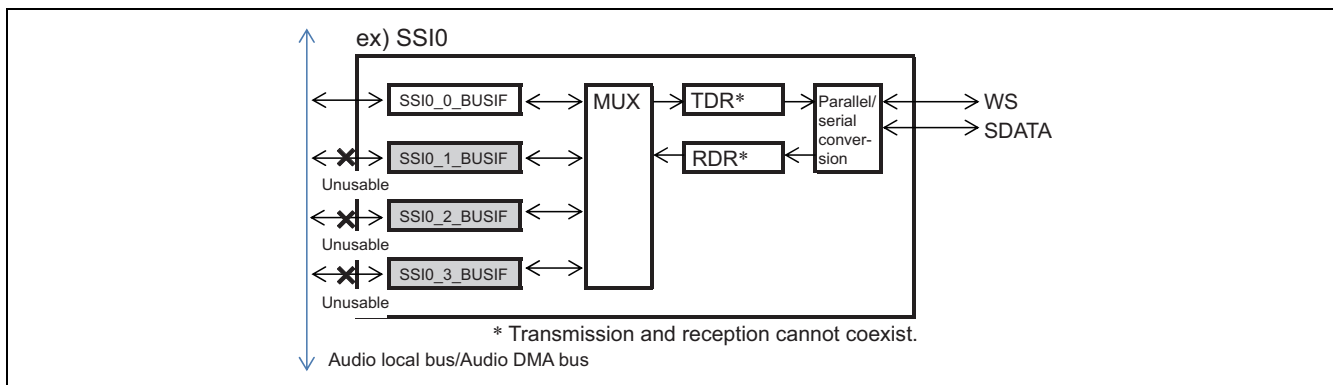

Figure 32.3 Basic Configuration (SSI0)

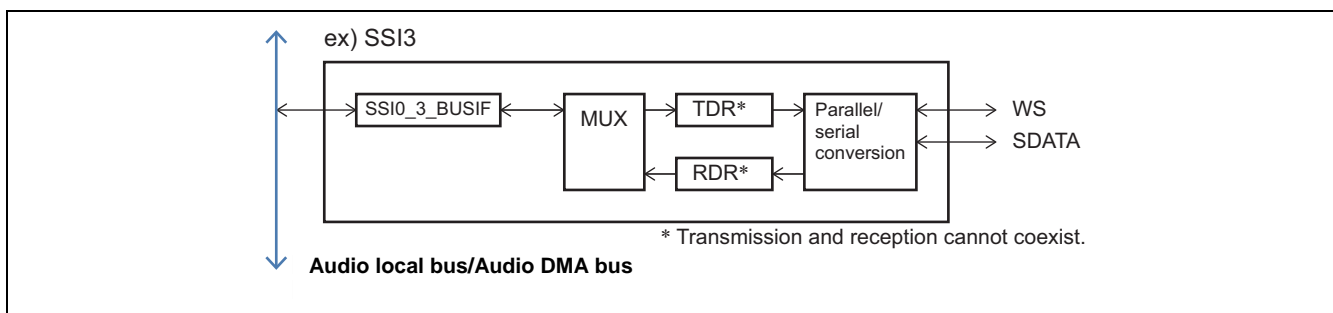

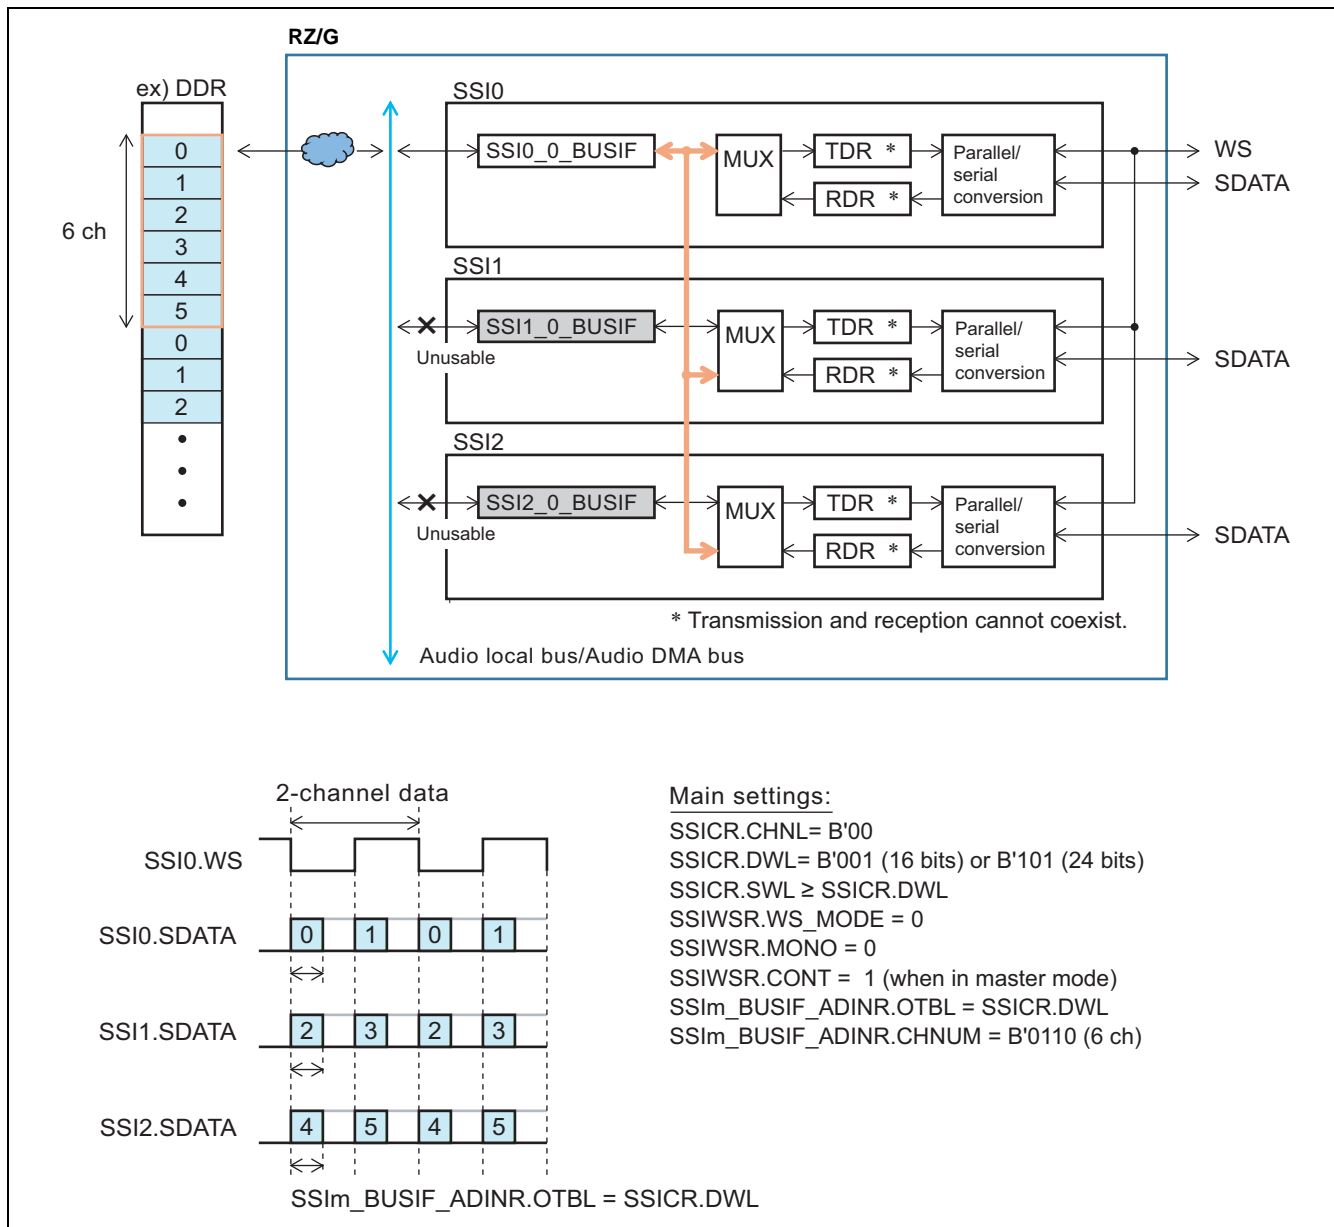

Figure 32.4 Basic Configuration (SSI3)

### 32.3.3 Configuration with Multiple SSI Modules

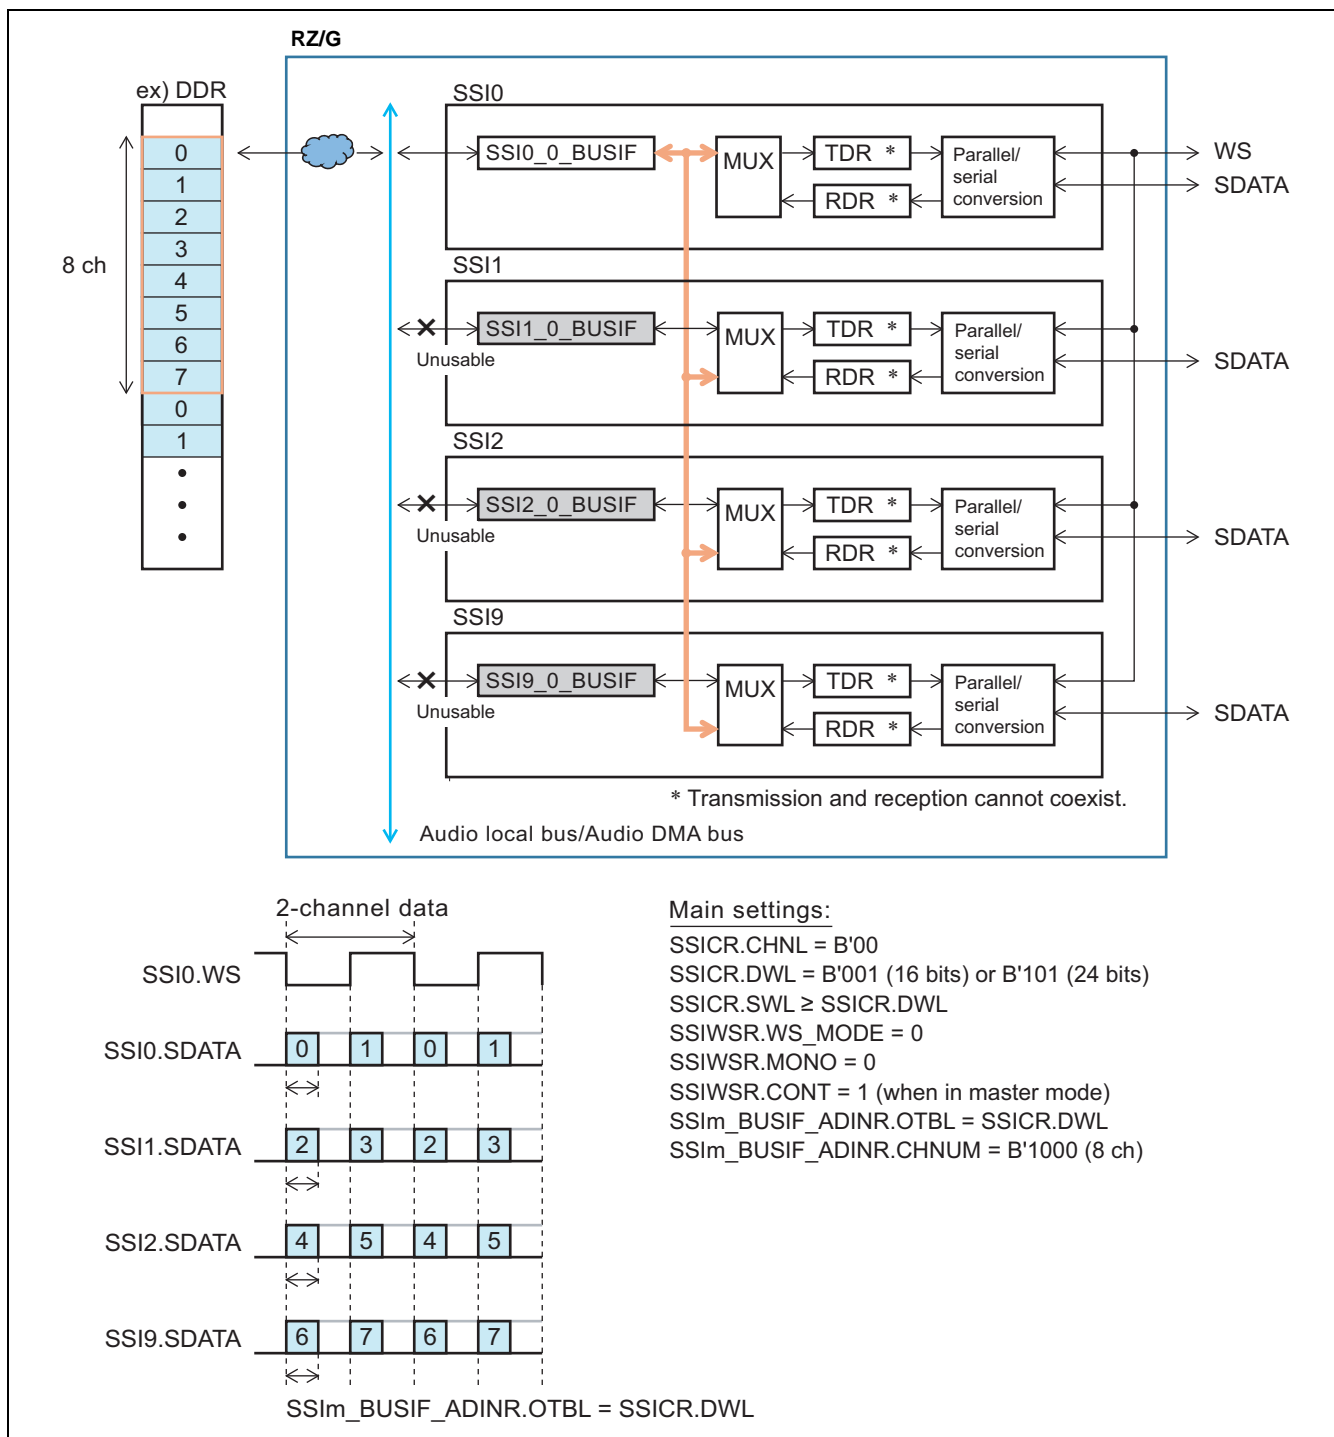

Multichannel data transfer can be performed by using multiple SSI modules. The available combination of modules is SSI0, SSI1, and SSI2 or SSI0, SSI1, SSI2, and SSI9.

**Figure 32.5 Multichannel Data Transfer (Using SSI0, SSI1 and SSI2)**

Note: When the above configuration is used, SSI0\_1\_BUSIF, SSI0\_2\_BUSIF, SSI0\_3\_BUSIF, all the BUSIFs of SSI1 and SSI2 cannot be used.

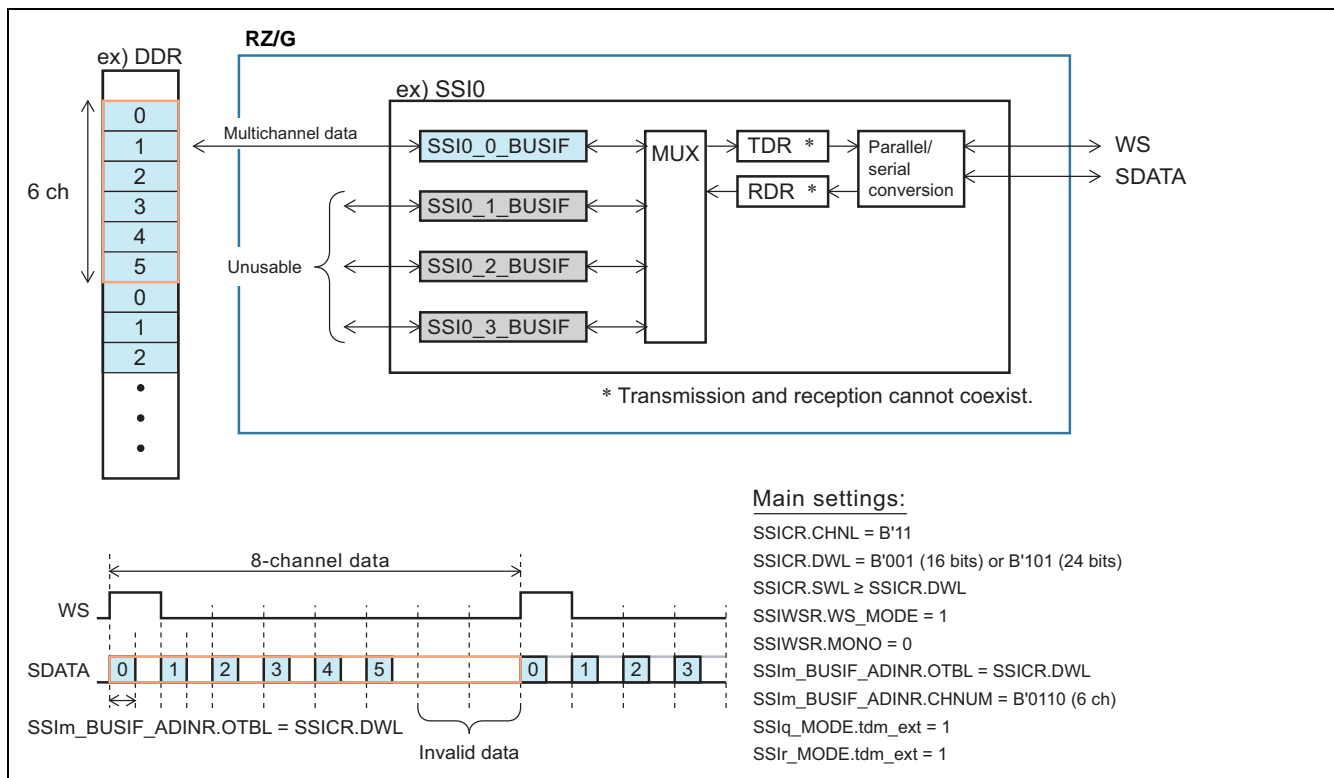

**Figure 32.6 Multichannel Data Transfer (Using SSI0, SSI1, SSI2 and SSI9)**

Note: When the above configuration is used, SSI0\_1\_BUSIF, SSI0\_2\_BUSIF, SSI0\_3\_BUSIF, all the BUSIFs of SSI1, SSI2, and SSI9 cannot be used.

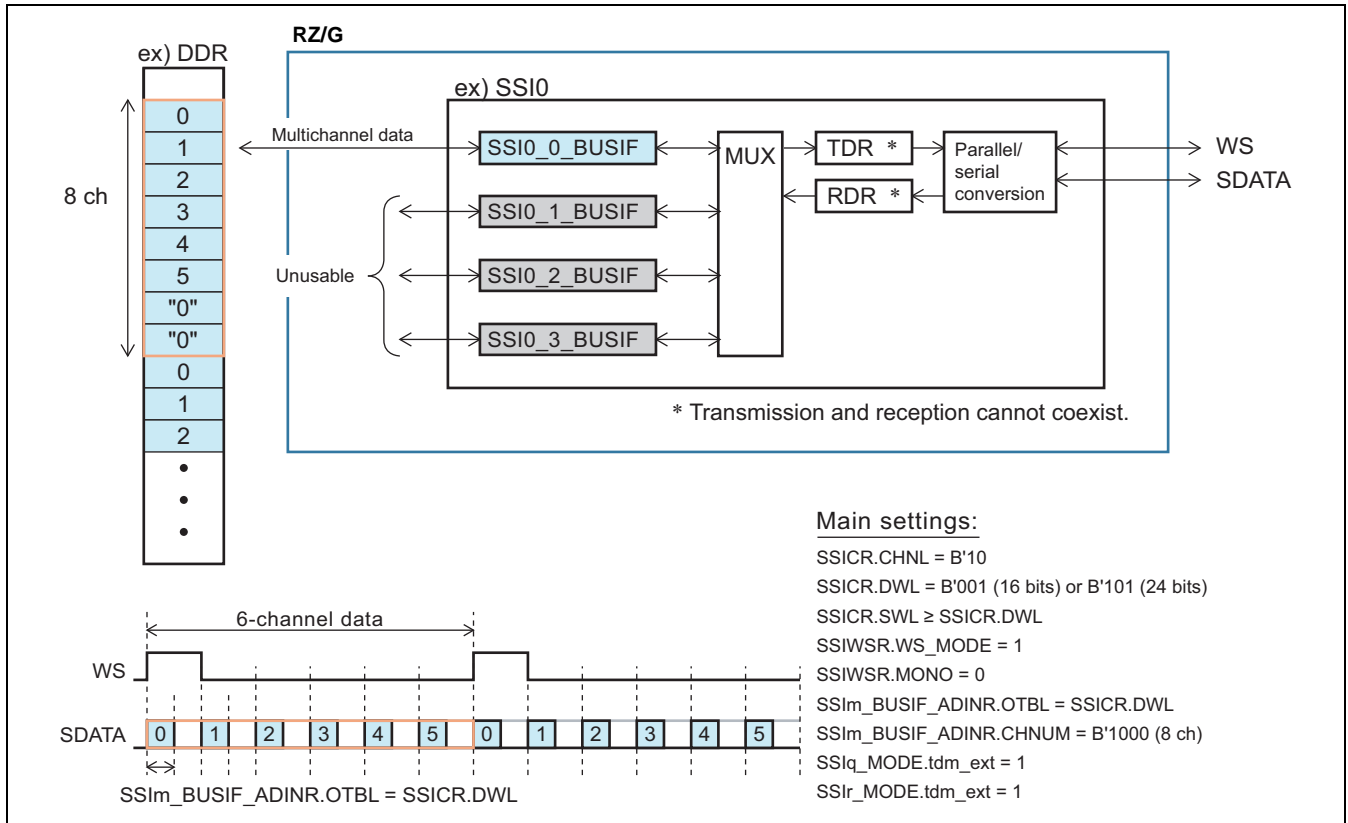

### 32.3.4 TDM Format Extension Function (TDM Extend Mode)

The TDM format extension function allows operation with 8-channel data in the serial bus and 6-channel data inside the RZ/G, or operation with 6-channel data in the serial bus and 8-channel data inside the RZ/G. This function is supported by SSI0, SSI1, SSI2, SSI3, SSI4, and SSI9.

**Figure 32.7 TDM Extend Mode Operation with 8-channel Data in Serial Bus and 6-channel Data Inside the RZ/G (SSI0)**

Note: When the above configuration is used, SSI0\_1\_BUSIF, SSI0\_2\_BUSIF, and SSI0\_3\_BUSIF cannot be used.

**Figure 32.8 TDM Extend Mode Operation with 6-channel Data in Serial Bus and 8-channel Data Inside the RZ/G (SSI0)**

Note: When the above configuration is used, SSI0\_1\_BUSIF, SSI0\_2\_BUSIF, and SSI0\_3\_BUSIF cannot be used.

### 32.3.5 TDM Format Split Function (TDM Split Mode)

The TDM format split function (TDM split mode) allows connecting four independent monaural or stereo data inside the RZ/G and outputting the data in the TDM format, and splitting TDM format input data into four independent monaural or stereo data and distributing the data inside the RZ/G. This function is supported by SSI0, SSI1, SSI2, and SSI9.

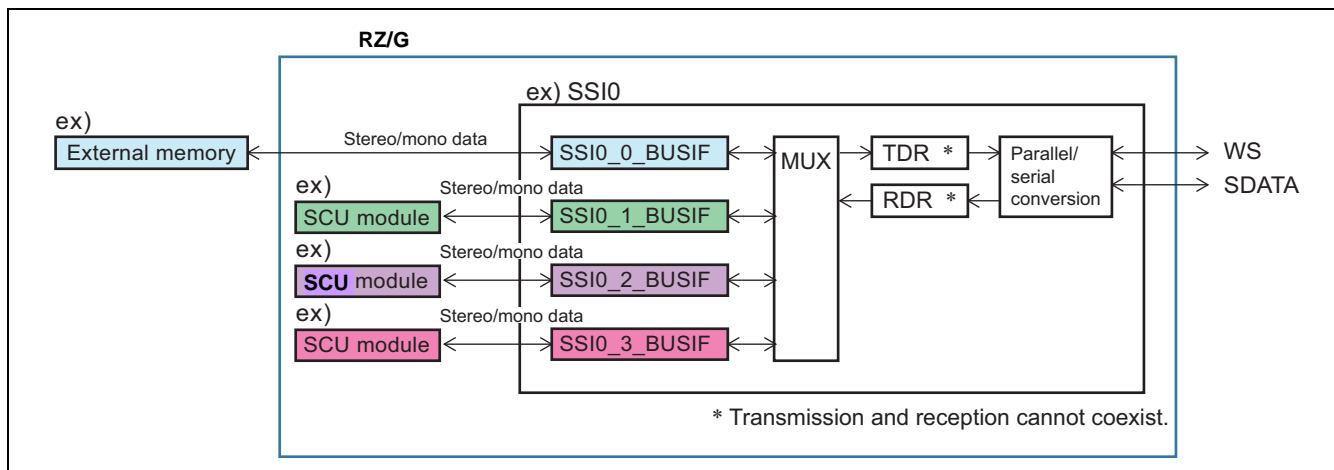

Figure 32.9 TDM Split Mode

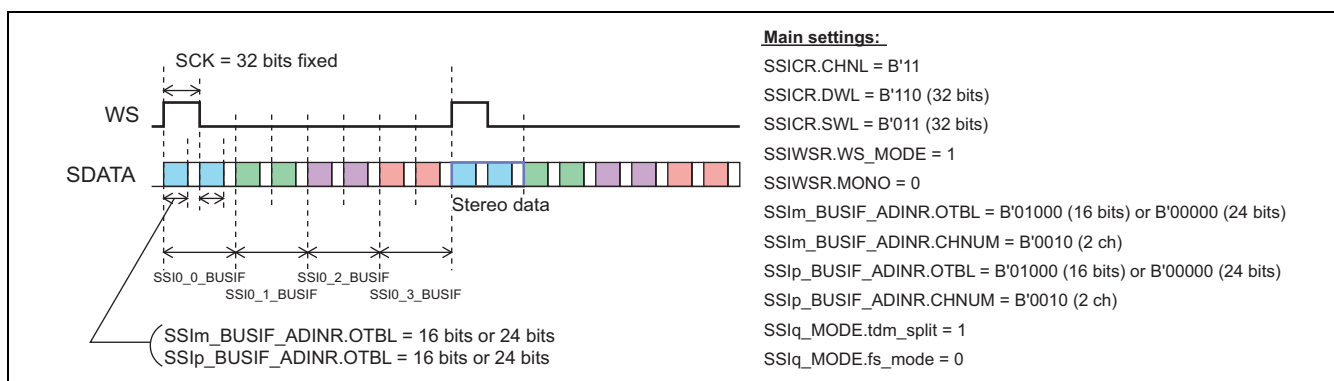

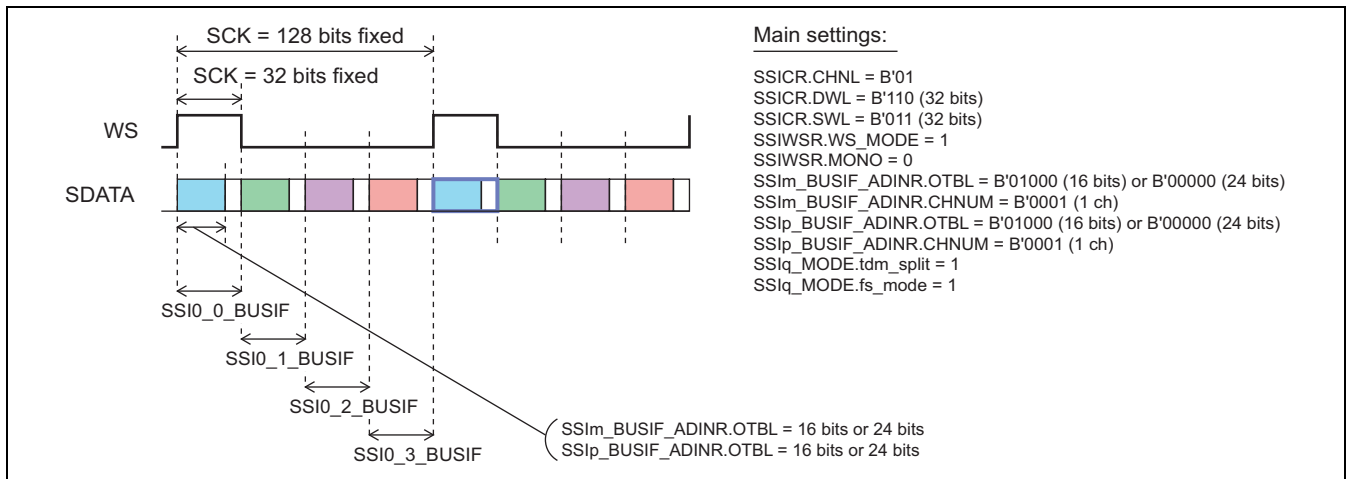

Figure 32.10 TDM Split Mode (Stereo x 4)

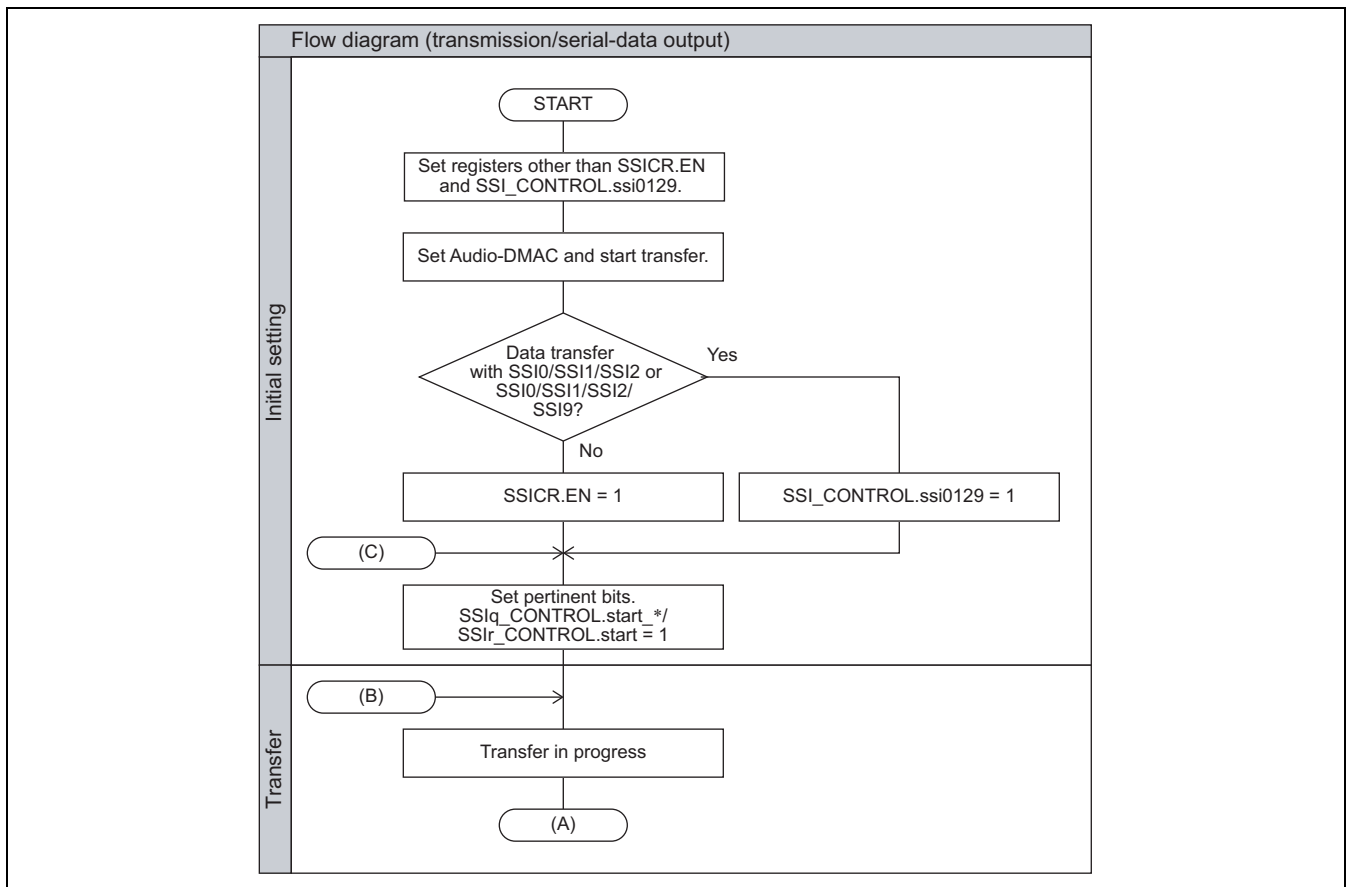

**Figure 32.11 TDM Split Mode (Monaural x 4)**

- Notes:
1. The SWL and DWL bits in SSICR should be fixed at 32-bit setting.
  2. Transmission and reception cannot coexist.
  3. Data input to BUSIFn 0 to 3 (n = 0, 1, 2, 3) should be operated synchronously with the SSI sampling frequency (WS signal cycle).

**32.3.6 Procedure of SSIU Transfer**

Figures 32.12 to 32.15 show the operation flow.

**Figure 32.12 Transmission (1)**

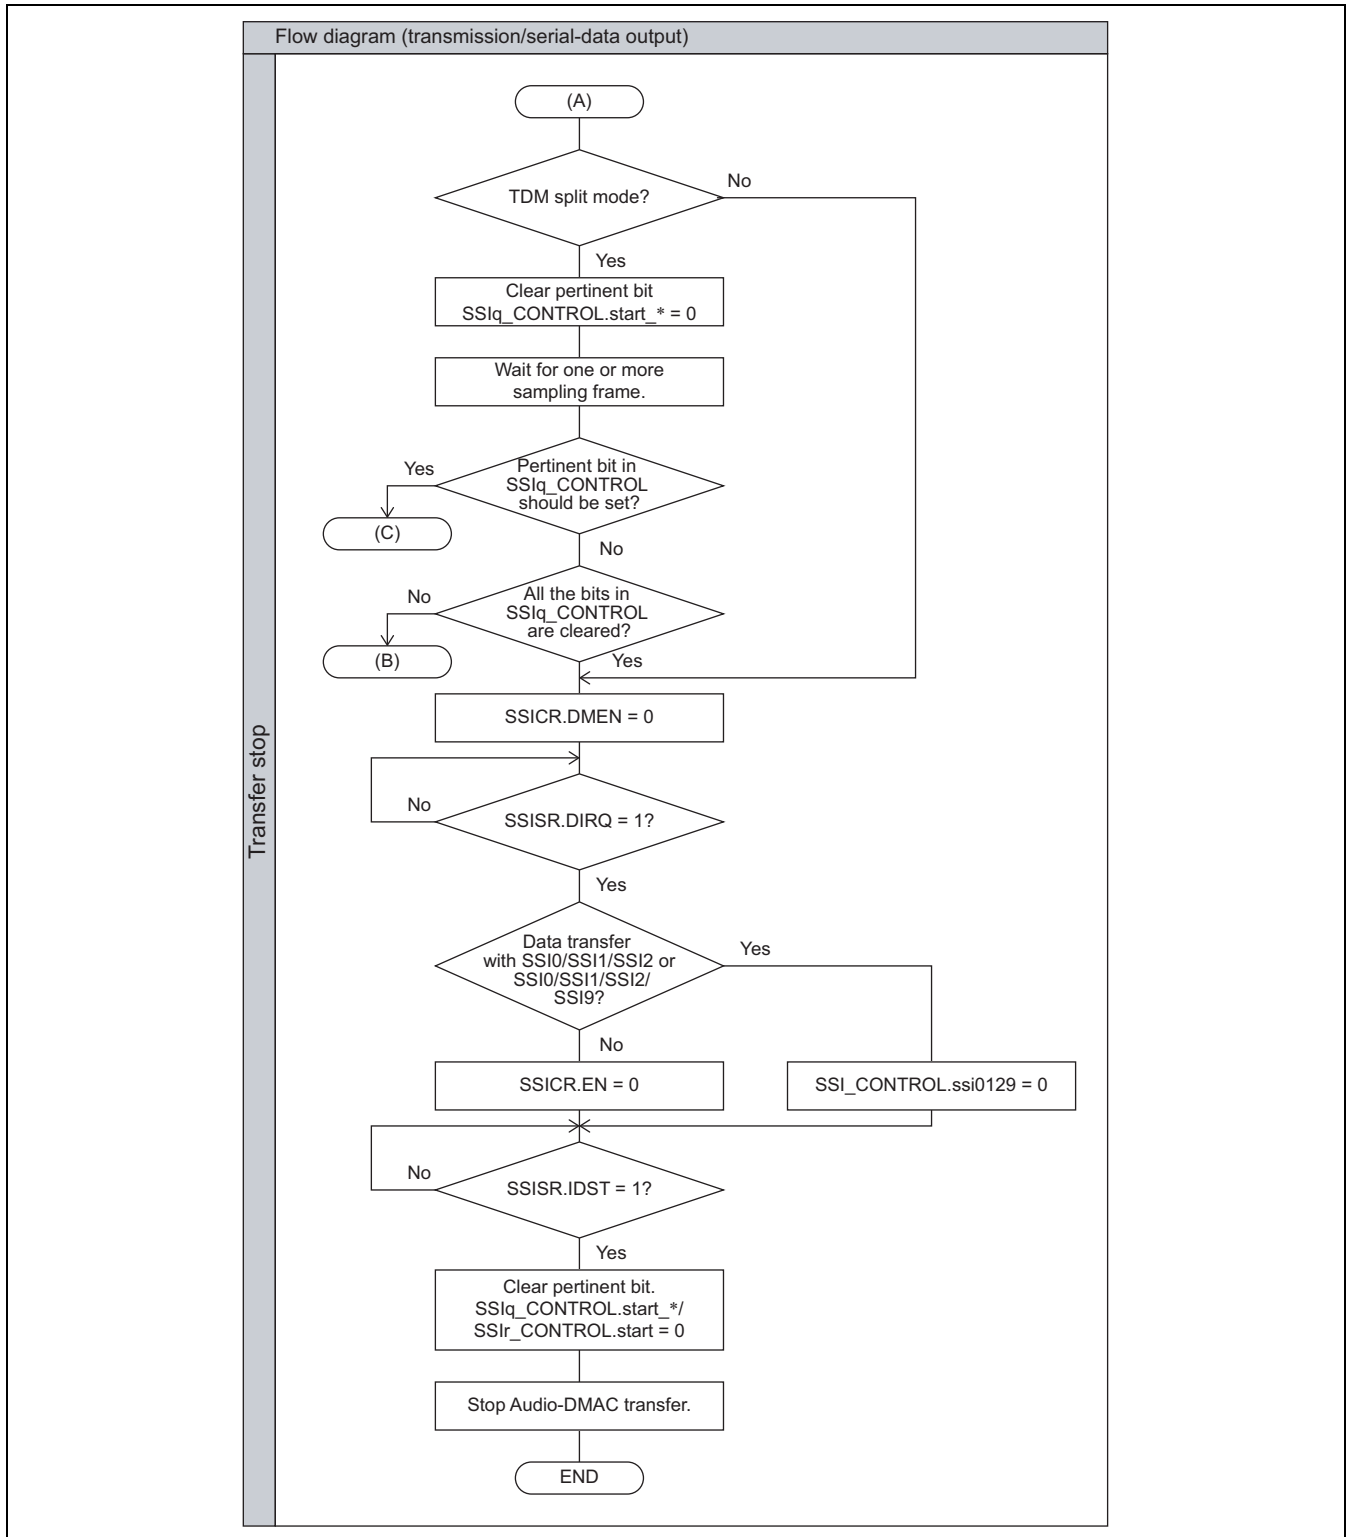

Figure 32.13 Transmission (2)

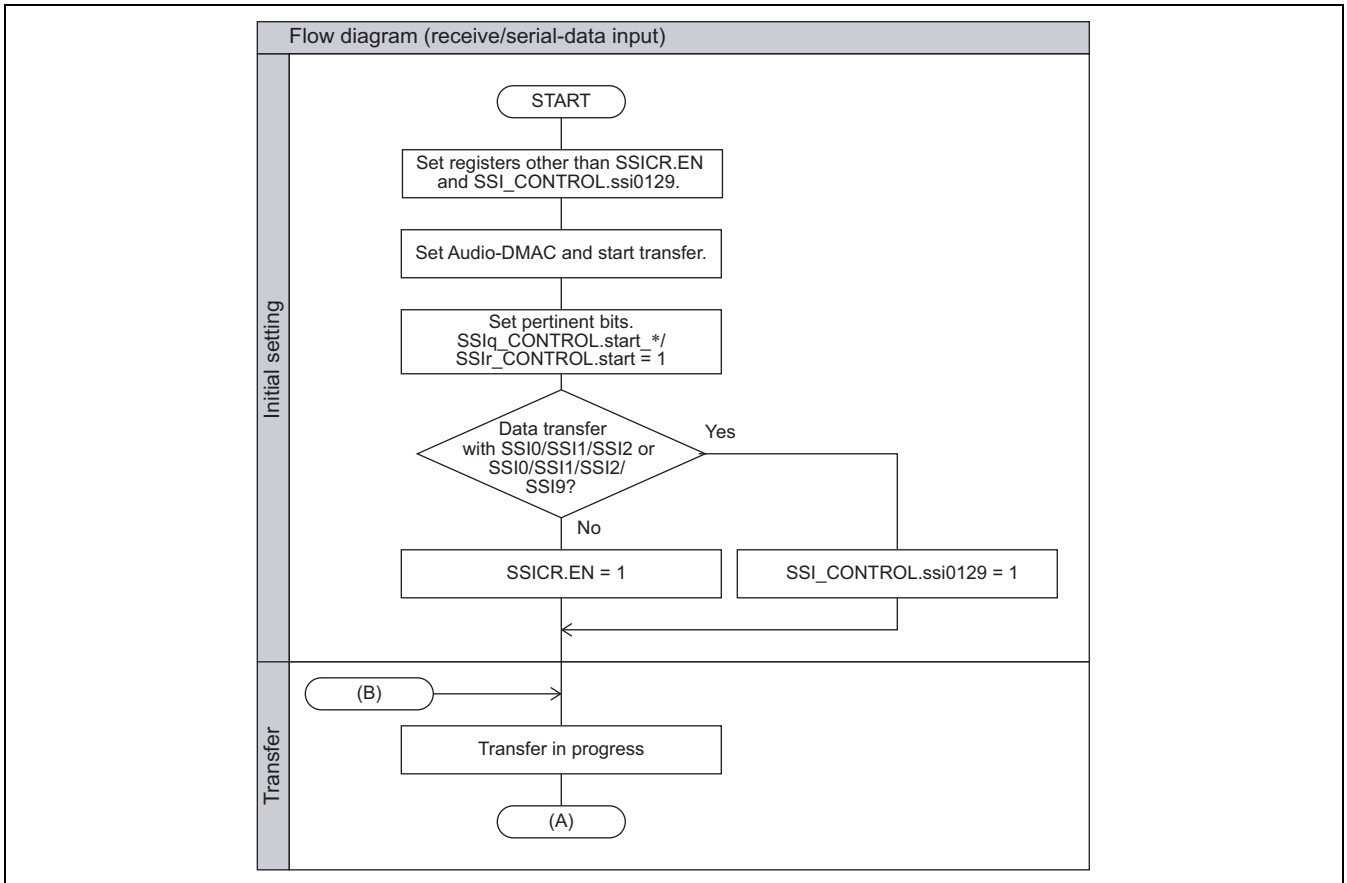

Figure 32.14 Reception (1)

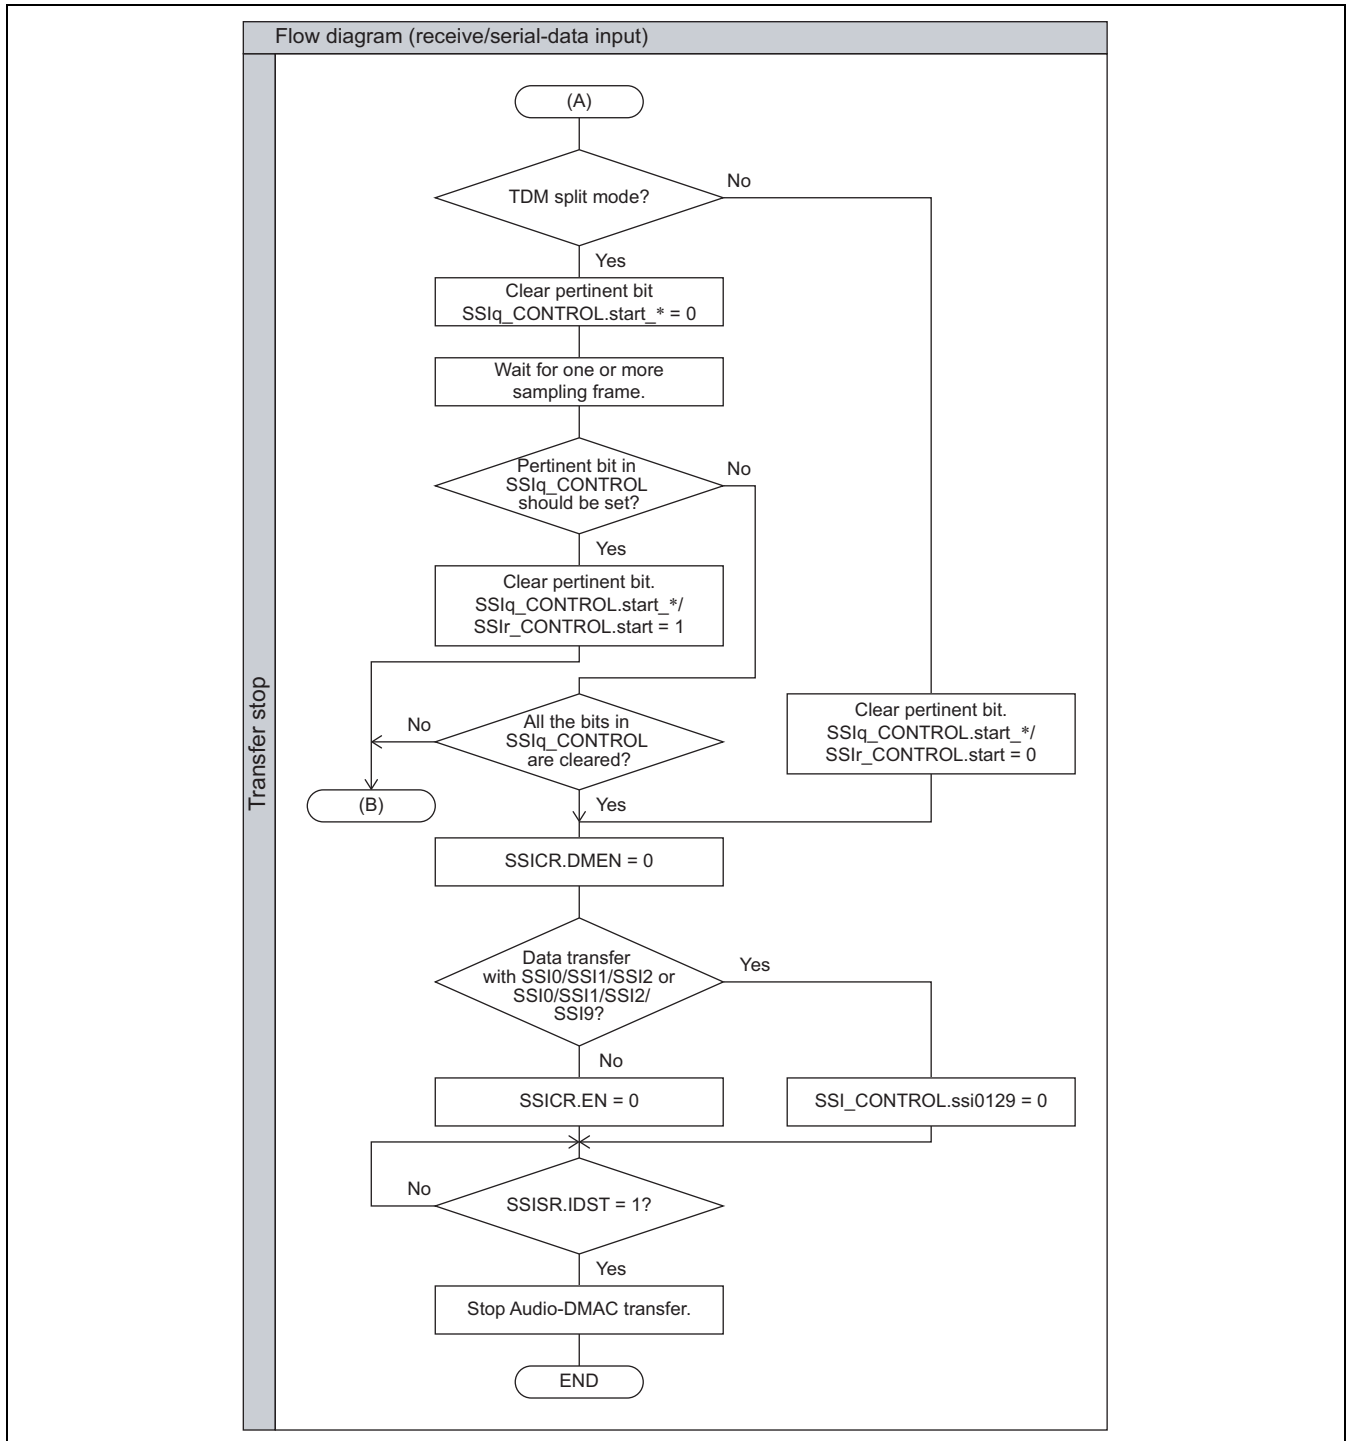

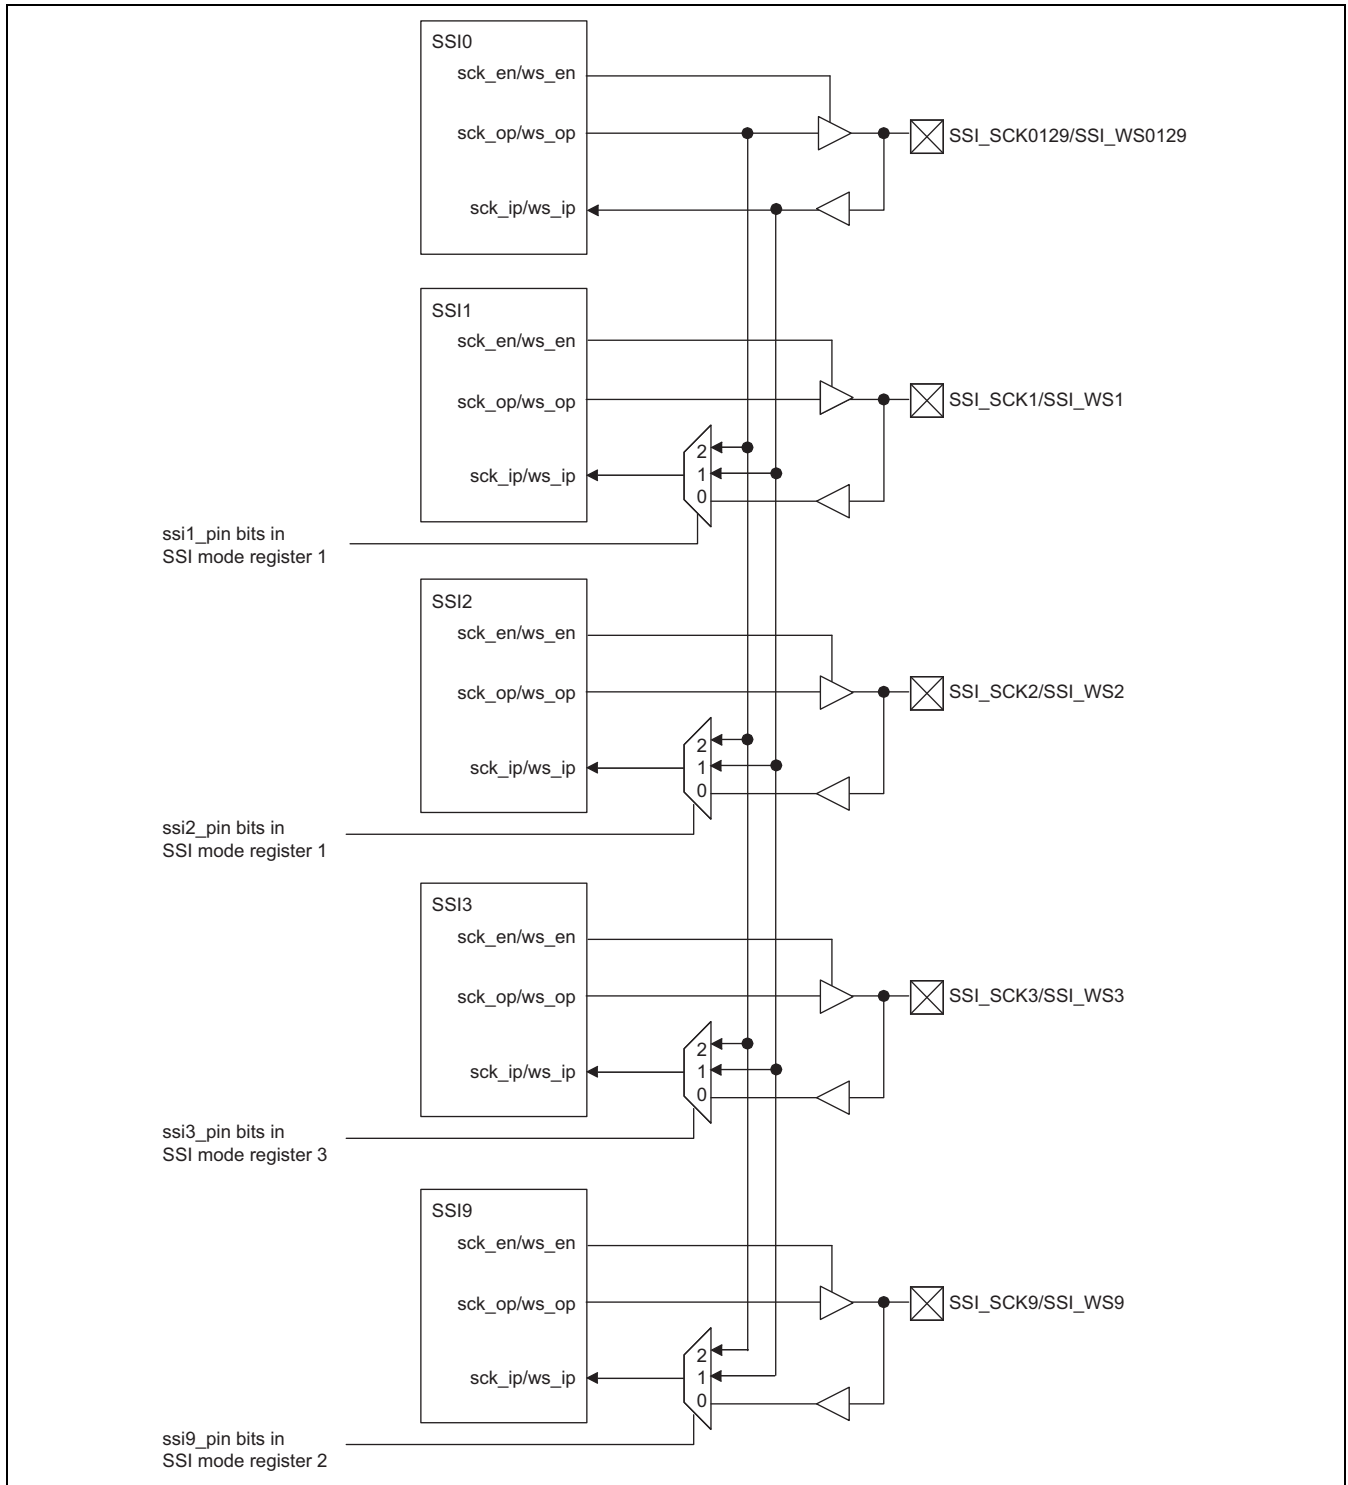

Figure 32.15 Reception (2)

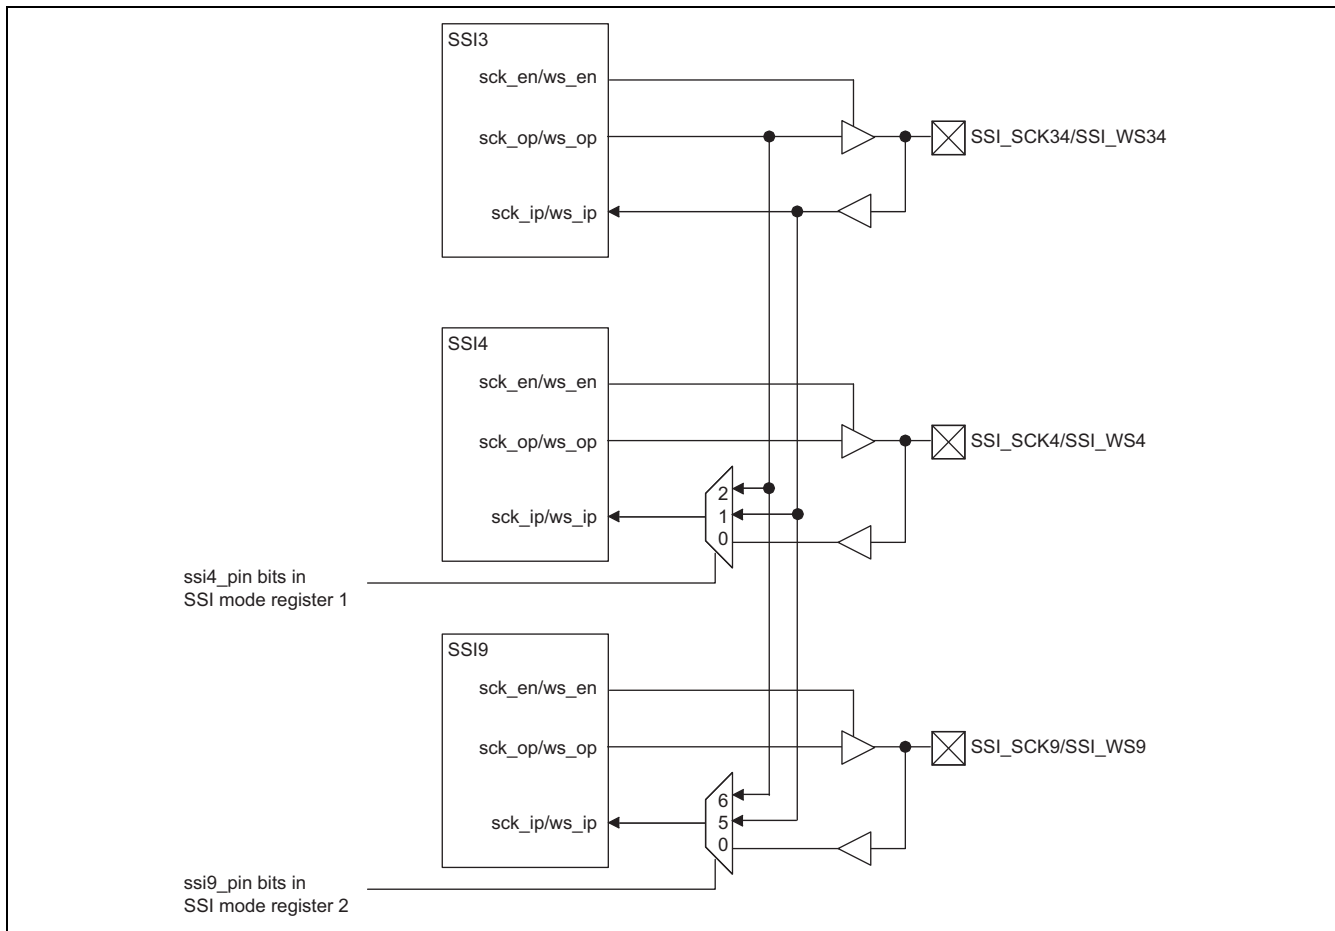

### 32.3.7 SSI Pin Connections

Multiple SSI modules (in combinations of SSI0, SSI1, SSI2, SSI3, and SSI9, SSI3, SSI4, and SSI9, and SSI7 and SSI8) can operate in synchronization with sharing of the same SSI\_SCK and SSI\_WS signals. Figures 32.16 to 32.18 show how to connect the pins for each combination of SSIs.

In the case of the combination of SSI0, SSI1, SSI2, SSI3, and SSI9, SSI0 as the master should start transfer first thus allowing output on SSI\_WS0129 and SSI\_SCK0129, after which SSI1, SSI2, SSI3, and SSI9 as the slaves should be used. If the master-side transfer is stopped by setting the CONT bit in SSIWSR to 0, the slave-side SSI1, SSI2, SSI3, and SSI9 should be stopped because output through SSI\_WS0129 is not possible. This also applies to the master and slaves in the combination of SSI3, SSI4, and SSI9, and to the master and slave in the combination of SSI7 and SSI8.

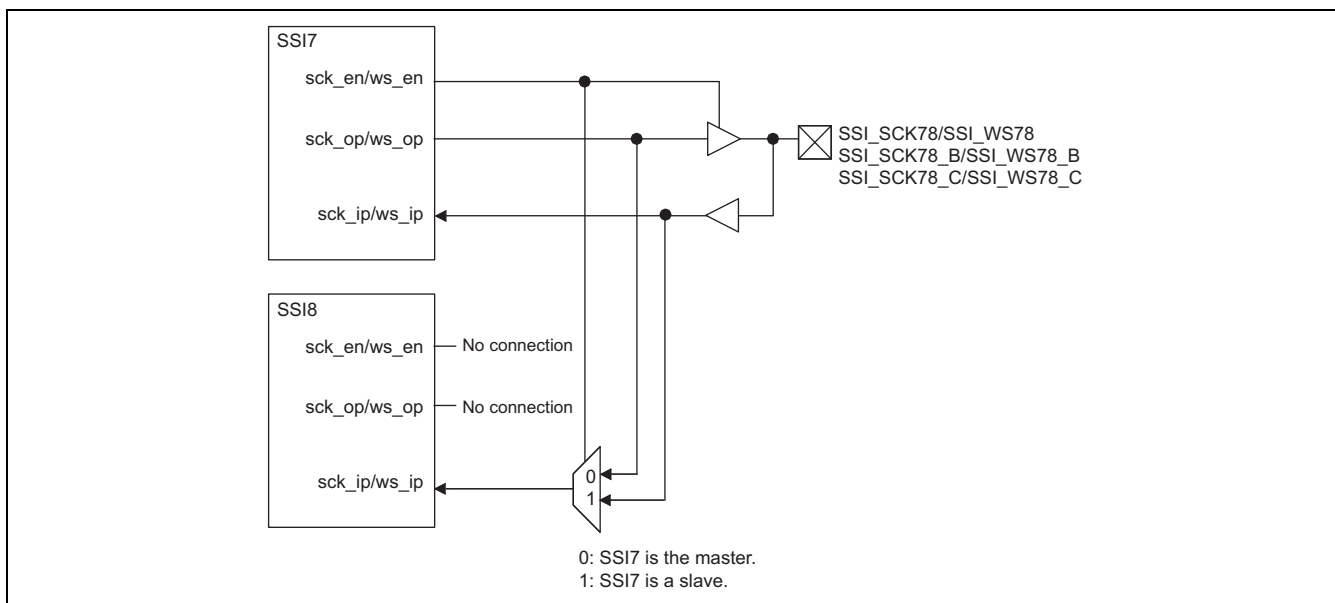

**Figure 32.16 Pin Connections for Combination of SSI0, SSI1, SSI2, SSI3, and SSI9**

**Figure 32.17 Pin Connections for Combination of SSI3, SSI4, and SSI9**

Note: The above configuration is prohibited if SSI0 SCK/WS is selected for SSI3 as shown in Figure 32.16.

**Figure 32.18 Pin Connections for Combination of SSI7 and SSI8**

## 32.4 Usage Note

RZ/G1H	RZ/G1N
RZ/G1M	RZ/G1E

### 32.4.1 Note on Transfer

If an underflow or overflow occurs, stop the transfer and restart it.

Do not stop serial clock (SCK) and word select (WS) signals during data transfer. Confirm that SSISR.IDST = 1 before stopping SCK and WS signals.

## 32A. Serial Sound Interface (SSI)

RZ/G1H

RZ/G1N

RZ/G1M

RZ/G1E

The serial sound interface (hereinafter referred to as the "SSI") is a transceiver module designed to send or receive audio data interfacing with a variety of devices offering I2S format. It also supports multi-channel mode in addition to other common formats.

### 32A.1 Features

The SSI has the following features:

- Number of channels: Maximum of four (when a multichannel format is specified)
- Operating mode: Non-compressed mode  
The non-compressed mode supports serial audio streams divided by channels.
- The SSI module can serve as both a transmitter and a receiver.
- Asynchronous transfer takes place between the data buffer and the shift register.
- Only the MSB first data alignment is supported.
- A value as the dividing ratio for the clock used by the serial bus interface is selectable.
- Controlling of data transmission or reception with DMAC or interrupt requests is possible.
- TDM format is supported.
- TDM format operation is performed at a 44.1- or 48-kHz sampling rate.
- The WS continue function by which operation can be performed without stopping WS signal is supported.
- Monaural mode (8 bits or 16 bits) is supported.
- In monaural mode, WS signal pulse width can be changed (short or long frame).
- If the sampling clock frequency is switched during transfer, it will be notified of the CPU with interrupts (a function to detect switching frequency).

Figure 32A.1 shows a block diagram of a single SSI module.

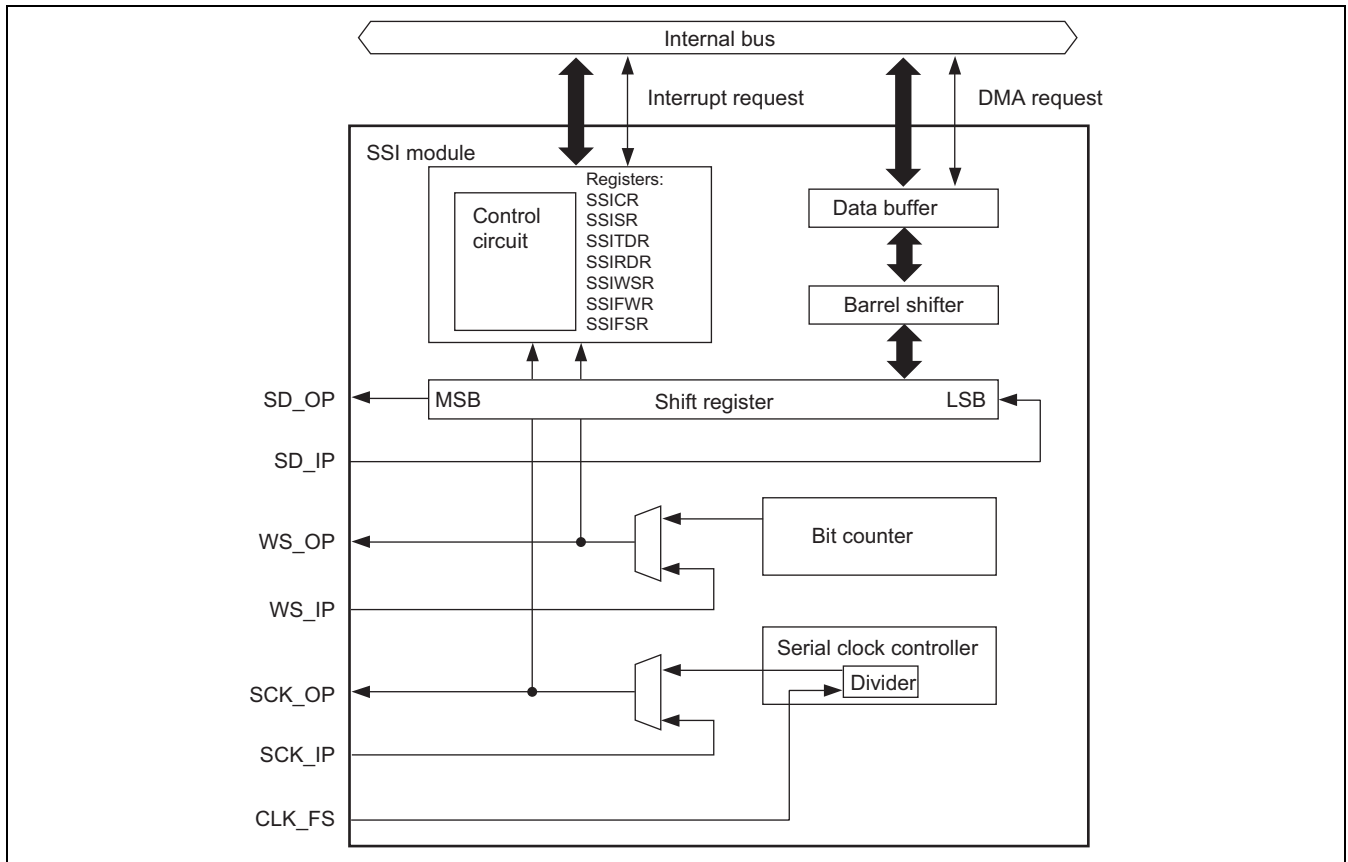

Figure 32A.1 Block Diagram of SSI

## 32A.2 Register Descriptions

The SSI has the following registers. Note that the module numbers are basically omitted from the register names in the text.

**Table 32A.1 Register Descriptions**

Module	Register Name	Abbreviation	R/W	Address	Access Size	RZ/G Series Products

Notes: Do not write to any addresses other than listed above. Operations cannot be guaranteed if writing is attempted. Values read from addresses other than those listed above are undefined.

1. For this register, bits 26 and 27 are readable/writable bits, although the others are read-only bits. For details, refer to section 32A.2.2, Status Register (SSISR<sub>n</sub>) (n = 0 to 9).
2. For this register, bits 14 and 15 are readable/writable bits, although the others are read-only bits. For details, refer to section 32A.2.7, FS Status Register (SSIFSR<sub>n</sub>) (n = 0 to 9).
3. H'EC54 1XXX and H'EC24 1XXX are used with PIO access and audio-DMAC, respectively.

[Legend for Register Descriptions]

Initial value: Register value after a reset

—: Undefined value

R/W: Readable/writable. The written value can be read.

R/WC0: Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.

R: Read-only. The write value should always be 0.

### 32A.2.1 Control Register (SSICRn) (n = 0 to 9)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

SSICR is a readable/writable 32-bit register that controls the IRQ, selects the polarity status, and sets operating mode.

### 32A.2.2 Status Register (SSISRn) (n = 0 to 9)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

SSISR consists of status flags indicating the operational status of the SSI module and bits indicating the current channel numbers and word numbers.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	DMRQ	UIRQ	OIRQ	IIRQ	DIRQ	—	—	—	—	—	—	—	—
Initial value:	—	—	—	0	0	0	—	0	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R/WC0	R/WC0	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	CHNO[1:0]	SWNO	IDST	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	0	0	1	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	Undefined	R	Reserved The read value is not guaranteed. The write value should always be 0.
28	DMRQ	0	R	DMA Request Status Flag This status flag allows the CPU to recognize the value of the DMA request pin on the SSI module. <ul style="list-style-type: none"> <li>TRMD = 0 (receive mode) If DMRQ = 1, the SSIRDR has unread data. If SSIRDR is read, DMRQ = 0 until there is new unread data.</li> <li>TRMD = 1 (transmit mode) If DMRQ = 1, SSITDR requires data to be written to continue the transmission to the audio serial bus. Once data is written to SSITDR, DMRQ = 0 until it requires further transmit data.</li> </ul>

Bit	Bit Name	Initial Value	R/W	Description
27	UIRQ	0	R/WC0	<p><b>Underflow Error Interrupt Status Flag</b></p> <p>This status flag indicates that data was supplied at a lower rate than was required.</p> <p>In either case, this bit is set to 1 regardless of the value of the UIEN bit and can be cleared by writing 0 to this bit.</p> <p>If UIRQ = 1 and UIEN = 1, an interrupt occurs.</p> <ul style="list-style-type: none"> <li>• TRMD = 0 (receive mode) If UIRQ = 1, SSIRDR was read before there was new unread data indicated by the DMRQ or DIRQ bit. This can lead to the same received data being stored twice by the host leading to potential corruption of multi-channel data.</li> <li>• TRMD = 1 (transmit mode) If UIRQ = 1, SSITDR did not have data written to it before it was required for transmission. This will lead to the same data being transmitted once more and a potential corruption of multi-channel data. This is more serious error than a receive mode underflow as the output SSI data results in error.</li> </ul> <p>Note: When underflow error occurs, the current data in the data buffer of this module is transmitted until the next data is filled.</p>
26	OIRQ	0	R/WC0	<p><b>Overflow Error Interrupt Status Flag</b></p> <p>This status flag indicates that data was supplied at a higher rate than was required.</p> <p>In either case this bit is set to 1 regardless of the value of the OIEN bit and can be cleared by writing 0 to this bit.</p> <p>If OIRQ = 1 and OIEN = 1, an interrupt occurs.</p> <ul style="list-style-type: none"> <li>• TRMD = 0 (receive mode) If OIRQ = 1, SSIRDR was not read before there was new unread data written to it. This will lead to the loss of a data and a potential corruption of multi-channel data.</li> <li>• TRMD = 1 (transmit mode) If OIRQ = 1, SSITDR had data written to it before it was transferred to the shift register. This will lead to the loss of a data and a potential corruption of multi-channel data.</li> </ul> <p>Note: When overflow error occurs, the current data in the data buffer of this module is overwritten by the next incoming data from the SSI interface.</p>
25	IIRQ	Undefined	R	<p><b>Idle Mode Interrupt Status Flag</b></p> <p>This interrupt status flag indicates whether the SSI module is in idle state.</p> <p>This bit is set regardless of the value of the IIEN bit to allow polling.</p> <p>“Idle state” refers to the state where the serial bus has been stopped after activation of the SSI.</p> <p>The interrupt can be masked by clearing IIEN, but cannot be cleared by writing to this bit.</p> <p>If IIRQ = 1 and IIEN = 1, an interrupt occurs.</p> <p>0: The SSI module is not in idle state. 1: The SSI module is in idle state.</p>

Bit	Bit Name	Initial Value	R/W	Description
24	DIRQ	0	R	<p>Data Interrupt Status Flag</p> <p>This status flag indicates that the module has data to be read or requires data to be written.</p> <p>In either case this bit is set to 1 regardless of the value of the DIEN bit to allow polling.</p> <p>The interrupt can be masked by clearing DIEN, but cannot be cleared by writing to this bit.</p> <p>If DIRQ= 1 and DIEN = 1, an interrupt occurs.</p> <ul style="list-style-type: none"> <li>• TRMD = 0 (receive mode) <ul style="list-style-type: none"> <li>0: No unread data in SSIRDR</li> <li>1: Unread data in SSIRDR</li> </ul> </li> <li>• TRMD = 1 (transmit mode) <ul style="list-style-type: none"> <li>0: Transmit buffer is full.</li> <li>1: Transmit buffer is empty and requires data to be written to SSITDR.</li> </ul> </li> </ul>
23 to 4	—	—	R	<p>Reserved</p> <p>The read value is not guaranteed. The write value should always be 0.</p>
3, 2	CHNO[1:0]	00	R	<p>Channel Number</p> <p>These bits indicate the current channel number. However, if the length of data words is 8 or 16 bits, the value of these bits is meaningless.</p> <p>00: 1st channel 01: 2nd channel 10: 3rd channel 11: 4th channel</p> <ul style="list-style-type: none"> <li>• TRMD = 0 (receive mode) <p>CHNO indicates which channel the data in SSIRDR currently represents. This value will change as the data in SSIRDR is updated from the shift register.</p> </li> <li>• TRMD = 1 (transmit mode) <p>CHNO indicates which channel is required to be written to SSITDR. This value will change as the data is copied to the shift register, regardless of whether the data is written to SSITDR.</p> <p>These bits cannot be used when WS_MODE = 1 or CONT = 1 in the WS mode register.</p> </li> </ul>

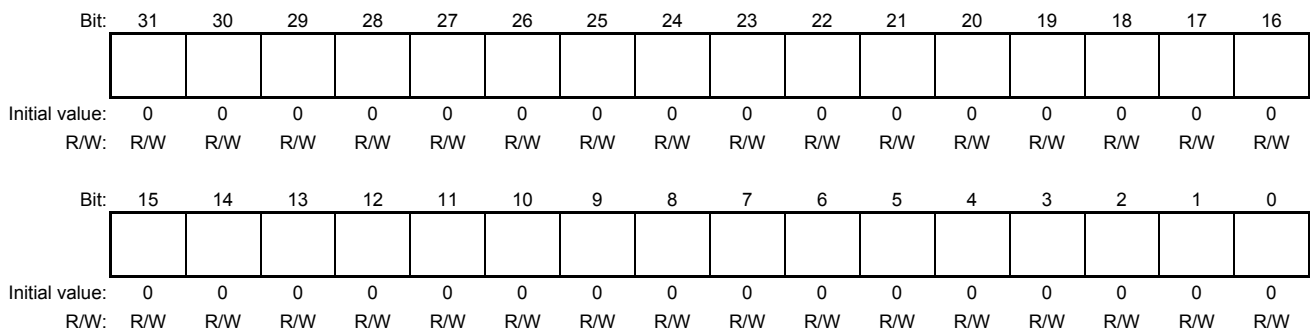

Bit	Bit Name	Initial Value	R/W	Description
1	SWNO	1	R	<p>System Word Number</p> <p>This status bit indicates the current word number. However, if the length of data words is 8 or 16 bits, the value of this bit is meaningless.</p> <ul style="list-style-type: none"> <li>• TRMD = 0 (receive mode) SWNO indicates which system word the data in SSIRDR currently represents. This value will change as the data in SSIRDR is updated from the shift register, regardless of whether SSIRDR has been read.</li> <li>• TRMD = 1 (transmit mode) SWNO indicates which system word is required to be written to SSITDR. This value will change as the data is copied to the shift register, regardless of whether the data is written to SSITDR. This bit cannot be used when WS_MODE = 1 or CONT = 1 in the WS mode register.</li> </ul>
0	IDST	Undefined	R	<p>Idle Mode Status Flag</p> <p>This status flag indicates that the serial bus activity has stopped. This bit is cleared if EN = 1 and the serial bus are currently active. This bit is automatically set to 1 under the following conditions.</p> <ul style="list-style-type: none"> <li>• SSI = Master transmitter (SWSD = 1 and TRMD = 1) This bit is set to 1 when the EN bit is cleared and data written in SSITDR has been output from the serial data input/output pin (SSI_SDATA).</li> <li>• SSI = Master receiver (SWSD = 1 and TRMD = 0) This bit is set to 1 when the EN bit is cleared and transfer of the current system word is completed.</li> <li>• SSI = Slave transmitter/receiver (SWSD = 0) This bit is set to 1 when the EN bit is cleared and transfer of the current system word is completed.</li> </ul> <p>Note: If an external device stops the serial bus clock before transfer of the current system word is completed, this bit is not set.</p>

### 32A.2.3 Transmit Data Register (SSITDRn) (n = 0 to 9)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

SSITDR is a 32-bit register that holds data to be transmitted.

Data written to this register is transferred to the shift register upon transmission request. If the data word length is less than 32 bits, the alignment is determined by the setting of the PDTA control bit in SSICR. The data in the buffer can be accessed by reading this register.

### 32A.2.4 Receive Data Register (SSIRDRn) (n = 0 to 9)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

SSIRDR is a 32-bit register that stores receive messages.

Data in this register is transferred from the shift register each time data word is received. If the data word length is less than 32 bits, the alignment is determined by the setting of the PDTA control bit in SSICR.

**32A.2.5 WS Mode Register (SSIWSRn) (n = 0 to 9)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

SSIWSR is a 32-bit readable/writable register that sets the TDM format, monaural format, and WS continue function.

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved The read value is 0. The write value should always be 0.
20 to 16	WIDTH[4:0]	00000	R/W	SYNC Pulse Width Change <ul style="list-style-type: none"> <li>When the TDM format is used (WS_MODE = 1 and MONO = 0 in this register):                             <ul style="list-style-type: none"> <li>00000: TDM format</li> <li>Other than 00000: Setting prohibited</li> </ul> </li> <li>When the monaural format is used (WS_MODE = 1 and MONO = 1 in this register):                             <ul style="list-style-type: none"> <li>00000: Setting prohibited</li> <li>00001: Pulse width is equivalent to one cycle of SCK.</li> <li>00010: Pulse width is equivalent to two cycles of SCK.</li> <li>...</li> <li>11111: Pulse width is equivalent to 31 cycles of SCK.</li> </ul> </li> </ul> Note that the set value of the system word length bits (SWL) in SSICR should be greater than that of the SYNC pulse width bits (WIDTH) when the monaural format is used.
15 to 9	—	All 0	R	Reserved The read value is 0. The write value should always be 0.
8	CONT	0	R/W	WS Continue Function <ul style="list-style-type: none"> <li>0: WS continue function is disabled.</li> <li>1: WS continue function is enabled.</li> </ul> Note: This bit can only be set in master mode (SSICR.SCKD = 1, SSICR.SWSD = 1).
7 to 2	—	All 0	R	Reserved The read value is 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
1	MONO	0	R/W	TDM Format/Monaural Format Selects the TDM format or monaural format. When the normal stereo format, multi-channel format, this bit should be 0. 0: TDM format 1: Monaural format
0	WS_MODE	0	R/W	WS Mode 0: Stereo format, multi-channel format 1: TDM format, monaural format

### 32A.2.6 FS Mode Register (SSIFMRn) (n = 0 to 9)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

SSIFMR is used to set the frequency switching detection function.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R/WC0	R/WC0	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved The read value is 0. The write value should always be 0.
15	FCST	0	R/WC0	WS Stopped Status Flag In the frequency switching detection function, this status flag reflects the state that the WS signal is stopped. When FCST = 1, this bit indicates that the WS signal has stopped (the state is detected only when FSEN in SSIFMR = 1). Write 0 if this bit is cleared to 0.
14	DTST	0	R/WC0	Frequency Switching Detection Status Flag In the frequency switching detection function, this status flag reflects the state that frequency switching has been detected. When DTST = 1, this bit indicates that the switching has been detected (the state is detected only when FSEN in SSIFMR = 1). Write 0 if this bit is cleared to 0.
13, 12	—	0	R	Reserved The read value is 0. The write value should always be 0.
11 to 0	FCNT[11:0]	H'000	R	Frequency Count Monitor When the frequency switching detection function is enabled, the count value between WS signal edges is reflected according to the setting of the operating mode and the serial WS polarity (SWSP in SSICR). This value is updated when the frequency is switched and the WS signal has been detected.

## 32A.3 Operation

### 32A.3.1 Bus Format

The SSI module can operate as a transmitter or a receiver and can be configured into many serial bus formats in either mode.

The bus format can be selected from one of the four major modes shown in Table 32A.2.

**Table 32A.2 Bus Format for SSI Module**

	SSICR																SSIWSR				
	TRMD	SCKD	SWSD	EN	MUEN	DIEN	IEN	OIEN	UIEN	DEL	PDTA	SDTA	SPDP	SWSP	SCKP	SWL[2:0]	DWL[2:0]	CHNL	WS_MODE	MONO	CONT
Non-compressed slave receiver	0	0	0	Control bits						Configuration bits									WS mode bits		
Non-compressed slave transmitter	1	0	0																		
Non-compressed master receiver	0	1	1																		
Non-compressed master transmitter	1	1	1																		

### 32A.3.2 Non-compressed Modes

The non-compressed modes support all serial audio streams split into channels. They support I2S, left-aligned, and right-aligned formats as well as many more variants on these modes.

#### (1) Slave receiver

This mode allows the module to receive serial data from another device. The clock and word select signal used for the serial data stream is also supplied from an external device. If these signals do not conform to the format specified in the configuration fields of the SSI module, operation is not guaranteed.

#### (2) Slave transmitter

This mode allows the module to transmit serial data to another device. The clock and word select signal used for the serial data stream is also supplied from an external device. If these signals do not conform to the format specified in the configuration fields of the SSI module, operation is not guaranteed.

#### (3) Master receiver

This mode allows the module to receive serial data from another device. The clock and word select signals are internally derived from the CLK\_FS input clock. The format of these signals is defined in the configuration fields of the SSI module. If the incoming data does not follow the configured format, operation is not guaranteed.

#### (4) Master transmitter

This mode allows the module to transmit serial data to another device. The clock and word select signals are internally derived from the CLK\_FS input clock. The format of these signals is defined in the configuration fields of the SSI module.

(5) Setting for each format

Table 32A.3 shows the setting for each format:

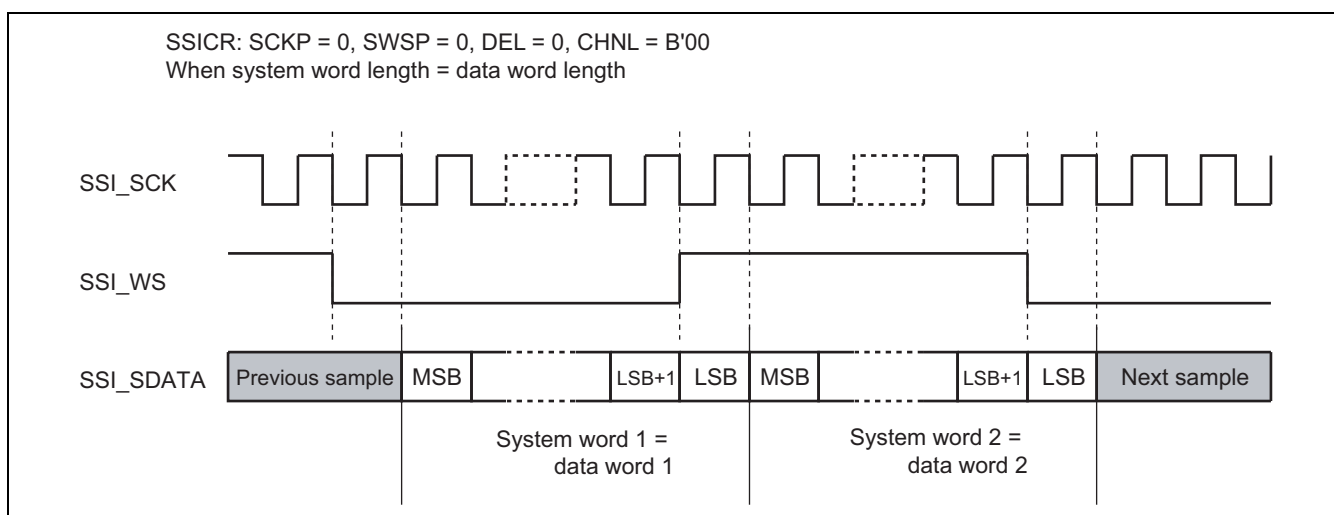

**Table 32A.3 Setting for Each Format**

Format	SSICR	SSIWSR		
	CHNL[1:0]	WS_MODE	MONO	WIDTH[4:0]
Stereo format	B'00	0	0	B'00000
Multi-channel format	B'01/B'10/B'11	0	0	B'00000
Monaural format	B'00	1	1	B'00001 to B'11111
TDM format	B'01/B'10/B'11	1	0	B'00000

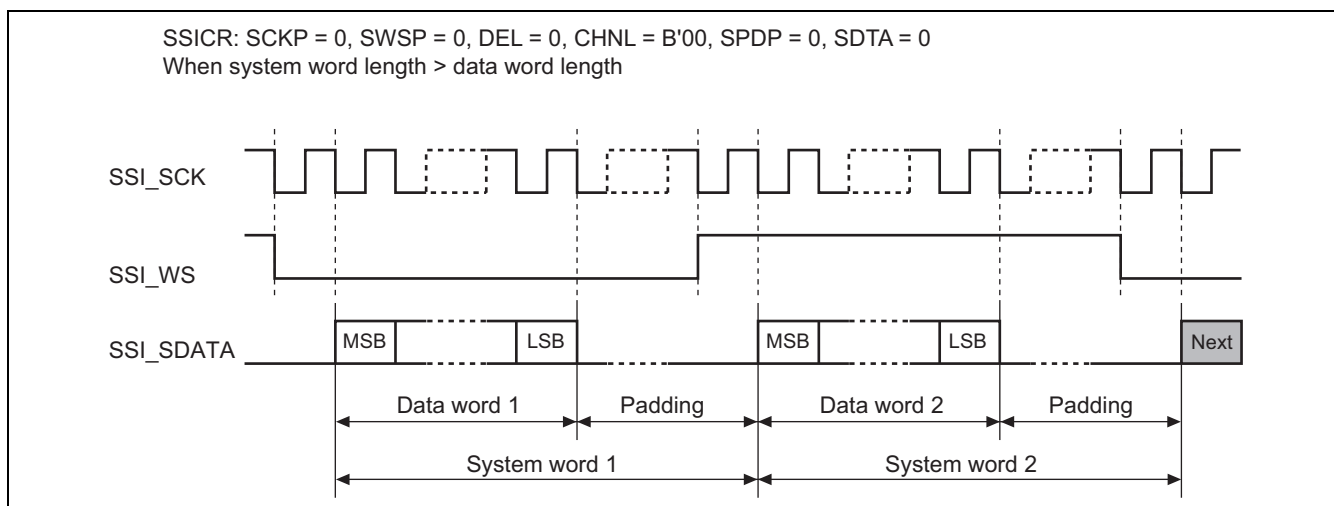

(6) Configuration bits (related to word length)

All bits related to the SSICR's word length are valid in non-compressed modes. There are many configurations the SSI module supports, but only some of the combinations are shown below for the I2S, left-aligned, and right-aligned formats.

Figures 32A.2 and 32A.3 demonstrate the supported I2S format both with and without padding. Padding occurs when the data word length is smaller than the system word length.

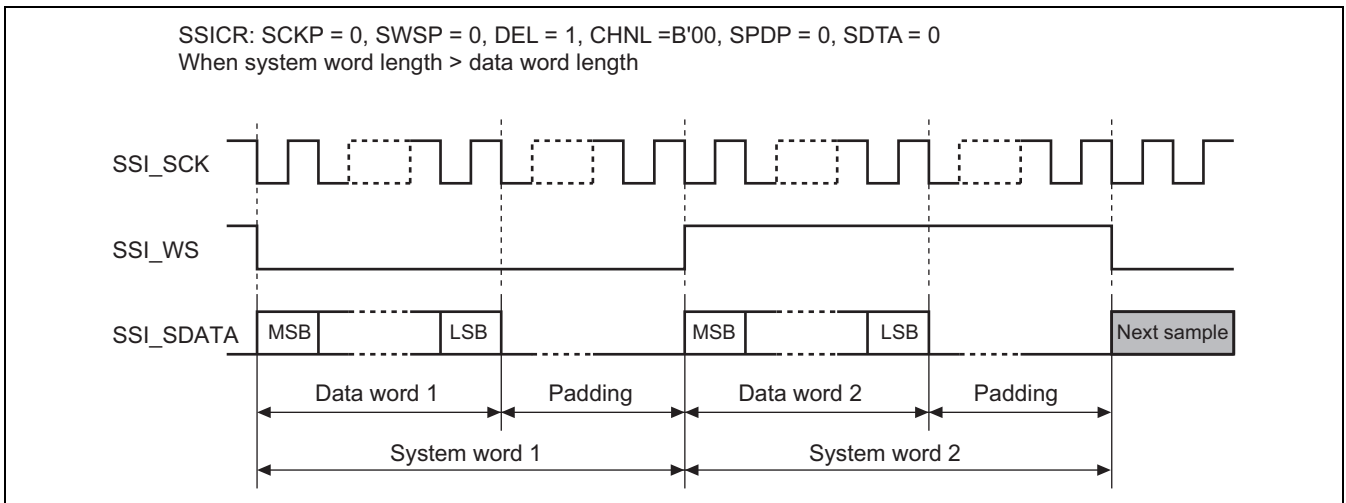

**Figure 32A.2 I2S Format (without Padding)**

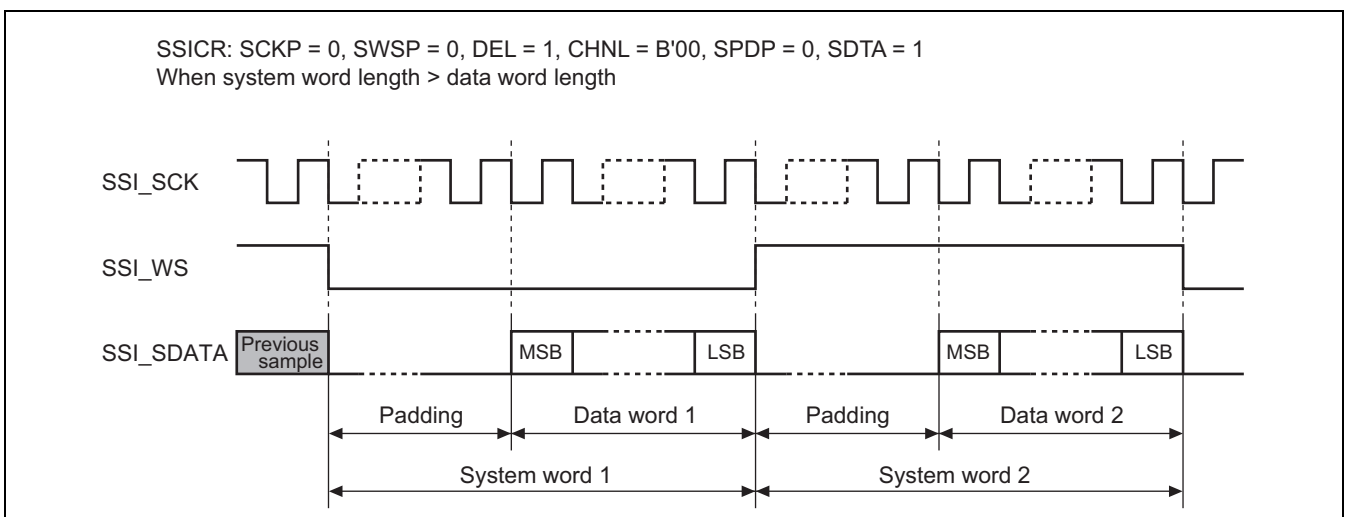

**Figure 32A.3 I2S Format (with Padding)**

Figure 32A.4 shows the left-aligned format and Figure 32A.5 shows the right-aligned format. Padding is assumed in both cases, but may not be present in a final implementation if the system word length equals the data word length.

**Figure 32A.4 Left-Aligned Format**  
**(Transmitting and Receiving in the Order of Serial Data and Padding Bits)**

**Figure 32A.5 Right-Aligned Format**  
**(Transmitting and Receiving in the Order of Padding Bits and Serial Data)**

**(7) Multi-channel formats**

Some devices extend the definition of the I2S format and allow more than two channels to be transferred within two system words.

The SSI module supports the transfer of two, three, and four channels by using the CHNL, SWL and DWL bits only when the system word length (SWL) is greater than or equal to the data word length (DWL) multiplied by channels (CHNL).

Table 32A.4 shows the number of padding bits for each of the valid setting. If setting is not valid, "—" is indicated instead of a number.

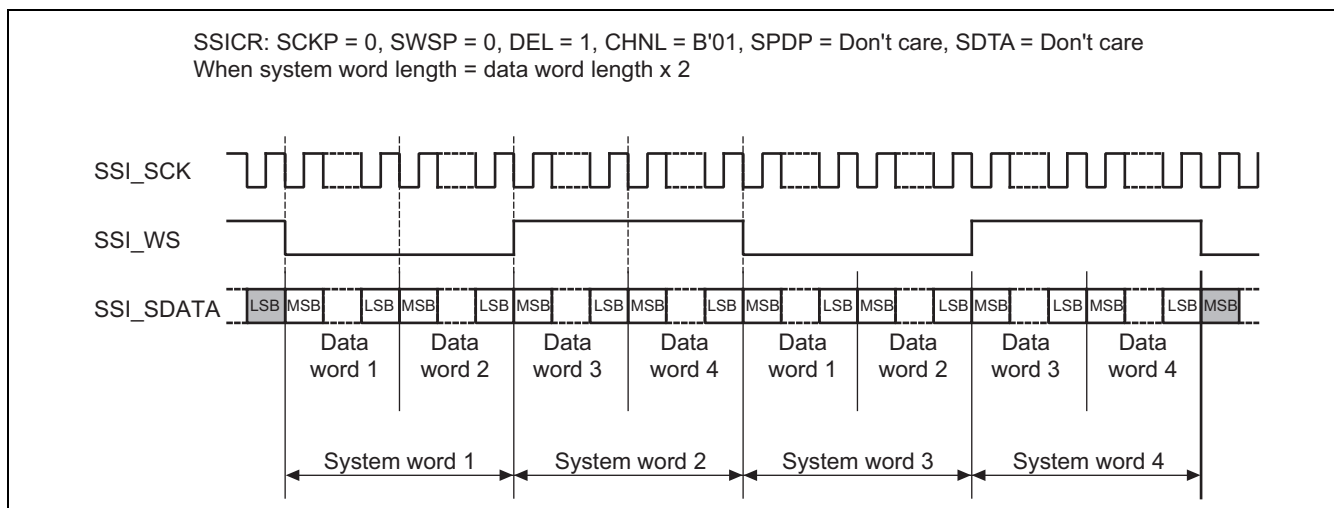

**Table 32A.4 The Number of Padding Bits for Each Valid Setting**

Padding Bits Per System Word		DWL[2:0]	B'000	B'001	B'010	B'011	B'100	B'101	B'110	
CHNL [1:0]	Decoded Channels per System Word	SWL [2:0]	Decoded Word Length	8	16	18	20	22	24	32

When the SSI module acts as a transmitter, each word written to SSITDR is transmitted to the serial audio bus in the order they are written. When the SSI module acts as a receiver, each word received by the serial audio bus is read in the order received from SSIRDR.

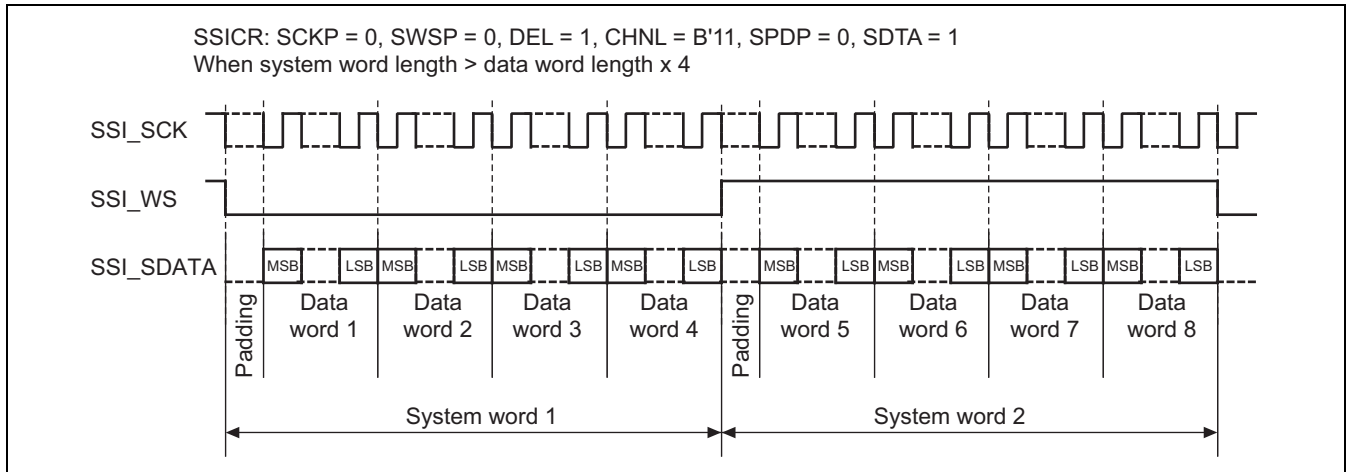

Figures 32A.6 to 32A.8 show how two, three and four channels are transferred to the serial audio bus. Note that there are no padding bits in the first example, the second example is left-aligned and the third is right-aligned. This selection is arbitrary and is just for demonstration purposes only.

**Figure 32A.6 Multi-Channel Format (Two Channels without Padding)**

**Figure 32A.7 Multi-Channel Format (Three Channels with High Padding)**

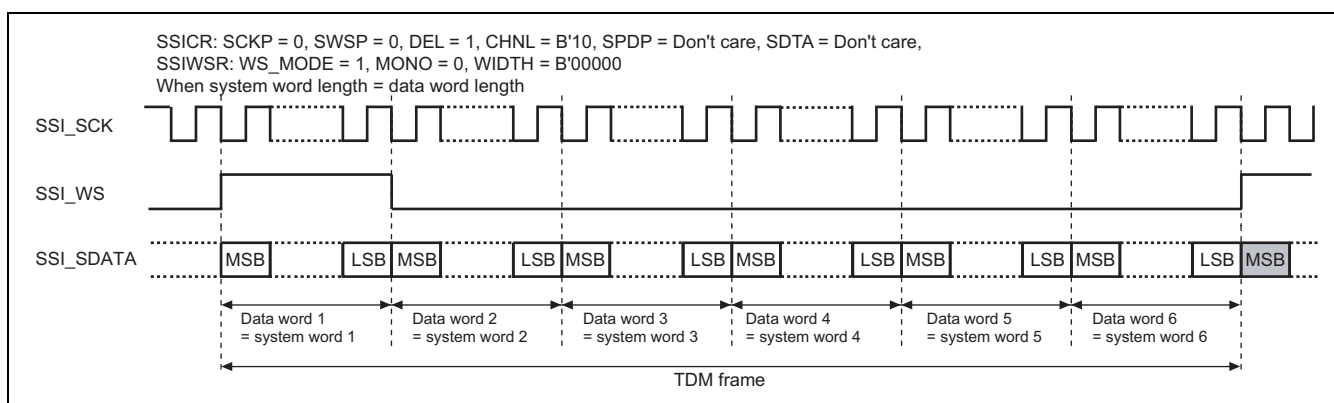

**Figure 32A.8 Multi-Channel Format (Four Channels; Transmitting and Receiving in the Order of Padding Bits and Serial Data; with Padding)**

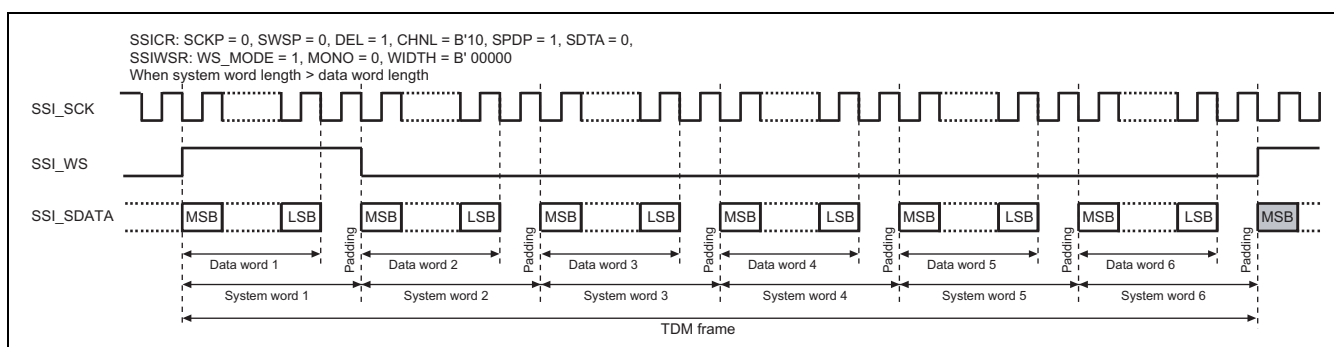

### (8) TDM formats

The TDM format is used for connecting the SSI with a multi-channel device which supports TDM. The TDM format is set by using the WS\_MODE and MONO bits in SSIWSR. When the SWSP bit in SSICR is 0 with the TDM format, SSI\_WS is driven high over the period of system word 1, and pulled low otherwise. When the SWSP bit is 1, SSI\_WS is pulled low over the period of system word 1, and driven high otherwise. The pulses generated on the SSI\_WS signal are referred to as SYNC pulses.

Figures 32A.9 and 32A.10 show the TDM formats without padding and with padding.

**Figure 32A.9 TDM Format (Six System Words, without Padding)**

**Figure 32A.10 TDM Format (Six System Words, with Padding)**

The following describes operation in each mode:

#### (a) Master transmitter

By a transfer start trigger (setting the EN bit in the control register to 1), a transfer of system word 1 begins synchronously with the SYNC pulses.

By a transfer stop trigger (setting the EN bit in the control register to 0), a transfer is stopped at the end of the currently-transferred system word and the SDATA signal is output according to the SPDP setting in SSICR (when SPDP = 0, a low-level signal is output).

If transmit data is not ready in the SSI module during transmission, an underflow will occur. When an underflow occurs, data to be output for the SYNC pulses cannot be determined. Therefore, stop and reconfigure the transfer.

#### (b) Master receiver

By a transfer start trigger (setting the EN bit in the control register to 1), a reception of system word 1 data begins at the point where the SSI module recognizes a SYNC pulse.

By a transfer stop trigger (setting the EN bit in the control register to 0), a reception is stopped at the end of the currently-transferred system word.

The receive data register should not be read when it does not have data. If read, an underflow will occur. When an underflow occurs, stop and reconfigure the transfer.

The receive data should not be written to before read. If written to, an overflow will occur. When an overflow occurs, stop and reconfigure the transfer.

**(c) Slave transmitter**

By a transfer start trigger (setting the EN bit in the control register to 1), a transfer of system word 1 begins synchronously with the SYNC pulses.

By a transfer stop trigger (setting the EN bit in the control register to 0), a transfer is stopped at the end of the currently-transferred system word and the SDATA signal is output according to the SPDP setting in SSICR (when SPDP = 0, a low-level signal is output).

If transmit data is not ready in the SSI module during transmission, an underflow will occur. When an underflow occurs, data to be output for SYNC pulses cannot be determined. Therefore, stop and re-set the transfer.

Transfers cannot be performed if the SCK signal and SYNC pulses are not provided to the SSI module during transfer.

**(d) Slave receiver**

By a transfer start trigger (setting the EN bit in the control register to 1), a reception of system word 1 data begins at the point where the SSI module recognizes a SYNC pulse.

By a transfer stop trigger (setting the EN bit in the control register to 0), a reception is stopped at the end of the currently-transferred system word.

The receive data should not be read when it does not have data. If read, an underflow will occur. When an underflow occurs, stop and reconfigure the transfer.

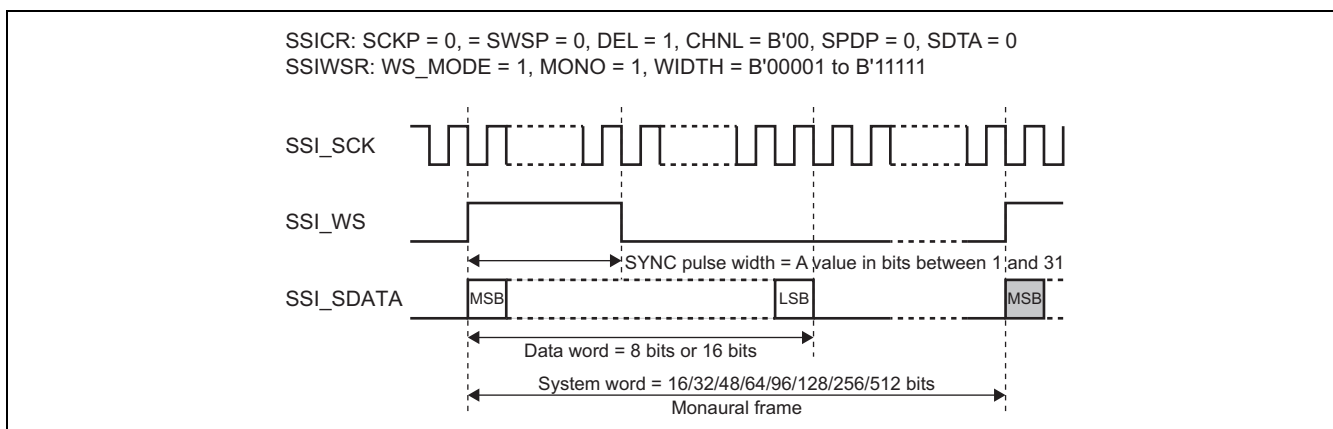

The receive data register should not be written to before read. If written to, an overflow will occur. When an overflow occurs, stop and reconfigure the transfer.

Transfer cannot proceed if the SCK signal and SYNC pulses are not being provided to the SSI module during transfer.

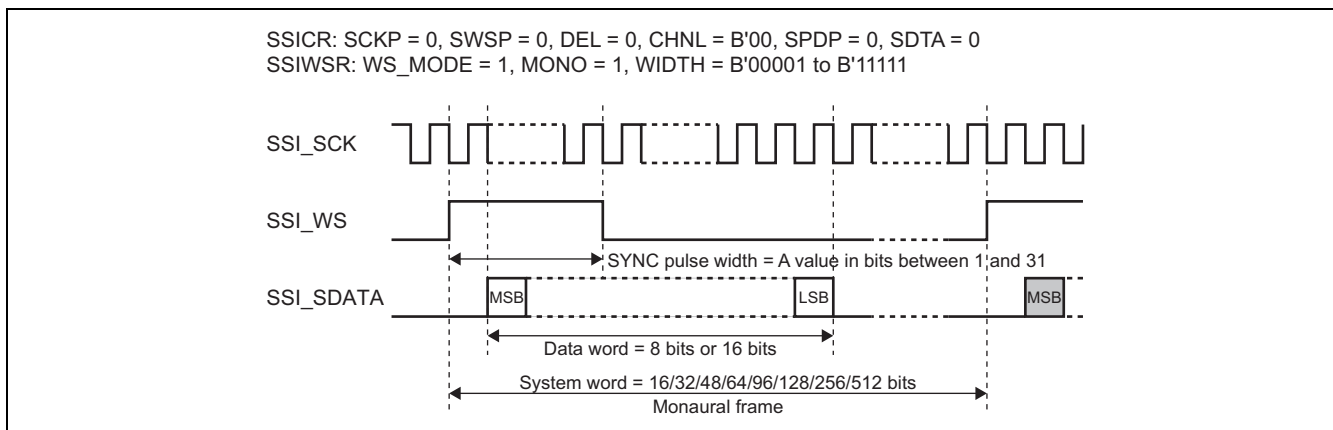

**(9) Monaural format**

The monaural format is set by using the WS\_MODE and MONO bits in SSIWSR. The available data lengths are 8 bits and 16 bits. When the SWSP bit in SSICR is 0 and the monaural format is selected, SSI\_WS is driven high over the period from bit 1 to bit 31, and pulled low otherwise. When the SWSP bit is 1, SSI\_WS is pulled low over the period from bit 1 to bit 31, and driven high otherwise. The pulses generated as the SSI\_WS signal are referred to as SYNC pulses. The width of the SYNC pulses can be set to a value in bits between 1 and 31 by using the WIDTH bits in SSIWSR. The setting must be smaller than the system word length (SSICR.SWL). In the monaural format, the system word length is equal to one monaural frame period.

Figure 32A.11 shows the left-aligned monaural format and Figure 32A.12 shows the monaural format with a delay of one bit-period.

**Figure 32A.11 Monaural Format (Left-Aligned)**

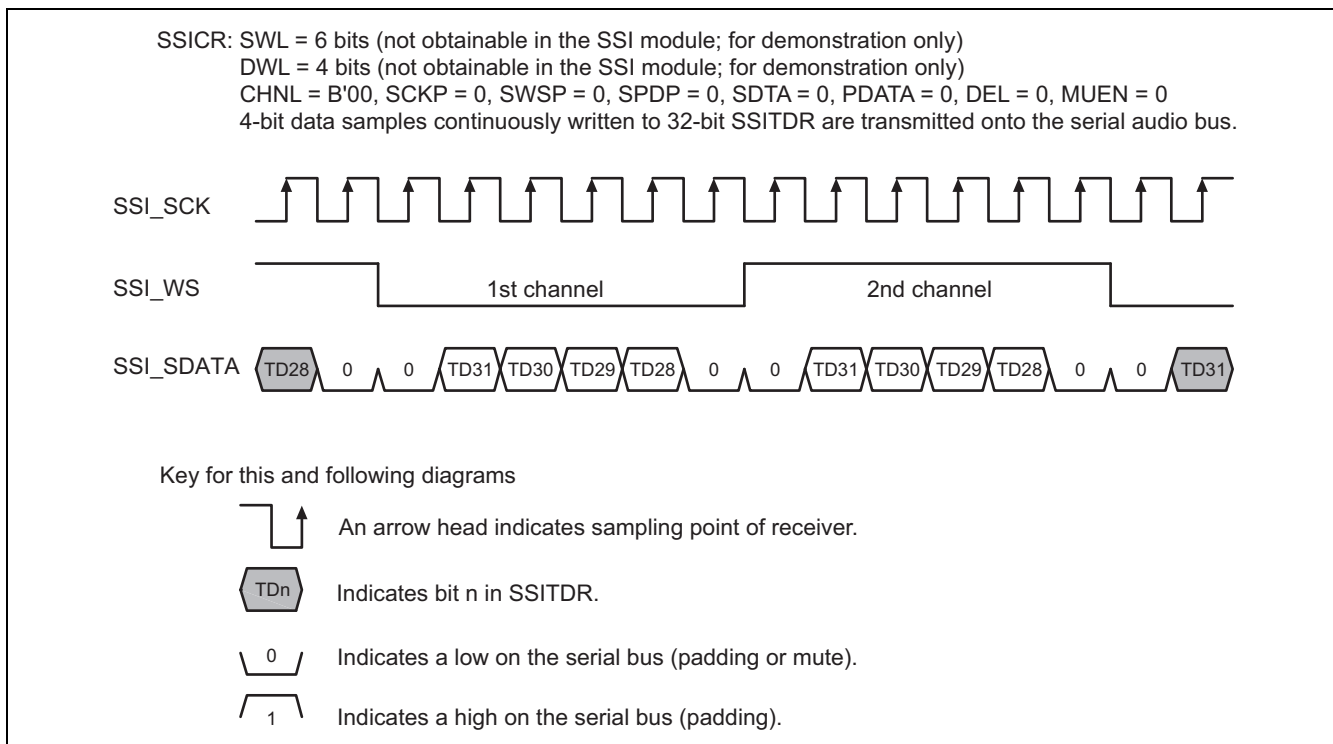

**Figure 32A.12 Monaural Format (with 1-bit Delay)**

**(10) Configuration bits**

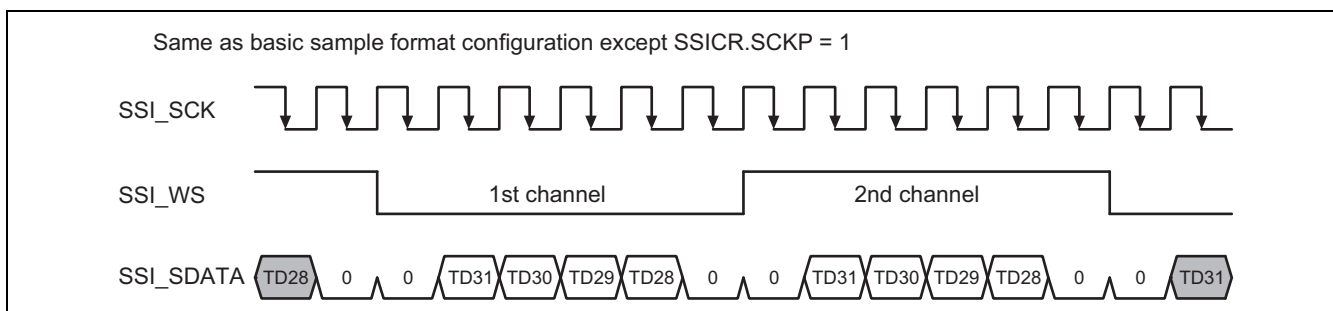

Several more configuration bits in non-compressed mode are shown below. These bits are not mutually exclusive, but some combinations may not be useful for any other device.

These configuration bits are described below with reference to Figure 32A.13, Basic Sample Format.

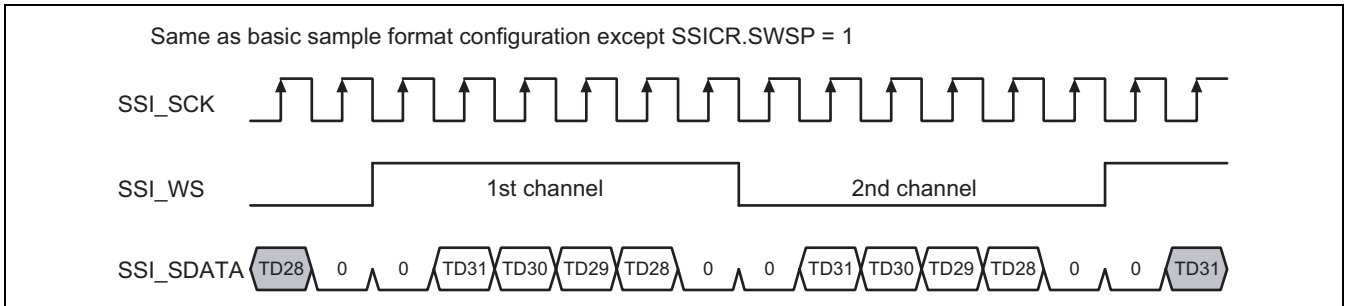

**Figure 32A.13 Basic Sample Format  
(Transmit Mode with Example System/Data Word Length)**

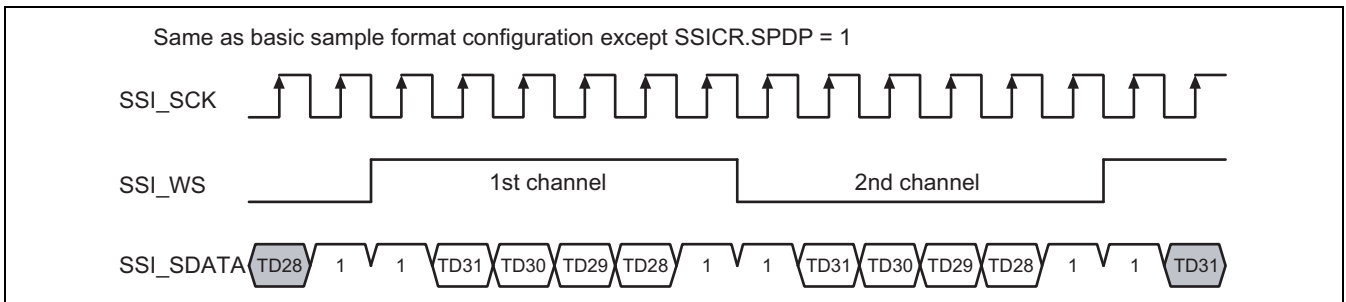

Figure 32A.13 uses a system word length of 6 bits and a data word length of 4 bits. These settings are not possible with the SSI module but are used only for clarification of the other configuration bits.

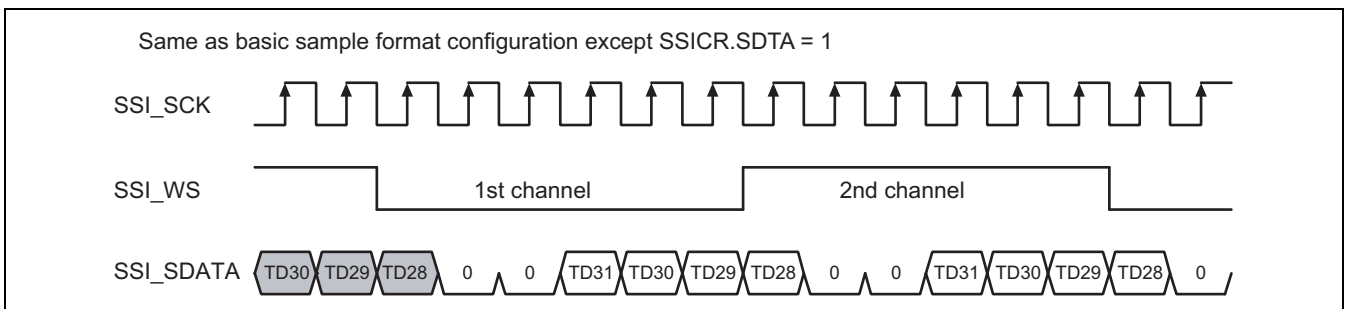

**Figure 32A.14 Inverted Clock**

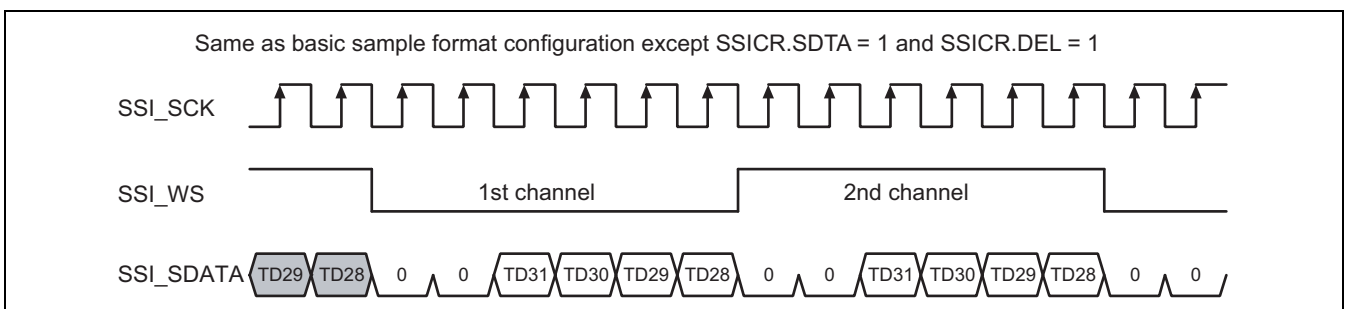

**Figure 32A.15 Inverted Word Select**

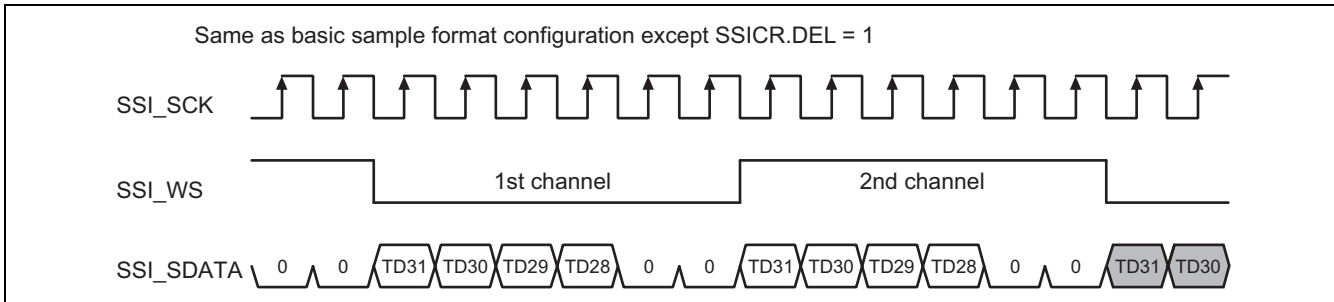

**Figure 32A.16 Inverted Padding Polarity**

**Figure 32A.19 Transmitting and Receiving in the Order of Serial Data and Padding Bits; without Delay**

**Figure 32A.20 Parallel Right-Aligned with Delay**

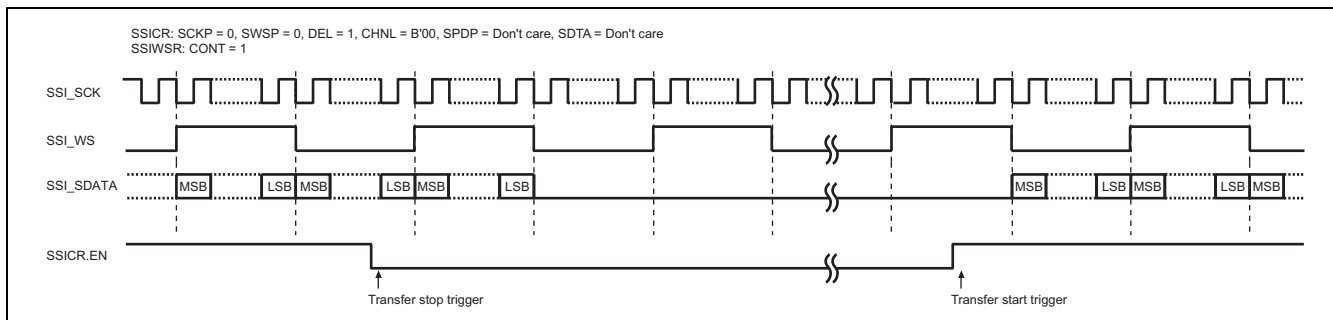

**Figure 32A.21 Mute Enabled**

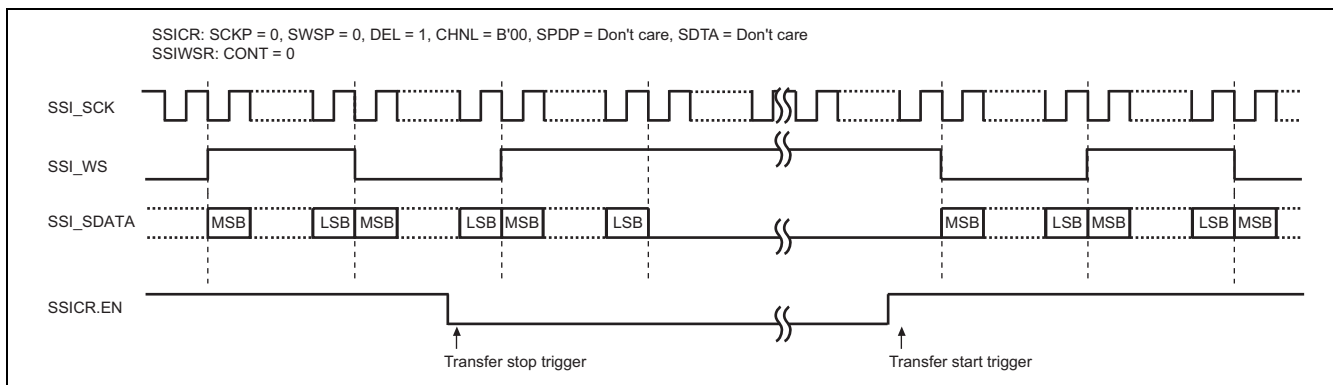

**(11) WS continue function**

The WS continue function is used to output SSI\_WS signal continuously regardless of whether data transfer is enabled or disabled. The WS continue function can be set by using the CONT bit in SSIWSR. This function can be combined with non-compressed mode and master mode only. When this function is enabled, the SSI\_WS signal continues to operate even if the EN bit in SSICR is cleared to 0 (stopping a transfer). When this function is disabled, the SSI\_WS signal operates synchronously with the EN bit.

Figures 32A.22 and 32A.23 show operations when the WS continue function is enabled and disabled, respectively.

**Figure 32A.22 WS Continue Function Operation (When the Function is Enabled)**

**Figure 32A.23 WS Continue Function Operation (When the Function is Disabled)**

**(12) Bit alignment in transferred data**

Figures 32A.24 to 32A.36 show the bit alignment in transmit or receive data. Only the MSB first alignment is available. The waveforms in Figures 32A.24 to 32A.36 are setting examples without delay (SSICR.DEL is set to 1, the number of bits specified with SSICR.DWL is the same as that specified with SSICR.SWL).

**Figure 32A.36 Bit Alignment in 8-/16-Bit Monaural Format**

### 32A.3.3 Operating Modes

There are three modes of operation: configuration, module enabled and module disabled. Figure 32A.37 shows how the module enters each of these modes.

**Figure 32A.37 Operating Modes**

#### (1) Configuration mode

This mode is entered after the module is released from reset. All required configuration fields in the control register should be defined in this mode, before the SSI module is enabled by setting the EN bit.

Setting the EN bit causes the module to enter the module enabled mode.

#### (2) Module enabled mode

Operation of the module in this mode is dependent on the operating mode selected. For details, refer to section 32A.3.4, Transmit Operation and section 32A.3.5, Receive Operation, below.

### 32A.3.4 Transmit Operation

Transmission can be controlled either by DMA or interrupt.

DMA control is preferred to reduce the processor load. In DMA control mode, the processor will only receive interrupts if there is an underflow or overflow of data or the DMAC has finished its transfer.

The alternative method is using the interrupts that the SSI module generates to supply data as required. This mode has a higher interrupt load as the module is only double buffered and will require data to be written at least every system word period.

When disabling the module, the SSI clock\* must remain present until the SSI module is in idle state, indicated by the SSISR.IIRQ bit.

Figure 32A.38 shows the transmit operation in DMA control mode, and Figure 32A.39 shows the transmit operation in interrupt control mode.

Note: \* Input clock from the SSI\_SCK pin when SCKD = 0.  
Input clock from the CLK\_FS pin when SCKD = 1.

Use the flowcharts in Figures 32A.38 and 32A.39 when bits ind9 to ind0, which are covered in the description of SSI mode register 0 (SSI\_MODE0) in section 32, Serial Sound Interface Unit (SSIU), are set to 1 (independent SSI transfer).

(1) Transmission using DMA controller

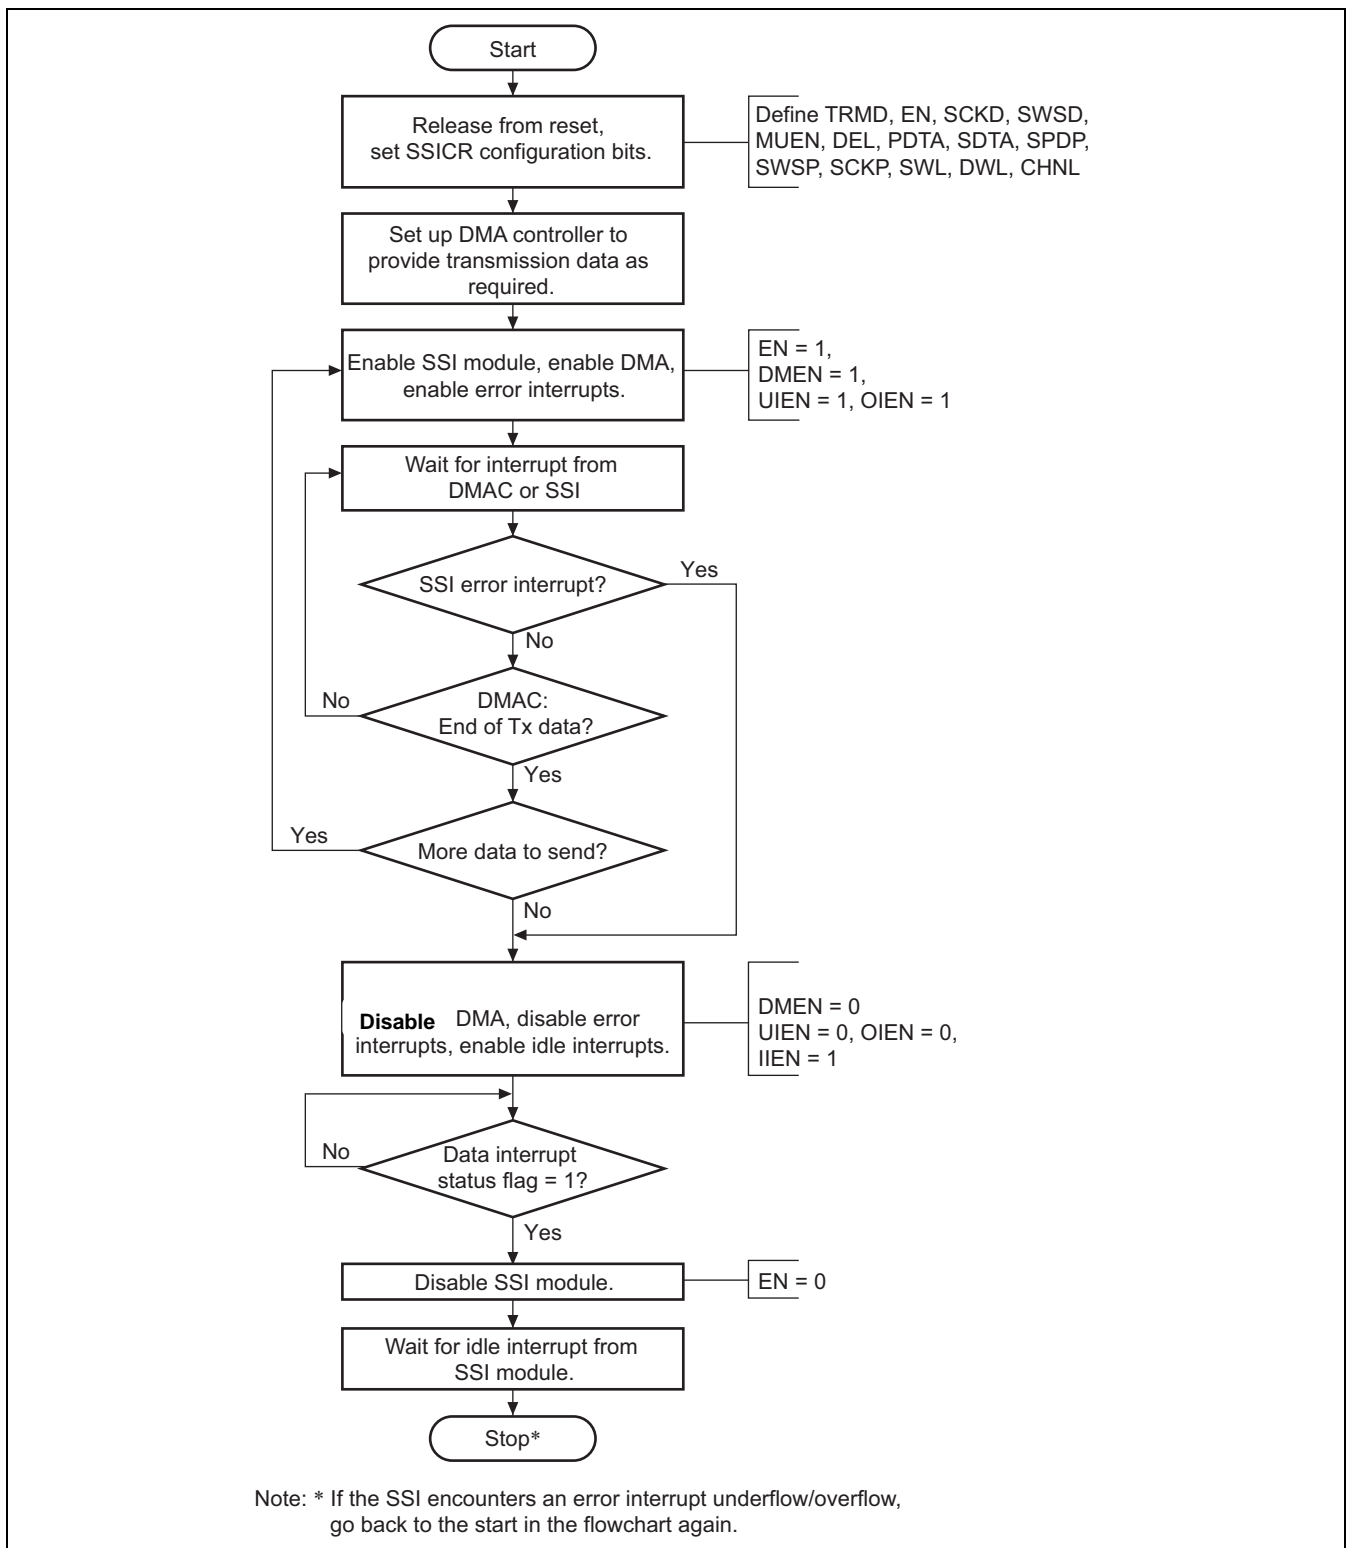

Figure 32A.38 Transmission Using DMA Controller

(2) Transmission using interrupt data flow control

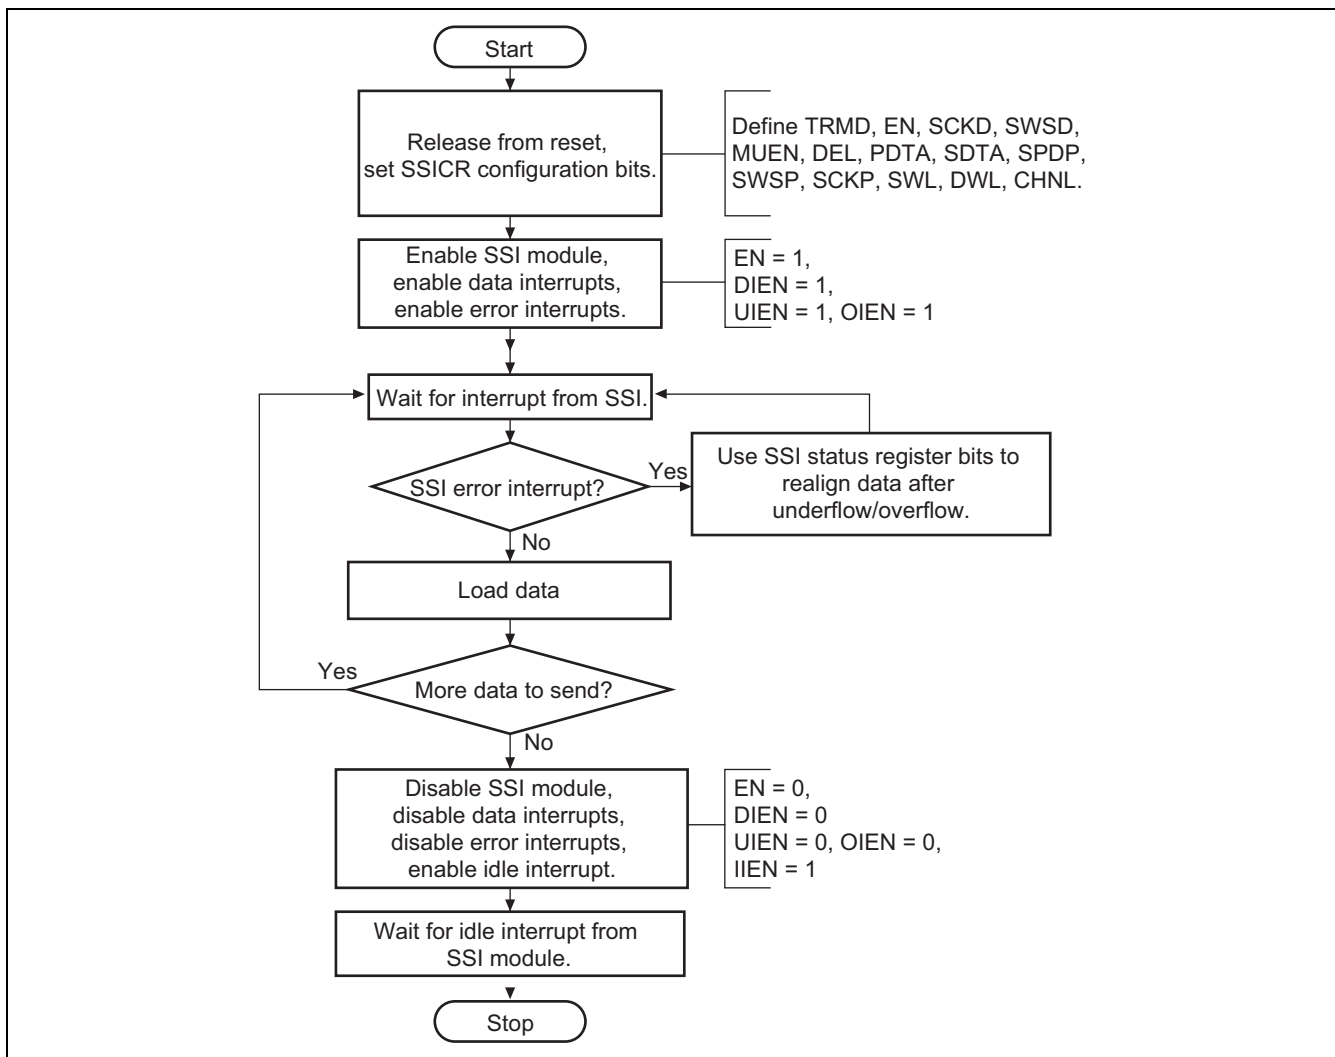

Figure 32A.39 Transmission Using Interrupt Data Flow Control

### 32A.3.5 Receive Operation

Like transmission, reception can be controlled either by DMA or interrupt.

Figures 32A.40 and 32A.41 show the flow of operation.

When disabling the SSI module, the SSI clock\* must be kept supplied until the SSISR.IIRQ bit is in idle state.

Note: \* Input clock from the SSI\_SCK pin when SCKD = 0.  
Input clock from the CLK\_FS pin when SCKD = 1.

Use the flowcharts in Figures 32A.40 and 32A.41 when bits ind9 to ind0, which are covered in the description of SSI mode register 0 (SSI\_MODE0) in section 32, Serial Sound Interface Unit (SSIU), are set to 1 (independent SSI transfer).

(1) Reception using DMA controller

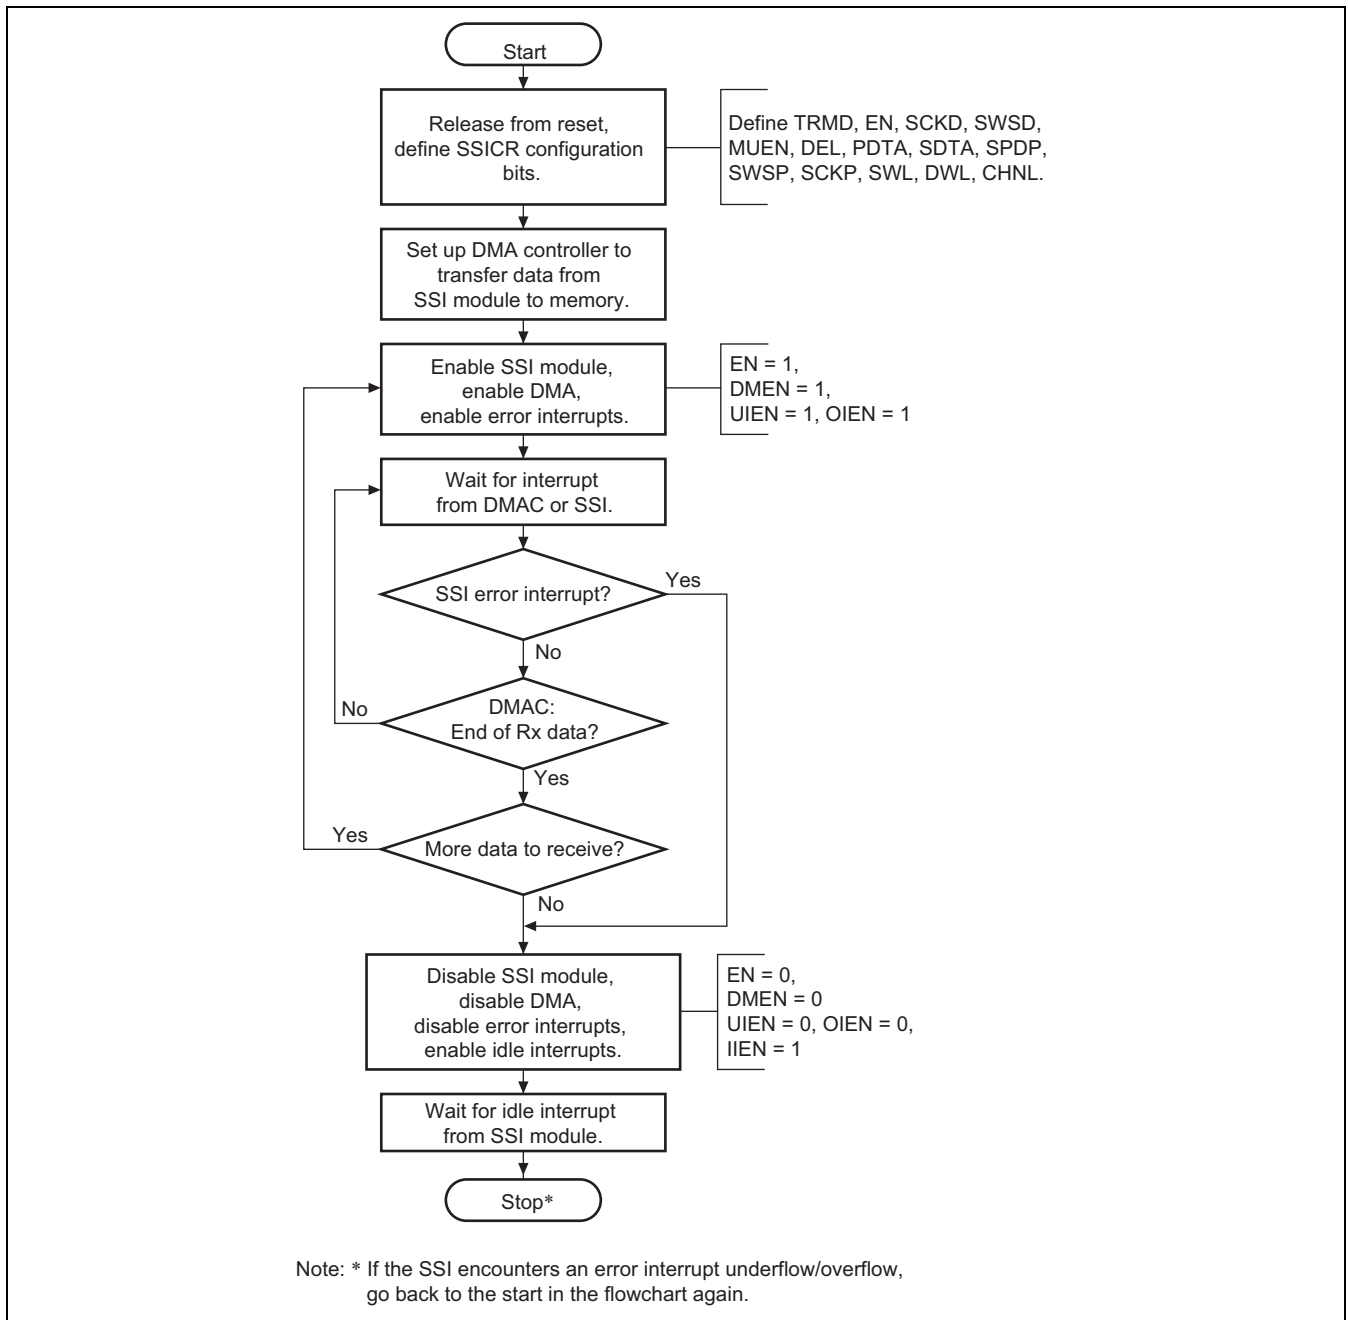

Figure 32A.40 Reception Using DMA Controller

(2) Reception using interrupt data flow control

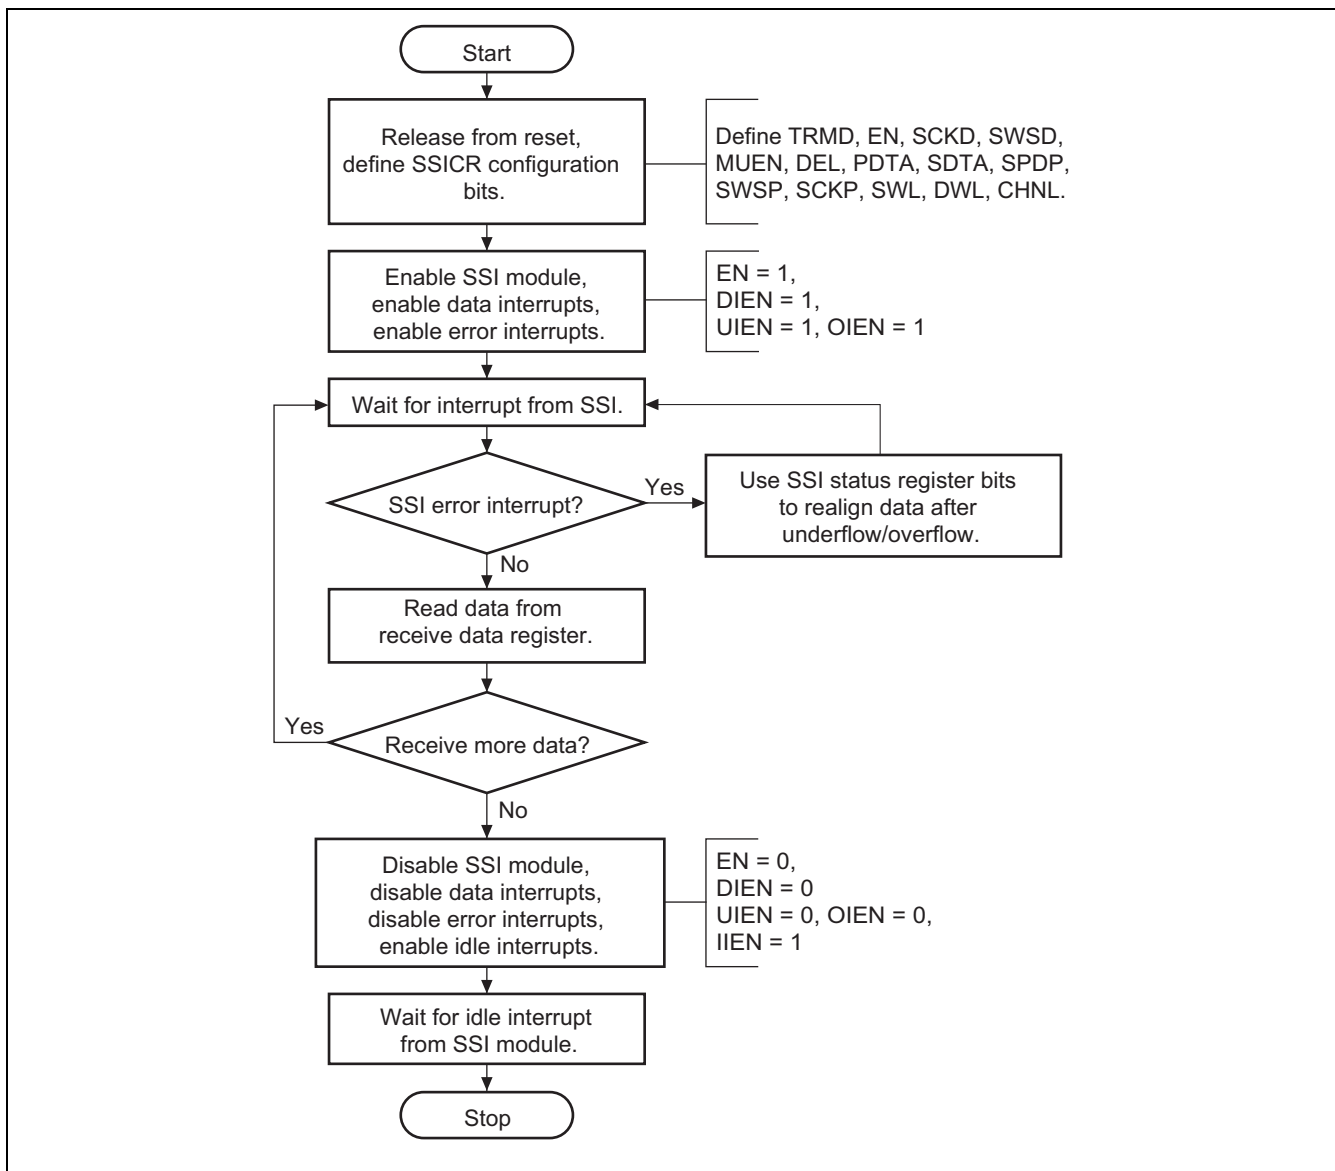

Figure 32A.41 Reception Using Interrupt Data Flow Control

### 32A.3.6 Serial Bit Clock Control

This function is used to control and select which clock is used for the serial bus interface.

If the serial clock direction is set to input (SSICR.SCKD = 0), the SSI module is in clock slave mode and the shift register uses the bit clock that was input to the SSI\_SCK pin.

If the serial clock direction is set to output (SSICR.SCKD = 1), the SSI module is in clock master mode, and the shift register uses the bit clock that is input from the CLK\_FS pin or the bit clock that is obtained by dividing the input from the CLK\_FS pin. In the latter case, the clock input from the CLK\_FS pin is divided by the ratio in the serial oversampling clock divide ratio (CKDV) in SSICR and used as the bit clock in the shift register.

In either case, the SSI\_SCK pin output is the same as the bit clock.

RZ/G1H

RZ/G1N

RZ/G1M

RZ/G1E

## 32A.4 Usage Notes

### 32A.4.1 Limitations from Overflow during Receive DMA Operation

If an overflow occurs while the receive DMA is in operation, the module should be restarted. The receive buffer in the SSI consists of 32-bit registers that share the L and R channels. Therefore, data to be received at the L channel may sometimes be received at the R channel if an overflow occurs, for example, under the following condition: the control register (SSICR) has a 32-bit setting for both data word length (DWL2 to DWL0) and system word length (SWL2 to SWL).

If an overflow is confirmed with the overflow error interrupt or overflow error status flag (SSISR.OIRQ), write 0 to the EN and DMEN bits in SSICR to disable DMA in the SSI module, thus stopping the operation (In this case, the controller setting should also be stopped). After this, write 0 to the OIRQ bit in SSISR to clear the overflow status, set DMA again and restart the transfer.

### 32A.4.2 Limitations on Combinations of Modes Related to Common Pins to SSI7 and SSI8

Table 32A.5 shows the available combinations of operating modes for SSI7 and SSI8. Operating modes can be set with the control registers for the SSI7 and SSI8 (SSICR).

**Table 32A.5 Usable Operating Mode Combinations for SSI7 and SSI8**

No.	Operating Mode		Operating Mode of External Device		Function
	SSI7	SSI8	SSI7 Side	SSI8 Side	
1	Slave	Slave	Master	Slave	SSI7 and SSI8 operate synchronously with SSI_WS78 and SSI_SCK78 input.
			Slave	Master	
			Slave	Slave	
2	Master	Slave	Slave	Slave	SSI8 and an external device operate synchronously with WS and SCK of SSI7.
3	Slave	Master	—	—	Setting prohibited
4	Master	Master	—	—	Setting prohibited

There are the following limitations on the operating mode combinations shown in Table 32A.5.

For No. 1, SSI\_WS78 and SSI\_SCK78 should be input before either of SSI7 or SSI8 starts data transfer.

For No. 2, the SSI7 as the master should start transfer first thus allowing SSI\_WS78 and SSI\_SCK78 to be output, and then the SSI8 as the slave should be used. If the master-side transfer is stopped with the CONT bit in SSIWSR being 0, the slave-side SSI8 should be stopped because SSI\_WS78 is not output.

### 32A.4.3 Limitations on Slave Mode Operation

When this LSI is used in slave mode, in ending a data transfer process, data transfer on this LSI should be stopped (SSICR.EN = 0) before the input word selection signal (SSI\_WS) is stopped.

In slave mode, data transfer is stopped by clearing the EN bit in SSICR (setting to stop transfer) and detecting the falling edge of the word selection signal (SSI\_WS). If the input word selection signal is stopped first, the falling edge of the word selection signal cannot be detected and data transfer cannot be ended successfully.

#### 32A.4.4 Limitations on Changes to Settings

The SSI\_SCK and SSI\_WS signals are not guaranteed immediately after changes of the WS mode bit in the WS mode register (SSIWSR) and configuration bits in the control register (SSICR). Settings must not be changed dynamically if this would affect any connected device.

#### 32A.4.5 Stopping or Resuming Transmission

Follow the procedure below to stop or resume transmission.

##### Stopping transmission:

1. Set the DMEN bit in SSICR to 0 for stopping transmission.
2. Wait for SSISR.DIRQ = 1 by using polling or interrupts.
3. Set the EN bit in SSICR to 0 to stop transmission.
4. Check that SSISR.IDST is 1.

##### Resuming transmission:

Set DMEN and EN bits in SSICR to 1 for resuming transmission (The DMEN bit should be set to 1 at the same time of or before the EN bit).

## 33. Audio Clock Generator (ADG)

RZ/G1H

RZ/G1N

RZ/G1M

RZ/G1E

### 33.1 Overview

The audio clock generator (ADG) selects and supplies the necessary clock for the SSI, or SCU module. It also divides the frequency of the selected clock and sends it outside the chip.

#### 33.1.1 Features

- Selects the clock signal from the AUDIO\_CLKA, AUDIO\_CLKB, or AUDIO\_CLKC pin or the internal clock and supplies it to the SSI, or SCU module.
- The frequency of the clock signals from the AUDIO\_CLKA, AUDIO\_CLKB, and AUDIO\_CLKC pins and the internal clock can be divided before use.
- The divided clock can be output through the AUDIO\_CLKOUT pin.

Note: The presence or absence of pins depends on the product. For details, see Table 33.1.

Initial value:	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	All 0	R	Reserved The initial value is always read from these bits. The write value should always be the initial value.
9, 8	CKS[1:0]	00	R/W	These bits specify the clock source for the on-chip baud rate generator. 00: ACLK_A 01: ACLK_A/4 10: ACLK_A/16 11: ACLK_A/64
7 to 0	BARR[7:0]	H'FF	R/W	These bits specify the division ratio. For details, see Table 33.3. Note: Although a 5.951-kHz to 97.5-MHz clock can be generated from the internal clock, set the division ratio here so that a maximum of 25-MHz clock should be obtained.

**Table 33.3 Division Ratio for BRGA**

<b>BRGA Operating Clock (CKS[1], CKS[0])</b>	<b>Division Ratio BRGA (N = 0 to 255)</b>	<b>Calculating Formula</b>
ACLK_A	1/2, 1/4, 1/6, ..., 1/512	$1 / (2(N + 1))$
ACLK_A/4	1/8, 1/16, 1/24, ..., 1/2048	$1 / (8(N + 1))$
ACLK_A/16	1/32, 1/64, 1/96, ..., 1/8192	$1 / (32(N + 1))$
ACLK_A/64	1/128, 1/256, 1/384, ..., 1/32768	$1 / (128(N + 1))$

### 33.2.2 BRGB Baud Rate Setting Register (BRRB)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

**Function:** BRRB is a 32-bit readable/writable register that specifies the baud rate for ACLK\_B (see Table 33.4).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

### 33.2.6 Audio Clock Select Register 2 (AUDIO\_CLK\_SEL2)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

**Function:** AUDIO\_CLK\_SEL2 selects the clocks for the SRU (for SSI9).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DIVSEL_SSI9 [1:0]	ACLK_SEL_SSI9 [1:0]	DIVSEL2_SSI9	DIVCLK_SEL_SSI9 [2:0]	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved The initial value is always read from these bits. The write value should always be the initial value.
15, 14	DIVSEL_SSI9[1:0]	00	R/W	SSI9 Frequency Divider Select
11	DIVSEL2_SSI9	0	R/W	[11], [15:14] 000: Not divided 001: Divided by 2 010: Divided by 4 011: Divided by 8 100: Divided by 16 101: Divided by 32 110, 111: Fixed at 0
13, 12	ACLK_SEL_SSI9[1:0]	00	R/W	SSI9 Clock Select 00: DIVCLK 01: BRGA output clock 10: BRGB output clock 11: Setting prohibited
10 to 8	DIVCLK_SEL_SSI9[2:0]	000	R/W	SSI9 Clock Select 000: Fixed at 0 001: AUDIO_CLKA 010: AUDIO_CLKB 011: AUDIO_CLKC Others: Setting Prohibited
7 to 0	—	All 0	R	Reserved The initial value is always read from these bits. The write value should always be the initial value.

### 33.2.7 Audio Clock Frequency Division Enable Register (DIV\_EN)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

**Function:** DIV\_EN enables or disables the AUDIO\_CLK\_A, AUDIO\_CLK\_B, AUDIO\_CLK\_C, BRGA, and BRGB frequency dividers.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	BRGB_DIV_EN	BRGA_DIV_EN	AUDIO_CLK_C_DIV_EN	AUDIO_CLK_B_DIV_EN	AUDIO_CLK_A_DIV_EN	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R

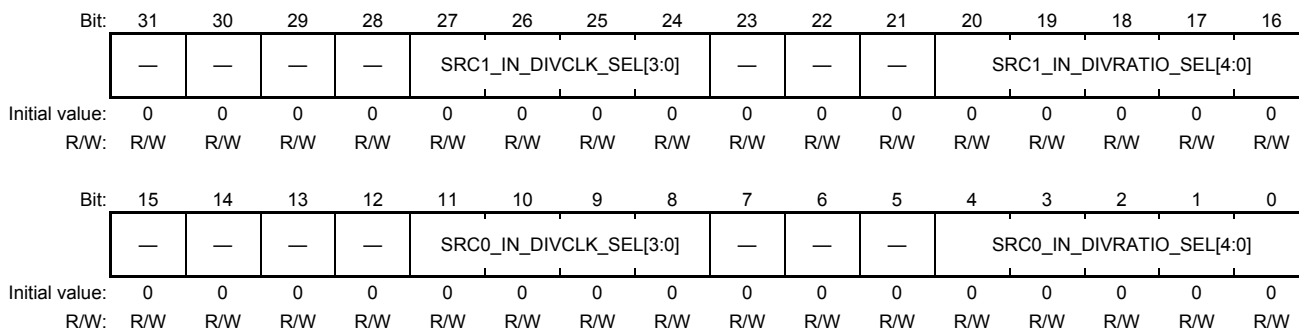

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	—	All 0	R	Reserved The initial value is always read from this bit. The write value should always be the initial value.
5	BRGB_DIV_EN	0	R/W	This bit enables the BRGB frequency divider. 0: Disables frequency division. 1: Divides BRGB into the specified frequency.
4	BRGA_DIV_EN	0	R/W	This bit enables the BRGA frequency divider. 0: Disables frequency division. 1: Divides BRGA into the specified frequency.
3	AUDIO_CLK_C_DIV_EN	0	R/W	This bit enables the AUDIO_CLK_C frequency divider. 0: Disables frequency division. 1: Divides AUDIO_CLK_C into the specified frequency.
2	AUDIO_CLK_B_DIV_EN	0	R/W	This bit enables the AUDIO_CLK_B frequency divider. 0: Disables frequency division. 1: Divides AUDIO_CLK_B into the specified frequency.
1	AUDIO_CLK_A_DIV_EN	0	R/W	This bit enables the AUDIO_CLK_A frequency divider. 0: Disables frequency division. 1: Divides AUDIO_CLK_A into the specified frequency.
0	—	0	R	Reserved The initial value is always read from this bit. The write value should always be the initial value.

### 33.2.8 SRC Input Timing Select Register 0 (SRCIN\_TIMSEL0)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√*

Note: \* Some restrictions apply.

Function: SRCIN\_TIMSEL0 selects the input timing signals for SRC0 and SRC1.

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R/W	Reserved The write value should always be the initial value.
27 to 24	SRC1_IN_DIVCLK_SEL [3:0]	0000	R/W	SRC1 Input Timing Signal Select 0000: Divided AUDIO_CLK_A 0001: Divided AUDIO_CLK_B 0010: Divided AUDIO_CLK_C 0011: Divided BRGA 0100: Divided BRGB 0101: Setting prohibited 0110: ssi_ws0 0111: ssi_ws1 1000: ssi_ws2 1001: ssi_ws3 1010: ssi_ws4 1011: ssi_ws5 1100: ssi_ws6 1101: ssi_ws7 1110: ssi_ws9 1111: Setting prohibited
23 to 21	—	All 0	R/W	Reserved The write value should always be the initial value.

Bit	Bit Name	Initial Value	R/W	Description
20 to 16	SRC1_IN_DIVRATIO_SEL [4:0]	0_0000	R/W	<p>SRC1 Input Timing Signal Frequency Division Ratio Select</p> <p>These bits select the frequency division ratio for the clock signal selected using SRC1_IN_DIVCLK_SEL[3:0]. ### 33.3 Operation

RZ/G1H	RZ/G1N
RZ/G1M	RZ/G1E

The following sections give examples of setting the ADG registers.

#### (1) Supplying SSI3 with Audio Clock

The following procedure can be used to divide the internal clock (195-MHz) by 18 and supply the resulting BRGB clock (10.833-MHz) to SSI3. (If the procedure is applied before starting SSI3, steps 1 to 5 can be executed in any order.)

1. Set BRRB so that the frequency division ratio should be 18.
2. Select internal clock (M2 $\phi$ ) as the clock to be input to BRGB using SSICKR.
3. Select the BRGB output clock as SSI3 clock using AUDIO\_CLK\_SEL0.
4. Release the ADG (M2 $\phi$ ) from the module standby state using SMSTPCR1 of the CPG module.
5. Release SSI3 from the module standby state using SMSTPCR10 of the CPG module.

**Table 33.5 Setting Example 1**

Register Name	Address	Setting Value	Description
BRRB	H'EC5A_0004	H'0000_0008	Divided by 18
SSICKR	H'EC5A_0008	H'2302_0000	Selects M2 $\phi$ as the clock to be input to BRGB.
AUDIO_CLK_SEL0	H'EC5A_000C	H'2000_0000	Selects the BRGB output clock as the clock to be output to SSI3.
SMSTPCR1	H'E615_0134	Set bit 6 to 0.	Releases the ADG (M2 $\phi$ ) from the module standby state.
SMSTPCR10	H'E615_0998	Set bits 12 to 0.	Releases the SSI3 from the module standby state.

## 34. Sampling Rate Converter Unit (SCU)

RZ/G1H

RZ/G1N

RZ/G1M

RZ/G1E

### 34.1 Overview

The SCU has ten (six)\* SRC modules (six (four\*) for high-sound-quality type; four (two\*) for general-sound-quality type) that are useful for synchronization of asynchronous data, which is necessary for data transfer with external memory or external devices. It also provides the functions to change the number of channels, perform mixing, and control the volume.

Notes: When the SRCs are not in use, configure the system with the same clock sources for AUDIO CLOCK that is input to ADG, and INIC or devices for I2S that are connected to external modules, and all thus operate at the same sampling frequency.

\* Applicable to the RZ/G1E.

#### 34.1.1 Features

##### (1) Sampling Rate Converter (SRC)

- Asynchronous sampling rate conversion is available
- Supports resolutions up to 24 bits
- High-sound-quality type (THD + N\*<sup>1</sup> is -132 dB) and general-sound-quality type (THD + N\*<sup>1</sup> is -96 dB)
- Automatically generates antialiasing filter coefficients
- Four (three)\*<sup>2</sup> modules support one, two, four, six, or eight channels, and six (three)\*<sup>2</sup> modules support one or two channels.

Notes: 1. Total harmonic distortion plus noise

2. Applicable to the RZ/G1E.

##### (2) Channel Transfer Unit (CTU)

- Downmixing and splitter functions
  - Conversion of eight input channels into two output channels
  - Conversion of six input channels into two output channels
  - Conversion of two input channels into four sets of two output channels
  - Conversion of one input channel into eight sets of one output channel
  - No conversion

##### (3) Mixer (MIX)

- Mixing (adds) two to four sources into one
- Ratio for adding sources is selectable
- Ratio is dynamically changeable
- Mixing with volume ramp is available (ramp period is selectable)

##### (4) Digital Volume and Mute Function (DVC)

- Volume control function including digital volume, volume ramp, and zero-crossing mute
- The digital volume function is specified by a 24-bit fixed-point value within the range from 0 to 8 times (mute or -120 to 18 dB)
- The volume ramp function can be used for soft mute, fade-in, fade-out, or desired volume adjustment
- The volume ramp period can be changed within the sampling range from the 0th to 23rd power of 2
- The zero-crossing mute function silences the sound at the zero-crossing point of the audio data

The CTU, MIX, and DVC functional blocks are collectively called "CMD".

### 34.1.2 Block Diagram

Figure 34.1 shows the SCU block diagram.

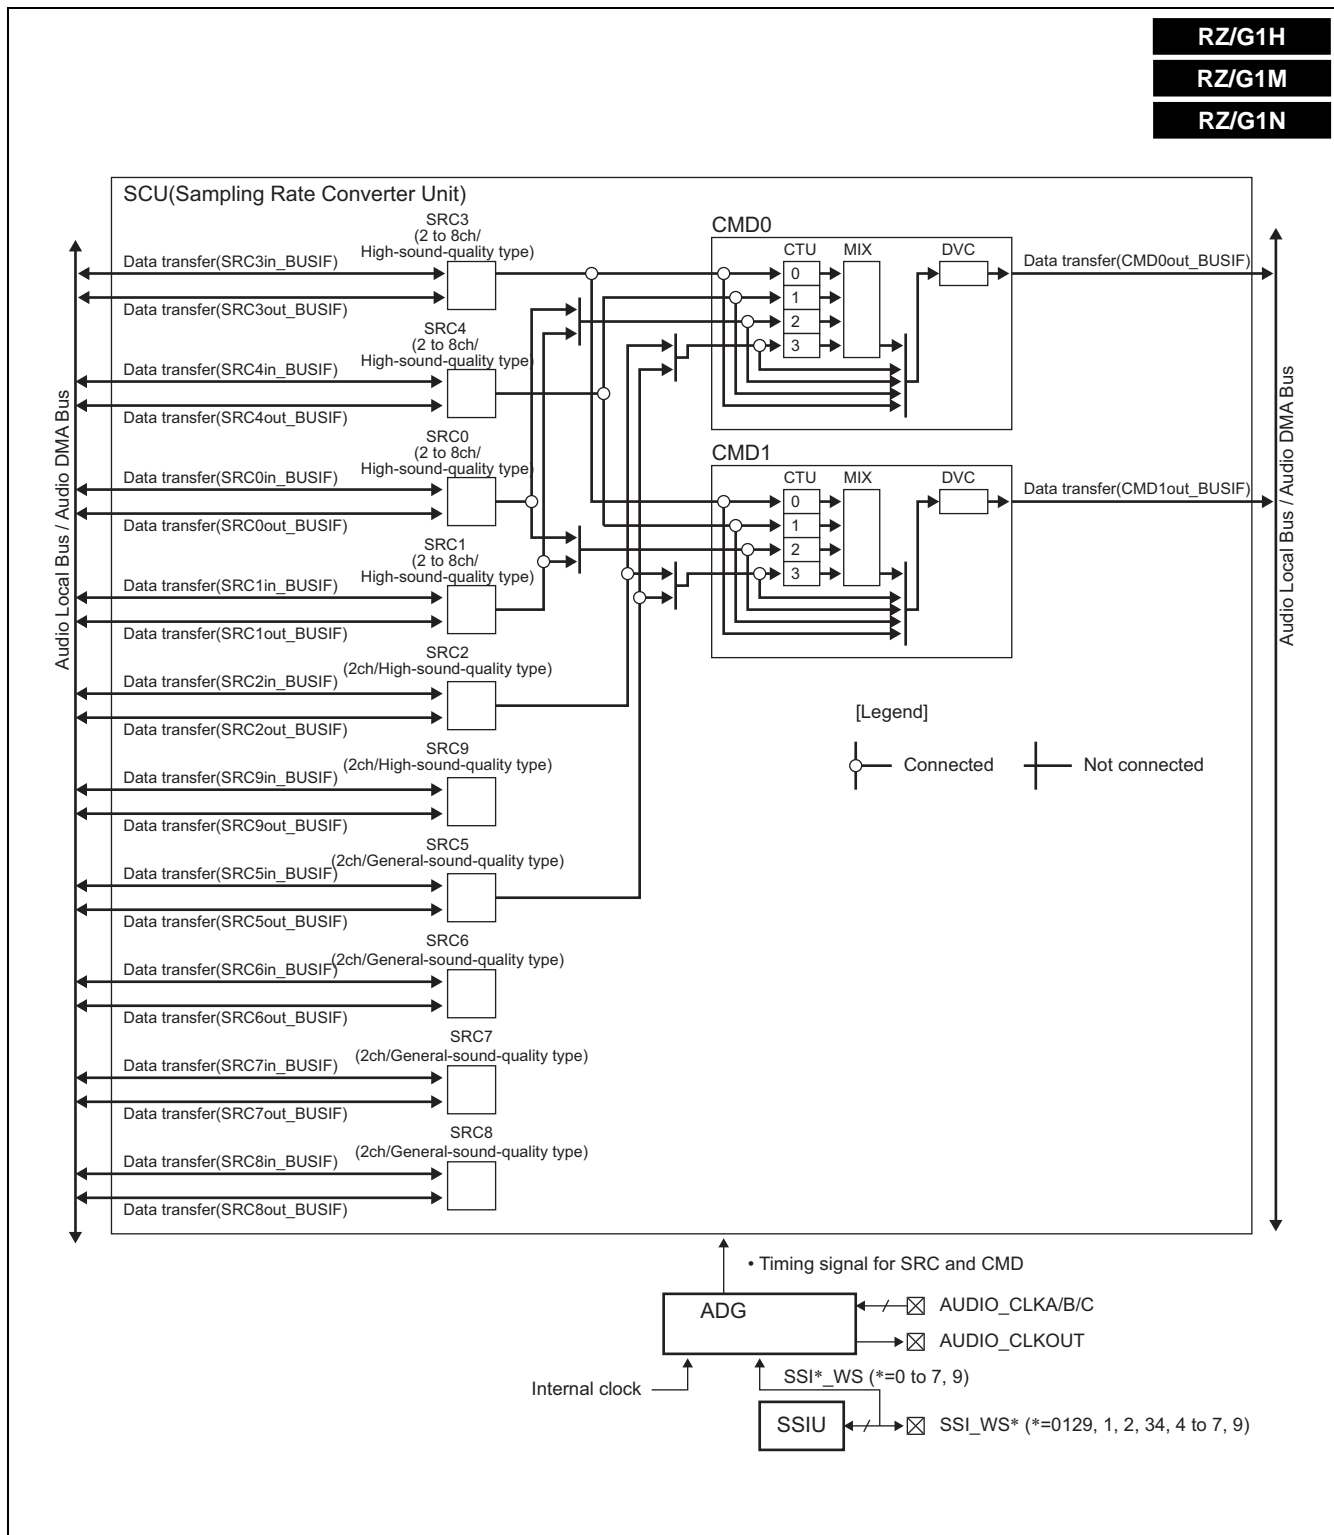

Figure 34.1a Block Diagram of SCU [for RZ/G1H, RZ/G1M, and RZ/G1N]

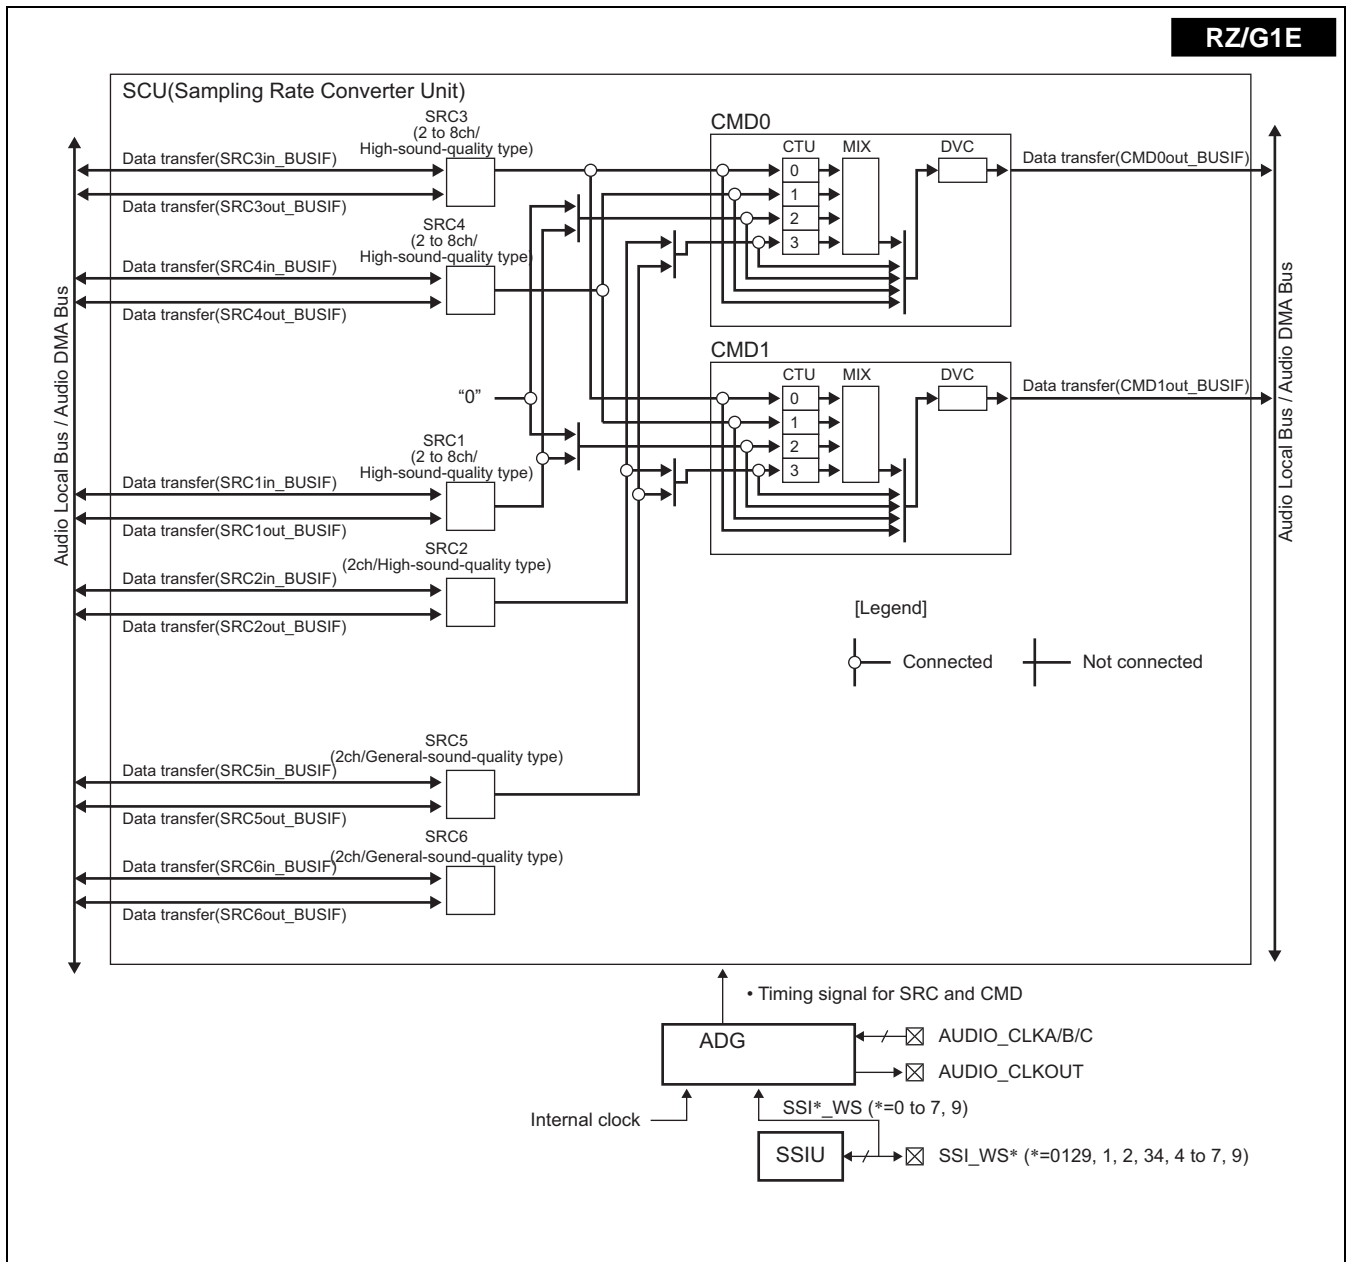

Figure 34.1b Block Diagram of SCU [for RZ/G1E]

### 34.1.3 Input/Output Pins

Table 34.1 shows the pin configuration.

**Table 34.1 Pin Configuration**

<b>Name</b>	<b>Pin Name</b>	<b>I/O</b>	<b>Function</b>
DVC_MUTE pin	DVC_MUTE	Input	DVCEN

### 34.1.4 Register Configuration

Table 34.2 shows the register configuration. Do not write to any addresses other than listed below. Operations cannot be guaranteed if writing is attempted. Values read from addresses other than those listed below are undefined. Access the register as a longword (32 bits). Operation cannot be guaranteed if the register is not accessed as a longword.

**Table 34.2 Register Configuration**

Notes: [RZ/G1H, RZ/G1M, RZ/G1N]

m = 0 to 9; n = 00, 01, 02, 03, 10, 11, 12, or 13; p = 0 or 1

[RZ/G1E]

m = 1 to 6; n = 00, 01, 02, 03, 10, 11, 12, or 13; p = 0 or 1

\* H'EC00 XXXX is the address for transferring by Audio-DMAC. H'EC30 XXXX is the address for transferring by Audio-DMAC (Peripheral-Peripheral).

## 34.2 Register Description

### Legend for Register Description

Initial value: Register value after a reset. H'xxxx represents a hexadecimal number. Others are represented in binary numbers.

—: Undefined value

R/W: Readable/writable. The written value can be read.

R: Read-only. The write value should always be 0.

R/WC0: Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.

R/WC1: Readable/writable. Writing 1 initializes the bit. Writing 0 is ignored.

W: Write-only. Reading this bit is prohibited. When the bit is reserved, the write value should always be 0.

—/W: Write-only. The read value is undefined.

All access to registers is made in longword units.

### 34.2.1 SRCm(in/out)\_BUSIF\_MODE Register (SRCm(in/out)\_BUSIF\_MODE)

Note: RZ/G1H, M and N: m = 0 to 9, RZ/G1E: m = 1 to 6

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: SRCm (in/out)\_BUSIF\_MODE sets the initial setting for the bus interface.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	sft_dir	sft_num			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	dma
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20	sft_dir	0	R/W	srcm(in/out)_busif_shift_dir Selects the bit-shift direction for position adjustment of the valid SRCm(in/out)_BUSIF input and output data. 0: Shift to left. 1: Shift to right.
19 to 16	sft_num	0000	R/W	srcm(in/out)_busif_shift_num Selects the bit-shift count for position adjustment of the valid SRCm(in/out)_BUSIF input and output data. 0000: 0 bit 0001: 1 bit 0010: 2 bits 0011: 3 bits 0100: 4 bits 0101: 5 bits 0110: 6 bits 0111: 7 bits 1000: 8 bits 1001: 9 bits 1010: 10 bits 1011: 11 bits 1100: 12 bits 1101: 13 bits 1110: 14 bits 1111: 15 bits
15 to 1	—	0	R	Reserved These bits are always read as 0. The write value should always be 0.

---

Bit	Bit Name	Initial Value	R/W	Description
0	dma	1	R/W	<i>srcm</i> (in/out)_busif_dma Selects the access type for SRC <i>m</i> (in/out)_BUSIF. 0: PIO access (setting prohibited) 1: DMA access Be sure to specify the DMA access.

---

### 34.2.2 SRCm\_BUSIF\_DALIGN Register (SRCm\_BUSIF\_DALIGN)

Note: RZ/G1H, M and N: m = 0, 1, 3, or 4, RZ/G1E: m = 1, 3, or 4

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: SRCm\_BUSIF\_DALIGN determines the initial settings of the SRCm route.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	place7			—	place6			—	place5			—	place4		
Initial value:	0	1	1	1	0	1	1	0	0	1	0	1	0	1	0	0
R/W:	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	place3			—	place2			—	place1			—	place0		
Initial value:	0	0	1	1	0	0	1	0	0	0	0	1	0	0	0	0
R/W:	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
30 to 28	place7	111	R/W	Changes the stream data order. These bits are used for the 8-channel setting. <b>For the 6- or less-channel setting, the initial value should not be changed.</b> The data order is changed before input to the SRC. Selects the input-side data to be output to place 7 on the output side. 000: Data at input-side place 0 is sent to output-side place 7. 001: Data at input-side place 1 is sent to output-side place 7. 010: Data at input-side place 2 is sent to output-side place 7. 011: Data at input-side place 3 is sent to output-side place 7. 100: Data at input-side place 4 is sent to output-side place 7. 101: Data at input-side place 5 is sent to output-side place 7. 110: Data at input-side place 6 is sent to output-side place 7. 111: Data at input-side place 7 is sent to output-side place 7.
27	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
26 to 24	place6	110	R/W	<p>Changes the stream data order. These bits are used for the 8-channel setting. <b>For the 6- or less-channel setting, the initial value should not be changed.</b></p> <p>The data order is changed before input to the SRC.</p> <p>Selects the input-side data to be output to place 6 on the output side.</p> <p>000: Data at input-side place 0 is sent to output-side place 6.            001: Data at input-side place 1 is sent to output-side place 6.            010: Data at input-side place 2 is sent to output-side place 6.            011: Data at input-side place 3 is sent to output-side place 6.            100: Data at input-side place 4 is sent to output-side place 6.            101: Data at input-side place 5 is sent to output-side place 6.            110: Data at input-side place 6 is sent to output-side place 6.            111: Data at input-side place 7 is sent to output-side place 6.</p>
23	—	0	R	<p>Reserved</p> <p>This bit is always read as 0. The write value should always be 0.</p>
22 to 20	place5	101	R/W	<p>Changes the stream data order. These bits are used for the 6- or more-channel setting. <b>For the 4- or less-channel setting, the initial value should not be changed.</b></p> <p>The data order is changed before input to the SRC.</p> <p>Selects the input-side data to be output to place 5 on the output side.</p> <p>000: Data at input-side place 0 is sent to output-side place 5.            001: Data at input-side place 1 is sent to output-side place 5.            010: Data at input-side place 2 is sent to output-side place 5.            011: Data at input-side place 3 is sent to output-side place 5.            100: Data at input-side place 4 is sent to output-side place 5.            101: Data at input-side place 5 is sent to output-side place 5.            110: Data at input-side place 6 is sent to output-side place 5.            111: Data at input-side place 7 is sent to output-side place 5.</p>
19	—	0	R	<p>Reserved</p> <p>This bit is always read as 0. The write value should always be 0.</p>
18 to 16	place4	100	R/W	<p>Changes the stream data order. These bits are used for the 6- or more-channel setting. <b>For the 4- or less-channel setting, the initial value should not be changed.</b></p> <p>The data order is changed before input to the SRC.</p> <p>Selects the input-side data to be output to place 4 on the output side.</p> <p>000: Data at input-side place 0 is sent to output-side place 4.            001: Data at input-side place 1 is sent to output-side place 4.            010: Data at input-side place 2 is sent to output-side place 4.            011: Data at input-side place 3 is sent to output-side place 4.            100: Data at input-side place 4 is sent to output-side place 4.            101: Data at input-side place 5 is sent to output-side place 4.            110: Data at input-side place 6 is sent to output-side place 4.            111: Data at input-side place 7 is sent to output-side place 4.</p>
15	—	0	R	<p>Reserved</p> <p>This bit is always read as 0. The write value should always be 0.</p>

Bit	Bit Name	Initial Value	R/W	Description
14 to 12	place3	011	R/W	<p>Changes the stream data order. These bits are used for the 4- or more-channel setting. <b>For the 2- or less-channel setting, the initial value should not be changed.</b></p> <p>The data order is changed before input to the SRC.</p> <p>Selects the input-side data to be output to place 3 on the output side.</p> <p>000: Data at input-side place 0 is sent to output-side place 3.            001: Data at input-side place 1 is sent to output-side place 3.            010: Data at input-side place 2 is sent to output-side place 3.            011: Data at input-side place 3 is sent to output-side place 3.            100: Data at input-side place 4 is sent to output-side place 3.            101: Data at input-side place 5 is sent to output-side place 3.            110: Data at input-side place 6 is sent to output-side place 3.            111: Data at input-side place 7 is sent to output-side place 3.</p>
11	—	0	R	<p>Reserved</p> <p>This bit is always read as 0. The write value should always be 0.</p>
10 to 8	place2	010	R/W	<p>Changes the stream data order. These bits are used for the 4- or more-channel setting. <b>For the 2- or less-channel setting, the initial value should not be changed.</b></p> <p>The data order is changed before input to the SRC.</p> <p>Selects the input-side data to be output to place 2 on the output side.</p> <p>000: Data at input-side place 0 is sent to output-side place 2.            001: Data at input-side place 1 is sent to output-side place 2.            010: Data at input-side place 2 is sent to output-side place 2.            011: Data at input-side place 3 is sent to output-side place 2.            100: Data at input-side place 4 is sent to output-side place 2.            101: Data at input-side place 5 is sent to output-side place 2.            110: Data at input-side place 6 is sent to output-side place 2.            111: Data at input-side place 7 is sent to output-side place 2.</p>
7	—	0	R	<p>Reserved</p> <p>This bit is always read as 0. The write value should always be 0.</p>

**34.2.3 SRCn\_BUSIF\_DALIGN Register (SRCn\_BUSIF\_DALIGN)**

Note: RZ/G1H, M and N: n = 2, 5, 6, 7, 8, or 9, RZ/G1E: n = 2, 5, or 6

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: SRCn\_BUSIF\_DALIGN determines the initial settings of the SRCn route.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	place1	—	—	—	place0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	place1	1	R/W	Changes the stream data order. The data order is changed before input to the SRC. Selects the input-side data to be output to place 1 on the output side. 0: Data at input-side place 0 is sent to output-side place 1. 1: Data at input-side place 1 is sent to output-side place 1.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	place0	0	R/W	Changes the stream data order. The data order is changed before input to the SRC. Selects the input-side data to be output to place 0 on the output side. 0: Data at input-side place 0 is sent to output-side place 0. 1: Data at input-side place 1 is sent to output-side place 0.

### 34.2.4 SRCm\_MODE Register (SRCm\_MODE)

Note: RZ/G1H, M and N: m = 0 to 9, RZ/G1E: m = 1 to 6

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: SRCm\_MODE determines the initial settings of the SRCm route.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	sync_out	sync_in	—	—	—	—	—	—	—	uf_data
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R	R	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	src
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
25	sync_out	0	R/W	srcmout_sync Selects how to treat data in the SRC output buffer. 0: Asynchronous SRC 1: Synchronous SRC
24	sync_in	0	R/W	srcmin_sync Selects how to treat data in the SRC input buffer. 0: Asynchronous SRC 1: Synchronous SRC
23 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	uf_data	0	R/W	srcm_uf_data_sel Selects how to treat data when an underflow occurs in the SRC input buffer. 0: Data before the underflow occurs is output. 1: All 0s are output.
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	src	0	R/W	srcm_src Selects whether to use SRCm. 0: SRCm is not used. 1: SRCm is used.

- Notes: 1. Please set one of sync\_in and sync\_out bits, when SRCm is used in synchronous mode by setting SRCMD bit in SRCm\_SRCCR register.
2. If sync\_out is set in synchronous mode, data should directly transmit to memory. (Data should not transmit throughout CMD.)

### 34.2.5 SRCm Control Register (SRCm\_CONTROL)

Note: RZ/G1H, M and N: m = 0 to 9, RZ/G1E: m = 1 to 6

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: SRCm\_CONTROL starts or stops transfer.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	start_out	—	—	—	start_in
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	start_out	0	R/W	SRCmout_start_flag Starts or stops transfer via SRCm. 0: Stops transfer. 1: Starts transfer.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	start_in	0	R/W	SRCmin_start_flag Starts or stops transfer via SRCm. 0: Stops transfer. 1: Starts transfer.

Note: [RZ/G1H, M, N]:

When CMD is used with route SRC0, SRC1, SRC2, SRC3, SRC4, or SRC5, SRCmout\_start\_flag should be set to 0 to stop transfer. When CMD is not used with route SRC0, SRC1, SRC2, SRC3, SRC4, or SRC5, or when route SRC6, SRC7, SRC8, or SRC9 is used, SRCmin\_start\_flag and SRCmout\_start\_flag should be set simultaneously.

[RZ/G1E]:

When CMD is used with route SRC1, SRC2, SRC3, SRC4, or SRC5, SRCmout\_start\_flag should be set to 0 to stop transfer. When CMD is not used with route SRC1, SRC2, SRC3, SRC4, or SRC5, SRCmin\_start\_flag and SRCmout\_start\_flag should be set simultaneously.

[RZ/G1H, M, N, E]:

When CMD is used and the sync\_in bit in the SRCm\_MODE register is set for synchronous mode, SRCmout\_start\_flag should be set to 1 to start transfer. However, in this case, use of the output data SRCm\_out\_BUSIF is prohibited and ignore the value of over\_flow\_srcout in the SRCm\_STATUS register.

### 34.2.6 SRCm Status Register (SRCm\_STATUS)

Note: RZ/G1H, M and N: m = 0 to 5, RZ/G1E: m = 1 to 5

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: SRCm\_STATUS indicates the state of each SRC. When a register bit is set, the corresponding interrupt signal is output. However, if interrupt outputs are masked by the SRCm interrupt enable register, interrupt signals are not output.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	dvc1	—	—	—	dvc0	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	uf_src0	of_src0	—	—	of_src1	uf_src1	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	dvc1	0	R	dvc1 Indicates the state of the DVC1_DVUSR register collectively. The state information is used only for the interrupt signal that is enabled by DVC1_DVIER.
27 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	dvc0	0	R	dvc0 Indicates the state of the DVC0_DVUSR register collectively. The state information is used only for the interrupt signal that is enabled by DVC0_DVIER.
23 to 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13	uf_src0	0	R	under_flow_srcout Indicates the state of the output buffer of SRCout in the SCU_SYSTEM_STATUS1 register. The state information is used when the interrupt signal is enabled by SCU_SYSTEM_INT_ENABLE1.
12	of_src0	0	R	over_flow_srcout Indicates the state of the output buffer of SRCout in the SCU_SYSTEM_STATUS0 register. The state information is used when the interrupt signal is enabled by SCU_SYSTEM_INT_ENABLE0.
11, 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
9	of_srcin	0	R	over_flow_srcin Indicates the state of the output buffer of SRCin in the SCU_SYSTEM_STATUS1 register. The state information is used when the interrupt signal is enabled by SCU_SYSTEM_INT_ENABLE1.
8	uf_srcin	0	R	under_flow_srcin Indicates the state of the output buffer of SRCin in the SCU_SYSTEM_STATUS0 register. The state information is used when the interrupt signal is enabled by SCU_SYSTEM_INT_ENABLE0.
7 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

### 34.2.7 SRCn Status Register (SRCn\_STATUS)

Note: RZ/G1H, M and N: n = 6 to 9, RZ/G1E: n = 6

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: SRCn\_STATUS indicates the state of each SRC. When a register bit is set, the corresponding interrupt signal is output. However, if interrupt outputs are masked by the SRCn interrupt enable register, interrupt signals are not output.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	uf_src0	of_src0	—	—	of_src1	uf_src1	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13	uf_src0	0	R	under_flow_srcout Indicates the state of the output buffer of SRCout in the SCU_SYSTEM_STATUS1 register. The state information is used when the interrupt signal is enabled by SCU_SYSTEM_INT_ENABLE1.
12	of_src0	0	R	over_flow_srcout Indicates the state of the output buffer of SRCout in the SCU_SYSTEM_STATUS0 register. The state information is used when the interrupt signal is enabled by SCU_SYSTEM_INT_ENABLE0.
11, 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9	of_src1	0	R	over_flow_srcin Indicates the state of the output buffer of SRCin in the SCU_SYSTEM_STATUS1 register. The state information is used when the interrupt signal is enabled by SCU_SYSTEM_INT_ENABLE1.
8	uf_src1	0	R	under_flow_srcin Indicates the state of the output buffer of SRCin in the SCU_SYSTEM_STATUS0 register. The state information is used when the interrupt signal is enabled by SCU_SYSTEM_INT_ENABLE0.
7 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

### 34.2.8 SRCm Interrupt Enable Register 0 (SRCm\_INT\_ENABLE0)

Note: RZ/G1H, M and N: m = 0 to 5, RZ/G1E: m = 1 to 5

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: SRCm\_INT\_ENABLE0 enables or disables output of interrupts corresponding to the states indicated in the SRCm status register.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	dvc1_ie	—	—	—	dvc0_ie	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R	R/W	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	uf_srco_ie	of_srco_ie	—	—	of_srci_ie	uf_srci_ie	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R	R	R/W	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	dvc1_ie	0	R/W	dvc1_int_enable 0: Interrupt outputs are disabled. 1: Interrupt outputs are enabled.
27 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	dvc0_ie	0	R/W	dvc0_int_enable 0: Interrupt outputs are disabled. 1: Interrupt outputs are enabled.
23 to 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13	uf_srco_ie	0	R/W	under_flow_srcout_int_enable 0: Interrupt outputs are disabled. 1: Interrupt outputs are enabled.
12	of_srco_ie	0	R/W	over_flow_srcout_int_enable 0: Interrupt outputs are disabled. 1: Interrupt outputs are enabled.
11, 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9	of_srci_ie	0	R/W	over_flow_srcin_int_enable 0: Interrupt outputs are disabled. 1: Interrupt outputs are enabled.

Bit	Bit Name	Initial Value	R/W	Description
8	uf_srcie	0	R/W	under_flow_srcin_int_enable 0: Interrupt outputs are disabled. 1: Interrupt outputs are enabled.
7 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

### 34.2.9 SRCn Interrupt Enable Register 0 (SRCn\_INT\_ENABLE0)

Note: RZ/G1H, M and N: n = 6 to 9, RZ/G1E: n = 6

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: SRCn\_INT\_ENABLE0 enables or disables output of interrupts corresponding to the states indicated in the SRCn status register.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	uf_srco_ie	of_srco_ie	—	—	of_srcie	uf_srcie	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R	R	R/W	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13	uf_srco_ie	0	R/W	under_flow_srcout_int_enable 0: Interrupt outputs are disabled. 1: Interrupt outputs are enabled.
12	of_srco_ie	0	R/W	over_flow_srcout_int_enable 0: Interrupt outputs are disabled. 1: Interrupt outputs are enabled.
11, 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9	of_srcie	0	R/W	over_flow_srcin_int_enable 0: Interrupt outputs are disabled. 1: Interrupt outputs are enabled.
8	uf_srcie	0	R/W	under_flow_srcin_int_enable 0: Interrupt outputs are disabled. 1: Interrupt outputs are enabled.
7 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

### 34.2.10 CMDn out\_BUSIF\_MODE Register (CMDn out\_BUSIF\_MODE)

Note: n = 0, 1

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: CMDn out\_BUSIF\_MODE sets the initial setting for the bus interface

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	sft_dir	sft_num			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	dma
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20	sft_dir	0	R/W	cmdnout_busif_shift_dir Selects the bit-shift direction for position adjustment of the valid CMDnout_BUSIF input and output data. 0: Shift to left. 1: Shift to right.
19 to 16	sft_num	0000	R/W	cmdnout_busif_shift_num Selects the bit-shift count for position adjustment of the valid CMDnout_BUSIF input and output data. 0000: 0 bit 0001: 1 bit 0010: 2 bits 0011: 3 bits 0100: 4 bits 0101: 5 bits 0110: 6 bits 0111: 7 bits 1000: 8 bits 1001: 9 bits 1010: 10 bits 1011: 11 bits 1100: 12 bits 1101: 13 bits 1110: 14 bits 1111: 15 bits
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

---

Bit	Bit Name	Initial Value	R/W	Description
0	dma	1	R/W	CMDnout_busif_dma Selects the access type for CMDnout_BUSIF. 0: PIO access (setting prohibited) 1: DMA access Be sure to specify the DMA access.

---

**34.2.11 CMDn\_BUSIF\_DALIGN Register (CMDn\_BUSIF\_DALIGN)**

Note: n = 0, 1

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: CMDn\_BUSIF\_DALIGN determines the initial settings of the CMDn route.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	start_out	0	R/W	CMDnout_start_flag Starts or stops transfer via CMDn. 0: Stops transfer. 1: Starts transfer.
3 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

### 34.2.14 SCU\_SYSTEM Status Register 0 (SCU\_SYSTEM\_STATUS0)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

#### [RZ/G1H, M, N]

Function: SCU\_SYSTEM\_STATUS0 indicates the internal buffer state. When a register bit is set, the corresponding interrupt signal is output. However, if interrupt outputs are masked by the SYSTEM interrupt enable register 0, interrupt signals are not output.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	of_cmd1o	of_cmd0o	—	—	of_src9o	of_src8o	of_src7o	of_src6o	of_src5o	of_src4o	of_src3o	of_src2o	of_src1o	of_src0o
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/WC1	R/WC1	R	R	R/WC1	R/WC1	R/WC1	R/WC1	R/WC1	R/WC1	R/WC1	R/WC1	R/WC1	R/WC1

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	uf_src9i	uf_src8i	uf_src7i	uf_src6i	uf_src5i	uf_src4i	uf_src3i	uf_src2i	uf_src1i	uf_src0i
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/WC1	R/WC1	R/WC1	R/WC1	R/WC1	R/WC1	R/WC1	R/WC1	R/WC1	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
29	of_cmd1o	0	R/WC1	over_flow_cmd1out Indicates the state of the CMD1out output buffer. 0: Normal operation 1: An overflow has occurred.
28	of_cmd0o	0	R/WC1	over_flow_cmd0out Indicates the state of the CMD0out output buffer. 0: Normal operation 1: An overflow has occurred.
27, 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
25	of_src9o	0	R/WC1	over_flow_src9out Indicates the state of the SRC9out output buffer. 0: Normal operation 1: An overflow has occurred.
24	of_src8o	0	R/WC1	over_flow_src8out Indicates the state of the SRC8out output buffer. 0: Normal operation 1: An overflow has occurred.
23	of_src7o	0	R/WC1	over_flow_src7out Indicates the state of the SRC7out output buffer. 0: Normal operation 1: An overflow has occurred.

Bit	Bit Name	Initial Value	R/W	Description
22	of_src6o	0	R/WC1	over_flow_src6out Indicates the state of the SRC6out output buffer. 0: Normal operation 1: An overflow has occurred.
21	of_src5o	0	R/WC1	over_flow_src5out Indicates the state of the SRC5out output buffer. 0: Normal operation 1: An overflow has occurred.
20	of_src4o	0	R/WC1	over_flow_src4out Indicates the state of the SRC4out output buffer. 0: Normal operation 1: An overflow has occurred.
19	of_src3o	0	R/WC1	over_flow_src3out Indicates the state of the SRC3out output buffer. 0: Normal operation 1: An overflow has occurred.
18	of_src2o	0	R/WC1	over_flow_src2out Indicates the state of the SRC6out output buffer. 0: Normal operation 1: An overflow has occurred.
17	of_src1o	0	R/WC1	over_flow_src1out Indicates the state of the SRC7out output buffer. 0: Normal operation 1: An overflow has occurred.
16	of_src0o	0	R/WC1	over_flow_src0out Indicates the state of the SRC0out output buffer. 0: Normal operation 1: An overflow has occurred.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9	uf_src9i	0	R/WC1	under_flow_src9in Indicates the state of the SRC9in input buffer. 0: Normal operation 1: An underflow has occurred.
8	uf_src8i	0	R/WC1	under_flow_src8in Indicates the state of the SRC8in input buffer. 0: Normal operation 1: An underflow has occurred.
7	uf_src7i	0	R/WC1	under_flow_src7in Indicates the state of the SRC7in input buffer. 0: Normal operation 1: An underflow has occurred.

Bit	Bit Name	Initial Value	R/W	Description
6	uf_src6i	0	R/WC1	under_flow_src6in Indicates the state of the SRC6in input buffer. 0: Normal operation 1: An underflow has occurred.
5	uf_src5i	0	R/WC1	under_flow_src5in Indicates the state of the SRC5in input buffer. 0: Normal operation 1: An underflow has occurred.
4	uf_src4i	0	R/WC1	under_flow_src4in Indicates the state of the SRC4in input buffer. 0: Normal operation 1: An underflow has occurred.
3	uf_src3i	0	R/WC1	under_flow_src3in Indicates the state of the SRC3in input buffer. 0: Normal operation 1: An underflow has occurred.
2	uf_src2i	0	R/WC1	under_flow_src2in Indicates the state of the SRC2in input buffer. 0: Normal operation 1: An underflow has occurred.
1	uf_src1i	0	R/WC1	under_flow_src1in Indicates the state of the SRC1in input buffer. 0: Normal operation 1: An underflow has occurred.
0	uf_src0i	0	R/WC1	under_flow_src0in Indicates the state of the SRC0in input buffer. 0: Normal operation 1: An underflow has occurred.

[RZ/G1E]

Function: SCU\_SYSTEM\_STATUS0 indicates the internal buffer state. When a register bit is set, the corresponding interrupt signal is output. However, if interrupt outputs are masked by the SYSTEM interrupt enable register 0, interrupt signals are not output.

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	INIT	1	R/W	Initialization of Processing When this bit is set to 1, the SRC processing is initialized. This bit should be cleared to 0 after it was set to 1. 0: Processing State 1: Initialization (sets the initial setting of other registers)

**34.2.20 SRCm Audio Information Register (SRCm\_ADINR)**

Note: RZ/G1H, M and N: m = 0 to 9, RZ/G1E: m = 1 to 6

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: SRCm\_ADINR is a 32-bit readable/writable register that selects channel number and bit length of output audio data.

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20 to 16	OTBL[4:0]	00000	R/W	Bit Length of Output Audio Data. These bits set the bit length of output audio data. 00000: 24 bits 00001: Reserved 00010: 22 bits 00011: Reserved 00100: 20 bits 00101: Reserved 00110: 18 bits 00111: Reserved 01000: 16 bits 01001 to 01111: Reserved 10000: 8 bits 10001 to 11111: Reversed
15 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
3 to 0	CHNUM[3:0]	0000	R/W	<p>Channel Number (For m = 0, 1, 3, or 4 / (m = 1, 3, or 4)*)</p> <p>These bits set the channel number.</p> <p>0000: 0 (None)</p> <p>0001: 1 channel</p> <p>0010: 2 channels</p> <p>0011: Reserved</p> <p>0100: 4 channels</p> <p>0101: Reserved</p> <p>0110: 6 channels</p> <p>0111: Reserved</p> <p>1000: 8 channels</p> <p>1001 to 1111: Reserved</p> <p>Channel Number (For m = 2, 5 to 9 / (m = 2, 5, or 6)*)</p> <p>These bits set the channel number.</p> <p>0000: 0 (None)</p> <p>0001: 1 channel</p> <p>0010: 2 channels</p> <p>0011 to 1111: Reserved</p> <p>Note: * Applicable to the RZ/G1E.</p>

### 34.2.21 SRCm IFS Control Register (SRCm\_IFSCR)

Note: RZ/G1H, M and N: m = 0 to 9, RZ/G1E: m = 1 to 6

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: SRCm\_IFSCR is a 32-bit readable/writable register that controls INTIFS value.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	INTIFS EN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	INTIFSEN	0	R/W	INTIFS Value Setting Enable This bit controls the INTIFS bit of SRCm_IFSVR register. This bit is effective only in asynchronous SRC Mode (bit SRCMD in SRCm_SRCCR register is 0) 0: Disables INTIFS bit of SRCm_IFSVR register 1: Enables INTIFS bit of SRCm_IFSVR register Basically, this bit should be set to 1.

### 34.2.22 SRCm IFS Value Setting Register (SRCm\_IFSVR)

Note: RZ/G1H, M and N: m = 0 to 9, RZ/G1E: m = 1 to 6

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: SRCm\_IFSVR is a 32-bit readable/writable register that sets the value of INTIFS. The INTIFS is the initial value of FSI of sampling rate conversion function. SRC detects input sampling rate and output sampling rate automatically. By doing this, it calculates the FSI value so that the below formula is satisfied.

$$F_{in}/F_{out} \approx FSI/FSO$$

The INTIFS value is used for the initial value of FSI. If this setting is disabled (INTIFSEN bit of SRCm\_IFSCR register is 0), SRC will use FSO for initial value of FSI.

$$INTIFS = F_{in} \times FSO/F_{out}$$

- Note:  $F_{in}$ : Input sampling frequency  
 $F_{out}$ : Output sampling frequency  
 FSI: Input sampling rate  
 FSO: Output sampling rate (Fixed value:  $2^{22} = H'040\ 0000$ )

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
27 to 0	INTIFS[27:0]	H'000 0000	R/W	Initial Value of FSI These bits set initial value of FSI. These bits should be set the ratio of input and output sampling-rate within the range of the restriction decided from channel number. Example: $F_{in} = 32\text{ kHz}$ $F_{out} = 44.1\text{ kHz}$ $FSI = 2^{22} \times 32000 / 44100 = 3043485 = H'02E709D$ For the setting value examples, see Table 34.8.

Note: When SRCm is used in synchronous mode (SRCMD bit in SRCm\_SRCCR register is 1), INTIFS can change without SRC initialization. On the operating state, INTIFS can change within 1%. However, the change of the SRC conversion rate means that it will set jitter by manual operation. Please evaluate sound quality, and use this function as far as you judged sound quality is no problem. If on the occasion of the change more than 1%, it should do SRC initialization (cf. section 34.3.5 (1) (d)) after changing INTIFS.

### 34.2.23 SRCm SRC Control Register (SRCm\_SRCCR)

Note: RZ/G1H, M and N: m = 0 to 9, RZ/G1E: m = 1 to 6

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: SRCm\_SRCCR is a 32-bit readable/writable register that controls the operation of sampling rate converter.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

### 34.2.30 CTUn CTU Pass Mode Register (CTUn\_CPMDR)

Note: n = 00, 01, 02, 03, 10, 11, 12, or 13

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: CTUn\_CPMDR is a 32-bit readable/writable register that controls the pass of channel data for each output.

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	SELOT0[3:0]	0000	R/W	Select output data for channel 0 These bits select the output data for channel 0. 0000: Connect input data of channel 0 0001: Connect input data of channel 0 0010: Connect input data of channel 1 0011: Connect input data of channel 2 0100: Connect input data of channel 3 0101: Connect input data of channel 4 0110: Connect input data of channel 5 0111: Connect input data of channel 6 1000: Connect input data of channel 7 1001: Connect calculated data by scale values of matrix row 0 1010: Connect calculated data by scale values of matrix row 1 1011: Connect calculated data by scale values of matrix row 2 1100: Connect calculated data by scale values of matrix row 3

Bit	Bit Name	Initial Value	R/W	Description
27 to 24	SELOT1[3:0]	0000	R/W	<p>Select output data for channel 1</p> <p>These bits select the output data for channel 1.</p> <p>0000: Connect input data of channel 1</p> <p>0001: Connect input data of channel 0</p> <p>0010: Connect input data of channel 1</p> <p>0011: Connect input data of channel 2</p> <p>0100: Connect input data of channel 3</p> <p>0101: Connect input data of channel 4</p> <p>0110: Connect input data of channel 5</p> <p>0111: Connect input data of channel 6</p> <p>1000: Connect input data of channel 7</p> <p>1001: Connect calculated data by scale values of matrix row 0</p> <p>1010: Connect calculated data by scale values of matrix row 1</p> <p>1011: Connect calculated data by scale values of matrix row 2</p> <p>1100: Connect calculated data by scale values of matrix row 3</p>
23 to 20	SELOT2[3:0]	0000	R/W	<p>Select output data for channel 2</p> <p>These bits select the output data for channel 2.</p> <p>0000: Connect input data of channel 2</p> <p>0001: Connect input data of channel 0</p> <p>0010: Connect input data of channel 1</p> <p>0011: Connect input data of channel 2</p> <p>0100: Connect input data of channel 3</p> <p>0101: Connect input data of channel 4</p> <p>0110: Connect input data of channel 5</p> <p>0111: Connect input data of channel 6</p> <p>1000: Connect input data of channel 7</p> <p>1001: Connect calculated data by scale values of matrix row 0</p> <p>1010: Connect calculated data by scale values of matrix row 1</p> <p>1011: Connect calculated data by scale values of matrix row 2</p> <p>1100: Connect calculated data by scale values of matrix row 3</p>

Bit	Bit Name	Initial Value	R/W	Description
19 to 16	SELOT3[3:0]	0000	R/W	<p>Select output data for channel 3</p> <p>These bits select the output data for channel 3.</p> <p>0000: Connect input data of channel 3</p> <p>0001: Connect input data of channel 0</p> <p>0010: Connect input data of channel 1</p> <p>0011: Connect input data of channel 2</p> <p>0100: Connect input data of channel 3</p> <p>0101: Connect input data of channel 4</p> <p>0110: Connect input data of channel 5</p> <p>0111: Connect input data of channel 6</p> <p>1000: Connect input data of channel 7</p> <p>1001: Connect calculated data by scale values of matrix row 0</p> <p>1010: Connect calculated data by scale values of matrix row 1</p> <p>1011: Connect calculated data by scale values of matrix row 2</p> <p>1100: Connect calculated data by scale values of matrix row 3</p>
15 to 12	SELOT4[3:0]	0000	R/W	<p>Select output data for channel 4</p> <p>These bits select the output data for channel 4.</p> <p>0000: Connect input data of channel 4</p> <p>0001: Connect input data of channel 0</p> <p>0010: Connect input data of channel 1</p> <p>0011: Connect input data of channel 2</p> <p>0100: Connect input data of channel 3</p> <p>0101: Connect input data of channel 4</p> <p>0110: Connect input data of channel 5</p> <p>0111: Connect input data of channel 6</p> <p>1000: Connect input data of channel 7</p> <p>1001: Connect calculated data by scale values of matrix row 0</p> <p>1010: Connect calculated data by scale values of matrix row 1</p> <p>1011: Connect calculated data by scale values of matrix row 2</p> <p>1100: Connect calculated data by scale values of matrix row 3</p>

Bit	Bit Name	Initial Value	R/W	Description
11 to 8	SELOT5[3:0]	0000	R/W	<p>Select output data for channel 5</p> <p>These bits select the output data for channel 5.</p> <p>0000: Connect input data of channel 5</p> <p>0001: Connect input data of channel 0</p> <p>0010: Connect input data of channel 1</p> <p>0011: Connect input data of channel 2</p> <p>0100: Connect input data of channel 3</p> <p>0101: Connect input data of channel 4</p> <p>0110: Connect input data of channel 5</p> <p>0111: Connect input data of channel 6</p> <p>1000: Connect input data of channel 7</p> <p>1001: Connect calculated data by scale values of matrix row 0</p> <p>1010: Connect calculated data by scale values of matrix row 1</p> <p>1011: Connect calculated data by scale values of matrix row 2</p> <p>1100: Connect calculated data by scale values of matrix row 3</p>
7 to 4	SELOT6[3:0]	0000	R/W	<p>Select output data for channel 6</p> <p>These bits select the output data for channel 6.</p> <p>0000: Connect input data of channel 6</p> <p>0001: Connect input data of channel 0</p> <p>0010: Connect input data of channel 1</p> <p>0011: Connect input data of channel 2</p> <p>0100: Connect input data of channel 3</p> <p>0101: Connect input data of channel 4</p> <p>0110: Connect input data of channel 5</p> <p>0111: Connect input data of channel 6</p> <p>1000: Connect input data of channel 7</p> <p>1001: Connect calculated data by scale values of matrix row 0</p> <p>1010: Connect calculated data by scale values of matrix row 1</p> <p>1011: Connect calculated data by scale values of matrix row 2</p> <p>1100: Connect calculated data by scale values of matrix row 3</p>

Bit	Bit Name	Initial Value	R/W	Description
3 to 0	SELOT7[3:0]	0000	R/W	Select output data for channel 7 These bits select the output data for channel 7. 0000: Connect input data of channel 7 0001: Connect input data of channel 0 0010: Connect input data of channel 1 0011: Connect input data of channel 2 0100: Connect input data of channel 3 0101: Connect input data of channel 4 0110: Connect input data of channel 5 0111: Connect input data of channel 6 1000: Connect input data of channel 7 1001: Connect calculated data by scale values of matrix row 0 1010: Connect calculated data by scale values of matrix row 1 1011: Connect calculated data by scale values of matrix row 2 1100: Connect calculated data by scale values of matrix row 3

**34.2.31 CTUn Scale Mode Register (CTUn\_SCMDR)**

Note: n = 00, 01, 02, 03, 10, 11, 12, or 13

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: CTUn\_SCMDR is a 32-bit readable/writable register that selects the number of rows calculated by matrix.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	SCMD[2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

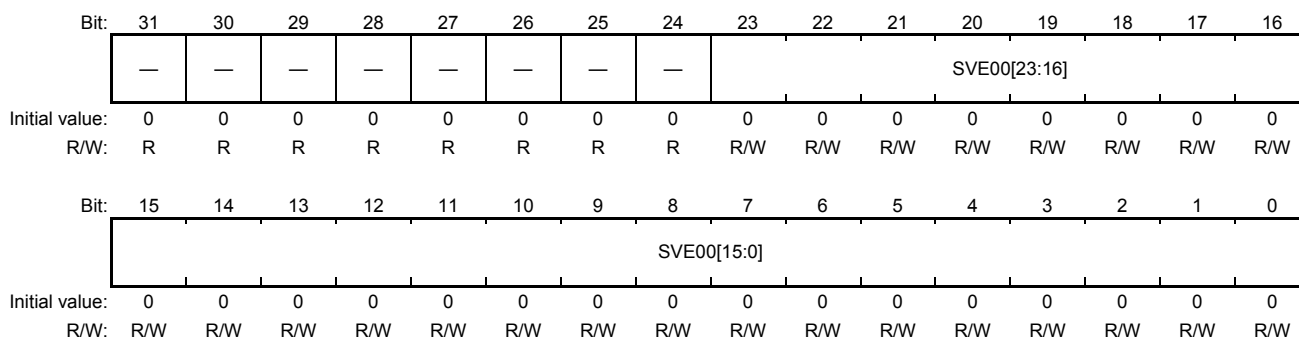

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2 to 0	SCMD[2:0]	000	R/W	The number of rows calculated by matrix These bits select the number of rows calculated by matrix by the scale values. 000: No operation 001: Calculate matrix row 0 by scale values. 010: Calculate matrix row 0 and 1 by scale values. 011: Calculate matrix row 0 and 1 and 2 by scale values. 100: Calculate matrix row 0 and 1 and 2 and 3 by scale values.

### 34.2.32 CTUn Scale Value e00 Register (CTUn\_SV00R)

Note: n = 00, 01, 02, 03, 10, 11, 12, or 13

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: CTUn\_SV00R is a 32-bit readable/writable register that sets the scale value for channel 0 of matrix row 0.

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 0	SVE00[23:0]	H'00_0000	R/W	Scale Value e00 for Input Channel 0 of Matrix Row 0 These bits set the scale value for input data of channel 0 of matrix row 0. SVE00[23]: Sign bit SVE00[22]: Integer bit SVE00[21:0]: Decimal bits

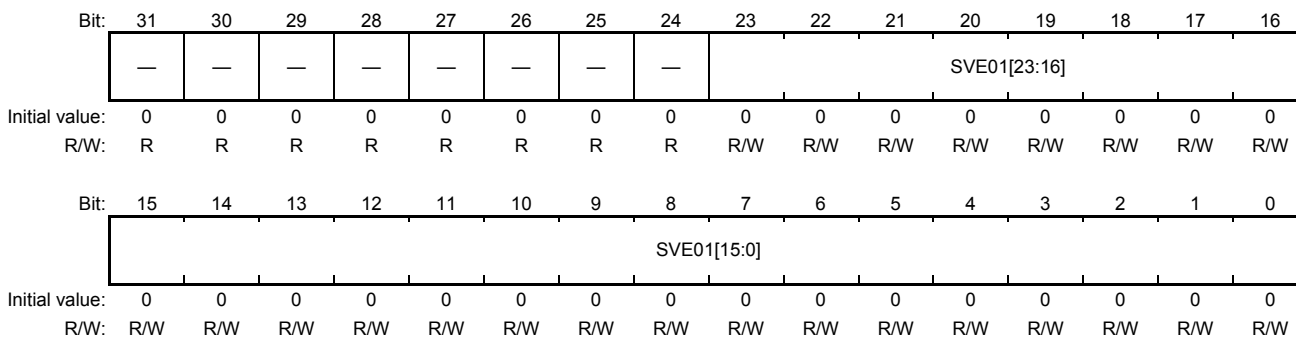

plus			minus		
Value	[time]	[dB]	Value	[time]	[dB]
H'7F_FFFF	2	6	H'80_0000	2	6
.....	.....	.....	.....	.....	.....
H'40_0000	1	0	H'C0_0000	1	0
.....	.....	.....	.....	.....	.....
H'00_0001	$2.38 \times 10^{-7}$	-132	.....	.....	.....
H'00_0000	0 (Mute)	$-\infty$	H'FF_FFFF	$2.38 \times 10^{-7}$	-132

### 34.2.33 CTUn Scale Value e01 Register (CTUn\_SV01R)

Note: n = 00, 01, 02, 03, 10, 11, 12, or 13

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: CTUn\_SV01R is a 32-bit readable/writable register that sets the scale value for channel 1 of matrix row 0.

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 0	SVE01[23:0]	H'00 0000	R/W	Scale Value e01 for Input Channel 1 of Matrix Row 0 These bits set the scale value for input data of channel 1 of matrix row 0. SVE01[23]: Sign bit SVE01[22]: Integer bit SVE01[21:0]: Decimal bits

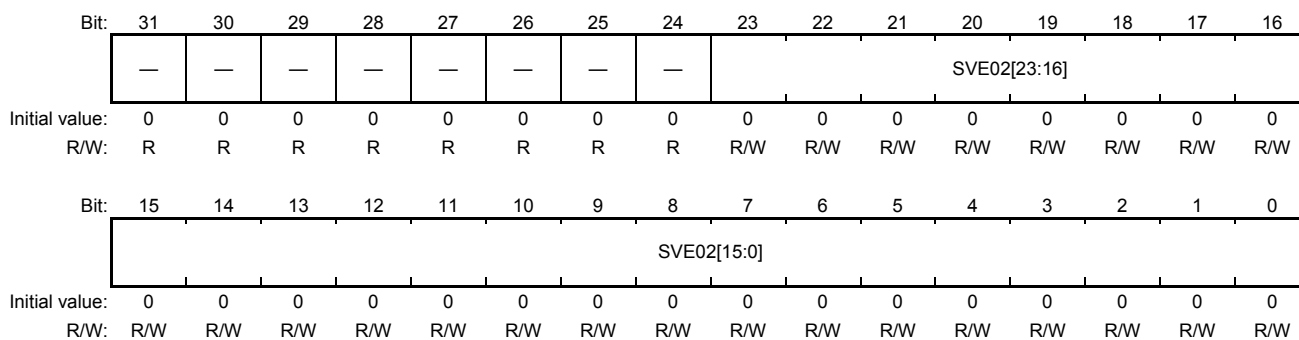

plus			minus		
Value	[time]	[dB]	Value	[time]	[dB]
H'7F_FFFF	2	6	H'80_0000	2	6
.....	.....	.....	.....	.....	.....
H'40_0000	1	0	H'C0_0000	1	0
.....	.....	.....	.....	.....	.....
H'00_0001	$2.38 \times 10^{-7}$	-132	.....	.....	.....
H'00_0000	0 (Mute)	$-\infty$	H'FF_FFFF	$2.38 \times 10^{-7}$	-132

### 34.2.34 CTUn Scale Value e02 Register (CTUn\_SV02R)

Note: n = 00, 01, 02, 03, 10, 11, 12, or 13

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: CTUn\_SV02R is a 32-bit readable/writable register that sets the scale value for channel 2 of matrix row 0.

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 0	SVE02[23:0]	H'00_0000	R/W	Scale Value e02 for Input Channel 2 of Matrix Row 0 These bits set the scale value for input data of channel 2 of matrix row 0. SVE02[23]: Sign bit SVE02[22]: Integer bit SVE02[21:0]: Decimal bits

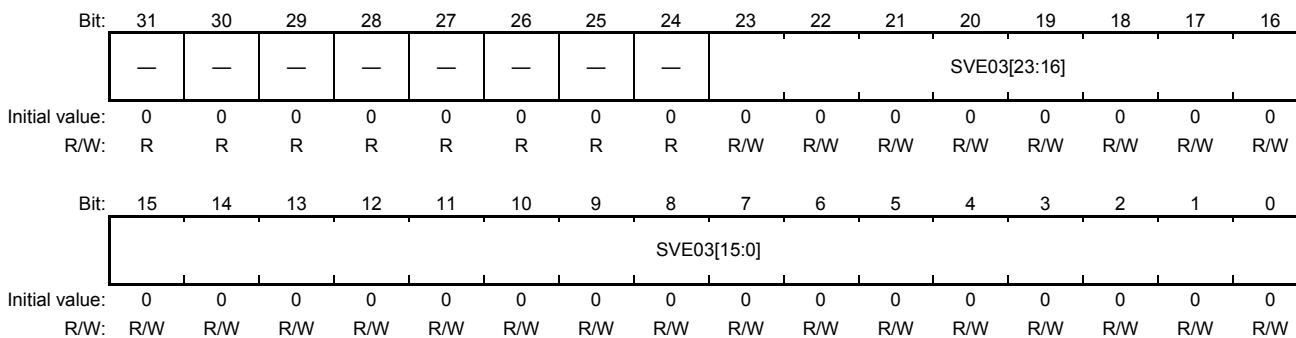

plus			minus		
Value	[time]	[dB]	Value	[time]	[dB]
H'7F_FFFF	2	6	H'80_0000	2	6
.....	.....	.....	.....	.....	.....
H'40_0000	1	0	H'C0_0000	1	0
.....	.....	.....	.....	.....	.....
H'00_0001	$2.38 \times 10^{-7}$	-132	.....	.....	.....
H'00_0000	0 (Mute)	$-\infty$	H'FF_FFFF	$2.38 \times 10^{-7}$	-132

### 34.2.35 CTUn Scale Value e03 Register (CTUn\_SV03R)

### 34.2.58 CTUn Scale Value e32 Register (CTUn\_SV32R)

Note: n = 00, 01, 02, 03, 10, 11, 12, or 13

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: CTUn\_SV32R is a 32-bit readable/writable register that sets the scale value for channel 2 of matrix row 3.

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 0	SVE32[23:0]	H'00 0000	R/W	Scale Value e32 for Input Channel 2 of Matrix Row 3 These bits set the scale value for input data of channel 2 of matrix row 3. SVE32[23]: Sign bit SVE32[22]: Integer bit SVE32[21:0]: Decimal bits

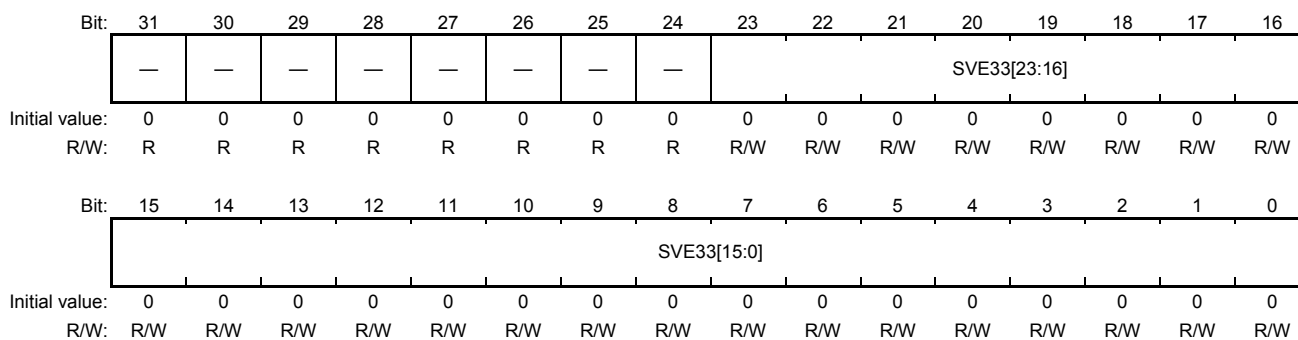

plus			minus		
Value	[time]	[dB]	Value	[time]	[dB]
H'7F_FFFF	2	6	H'80_0000	2	6
.....	.....	.....	.....	.....	.....
H'40_0000	1	0	H'C0_0000	1	0
.....	.....	.....	.....	.....	.....
H'00_0001	$2.38 \times 10^{-7}$	-132	.....	.....	.....
H'00_0000	0 (Mute)	$-\infty$	H'FF_FFFF	$2.38 \times 10^{-7}$	-132

### 34.2.59 CTUn Scale Value e33 Register (CTUn\_SV33R)

Note: n = 00, 01, 02, 03, 10, 11, 12, or 13

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: CTUn\_SV33R is a 32-bit readable/writable register that sets the scale value for channel 3 of matrix row 3.

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 0	SVE33[23:0]	H'00_0000	R/W	Scale Value e33 for Input Channel 3 of Matrix Row 3 These bits set the scale value for input data of channel 3 of matrix row 3. SVE33[23]: Sign bit SVE33[22]: Integer bit SVE33[21:0]: Decimal bits

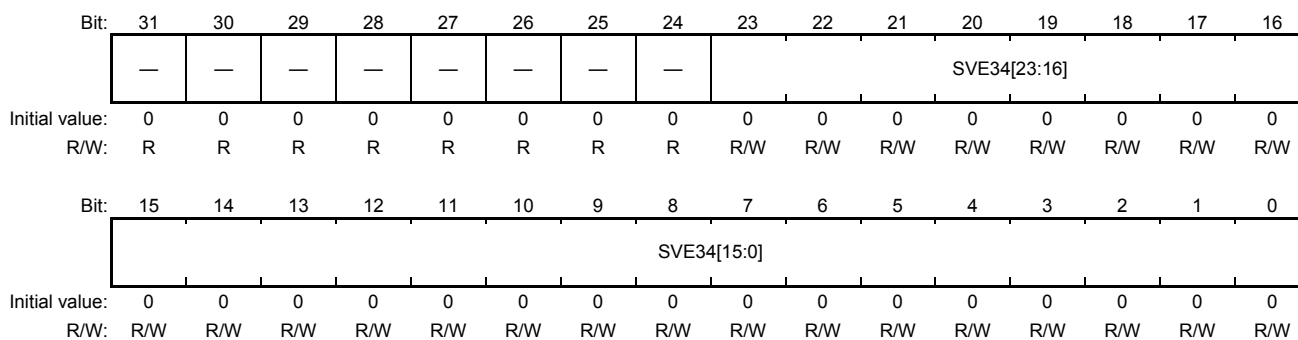

plus			minus		
Value	[time]	[dB]	Value	[time]	[dB]
H'7F_FFFF	2	6	H'80_0000	2	6
.....	.....	.....	.....	.....	.....
H'40_0000	1	0	H'C0_0000	1	0
.....	.....	.....	.....	.....	.....
H'00_0001	$2.38 \times 10^{-7}$	-132	.....	.....	.....
H'00_0000	0 (Mute)	$-\infty$	H'FF_FFFF	$2.38 \times 10^{-7}$	-132

### 34.2.60 CTUn Scale Value e34 Register (CTUn\_SV34R)

Note: n = 00, 01, 02, 03, 10, 11, 12, or 13

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: CTUn\_SV34R is a 32-bit readable/writable register that sets the scale value for channel 4 of matrix row 3.

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 0	SVE34[23:0]	H'00 0000	R/W	Scale Value e34 for Input Channel 4 of Matrix Row 3 These bits set the scale value for input data of channel 4 of matrix row 3. SVE34[23]: Sign bit SVE34[22]: Integer bit SVE34[21:0]: Decimal bits

plus			minus		
Value	[time]	[dB]	Value	[time]	[dB]
H'7F_FFFF	2	6	H'80_0000	2	6
.....	.....	.....	.....	.....	.....
H'40_0000	1	0	H'C0_0000	1	0
.....	.....	.....	.....	.....	.....
H'00_0001	$2.38 \times 10^{-7}$	-132	.....	.....	.....
H'00_0000	0 (Mute)	$-\infty$	H'FF_FFFF	$2.38 \times 10^{-7}$	-132

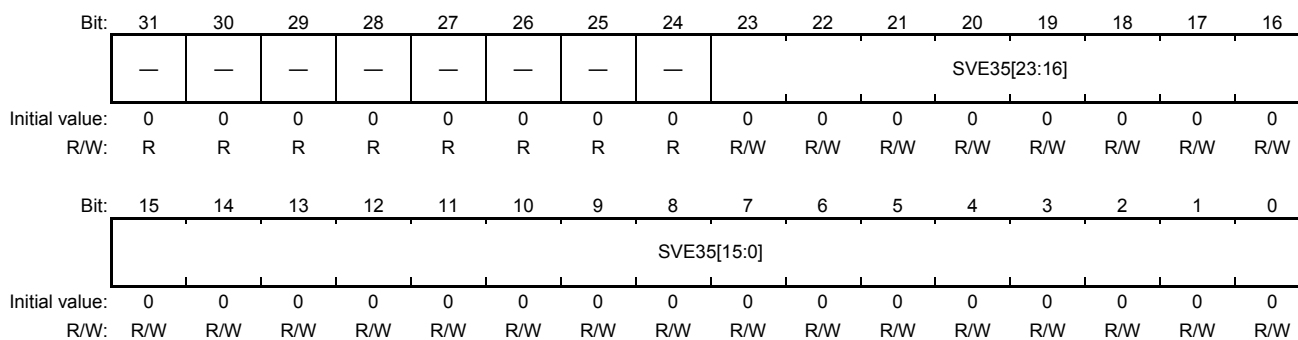

### 34.2.61 CTUn Scale Value e35 Register (CTUn\_SV35R)

Note: n = 00, 01, 02, 03, 10, 11, 12, or 13

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: CTUn\_SV35R is a 32-bit readable/writable register that sets the scale value for channel 5 of matrix row 3.

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 0	SVE35[23:0]	H'00_0000	R/W	Scale Value e35 for Input Channel 5 of Matrix Row 3 These bits set the scale value for input data of channel 5 of matrix row 3. SVE35[23]: Sign bit SVE35[22]: Integer bit SVE35[21:0]: Decimal bits

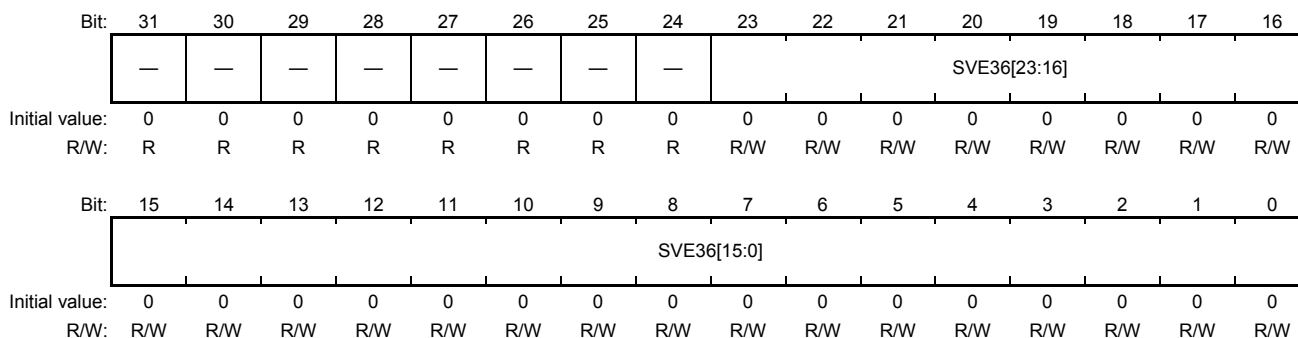

plus			minus		
Value	[time]	[dB]	Value	[time]	[dB]
H'7F_FFFF	2	6	H'80_0000	2	6
.....	.....	.....	.....	.....	.....
H'40_0000	1	0	H'C0_0000	1	0
.....	.....	.....	.....	.....	.....
H'00_0001	$2.38 \times 10^{-7}$	-132	.....	.....	.....
H'00_0000	0 (Mute)	$-\infty$	H'FF_FFFF	$2.38 \times 10^{-7}$	-132

### 34.2.62 CTUn Scale Value e36 Register (CTUn\_SV36R)

Note: n = 00, 01, 02, 03, 10, 11, 12, or 13

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: CTUn\_SV36R is a 32-bit readable/writable register that sets the scale value for channel 6 of matrix row 3.

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 0	SVE36[23:0]	H'00 0000	R/W	Scale Value e36 for Input Channel 6 of Matrix Row 3 These bits set the scale value for input data of channel 6 of matrix row 3. SVE36[23]: Sign bit SVE36[22]: Integer bit SVE36[21:0]: Decimal bits

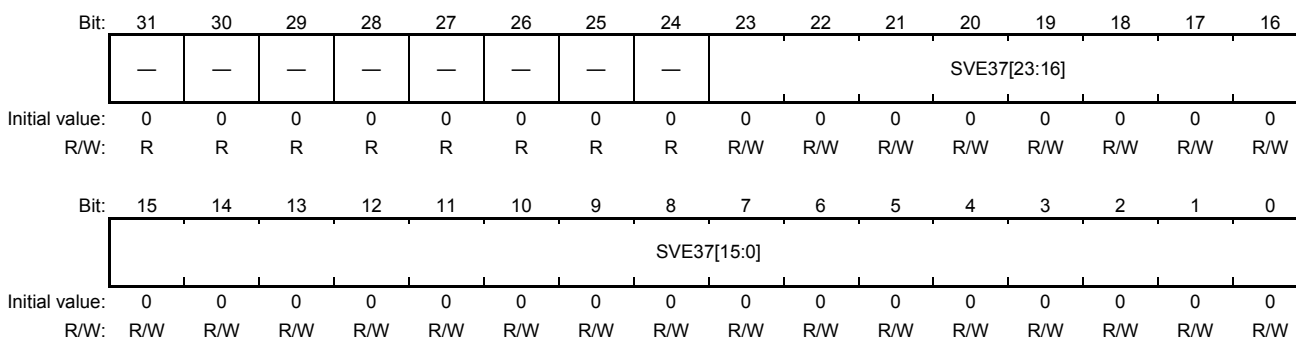

plus			minus		
Value	[time]	[dB]	Value	[time]	[dB]
H'7F_FFFF	2	6	H'80_0000	2	6
.....	.....	.....	.....	.....	.....
H'40_0000	1	0	H'C0_0000	1	0
.....	.....	.....	.....	.....	.....
H'00_0001	$2.38 \times 10^{-7}$	-132	.....	.....	.....
H'00_0000	0 (Mute)	$-\infty$	H'FF_FFFF	$2.38 \times 10^{-7}$	-132

**34.2.63 CTUn Scale Value e37 Register (CTUn\_SV37R)**

Note: n = 00, 01, 02, 03, 10, 11, 12, or 13

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: CTUn\_SV37R is a 32-bit readable/writable register that sets the scale value for channel 7 of matrix row 3.

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 0	SVE37[23:0]	H'00_0000	R/W	Scale Value e37 for Input Channel 7 of Matrix Row 3 These bits set the scale value for input data of channel 7 of matrix row 3. SVE37[23]: Sign bit SVE37[22]: Integer bit SVE37[21:0]: Decimal bits

plus			minus		
Value	[time]	[dB]	Value	[time]	[dB]
H'7F_FFFF	2	6	H'80_0000	2	6
.....	.....	.....	.....	.....	.....
H'40_0000	1	0	H'C0_0000	1	0
.....	.....	.....	.....	.....	.....
H'00_0001	$2.38 \times 10^{-7}$	-132	.....	.....	.....
H'00_0000	0 (Mute)	$-\infty$	H'FF_FFFF	$2.38 \times 10^{-7}$	-132

**34.2.64 MIXp Software Reset Register (MIXp\_SWRSR)**

Note: p = 0 or 1

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: MIXp\_SWRSR is a 32-bit readable/writable register that controls operation/reset of the MIX internal circuits.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SWRST
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SWRST	1	R/W	Software Reset While this bit is 0, the MIX internal circuits are put in the reset state. MIXp_* registers except this register are reset. Therefore, they should be set again after the reset is canceled. 0: Resets the MIX 1: Operating state

**34.2.65 MIXp MIX Initialization Register (MIXp\_MIXIR)**

Note: p = 0 or 1

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: MIXp\_MIXIR is a 32-bit readable/writable register that initializes the operation of the MIX internal circuits.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	INIT
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	INIT	1	R/W	Initialization of Processing When this bit is set to 1, the MIX processing is initialized. This bit should be cleared to 0 after it was set to 1. 0: Processing State 1: Initialization (sets the initial setting of other registers)

**34.2.66 MIXp Audio Information Register (MIXp\_ADINR)**

Note: p = 0 or 1

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: MIXp\_ADINR is a 32-bit readable/writable register that selects channel number.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	CHNUM[3:0]				
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3 to 0	CHNUM[3:0]	0000	R/W	Channel Number These bits set the channel number 0000: 0 (None) 0001: 1 channel 0010: 2 channels 0011: Reserved 0100: 4 channels 0101: Reserved 0110: 6 channels 0111: Reserved 1000: 8 channels 1001 to 1111: Reserved

**34.2.67 MIXp MIX Mode Register (MIXp\_MIXMR)**

Note: p = 0 or 1

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: MIXp\_MIXMR is a 32-bit readable/writable register that controls the mix mode.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MIX MODE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	MIXMODE	0	R/W	MIX Mode This bit controls the mix mode. 0: Selects volume step mixer 1: Selects volume ramp mixer

**34.2.68 MIXp MIX Volume Period Register (MIXp\_MVPDR)**

Note: p = 0 or 1

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: MIXp\_MVPDR is a 32-bit readable/writable register that sets the value of the change of the volume a sample.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	MXPDU[3:0]				—	—	—	—	MXPDDW[3:0]			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 8	MXPDU[3:0]	0000	R/W	MIX Period for Volume Up These bits set the decibel value that changed by one sample for volume down. And when MIXMODE bit of MIXp_MIXMR register is 1, this setting can be used. 0000: 128 dB / 1 sample 0001: 64 dB / 1 sample 0010: 32 dB / 1 sample 0011: 16 dB / 1 sample 0100: 8 dB / 1 sample 0101: 4 dB / 1 sample 0110: 2 dB / 1 sample 0111: 1 dB / 1 sample 1000: 0.5 dB / 1 sample 1001: 0.25 dB / 1 sample 1010: 0.125 dB / 1 sample 1011 to 1111: Reserved
7 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

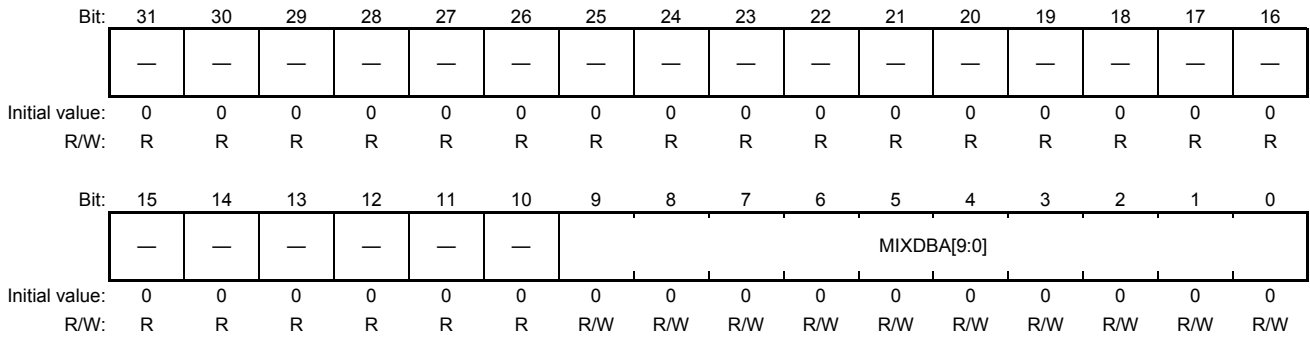

Bit	Bit Name	Initial Value	R/W	Description
3 to 0	MXPDDW[3:0]	0000	R/W	<p>MIX Period for Volume Down</p> <p>These bits set the decibel value that changed by one sample for volume up. And when MIXMODE bit of MIXp_MIXMR register is 1, this setting can be used.</p> <p>0000: -128 dB / 1 sample            0001: -64 dB / 1 sample            0010: -32 dB / 1 sample            0011: -16 dB / 1 sample            0100: -8 dB / 1 sample            0101: -4 dB / 1 sample            0110: -2 dB / 1 sample            0111: -1 dB / 1 sample            1000: -0.5 dB / 1 sample            1001: -0.25 dB / 1 sample            1010: -0.125 dB / 1 sample            1011 to 1111: Reserved</p>

**34.2.69 MIXp MIX Decibel A Register (MIXp\_MDBAR)**

Note: p = 0 or 1

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: MIXp\_MDBAR is a 32-bit readable/writable register that sets the decibel (gain level) of system A.

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	MIXDBA[9:0]	All 0	R/W	dB of System A These bits control the decibel (gain level) of system A. The value can select 1024 points from 0 dB to $-\infty$ dB at intervals of 0.125 dB.

Value	[time]	[dB]	Value	[time]	[dB]
H'000	1	0	.....	.....	.....
.....	.....	.....	H'091	0.125	-18.125
H'031	0.5	-6.125	.....	.....	.....
.....	.....	.....	H'3FE	$4.1 \times 10^{-7}$	-127.75
H'061	0.25	-12.125	H'3FF	0 (Mute)	$-\infty$

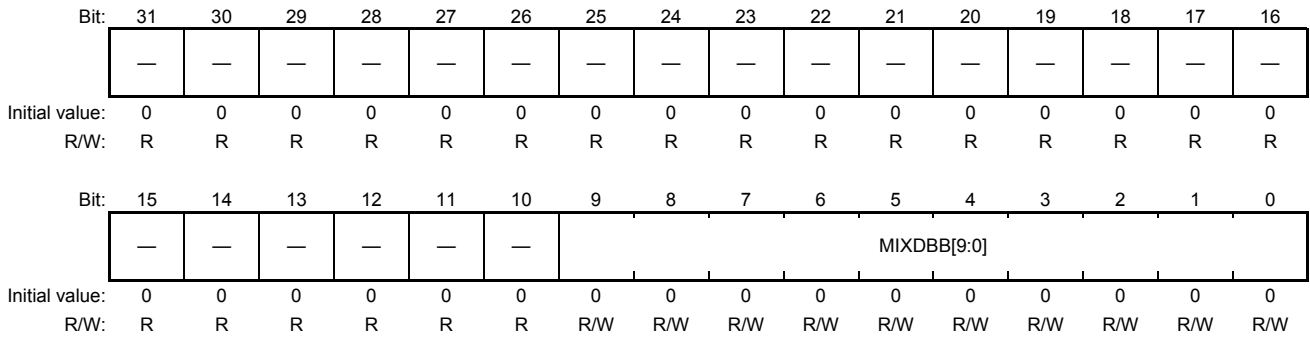

The relation between the setting value and the decibel is shown in Tables 34.9, 34.10, 34.11 and 34.12.

**34.2.70 MIXp MIX Decibel B Register (MIXp\_MDBBR)**

Note: p = 0 or 1

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: MIXp\_MDBBR is a 32-bit readable/writable register that sets the decibel (gain level) of system B.

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	MIXDBB[9:0]	All 0	R/W	dB of System B These bits control the decibel (gain level) of system B. The value can select 1024 points from 0 dB to $-\infty$ dB at intervals of 0.125 dB.

Value	[time]	[dB]	Value	[time]	[dB]
H'000	1	0	.....	.....	.....
.....	.....	.....	H'091	0.125	-18.125
H'031	0.5	-6.125	.....	.....	.....
.....	.....	.....	H'3FE	$4.1 \times 10^{-7}$	-127.75
H'061	0.25	-12.125	H'3FF	0 (Mute)	$-\infty$

The relation between the setting value and the decibel is shown in Tables 34.9, 34.10, 34.11 and 34.12.

### 34.2.71 MIXp MIX Decibel C Register (MIXp\_MDBCR)

Note: p = 0 or 1

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: MIXp\_MDBCR is a 32-bit readable/writable register that sets the decibel (gain level) of system C.

The relation between the setting value and the decibel is shown in Tables 34.9, 34.10, 34.11 and 34.12.																																								

**34.2.72 MIXp MIX Decibel D Register (MIXp\_MDBDR)**

Note: p = 0 or 1

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: MIXp\_MDBDR is a 32-bit readable/writable register that sets the decibel (gain level) of system D.

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	MIXDBD[9:0]	All 0	R/W	dB of System D These bits control the decibel (gain level) of system D. The value can select 1024 points from 0 dB to $-\infty$ dB at intervals of 0.125 dB.

Value	[time]	[dB]	Value	[time]	[dB]
H'000	1	0	.....	.....	.....
.....	.....	.....	H'091	0.125	-18.125
H'031	0.5	-6.125	.....	.....	.....
.....	.....	.....	H'3FE	$4.1 \times 10^{-7}$	-127.75
H'061	0.25	-12.125	H'3FF	0 (Mute)	$-\infty$

The relation between the setting value and the decibel is shown in Tables 34.9, 34.10, 34.11 and 34.12.

**34.2.73 MIXp MIX Decibel Enable Register (MIXp\_MDBER)**

Note: p = 0 or 1

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: MIXp\_MDBER is a 32-bit readable/writable register that controls the dB value.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MIX DBEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	MIXDBEN	0	R/W	MIX dB Enable This bit controls the dB value that sets in MIXp_MDBAR, MIXp_MDBBR, MIXp_MDBCR and MIXp_MDBDR registers. 0: Disables the setting of dB 1: Enables the setting of dB

**34.2.74 MIXp MIX Status Register (MIXp\_MIXSR)**

Note: p = 0 or 1

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: MIXp\_MIXSR is a 32-bit readable register that indicates the status of the volume ramp.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MRPSTS
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	MRPSTS	00	R	MIX Volume Ramp Status These bits indicate the volume ramp status of mix operation. 00: Level of volume ramp is stable 01: Volume ramp down 10: Volume ramp up

**34.2.75 DVCp Software Reset Register (DVCp\_SWRSR)**

Note: p = 0 or 1

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: DVCp\_SWRSR is a 32-bit readable/writable register that controls operation/reset of the DVC internal circuits.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SWRST
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SWRST	1	R/W	Software Reset While this bit is 0, the DVC internal circuits are put in the reset state. DVCp_* registers except this register are reset. Therefore, they should be set again after the reset is canceled. 0: Resets the DVC 1: Operating state

**34.2.76 DVCp DVU Initialization Register (DVCp\_DVUIR)**

Note: p = 0 or 1

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: DVCp\_DVUIR is a 32-bit readable/writable register that initializes the operation of the DVC internal circuits.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	INIT
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	INIT	1	R/W	Initialization of Processing When this bit is set to 1, the DVC processing is initialized. This bit should be cleared to 0 after it was set to 1. 0: Processing State 1: Initialization (sets the initial setting of other registers)

### 34.2.77 DVCp Audio Information Register (DVCp\_ADINR)

Note: p = 0 or 1

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: DVCp\_ADINR is a 32-bit readable/writable register that selects channel number and bit length of output audio data.

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20 to 16	OTBL[4:0]	00000	R/W	Bit Length of Output Audio Data. These bits set the bit length of output audio data. 00000: 24 bits 00001: Reserved 00010: 22 bits 00011: Reserved 00100: 20 bits 00101: Reserved 00110: 18 bits 00111: Reserved 01000: 16 bits 01001 to 01111: Reserved 10000: 8 bits 10001 to 11111: Reversed
15 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

---

Bit	Bit Name	Initial Value	R/W	Description
3 to 0	CHNUM[3:0]	0000	R/W	Channel Number
				These bits set the channel number
				0000: 0 (None)
				0001: 1 channel
				0010: 2 channels
				0011: Reserved
				0100: 4 channels
				0101: Reserved
				0110: 6 channels
				0111: Reserved
				1000: 8 channels
				1001 to 1111: Reserved

---

**34.2.78 DVCp DVU Control Register (DVCp\_DVUCR)**

Note: p = 0 or 1

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: DVCp\_DVUCR is a 32-bit readable/writable register that selects the mode of function to operate.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	HWMD
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	VVMD	—	—	—	VRMD	—	—	—	ZCMD
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	HWMD	0	R/W	Enable the DVC_MUTE pin This bit enables DVC_MUTE pin for the setting of DVCEN bit of DVCp_DVUER register. (Set enable only. To set disable, write 0 DVCEN bit) 0: Disables the DVC_MUTE pin 1: Enables the DVC_MUTE pin
15 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	VVMD	0	R/W	Select Digital Volume Value Mode This bit selects the digital volume value function. 0: Sleep the digital volume value function 1: Use the digital volume value function
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	VRMD	0	R/W	Select Volume Ramp Mode This bit selects the volume ramp function. 0: Sleep the volume ramp function 1: Use the volume ramp function
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	ZCMD	0	R/W	Select Zero Cross Mute Mode This bit selects the zero cross mute function. 0: Sleep the zero cross mute function 1: Use the zero cross mute function

### 34.2.79 DVCp Zero Cross Mute Control Register (DVCp\_ZCMCR)

Note: p = 0 or 1

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: DVCp\_ZCMCR is a 32-bit readable/writable register that controls the operation of the zero cross mute function for each channel.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	ZCEN7	ZCEN6	ZCEN5	ZCEN4	ZCEN3	ZCEN2	ZCEN1	ZCEN0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7	ZCEN7	0	R/W	Zero Cross Mute Enable for Channel 7 This bit controls the operation of the zero cross mute function for channel 7. 0: Disables the operation of the zero cross mute function 1: Enables the operation of the zero cross mute function
6	ZCEN6	0	R/W	Zero Cross Mute Enable for Channel 6 This bit controls the operation of the zero cross mute function for channel 6. 0: Disables the operation of the zero cross mute function 1: Enables the operation of the zero cross mute function
5	ZCEN5	0	R/W	Zero Cross Mute Enable for Channel 5 This bit controls the operation of the zero cross mute function for channel 5. 0: Disables the operation of the zero cross mute function 1: Enables the operation of the zero cross mute function
4	ZCEN4	0	R/W	Zero Cross Mute Enable for Channel 4 This bit controls the operation of the zero cross mute function for channel 4. 0: Disables the operation of the zero cross mute function 1: Enables the operation of the zero cross mute function
3	ZCEN3	0	R/W	Zero Cross Mute Enable for Channel 3 This bit controls the operation of the zero cross mute function for channel 3. 0: Disables the operation of the zero cross mute function 1: Enables the operation of the zero cross mute function

Bit	Bit Name	Initial Value	R/W	Description
2	ZCEN2	0	R/W	Zero Cross Mute Enable for Channel 2 This bit controls the operation of the zero cross mute function for channel 2. 0: Disables the operation of the zero cross mute function 1: Enables the operation of the zero cross mute function
1	ZCEN1	0	R/W	Zero Cross Mute Enable for Channel 1 This bit controls the operation of the zero cross mute function for channel 1. 0: Disables the operation of the zero cross mute function 1: Enables the operation of the zero cross mute function
0	ZCEN0	0	R/W	Zero Cross Mute Enable for Channel 0 This bit controls the operation of the zero cross mute function for channel 0. 0: Disables the operation of the zero cross mute function 1: Enables the operation of the zero cross mute function

### 34.2.80 DVCp Volume Ramp Control Register (DVCp\_VRCTR)

Note: p = 0 or 1

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: DVCp\_VRCTR is a 32-bit readable/writable register that controls the operation of the volume ramp function for each channel.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	VREN7	VREN6	VREN5	VREN4	VREN3	VREN2	VREN1	VREN0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7	VREN7	0	R/W	Volume Ramp Enable for Channel 7 This bit controls the operation of the volume ramp function for channel 7. 0: Disables the operation of the volume ramp function 1: Enables the operation of the volume ramp function
6	VREN6	0	R/W	Volume Ramp Enable for Channel 6 This bit controls the operation of the volume ramp function for channel 6. 0: Disables the operation of the volume ramp function 1: Enables the operation of the volume ramp function
5	VREN5	0	R/W	Volume Ramp Enable for Channel 5 This bit controls the operation of the volume ramp function for channel 5. 0: Disables the operation of the volume ramp function 1: Enables the operation of the volume ramp function
4	VREN4	0	R/W	Volume Ramp Enable for Channel 4 This bit controls the operation of the volume ramp function for channel 4. 0: Disables the operation of the volume ramp function 1: Enables the operation of the volume ramp function
3	VREN3	0	R/W	Volume Ramp Enable for Channel 3 This bit controls the operation of the volume ramp function for channel 3. 0: Disables the operation of the volume ramp function 1: Enables the operation of the volume ramp function
2	VREN2	0	R/W	Volume Ramp Enable for Channel 2 This bit controls the operation of the volume ramp function for channel 2. 0: Disables the operation of the volume ramp function 1: Enables the operation of the volume ramp function

Bit	Bit Name	Initial Value	R/W	Description
1	VREN1	0	R/W	Volume Ramp Enable for Channel 1 This bit controls the operation of the volume ramp function for channel 1. 0: Disables the operation of the volume ramp function 1: Enables the operation of the volume ramp function
0	VREN0	0	R/W	Volume Ramp Enable for Channel 0 This bit controls the operation of the volume ramp function for channel 0. 0: Disables the operation of the volume ramp function 1: Enables the operation of the volume ramp function

Note: All of these bits should be set to 1 when VRMD bit of DVCp\_DVUCR register is 1.

**34.2.81 DVCp Volume Ramp Period Register (DVCp\_VRPDR)**

Note: p = 0 or 1

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: DVCp\_VRPDR is a 32-bit readable/writable register that controls.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**34.2.82 DVCp Volume Ramp Decibel Register (DVCp\_VRDBR)**

Note: p = 0 or 1

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: DVCp\_VRDBR is a 32-bit readable/writable register that sets the decibel (gain level) of volume ramp.

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	VRDB[9:0]	All 0	R/W	dB of Volume Ramp These bits control the decibel (gain level) of volume ramp. The value can select 1024 points from 0 dB to $-\infty$ dB at intervals of 0.125 dB.

Value	[time]	[dB]	Value	[time]	[dB]
H'000	1	0	.....	.....	.....
.....	.....	.....	H'091	0.125	-18.125
H'031	0.5	-6.125	.....	.....	.....
.....	.....	.....	H'3FE	$4.1 \times 10^{-7}$	-127.75
H'061	0.25	-12.125	H'3FF	0 (Mute)	$-\infty$

The relation between the setting value and the decibel is shown in Tables 34.9, 34.10, 34.11 and 34.12.

**34.2.83 DVCp Volume Ramp Wait Time Register (DVCp\_VRWTR)**

Note: p = 0 or 1

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: DVCp\_VRWTR is a 32-bit readable/writable register that sets the standby time to start the operation of the volume ramp function.

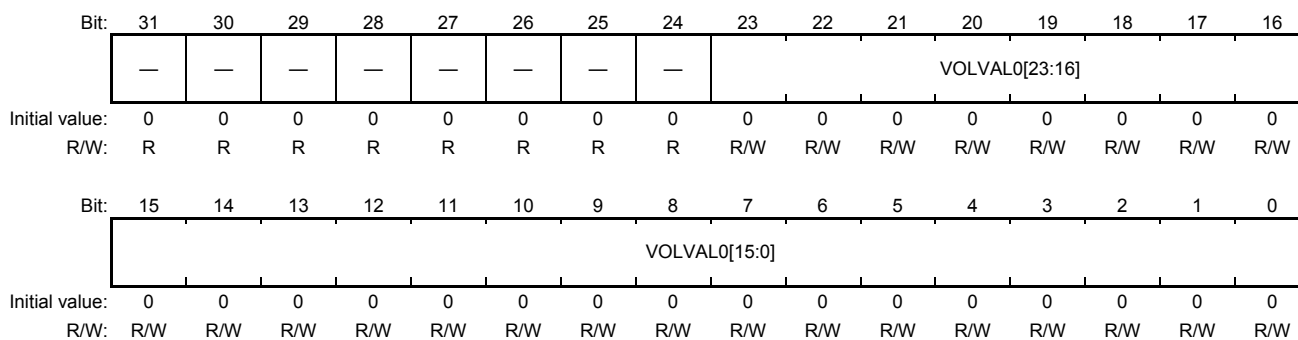

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 0	VRWT[23:0]	H'00 0000	R/W	Volume Ramp Wait Time These bits set the standby time to adjust the start timing of operation of the volume ramp function when the setting of DVCp_VRDBR register is changed. If the internal counter of the DVC logic reached to the value of these bits, the volume ramp function starts to operate to change the volume to target volume of DVCp_VRDBR register.

### 34.2.84 DVCp Volume Value Setting 0 Register (DVCp\_VOL0R)

Note: p = 0 or 1

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: DVCp\_VOL0R is a 32-bit readable/writable register that sets digital volume value for channel 0.

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 0	VOLVAL0 [23:0]	H'00_0000	R/W	Digital Volume Value for Channel 0 These bits set the digital volume of channel 0. The maximum value is 8-time (18 dB) and the minimum value is 0 (-∞ dB). VOLVAL0[23]: Sign bit (The write value should be 0.) VOLVAL0[22:20]: Integer bits VOLVAL0[19:0]: Decimal bits

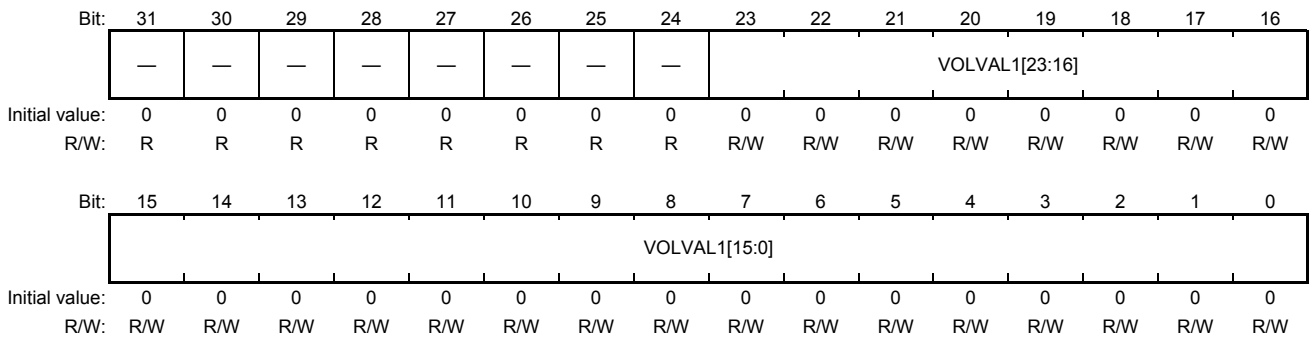

Value	[time]	[dB]	Value	[time]	[dB]
H'7F_FFFF	8	18	H'08_0000	0.5	-6
...	...	...	...	...	...
H'10_0000	1	0	H'00_0001	$9.5 \times 10^{-7}$	-120
...	...	...	H'00_0000	0	-∞

**34.2.85 DVCp Volume Value Setting 1 Register (DVCp\_VOL1R)**

Note: p = 0 or 1

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: DVCp\_VOL1R is a 32-bit readable/writable register that sets digital volume value for channel 1.

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 0	VOLVAL1 [23:0]	H'00 0000	R/W	Digital Volume Value for Channel 1 These bits set the digital volume of channel 1. The maximum value is 8-time (18 dB) and the minimum value is 0 (-∞ dB). VOLVAL1[23]: Sign bit (The write value should be 0.) VOLVAL1[22:20]: Integer bits VOLVAL1[19:0]: Decimal bits

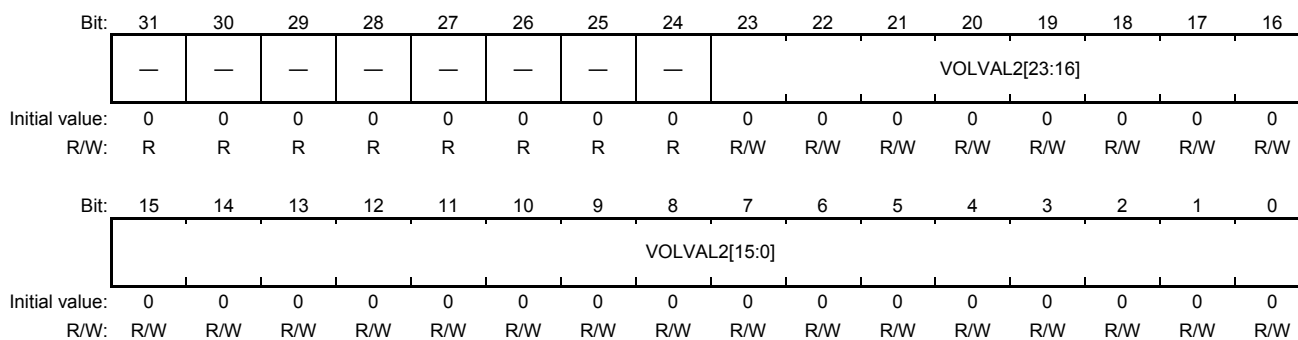

Value	[time]	[dB]	Value	[time]	[dB]
H'7F_FFFF	8	18	H'08_0000	0.5	-6
...	...	...	...	...	...
H'10_0000	1	0	H'00_0001	$9.5 \times 10^{-7}$	-120
...	...	...	H'00_0000	0	-∞

### 34.2.86 DVCp Volume Value Setting 2 Register (DVCp\_VOL2R)

Note: p = 0 or 1

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: DVCp\_VOL2R is a 32-bit readable/writable register that sets digital volume value for channel 2.

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 0	VOLVAL2 [23:0]	H'00 0000	R/W	Digital Volume Value for Channel 2 These bits set the digital volume of channel 2. The maximum value is 8-time (18 dB) and the minimum value is 0 (-∞ dB). VOLVAL2[23]: Sign bit (The write value should be 0.) VOLVAL2[22:20]: Integer bits VOLVAL2[19:0]: Decimal bits

Value	[time]	[dB]	Value	[time]	[dB]
H'7F_FFFF	8	18	H'08_0000	0.5	-6
...	...	...	...	...	...
H'10_0000	1	0	H'00_0001	$9.5 \times 10^{-7}$	-120
...	...	...	H'00_0000	0	-∞

### 34.2.87 DVCp Volume Value Setting 3 Register (DVCp\_VOL3R)

Note: p = 0 or 1

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: DVCp\_VOL3R is a 32-bit readable/writable register that sets digital volume value for channel 3.

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 0	VOLVAL3 [23:0]	H'00 0000	R/W	Digital Volume Value for Channel 3 These bits set the digital volume of channel 3. The maximum value is 8-time (18 dB) and the minimum value is 0 (-∞ dB). VOLVAL3[23]: Sign bit (The write value should be 0.) VOLVAL3[22:20]: Integer bits VOLVAL3[19:0]: Decimal bits

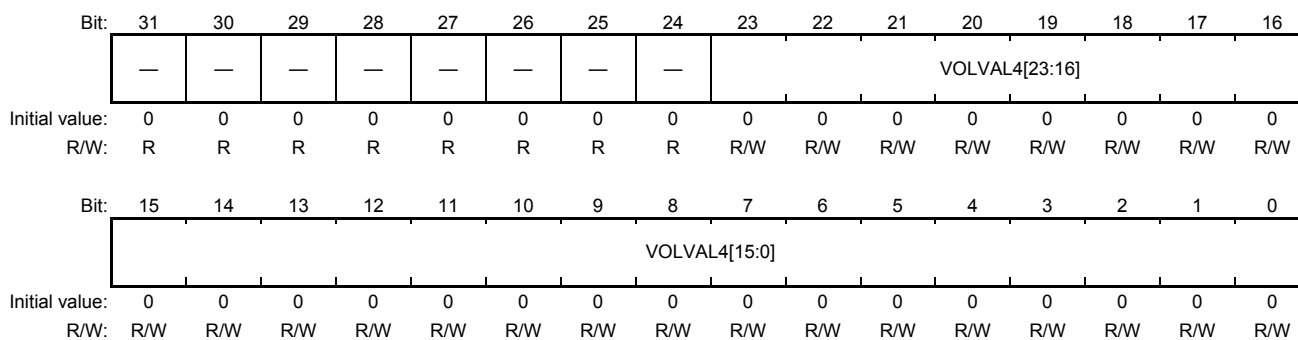

Value	[time]	[dB]	Value	[time]	[dB]
H'7F_FFFF	8	18	H'08_0000	0.5	-6
...	...	...	...	...	...
H'10_0000	1	0	H'00_0001	$9.5 \times 10^{-7}$	-120
...	...	...	H'00_0000	0	-∞

### 34.2.88 DVCp Volume Value Setting 4 Register (DVCp\_VOL4R)

Note: p = 0 or 1

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: DVCp\_VOL4R is a 32-bit readable/writable register that sets digital volume value for channel 4.

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 0	VOLVAL4 [23:0]	H'00 0000	R/W	Digital Volume Value for Channel 4 These bits set the digital volume of channel 4. The maximum value is 8-time (18 dB) and the minimum value is 0 (-∞ dB). VOLVAL4[23]: Sign bit (The write value should be 0.) VOLVAL4[22:20]: Integer bits VOLVAL4[19:0]: Decimal bits

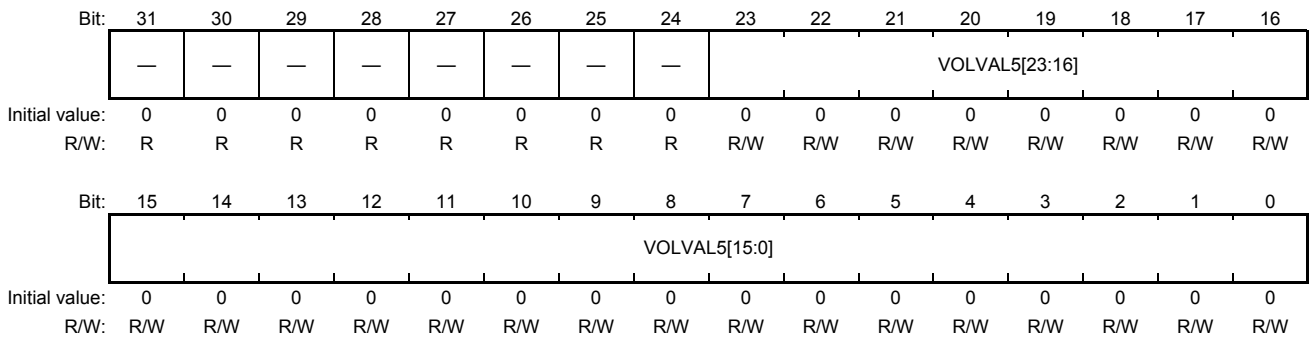

Value	[time]	[dB]	Value	[time]	[dB]
H'7F_FFFF	8	18	H'08_0000	0.5	-6
...	...	...	...	...	...
H'10_0000	1	0	H'00_0001	$9.5 \times 10^{-7}$	-120
...	...	...	H'00_0000	0	-∞

**34.2.89 DVCp Volume Value Setting 5 Register (DVCp\_VOL5R)**

Note: p = 0 or 1

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: DVCp\_VOL5R is a 32-bit readable/writable register that sets digital volume value for channel 5.

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 0	VOLVAL5 [23:0]	H'00 0000	R/W	Digital Volume Value for Channel 5 These bits set the digital volume of channel 5. The maximum value is 8-time (18 dB) and the minimum value is 0 (-∞ dB). VOLVAL5[23]: Sign bit (The write value should be 0.) VOLVAL5[22:20]: Integer bits VOLVAL5[19:0]: Decimal bits

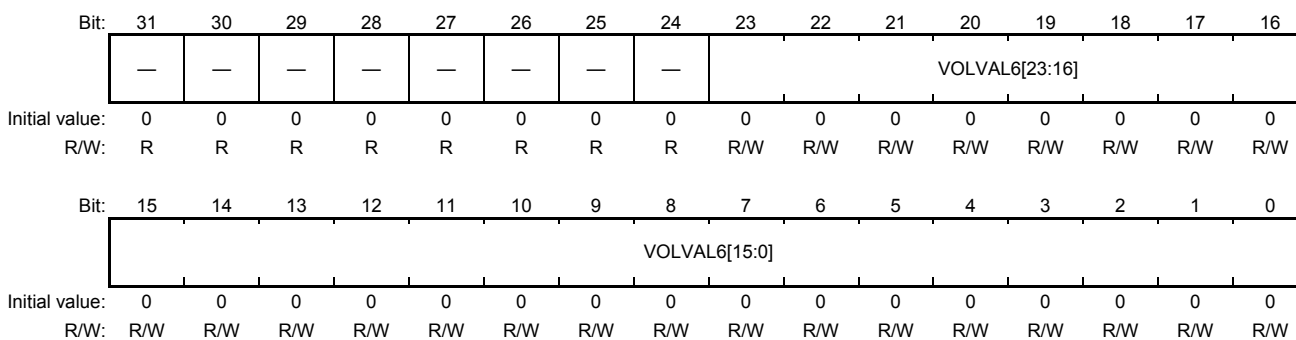

Value	[time]	[dB]	Value	[time]	[dB]
H'7F_FFFF	8	18	H'08_0000	0.5	-6
...	...	...	...	...	...
H'10_0000	1	0	H'00_0001	$9.5 \times 10^{-7}$	-120
...	...	...	H'00_0000	0	-∞

### 34.2.90 DVCp Volume Value Setting 6 Register (DVCp\_VOL6R)

Note: p = 0 or 1

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: DVCp\_VOL6R is a 32-bit readable/writable register that sets digital volume value for channel 6.

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 0	VOLVAL6 [23:0]	H'00 0000	R/W	Digital Volume Value for Channel 6 These bits set the digital volume of channel 6. The maximum value is 8-time (18 dB) and the minimum value is 0 (-∞ dB). VOLVAL6[23]: Sign bit (The write value should be 0.) VOLVAL6[22:20]: Integer bits VOLVAL6[19:0]: Decimal bits

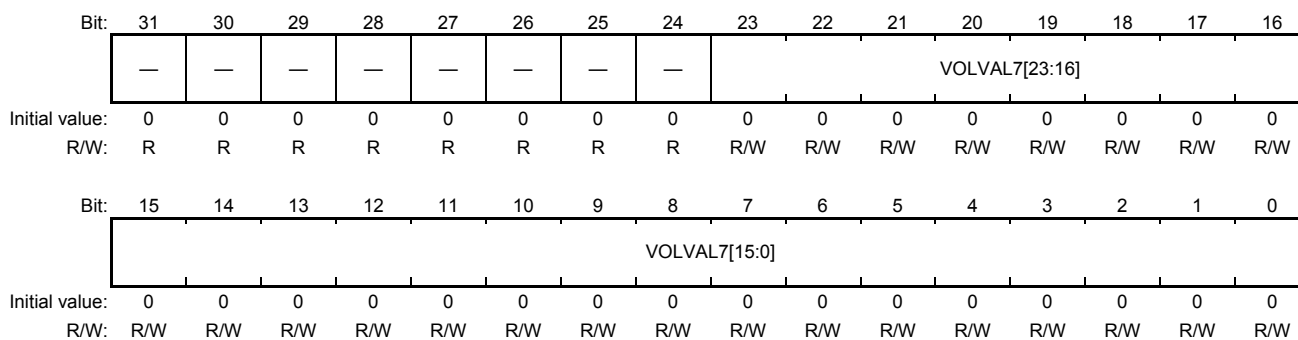

Value	[time]	[dB]	Value	[time]	[dB]
H'7F_FFFF	8	18	H'08_0000	0.5	-6
...	...	...	...	...	...
H'10_0000	1	0	H'00_0001	$9.5 \times 10^{-7}$	-120
...	...	...	H'00_0000	0	-∞

### 34.2.91 DVCp Volume Value Setting 7 Register (DVCp\_VOL7R)

Note: p = 0 or 1

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: DVCp\_VOL7R is a 32-bit readable/writable register that sets digital volume value for channel 7.

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 0	VOLVAL7 [23:0]	H'00 0000	R/W	Digital Volume Value for Channel 7 These bits set the digital volume of channel 7. The maximum value is 8-time (18 dB) and the minimum value is 0 (-∞ dB). VOLVAL7[23]: Sign bit (The write value should be 0.) VOLVAL7[22:20]: Integer bits VOLVAL7[19:0]: Decimal bits

Value	[time]	[dB]	Value	[time]	[dB]
H'7F_FFFF	8	18	H'08_0000	0.5	-6
...	...	...	...	...	...
H'10_0000	1	0	H'00_0001	$9.5 \times 10^{-7}$	-120
...	...	...	H'00_0000	0	-∞

**34.2.92 DVCp DVU Enable Register (DVCp\_DVUER)**

Note: p = 0 or 1

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: DVCp\_DVUER is a 32-bit readable/writable register that controls the setting of DVC registers.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DVCEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	DVCEN	0	R/W	DVC Register Setting Enable This bit controls the setting of DVC registers (DVCp_ZCMCR, DVCp_VRCTR, DVCp_VRPDR, DVCp_VRDBR, DVCp_VOL0R, DVCp_VOL1R, DVCp_VOL2R, DVCp_VOL3R, DVCp_VOL4R, DVCp_VOL5R, DVCp_VOL6R, DVCp_VOL7R ). 0: Disables the setting of dvc registers to DVC logic 1: Enables the setting of dvc registers to DVC logic

**34.2.93 DVCp DVU Status Register (DVCp\_DVUSR)**

Note: p = 0, 1

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: DVCp\_DVUSR is a 32-bit readable register that indicates the status of the zero cross mute and the volume ramp. This register is used for debug.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	ALLZS TS	ZSTS7	ZSTS6	ZSTS5	ZSTS4	ZSTS3	ZSTS2	ZSTS1	ZSTS0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	VRSTS_ LEVEL	VRSTS_ MUTE	VRSTS[2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	ALLZSTS	0	R	All-Channel Zero Cross Mute Status 0: Not all-channel zero cross mute state 1: All-channel zero cross mute state Note: The state is determined only based on the channels for which the zero cross mute function is set.
23	ZSTS7	0	R	Zero Cross Mute Status of Channel 7 This bit indicates the zero cross mute status of channel 7. 0: Not mute status 1: Mute status
22	ZSTS6	0	R	Zero Cross Mute Status of Channel 6 This bit indicates the zero cross mute status of channel 6. 0: Not mute status 1: Mute status
21	ZSTS5	0	R	Zero Cross Mute Status of Channel 5 This bit indicates the zero cross mute status of channel 5. 0: Not mute status 1: Mute status
20	ZSTS4	0	R	Zero Cross Mute Status of Channel 4 This bit indicates the zero cross mute status of channel 4. 0: Not mute status 1: Mute status
19	ZSTS3	0	R	Zero Cross Mute Status of Channel 3 This bit indicates the zero cross mute status of channel 3. 0: Not mute status 1: Mute status

Bit	Bit Name	Initial Value	R/W	Description
18	ZSTS2	0	R	Zero Cross Mute Status of Channel 2 This bit indicates the zero cross mute status of channel 2. 0: Not mute status 1: Mute status
17	ZSTS1	0	R	Zero Cross Mute Status of Channel 1 This bit indicates the zero cross mute status of channel 1. 0: Not mute status 1: Mute status
16	ZSTS0	0	R	Zero Cross Mute Status of Channel 0 This bit indicates the zero cross mute status of channel 0. 0: Not mute status 1: Mute status
15 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	VRSTS_LEVEL	0	R	Volume Ramp Level Status 0: The volume ramp level is not the level specified by the DVCp_VRDBR register. (VRSTS is not 011.) 1: The volume ramp level is the level specified by the DVCp_VRDBR register. (VRSTS is 011.)
3	VRSTS_MUTE	1	R	Volume Ramp Mute Status 0: Not mute status 1: Mute status
2 to 0	VRSTS[2:0]	000	R	Volume Ramp Status These bits indicate the volume ramp status. 000: Mute status 001: Volume ramp down 010: Volume ramp up 011: The volume ramp level is not the level specified by the DVCp_VRDBR register. 100: Volume of input data is maintained (Volume is 1-time) 101~111: Reserved bits

### 34.2.94 DVCp Interrupt Enable Register (DVCp\_DVIER)

Note: p = 0, 1

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: DVCp\_DVIER enables or disables output of interrupts corresponding to the states indicated in the DVCp\_DVUSR register.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	ALLZS TS_ie	ZSTS7 _ie	ZSTS6 _ie	ZSTS5 _ie	ZSTS4 _ie	ZSTS3 _ie	ZSTS2 _ie	ZSTS1 _ie	ZSTS0 _ie
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	VRSTS_L EVEL_ie	VRSTS_M UTE_ie	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	ALLZSTS_ie	0	R/W	allzsts_int_enable 0: Interrupt outputs are disabled. 1: Interrupt outputs are enabled.
23	ZSTS7_ie	0	R/W	zsts7_int_enable 0: Interrupt outputs are disabled. 1: Interrupt outputs are enabled.
22	ZSTS6_ie	0	R/W	zsts6_int_enable 0: Interrupt outputs are disabled. 1: Interrupt outputs are enabled.
21	ZSTS5_ie	0	R/W	zsts5_int_enable 0: Interrupt outputs are disabled. 1: Interrupt outputs are enabled.
20	ZSTS4_ie	0	R/W	zsts4_int_enable 0: Interrupt outputs are disabled. 1: Interrupt outputs are enabled.
19	ZSTS3_ie	0	R/W	zsts3_int_enable 0: Interrupt outputs are disabled. 1: Interrupt outputs are enabled.
18	ZSTS2_ie	0	R/W	zsts2_int_enable 0: Interrupt outputs are disabled. 1: Interrupt outputs are enabled.
17	ZSTS1_ie	0	R/W	zsts1_int_enable 0: Interrupt outputs are disabled. 1: Interrupt outputs are enabled.

Bit	Bit Name	Initial Value	R/W	Description
16	ZSTS0_ie	0	R/W	zsts0_int_enable 0: Interrupt outputs are disabled. 1: Interrupt outputs are enabled.
15 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	VRSTS_LEVEL_ie	0	R/W	vrsts_level_int_enable 0: Interrupt outputs are disabled. 1: Interrupt outputs are enabled.
3	VRSTS_MUTE_ie	0	R/W	vrsts_mute_int_enable 0: Interrupt outputs are disabled. 1: Interrupt outputs are enabled.
2 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

**34.2.95 SRCm in Write Data Register (SRCm in\_BUSIF)**

Note: RZ/G1H, M and N: m = 0 to 9, RZ/G1E: m = 1 to 6

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: SRCm in\_BUSIF are window registers in which data is stored during data transfer via SRCm in\_BUSIF. These registers are used for transmission.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SRCm in_BUSIF	All 0	-W	These bits are a window register in which data is stored during data transfer via SRCm in_BUSIF. This register is used for transmission.

### 34.2.96 SRCm out Read Data Register (SRCm out\_BUSIF)

Note: RZ/G1H, M and N: m = 0 to 9, RZ/G1E: m = 1 to 6

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: SRCm out\_BUSIF are window registers in which data is stored during data transfer via SRCm out\_BUSIF. These registers are used for reception.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SRCm out_BUSIF	All 0	R	These bits are a window register in which data is stored during data transfer via SRCm out_BUSIF. This register is used for reception.

### 34.2.97 CMDn out Read Data Register (CMDn out\_BUSIF)

Note: n = 0 or 1

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: CMDn out\_BUSIF are window registers in which data is stored during data transfer via CMDn out\_BUSIF. These registers are used for reception.

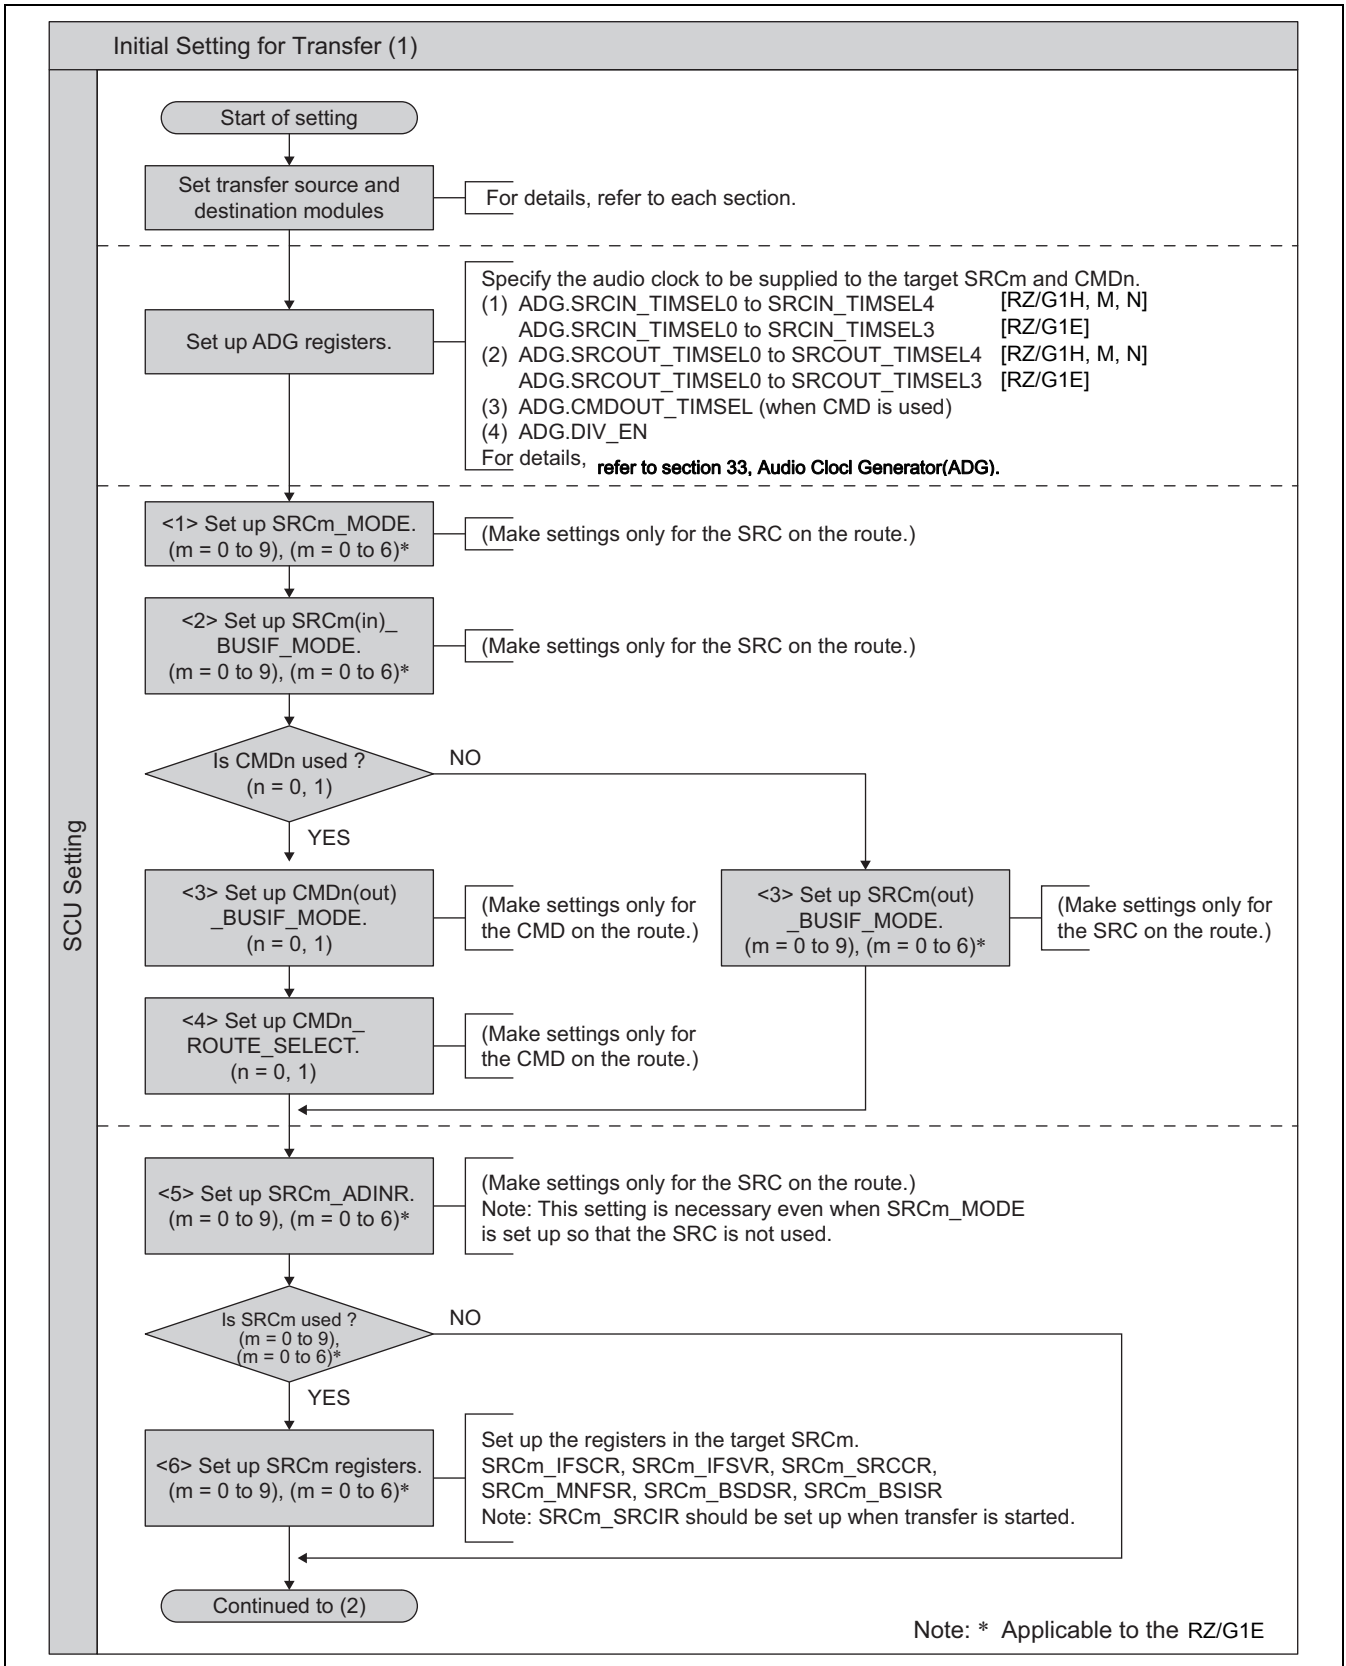

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CMDn out_BUSIF	All 0	R	These bits are a window register in which data is stored during data transfer via CMDn out_BUSIF. This register is used for reception.

### 34.3 SCU Operation

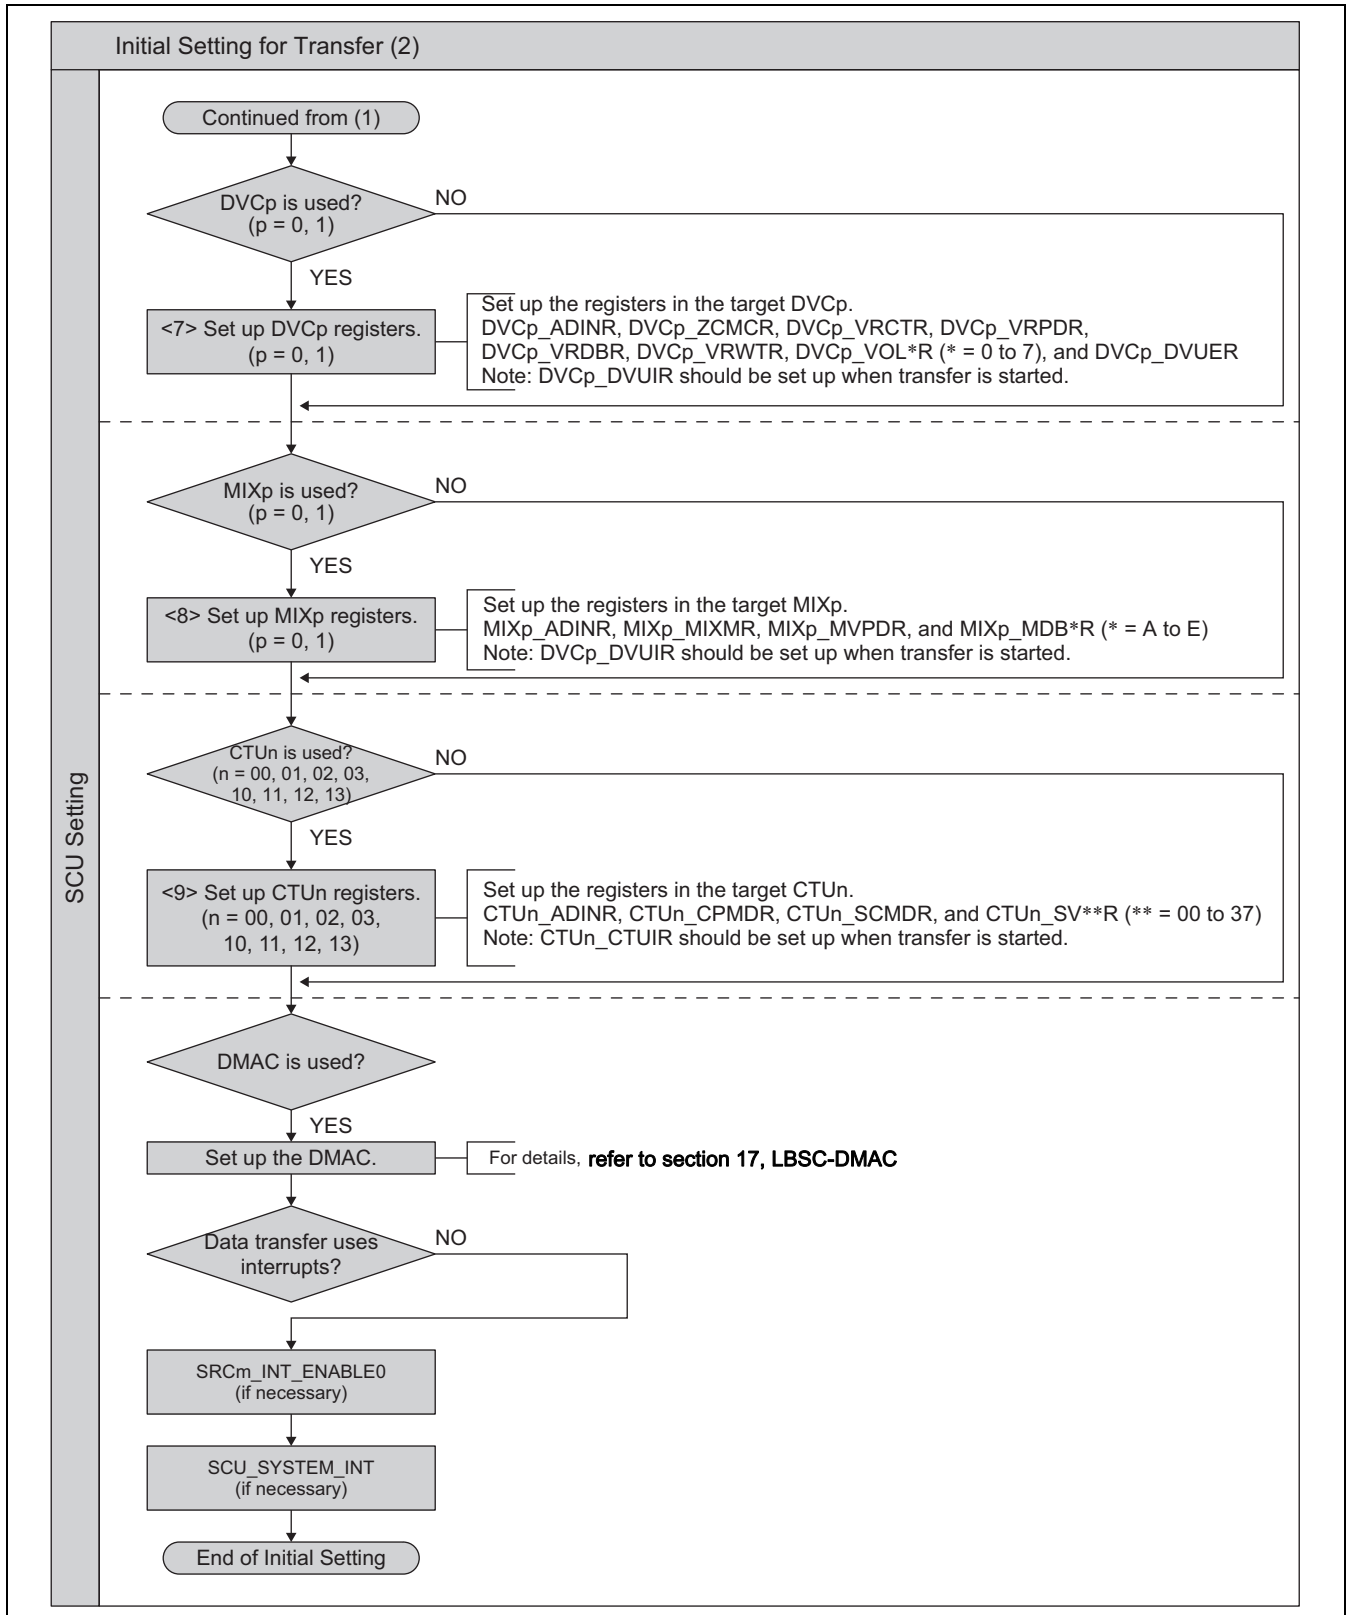

RZ/G1H	RZ/G1N
RZ/G1M	RZ/G1E

#### 34.3.1 Procedure for Initializing the SCU

Figures 34.2 and 34.3 show the procedure for initializing the SCU. For details on the register settings, refer to section 34.2, Register Description.

**Figure 34.2 Procedure for Initializing the SCU (1)**

**Figure 34.3 Procedure for Initializing the SCU (2)**

### 34.3.2 Procedure for Starting and Stopping Transfer by the SCU

Figure 34.4 shows the procedure for starting and stopping the transfer by the SCU. For details on the register settings, refer to section 34.2, Register Description.

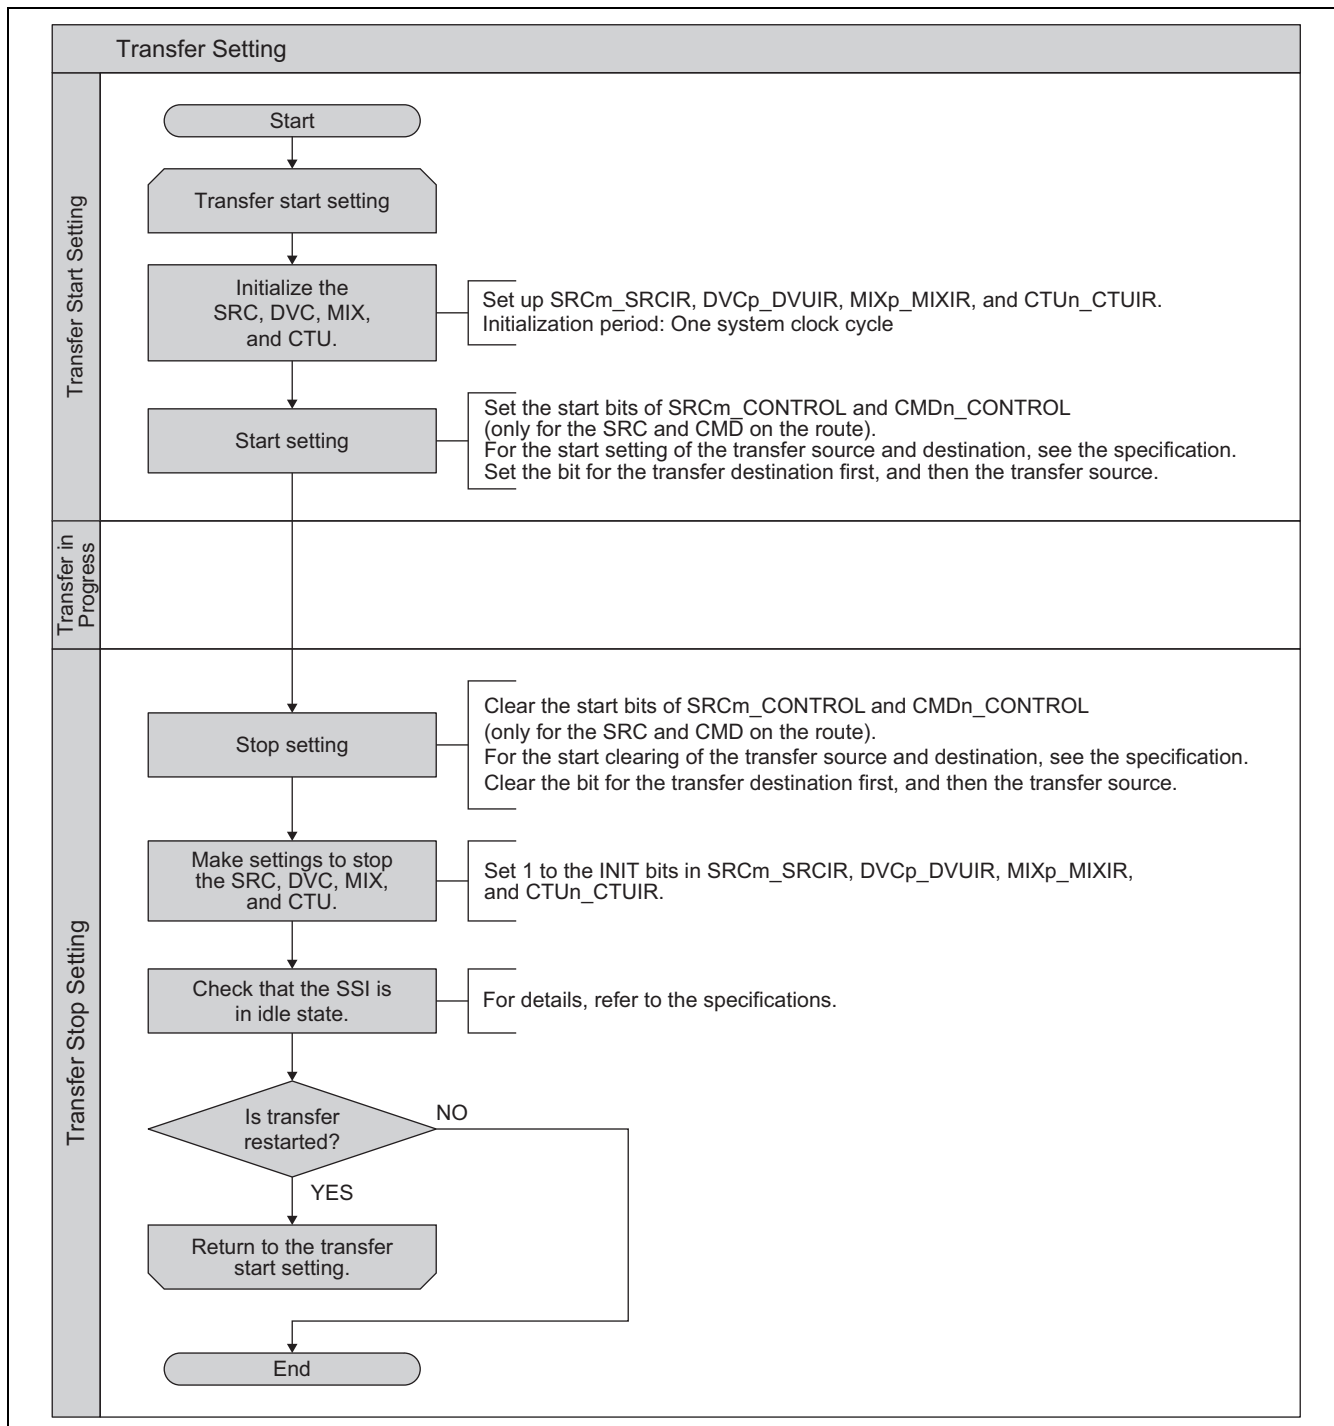

Figure 34.4 Procedure for Starting and Stopping Transfer by the SCU

### 34.3.3 Data Format for Data Transfer BUSIF

Table 34.3 shows the data formats handled in the SCU. When writing or reading data through the data transfer BUSIF (SRCm in\_BUSIF, SRCm out\_BUSIF, or CMDn out\_BUSIF), align data to match the appropriate data format from those in Table 34.3. Data alignment can be changed through the SRCm(in/out)\_BUSIF\_MODE, SRCm\_MODE register or CMDnout\_BUSIF\_MODE register (see section 34.2.4, SRCm\_MODE Register (SRCm\_MODE) or section 34.2.10, CMDn out\_BUSIF\_MODE Register (CMDn out\_BUSIF\_MODE)).

**Table 34.3 Data Formats Handled in the SCU**

24-bit stereo data, multichannel data	<div style="text-align: center;"> <span style="float: left;">31</span> <span style="float: right;">8 7 0</span>   <div style="border: 1px solid black; padding: 2px; width: 100%; display: flex; justify-content: space-between;"> <span>MSB</span> <span>LSB</span> <span style="background-color: #cccccc; padding: 0 5px;">x</span> <span style="background-color: #cccccc; padding: 0 5px;">x</span> <span style="background-color: #cccccc; padding: 0 5px;">x</span> <span style="background-color: #cccccc; padding: 0 5px;">x</span> </div> </div>
17- to 23-bit stereo data, multichannel data	<div style="text-align: center;"> <span style="float: left;">31</span> <span style="float: right;">? 0</span>   <div style="border: 1px solid black; padding: 2px; width: 100%; display: flex; justify-content: space-between;"> <span>MSB</span> <span>LSB</span> <span style="background-color: #cccccc; padding: 0 5px;">x</span> <span style="background-color: #cccccc; padding: 0 5px;">x</span> <span style="background-color: #cccccc; padding: 0 5px;">x</span> <span style="background-color: #cccccc; padding: 0 5px;">x</span> <span style="background-color: #cccccc; padding: 0 5px;">x</span> <span style="background-color: #cccccc; padding: 0 5px;">x</span> </div> </div>
16-bit stereo data, multichannel data	<div style="text-align: center;"> <span style="float: left;">31</span> <span style="float: right;">16 15 0</span>   <div style="border: 1px solid black; padding: 2px; width: 100%; display: flex; justify-content: space-between;"> <span>MSB</span> <span>LSB</span> <span>MSB</span> <span>LSB</span> </div> <div style="display: flex; justify-content: space-around; margin-top: 5px;"> <span>(Lch)</span> <span>(Rch)</span> </div> </div>
9- to 15-bit stereo data, multichannel data	<div style="text-align: center;"> <span style="float: left;">31</span> <span style="float: right;">? 16 15 ? 0</span>   <div style="border: 1px solid black; padding: 2px; width: 100%; display: flex; justify-content: space-between;"> <span>MSB</span> <span>LSB</span> <span style="background-color: #cccccc; padding: 0 5px;">x</span> <span style="background-color: #cccccc; padding: 0 5px;">x</span> <span>MSB</span> <span>LSB</span> <span style="background-color: #cccccc; padding: 0 5px;">x</span> <span style="background-color: #cccccc; padding: 0 5px;">x</span> </div> <div style="display: flex; justify-content: space-around; margin-top: 5px;"> <span>(Lch)</span> <span>(Rch)</span> </div> </div>
8-bit stereo data	<div style="text-align: center;"> <span style="float: left;">31</span> <span style="float: right;">24 23 16 15 8 7 0</span>   <div style="border: 1px solid black; padding: 2px; width: 100%; display: flex; justify-content: space-between;"> <span>MSB</span> <span>MSB</span> <span>MSB</span> <span>MSB</span> <span>MSB</span> <span>MSB</span> <span>MSB</span> <span>MSB</span> </div> <div style="display: flex; justify-content: space-around; margin-top: 5px;"> <span>(Rch/2)</span> <span>(Lch/2)</span> <span>(Rch/1)</span> <span>(Lch/1)</span> </div> </div>
16-bit monaural data	<div style="text-align: center;"> <span style="float: left;">31</span> <span style="float: right;">16 15 0</span>   <div style="border: 1px solid black; padding: 2px; width: 100%; display: flex; justify-content: space-between;"> <span>MSB</span> <span>MSB</span> <span style="background-color: #cccccc; padding: 0 5px;">x</span> <span style="background-color: #cccccc; padding: 0 5px;">x</span> <span style="background-color: #cccccc; padding: 0 5px;">x</span> <span style="background-color: #cccccc; padding: 0 5px;">x</span> <span style="background-color: #cccccc; padding: 0 5px;">x</span> <span style="background-color: #cccccc; padding: 0 5px;">x</span> <span style="background-color: #cccccc; padding: 0 5px;">x</span> <span style="background-color: #cccccc; padding: 0 5px;">x</span> <span style="background-color: #cccccc; padding: 0 5px;">x</span> </div> </div>
8-bit monaural data	<div style="text-align: center;"> <span style="float: left;">31</span> <span style="float: right;">24 23 16 15 0</span>   <div style="border: 1px solid black; padding: 2px; width: 100%; display: flex; justify-content: space-between;"> <span>MSB</span> <span>MSB</span> <span style="background-color: #cccccc; padding: 0 5px;">x</span> <span style="background-color: #cccccc; padding: 0 5px;">x</span> <span style="background-color: #cccccc; padding: 0 5px;">x</span> <span style="background-color: #cccccc; padding: 0 5px;">x</span> <span style="background-color: #cccccc; padding: 0 5px;">x</span> <span style="background-color: #cccccc; padding: 0 5px;">x</span> <span style="background-color: #cccccc; padding: 0 5px;">x</span> <span style="background-color: #cccccc; padding: 0 5px;">x</span> <span style="background-color: #cccccc; padding: 0 5px;">x</span> <span style="background-color: #cccccc; padding: 0 5px;">x</span> <span style="background-color: #cccccc; padding: 0 5px;">x</span> </div> </div>

- Notes:
1. Write 0 to the "x" bits in the table when writing data through the data transfer SRCm in\_BUSIF. When reading data through the SRCm out\_BUSIF or CMDn out\_BUSIF, ignore the values read from these bits.
  2. In the 8-bit stereo data format, (Lch/1) and (Rch/1) indicate the data pair to be processed first and (Lch/2) and (Rch/2) indicate the next data pair to be processed.
  3. Only the MSB-first data formats can be used in the SRU.

#### 34.3.4 Changing Data Order in Channel Units

The data order can be changed in channel units in the SCU immediately before input to the SRC and immediately after output from the CMD. Tables 34.3 and 34.4 show the data places in each data format. Use SRCm\_BUSIF\_DALIGN or SRCn\_BUSIF\_DALIGN to change the order before input to the SRC (see section 34.2.2, SRCm\_BUSIF\_DALIGN Register (SRCm\_BUSIF\_DALIGN) or section 34.2.3, SRCn\_BUSIF\_DALIGN Register (SRCn\_BUSIF\_DALIGN)). Use CMDn\_BUSIF\_DALIGN to change the order immediately after output from the CMD (see section 34.2.11, CMDn\_BUSIF\_DALIGN Register (CMDn\_BUSIF\_DALIGN)). Tables 34.3 and 34.4 show the data places when these registers are set to the initial values.

**Table 34.4 Data Places in Each Data Format (1)**

### 34.3.5 SRC Block

The SRC is a block for implementing the sampling rate conversion function, which can convert asynchronous sampling rates.

- Asynchronous sampling rate conversion is available
- Supports resolutions up to 24 bits
- High-sound-quality type (THD+N is -132 dB) and general-sound-quality type (THD+N is -96 dB)
- Automatically generates antialiasing filter coefficients
- Four (three)\* modules support one, two, four, six, or eight channels, and six (three)\* modules support one or two channels.

Figure 34.5 shows the SRC block diagram.

The "Input audio data" in the figure indicates the data before SRC processing is applied. The "Output audio data" indicates the data after SRC processing is applied.

The "Input data timing" is a signal to show the sampling period for the input audio data. The "Output data timing" is a signal to show the sampling period for the output audio data. When CMD is used in the route, the output data timing signal is the same signal as the output data timing signal used in the CMD.

In synchronous mode specified by setting the SRCMD bit in the SRCm\_SRCCR register, when the sync\_in bit in the SRCm\_MODE register is set to 1, the SRCm doesn't need the input data timing signal, and when the sync\_out bit in the SRCm\_MODE register is set to 1, the SRCm doesn't need the output data timing signal.

Before using the SRC function, be sure to specify the sampling rate through the SRCm\_IFS value setting register (see section 34.2.22, SRCm\_IFS Value Setting Register (SRCm\_IFSVR)).

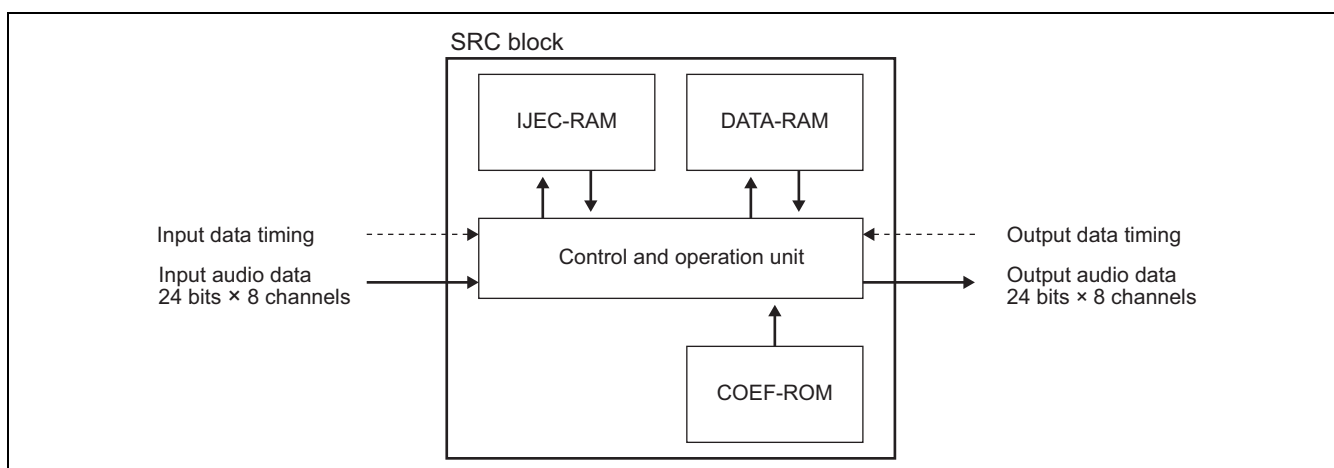

Figure 34.5 SRC Block Diagram

Table 34.6 shows the SRC functions.

**Table 34.6 SRC Functions**

**[RZ/G1H, RZ/G1M, and RZ/G1N]**

Item		Performance			
Type of SRC		Asynchronous/ Synchronous SRC			
Operation frequency		130 MHz			
Channel number		1 or 2	4	6	8
Sampling rate of input source	SRC0	8k to 192k [Hz]	8k to 192k [Hz]	8k to 192k [Hz]	8k to 192k [Hz]
	SRC1, SRC3, SRC4	8k to 192k [Hz]	8k to 192k [Hz]	8k to 128k [Hz]	8k to 96k [Hz]

	SRC5, SRC6	6 to 1/6 [times]	—	—	—
Sound quality (THD+N)	SRC1 to SRC4	-132 dB (for high-quality type)			
	SRC5, SRC6	-96 dB (for general-quality type)			

Table 34.7 shows the IJEC RAM and DATA RAM buffer size settings and the latencies.

Latency is different by setting of channel number.

Select the combination of settings BUFDATA[10:0] bits in SRCm\_BSDSR/ SRCn\_BSDSR register and IJECSIZE[8:0] bits in SRCm\_BSISR register from Table 34.7. Operation cannot be guaranteed if the register is not set as specified combination.

Output delay depends on FSO/FSI ratio and it is calculated from following formula.

$$\text{Output delay [sample]} = (\text{Processing delay}) \times (\text{FSO/FSI ratio}) + (\text{Logic delay})$$

**Table 34.7 Combination of Register Setting Related to FSO/FSI Ratio and Channel, Latency**

**(1) Register Setting Procedure**

The following describes the SRC register setting procedures. The register should be used according to the following procedures.

**(a) SRC Processing Procedure**

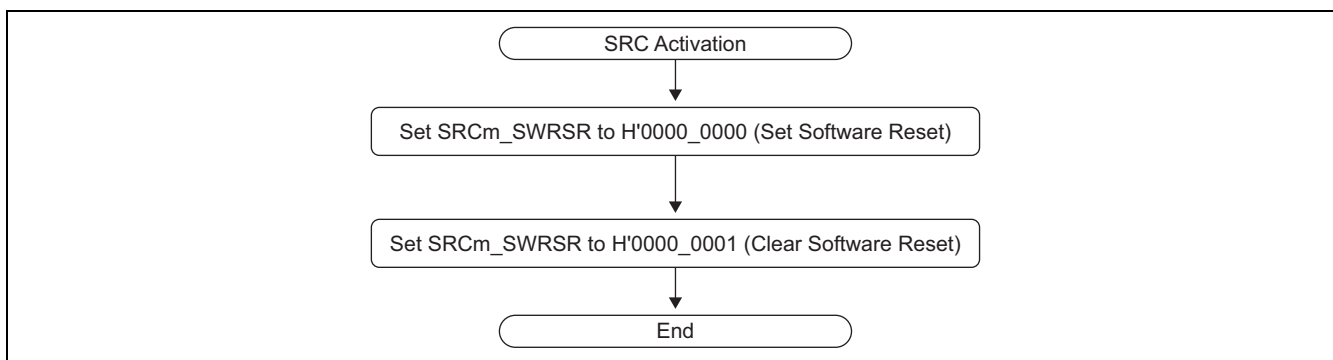

Figure 34.6 shows the processing procedure of SRC.

**Figure 34.6 SRC Processing Procedure**

**(b) SRC Activation**

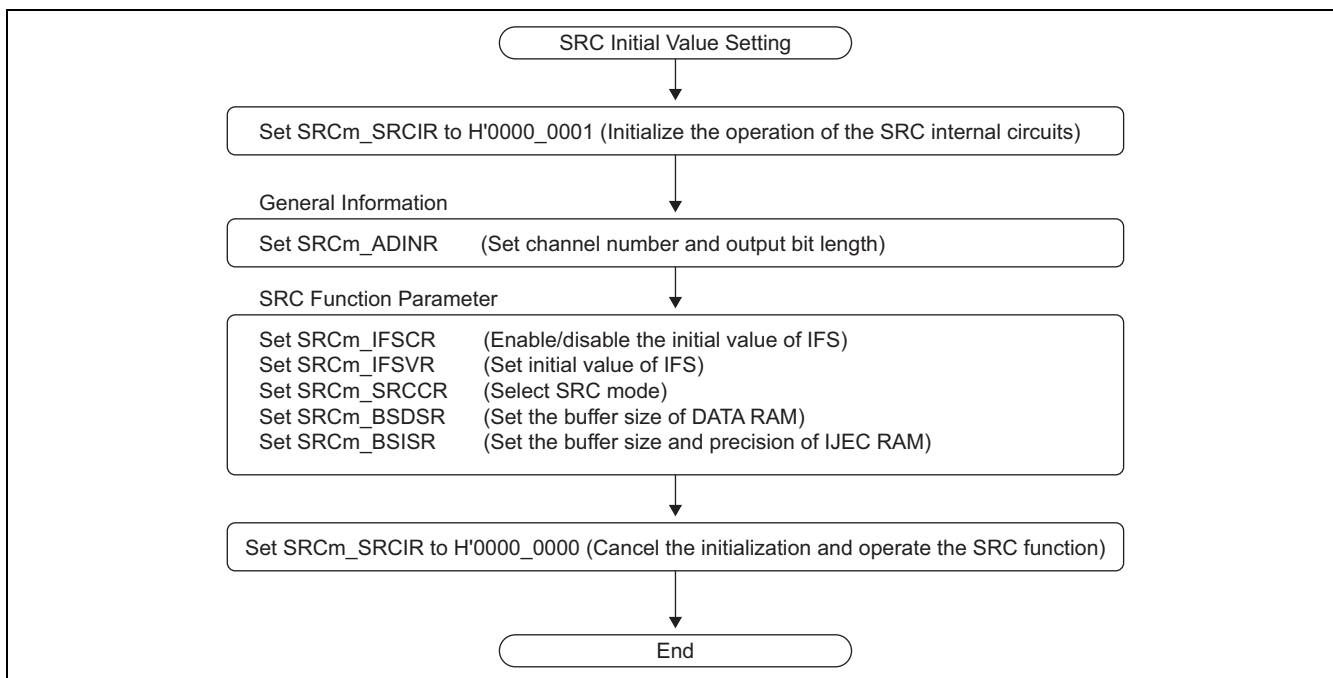

Figure 34.7 shows the SRC activation flowchart. When the SRC is activated, a software reset should be set to initialize logic and register setting. Then, the software reset should be cleared and ready to operate SRC. When reset the SRC function, all registers are initialized. If the SRC function was initialized by a hardware reset, it doesn't need to initialize the SRC function by software reset.

**Figure 34.7 SRC Activation Flowchart**

**(c) SRC Initial Value Setting**

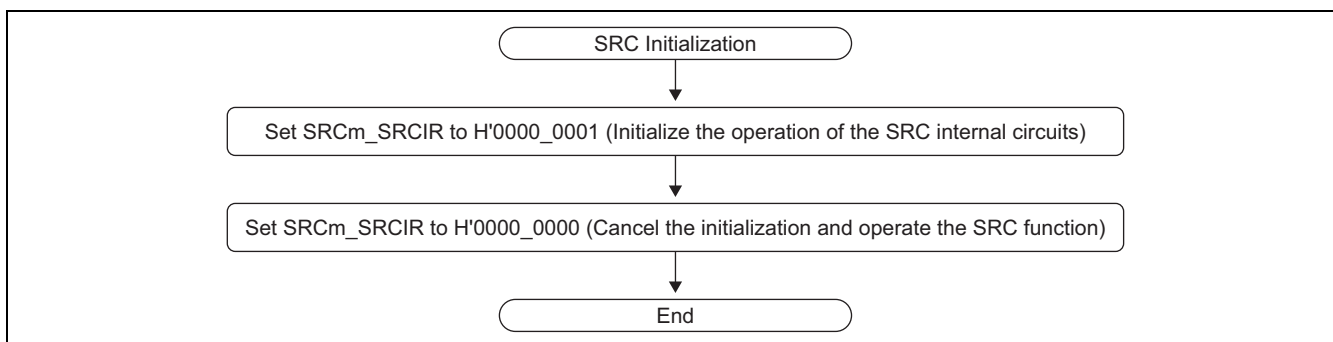

Figure 34.8 shows the flowchart of the SRC initial value setting. Before operate SRC function, the initial values should be set.

**Figure 34.8 SRC Initial Value Setting Flowchart**

**(d) SRC Initialization**

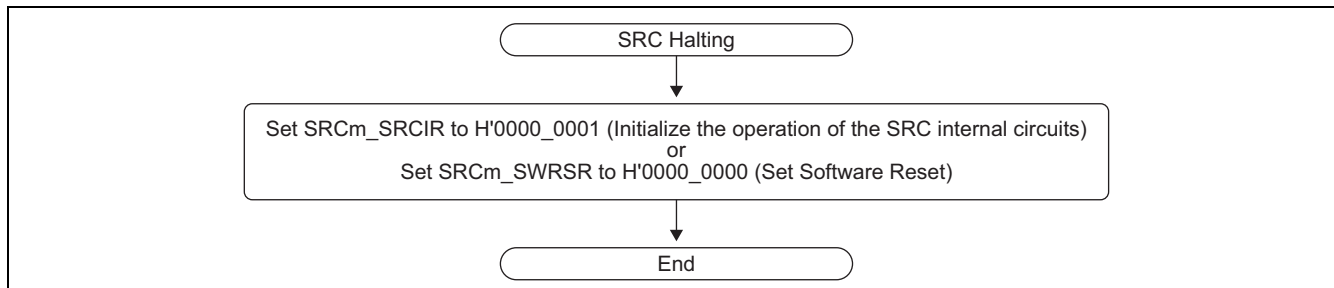

Figure 34.9 shows the SRC initialization flowchart. SRCm\_SRCIR register doesn't initialize the register settings and these values are maintained. Before cancel the initialization, it is necessary to set or check the register settings of peripheral IP. And also it is necessary to provide the input and output timing signal.

**Figure 34.9 SRC Initialization Flowchart**

**(e) SRC Halting**

Figure 34.10 shows the flowchart of SRC halting. When SRC is halting, it should be initialize or reset by software reset or hardware reset. Before initialize or reset the SRC function, it is necessary to confirm the register settings and operation of peripheral IP.

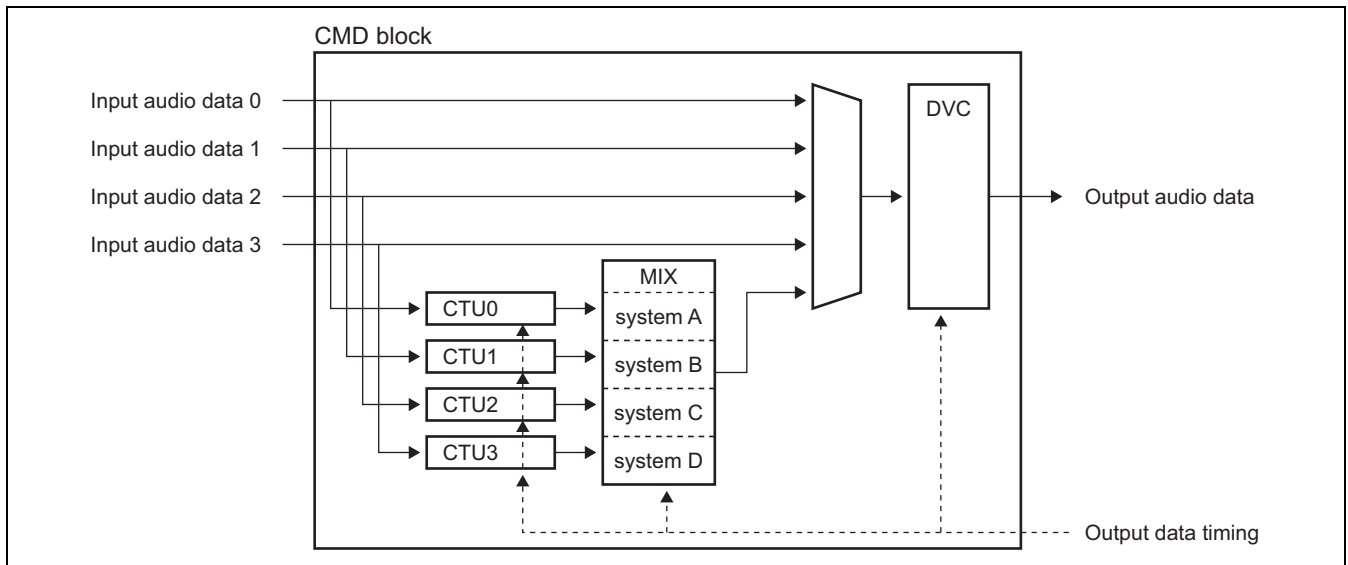

**Figure 34.10 SRC Halting Flowchart**

**34.3.6 CMD Block**

The CMD is a block for implementing the channel transfer unit (CTU block), mixing (MIX block), and digital volume and mute (DVC block) functions. Figure 34.11 shows the CMD block diagram.

The "Input audio data 0" to "Input audio data 3" in the figure indicate the data before the CMD function is applied. The "Output audio data" indicates the data after the CMD function is applied.

The "Output data timing" is a signal to show the sampling period for the output audio data. In addition, please give the same signals to CMD output timing signal and output data timing signal used in the SRC.

**Figure 34.11 CMD Block Diagram**

### 34.3.7 Functional Blocks in CMD

#### (1) CTU Block

The CTU is a block for implementing channel transfer unit functions such as downmixing and splitter functions.

- Conversion of eight input channels into two output channels
- Conversion of six input channels into two output channels
- Conversion of two input channels into four sets of two output channels
- Conversion of one input channel into eight sets of one output channel
- No conversion

The settings of the Scale Value e00 to Scale Value e37 registers are calculated by using the following formula (signed bits are excluded):

$$\text{Setting (decimal)} = 10^X \times 4194304$$

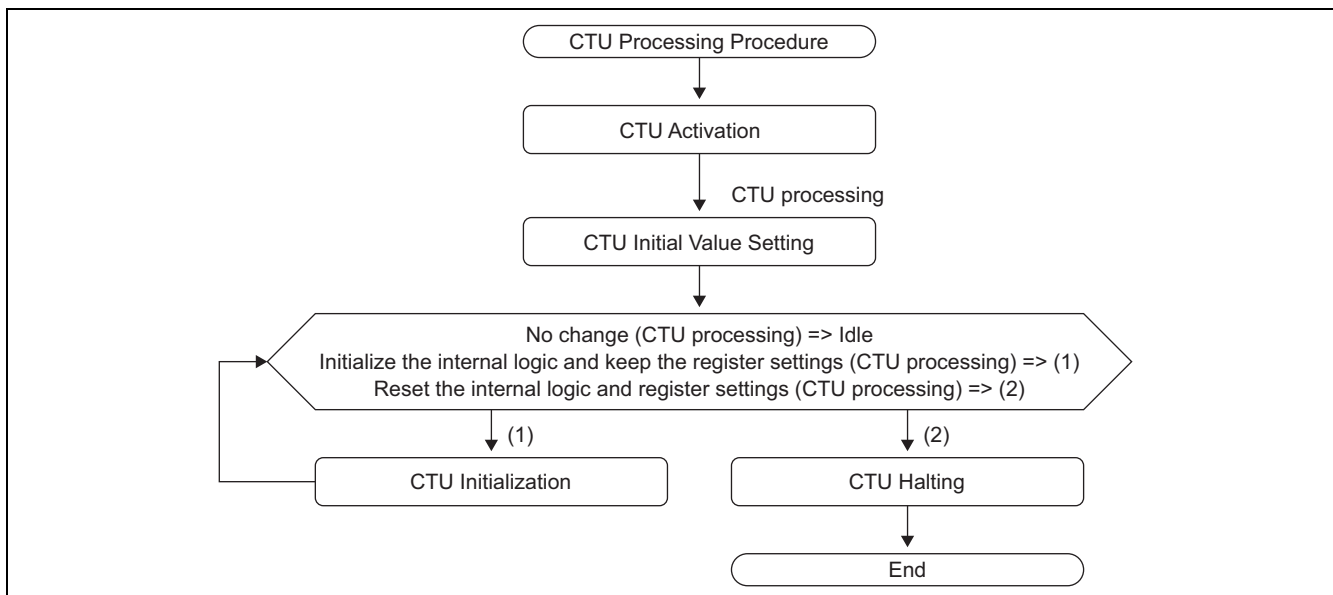

$$X = (\text{value in dB}) / 20$$

**(a) Register Setting Procedure**

The following describes the CTU register setting procedures. The register should be used according to the following procedures.

- CTU Processing Procedure

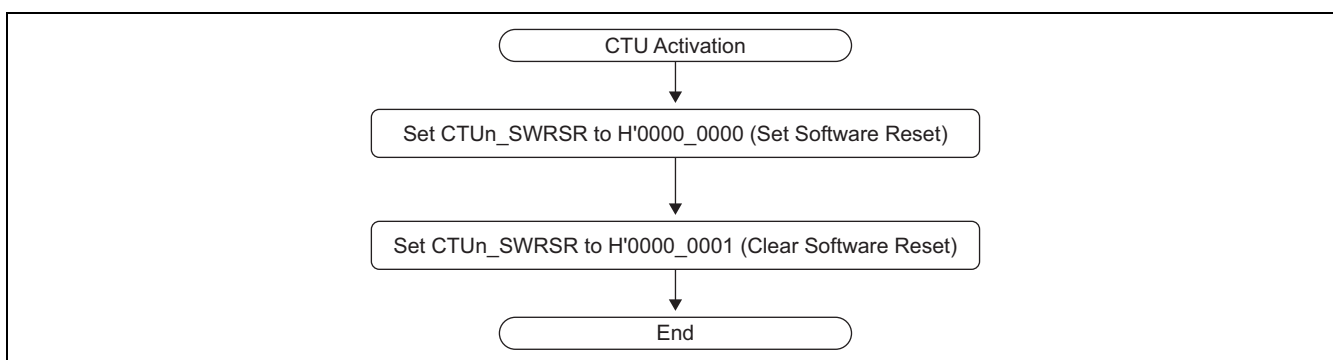

Figure 34.12 shows the processing procedure of CTU.

**Figure 34.12 CTU Processing Procedure**

- CTU Activation

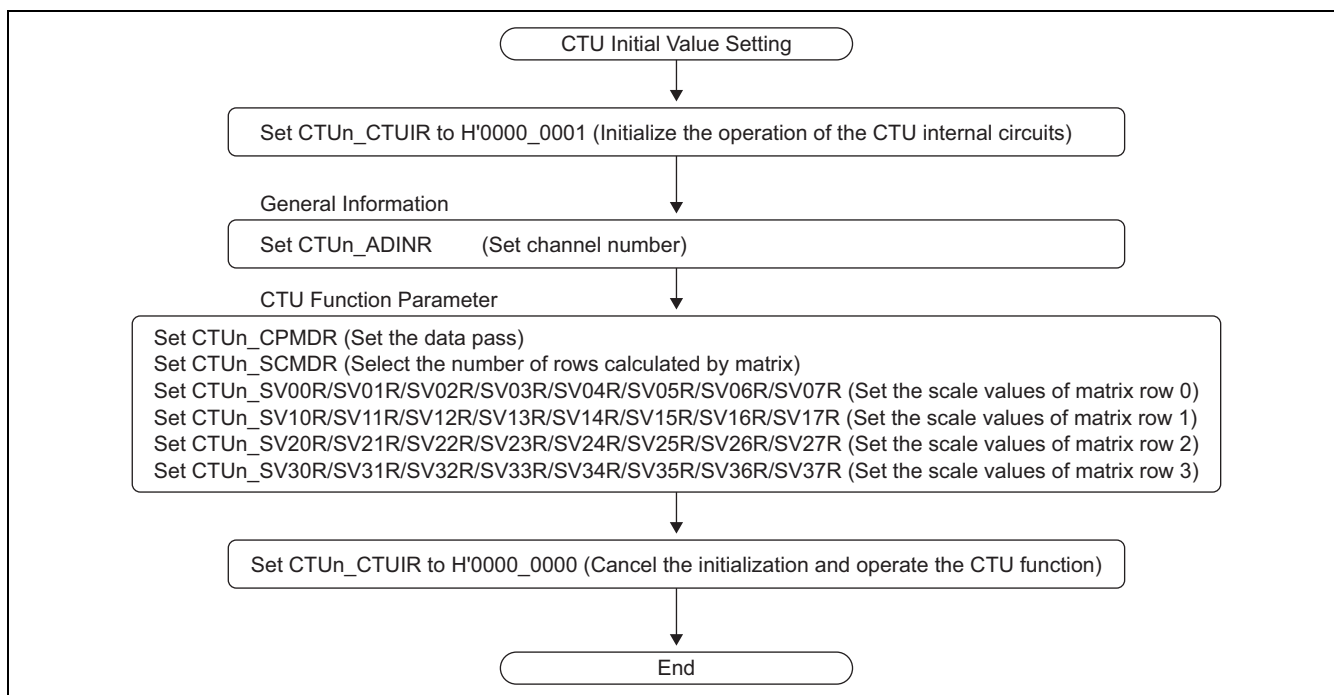

Figure 34.13 shows the CTU activation flowchart. When the CTU is activated, a software reset should be set to initialize logic and register setting. Then, the software reset should be cleared and ready to operate CTU. When reset the CTU function, all registers are initialized. If the CTU function was initialized by a hardware reset, it doesn't need to initialize the CTU function by software reset.

**Figure 34.13 CTU Activation Flowchart**

- CTU Initial Value Setting

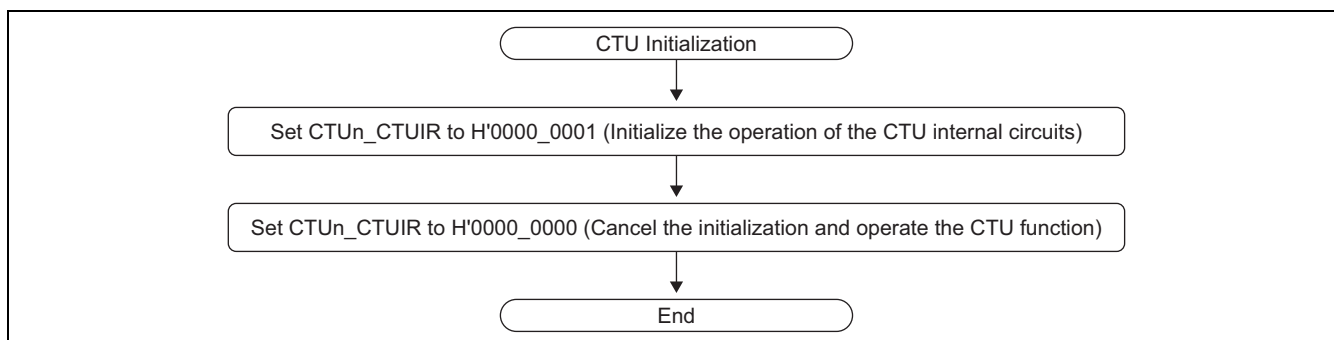

Figure 34.14 shows the flowchart of the CTU initial value setting. Before operate CTU function, the initial values should be set. After set the register setting and cancel the initialization, CTU module starts the operation.

**Figure 34.14 CTU Initial Value Setting Flowchart**

- CTU Initialization

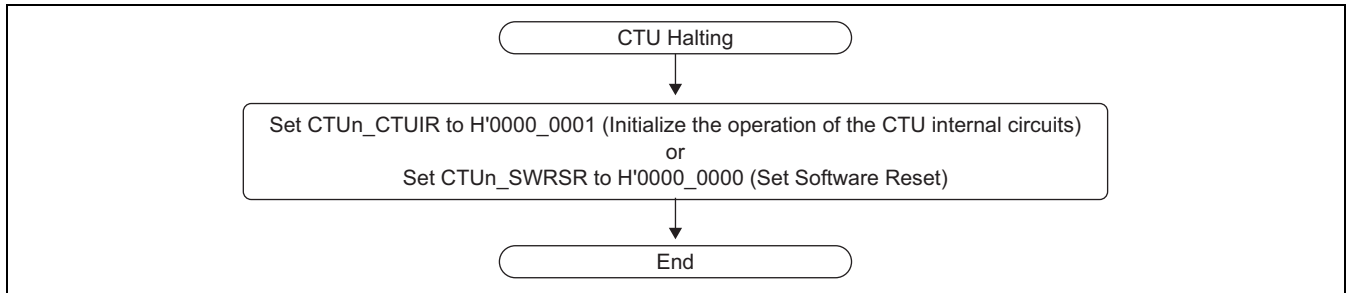

Figure 34.15 shows the CTU initialization flowchart. CTUn\_CTUIR register doesn't initialize the register settings and these values are maintained. Before cancel the initialization, it is necessary to set or check the register settings of peripheral IP.

**Figure 34.15 CTU Initialization Flowchart**

- CTU Halting

Figure 34.16 shows the flowchart of CTU halting. When CTU is halting, it should be initialize or reset by software reset or hardware reset. Before initialize or reset the CTU function, it is necessary to confirm the register settings and operation of peripheral IP.

**Figure 34.16 CTU Halting Flowchart**

- CTU – Example

The channel conversion executes the linear transformation (matrix operation) as follows.

$$\begin{pmatrix} y_0 \\ y_1 \\ y_2 \\ y_3 \\ y_4 \\ y_5 \\ y_6 \\ y_7 \end{pmatrix} = \begin{pmatrix} e_{00} & e_{01} & e_{02} & e_{03} & e_{04} & e_{05} & e_{06} & e_{07} \\ e_{10} & e_{11} & e_{12} & e_{13} & e_{14} & e_{15} & e_{16} & e_{17} \\ e_{20} & e_{21} & e_{22} & e_{23} & e_{24} & e_{25} & e_{26} & e_{27} \\ e_{30} & e_{31} & e_{32} & e_{33} & e_{34} & e_{35} & e_{36} & e_{37} \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \end{pmatrix} \times \begin{pmatrix} x_0 \\ x_1 \\ x_2 \\ x_3 \\ x_4 \\ x_5 \\ x_6 \\ x_7 \end{pmatrix}$$

$x_i$ : Input data of channel  $i$  ( $i = 0$  to  $7$ )

$y_i$ : Output data of channel  $i$  ( $i = 0$  to  $7$ )

$e_j$ : CTUn\_SVjR.SVEj ( $j = 00, 01, 02, 03, 04, 05, 06, 07,$   
 $10, 11, 12, 13, 14, 15, 16, 17,$   
 $20, 21, 22, 23, 24, 25, 26, 27,$   
 $30, 31, 32, 33, 34, 35, 36, 37)$

Figure 34.17 shows 2 channels fold-down.

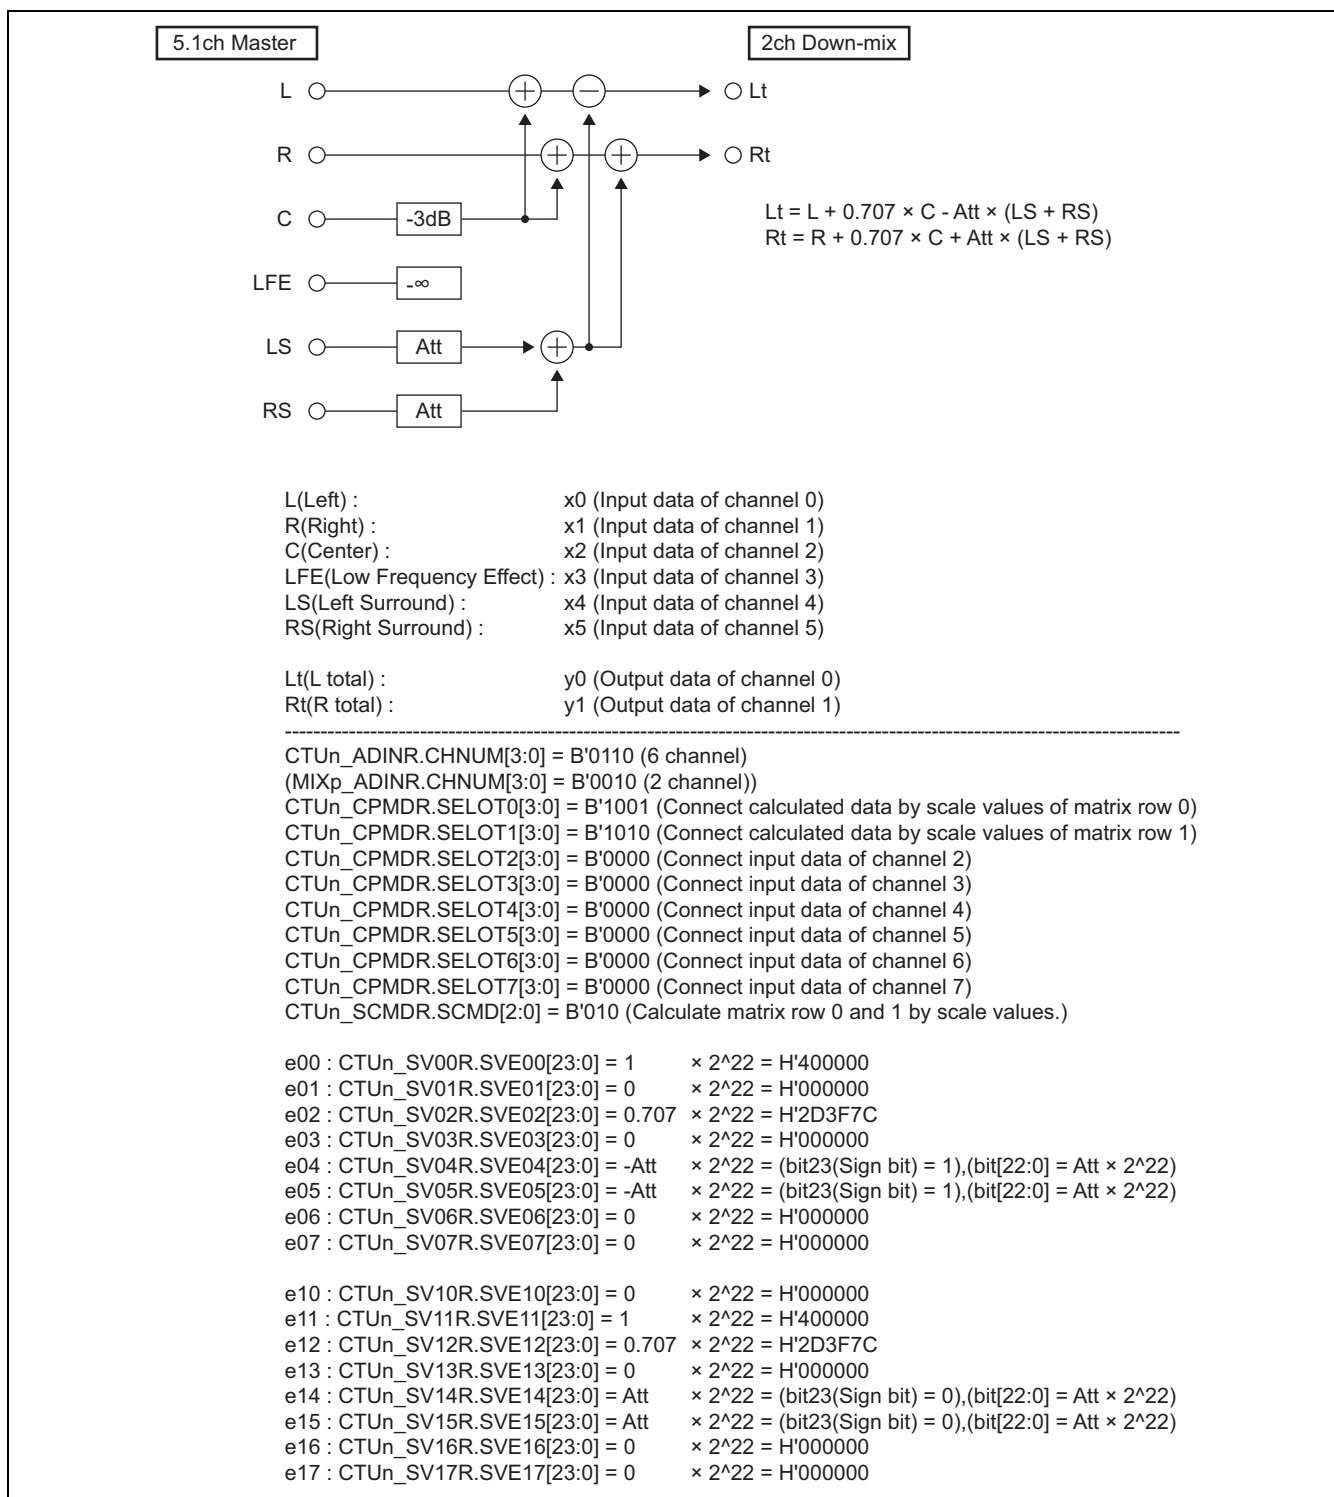

Figure 34.17 2 channels fold-down (Lt/Rt Downmix)

**(2) MIX Block**

The MIX block is for mixing (adding) streams from two to four audio data sources into a single stream.

- Ratio for adding sources is selectable
- Ratio is dynamically changeable
- Mixing with volume ramp is available (ramp period is selectable)

**Figure 34.18 Step Processing**

**Figure 34.19 Ramp Processing**

Tables 34.9 to 34.12 show the settings of the MIX decibel register and the corresponding levels in decibels.

**Table 34.9 Settings of MIXp\_MDBAR, MIXp\_MDBBR, MIXp\_MDBCR, and MIXp\_MDBDR and Corresponding Values in Decibels (No. 0 to 255)**

No	Value (HEX)	dB	No	Value (HEX)	dB	No	Value (HEX)	dB	No	Value (HEX)	dB

**(a) Register Setting Procedure**

The following describes the MIX register setting procedures. The register should be used according to the following procedures.

- MIX Processing Procedure

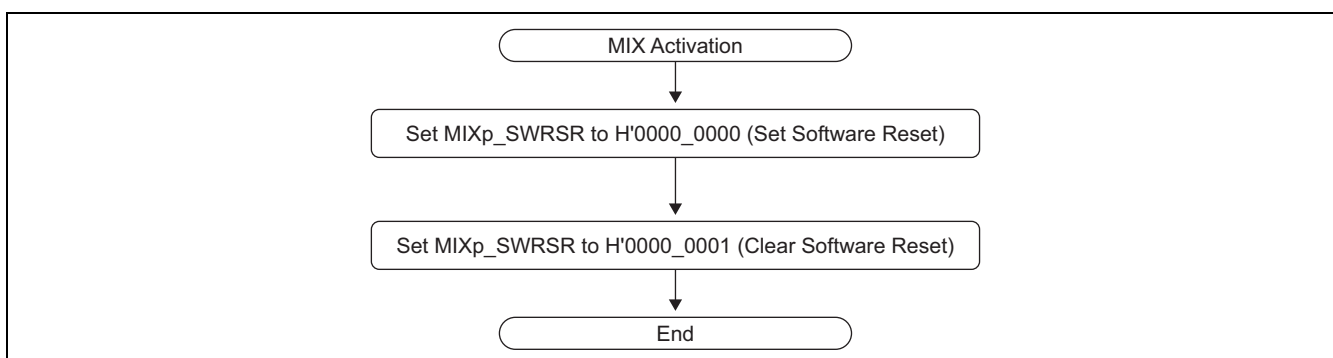

Figure 34.20 shows the processing procedure of MIX.

**Figure 34.20 MIX Processing Procedure**

- MIX Activation

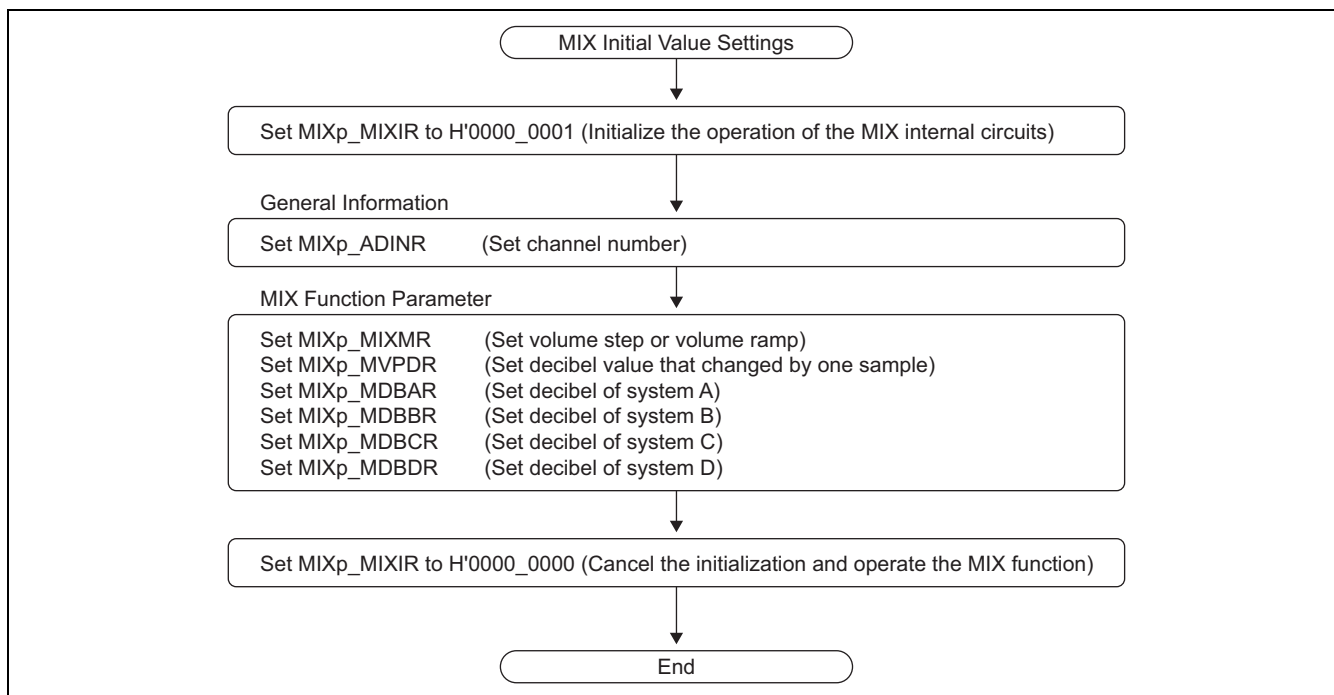

Figure 34.21 shows the MIX activation flowchart. When the MIX is activated, a software reset should be set to initialize logic and register setting. Then, the software reset should be cleared and ready to operate MIX. When reset the MIX function, all registers are initialized. If the MIX function was initialized by a hardware reset, it doesn't need to initialize the MIX function by software reset.

**Figure 34.21 MIX Activation Flowchart**

- MIX Initial Value Setting

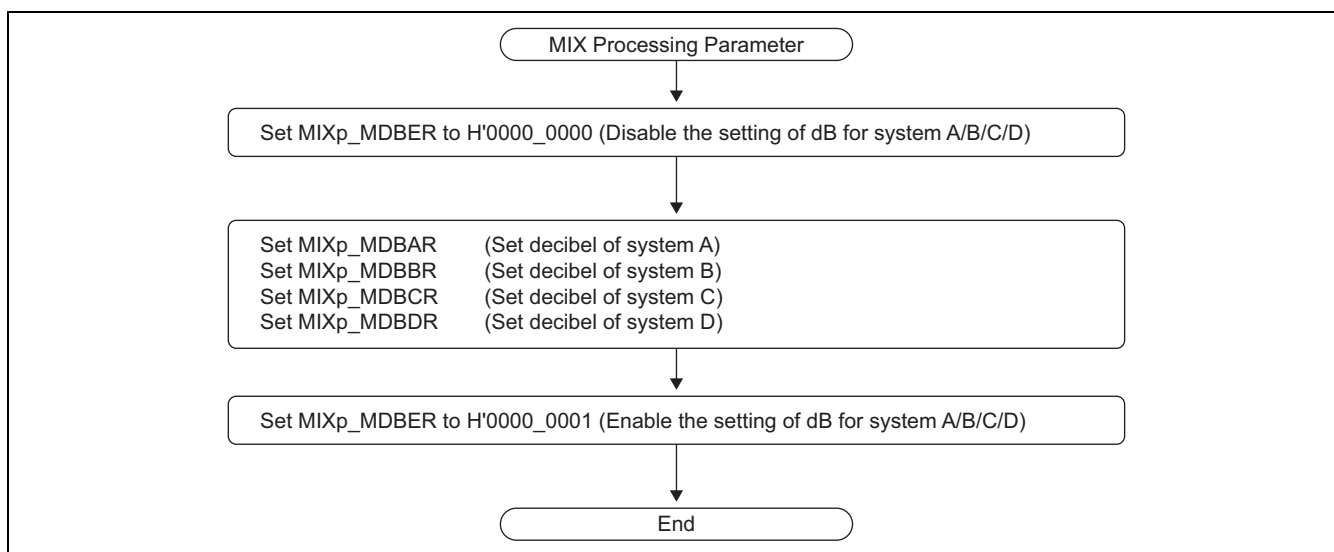

Figure 34.22 shows the flowchart of the MIX initial value setting. Before operate MIX function, the initial values should be set. After set the register setting and cancel the initialization, MIX module changes the volume of each system by volume step to the dB value of MIXp\_MDBAR and MIXp\_MDBBR and MIXp\_MDBCR and MIXp\_MDBDR regardless of MIXp\_MIXMR setting.

**Figure 34.22 MIX Initial Value Setting Flowchart**

- MIX Processing Parameter

Figure 34.23 shows the MIX processing parameter flowchart. Before change the parameter of decibel for each system, the setting of the MIXp\_MDBER should be disables. After that set the decibels of MIXp\_MDBAR and MIXp\_MDBBR and MIXp\_MDBCR and MIXp\_MDBDR and enables the MIXp\_MDBER for reflect the decibel setting to the MIX processing.

**Figure 34.23 MIX Processing Parameter Flowchart**

- MIX Initialization

Figure 34.24 shows the MIX initialization flowchart. MIXp\_MIXIR register doesn't initialize the register settings and these values are maintained. Before cancel the initialization, it is necessary to set or check the register settings of peripheral IP.

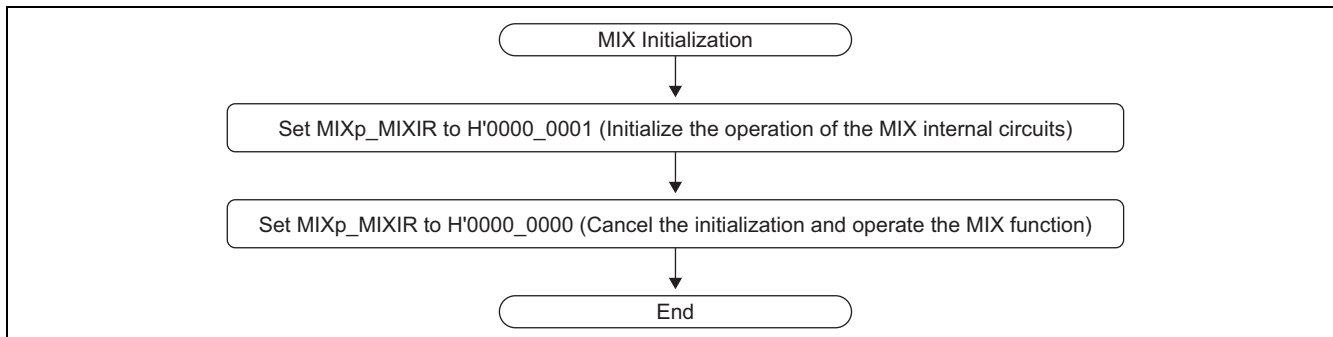

Figure 34.24 MIX Initialization Flowchart

- MIX Halting

Figure 34.25 shows the flowchart of MIX halting. When MIX is halting, it should be initialize or reset by software reset or hardware reset. Before initialize or reset the MIX function, it is necessary to confirm the register settings and operation of peripheral IP.

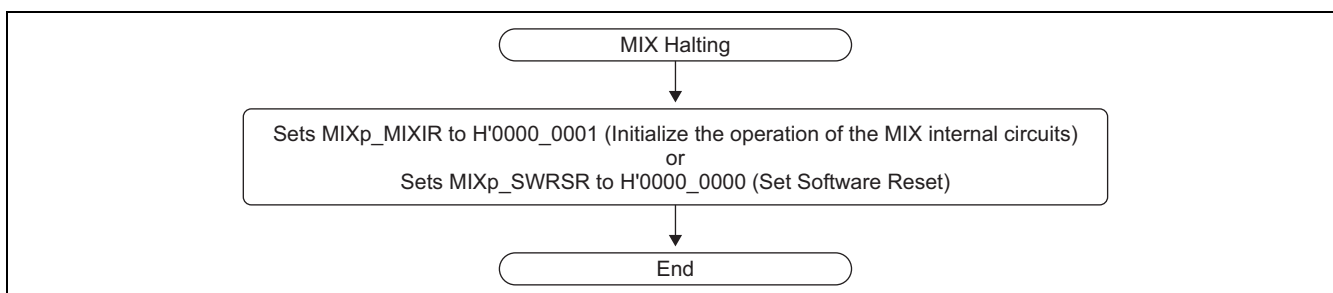

Figure 34.25 MIX Halting Flowchart

**(3) DVC Block**

The DVC is a block for implementing the volume and mute functions.

- Volume control function including digital volume, volume ramp, and zero-crossing mute
- The digital volume function is specified by a 24-bit fixed-point value within the range from 0 to 8 times (mute or -120 to 18 dB)
- The volume ramp function can be used for soft mute, fade-in, fade-out, or desired volume adjustment
- The volume ramp period can be changed within the sampling range from the 0th to 23rd power of 2
- The zero-crossing mute function silences the sound at the zero-crossing point of the audio data

Table 34.13 shows the DVC functions.

**Table 34.13 DVC Functions**

Item	Performance
Digital volume	Range: -120 dB to 18 dB ( $9.5 \times 10^{-7}$ times to 8 times)
Volume ramp	Volume ramp is used for many kinds of operation (soft mute, fade-in, fade-out, and volume adjustment by ramp) Ramp period: $2^0/f_{so}$ to $2^{23}/f_{so}$ Examples: (1/ $f_{so}$ ): -128 dB/1 step (2/ $f_{so}$ ): -64 dB/1 step (4/ $f_{so}$ ): -32 dB/1 step : (128/ $f_{so}$ ): -1 dB/1 step (256/ $f_{so}$ ): -0.5 dB/1 step (512/ $f_{so}$ ): -0.25 dB/1 step (1024/ $f_{so}$ ): -0.125 dB/1 step (2048/ $f_{so}$ ): -0.125 dB/2 steps (4096/ $f_{so}$ ): -0.125 dB/4 steps : (8388608/ $f_{so}$ ): -0.125 dB/8192 steps)
Zero-crossing mute	Mute the signal at zero-crossing point

The settings and corresponding values for the volume ramp are the same as those listed in Tables 34.9 to 34.12.

The settings and corresponding values for the digital volume are calculated by using the following formula:

$$\text{Setting (decimal)} = 10^X \times 1048576$$

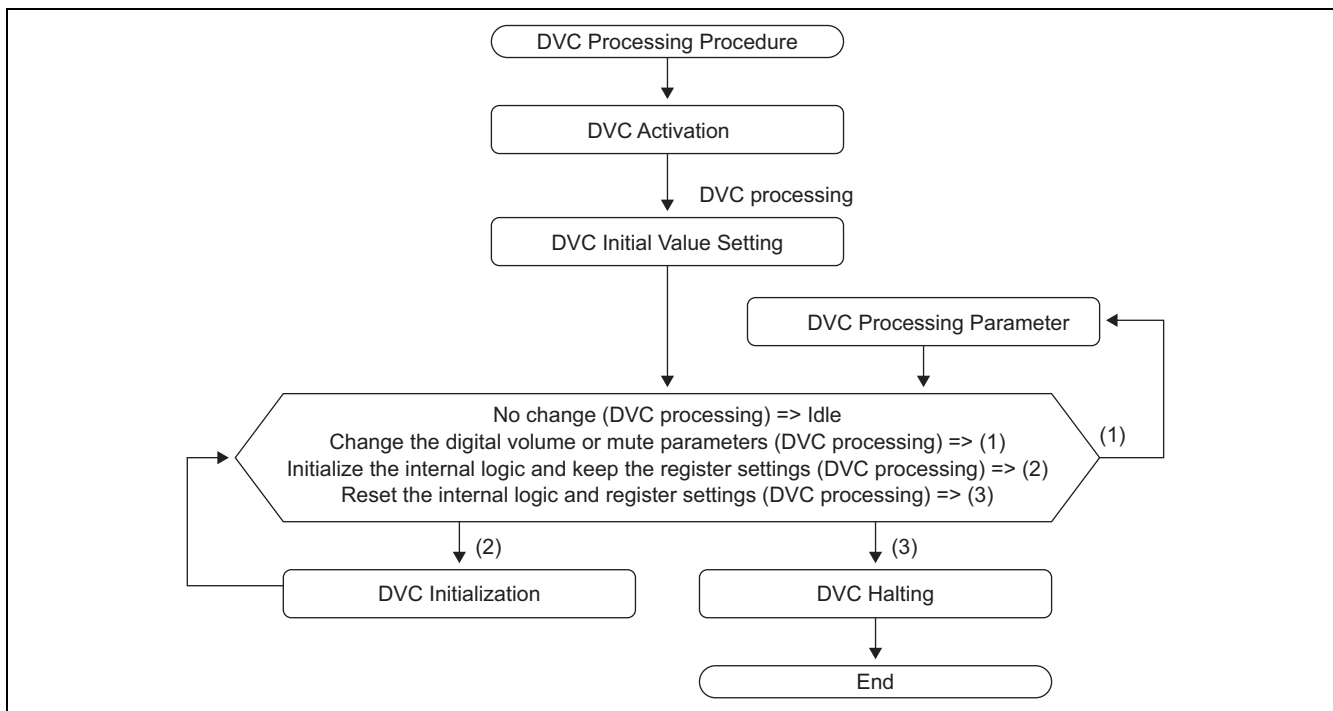

$$X = (\text{value in dB}) / 20$$

**(a) Register Setting Procedure**

The following describes the DVC register setting procedures. The register should be used according to the following procedures.

- DVC Processing Procedure

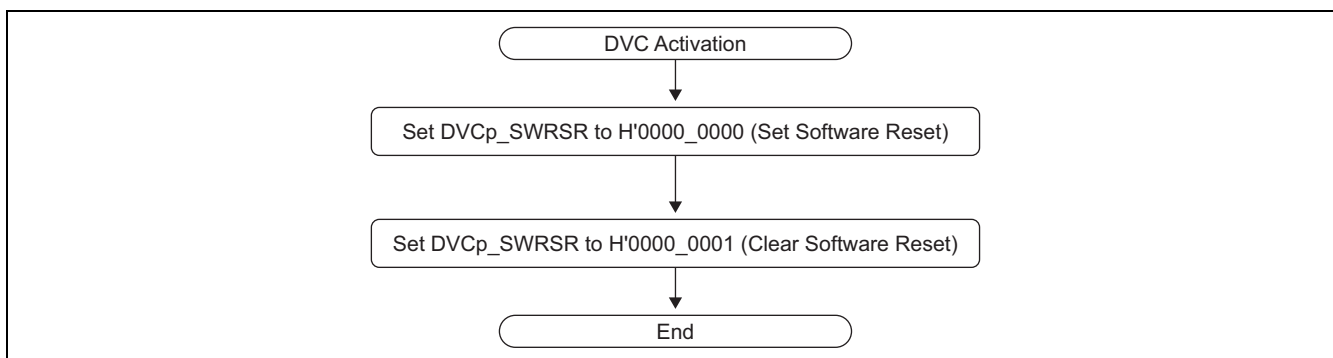

Figure 34.26 shows the processing procedure of DVC.

**Figure 34.26 DVC Processing Procedure**

- DVC Activation

Figure 34.27 shows the DVC activation flowchart. When the DVC is activated, a software reset should be set to initialize logic and register setting. Then, the software reset should be cleared and ready to operate DVC. When reset the DVC function, all registers are initialized. If the DVC function was initialized by a hardware reset, it doesn't need to initialize the DVC function by software reset.

**Figure 34.27 DVC Activation Flowchart**

- DVC Initial Value Setting

Figure 34.28 shows the flowchart of the DVC initial value setting. Before operate DVC function, the initial values should be set.

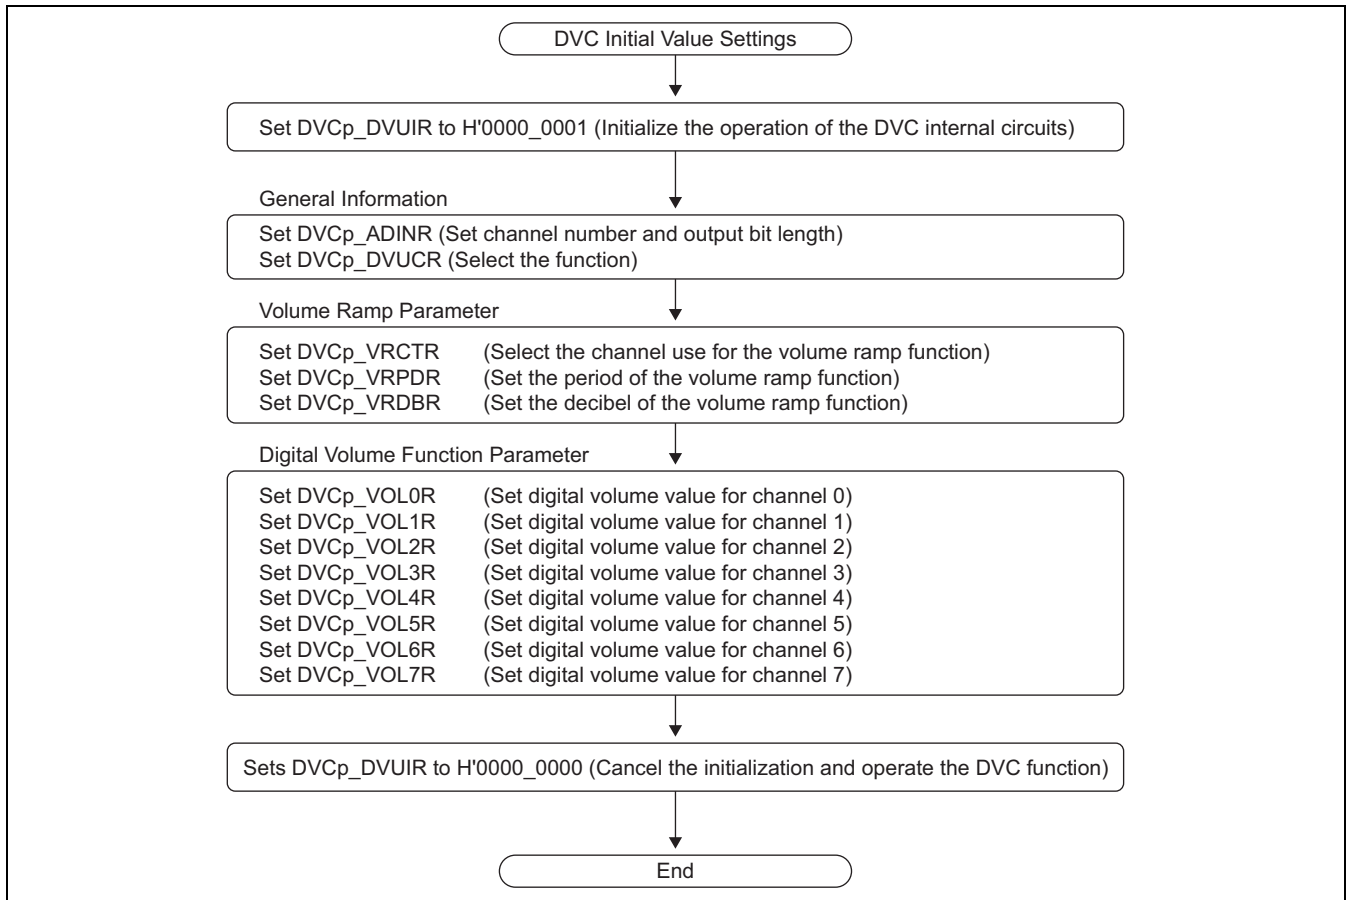

Figure 34.28 DVC Initial Value Setting Flowchart

- DVC Processing Parameter

Figure 34.29 shows the DVC processing parameter flowchart. When DVC is processing, user can control the zero cross mute and the volume ramp and the digital volume value or by changing the setting value of registers. Before change the parameter of each function, the setting of DVCp\_DVUER should be disables. After that set the setting of each function and enables the DVCp\_DVUER for reflect the register setting to the DVC processing.

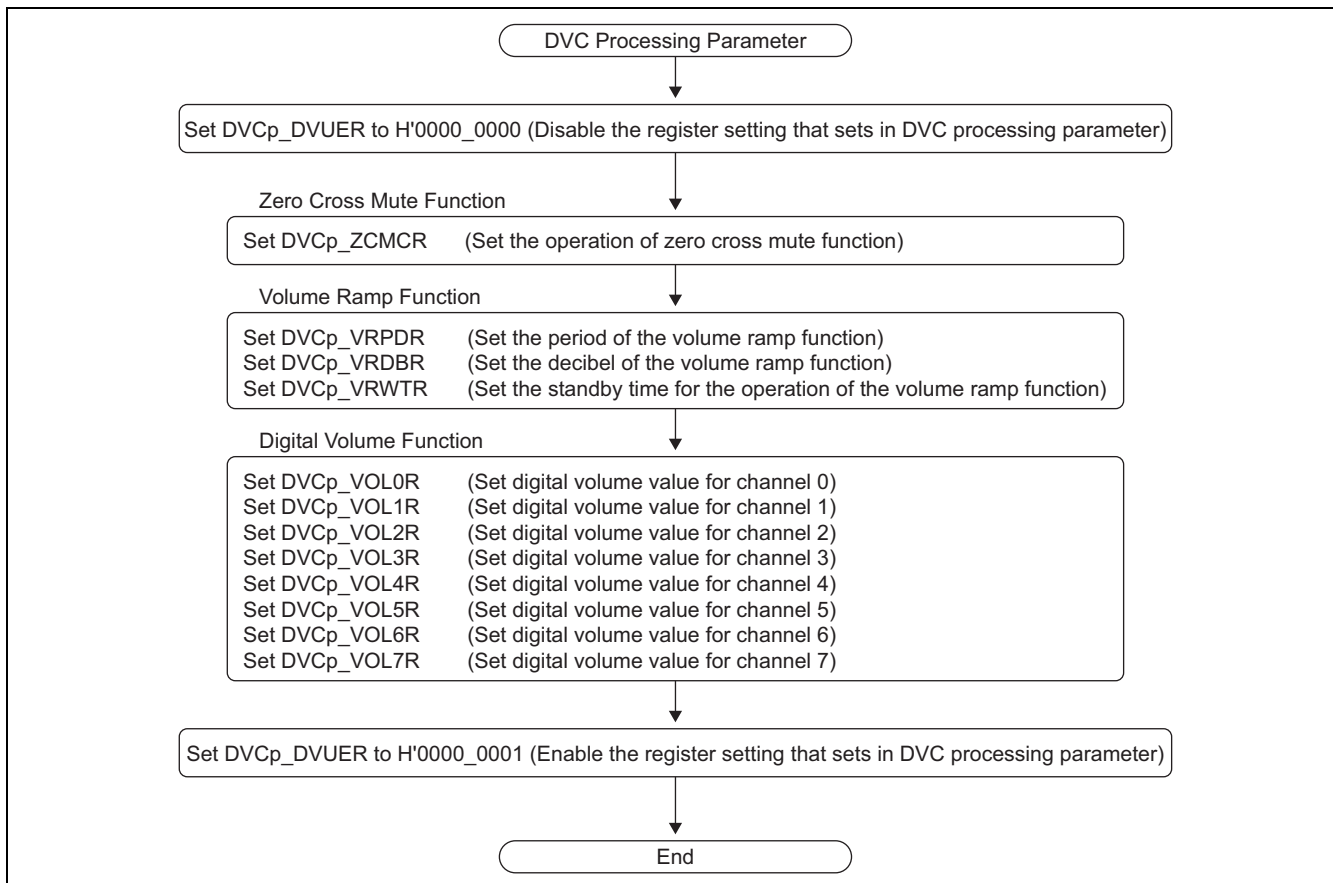

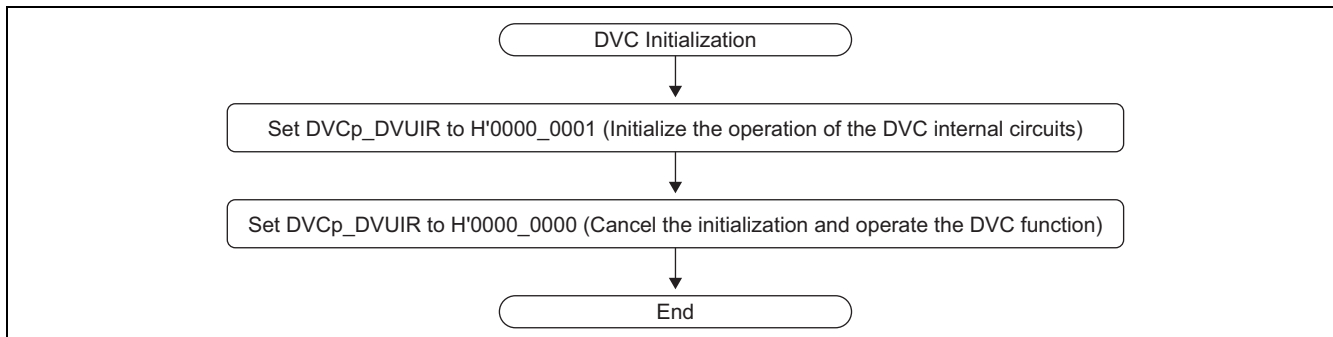

Figure 34.29 DVC Processing Parameter Flowchart

- DVC Initialization

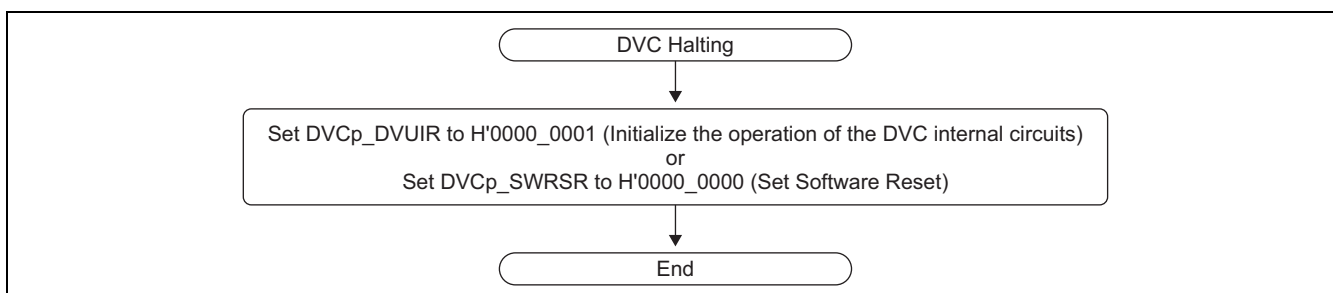

Figure 34.30 shows the flowchart of DVC Initialization. DVCp\_DVUIR register doesn't initialize the register settings and these values are maintained. Before cancel the initialization, it is necessary to set or check the register settings of peripheral IP.

**Figure 34.30 DVC Initialization Flowchart**

- DVC Halting

Figure 34.31 shows the flowchart of DVC halting. When DVC is halting, it should be initialize or reset by software reset or hardware reset. Before initialize or reset the DVC function, it is necessary to confirm the register settings and operation of peripheral IP.

**Figure 34.31 DVC Halting Flowchart**

### 34.3.8 Input Data Timing and Output Data Timing

When using the SRC or CMD, the input data timing and output data timing should be specified. For details of the settings, refer to section 33, Audio Clock Generator (ADG).

## 35. Direct Memory Access Controller for Audio (Audio-DMAC)

RZ/G1H

RZ/G1N

RZ/G1M

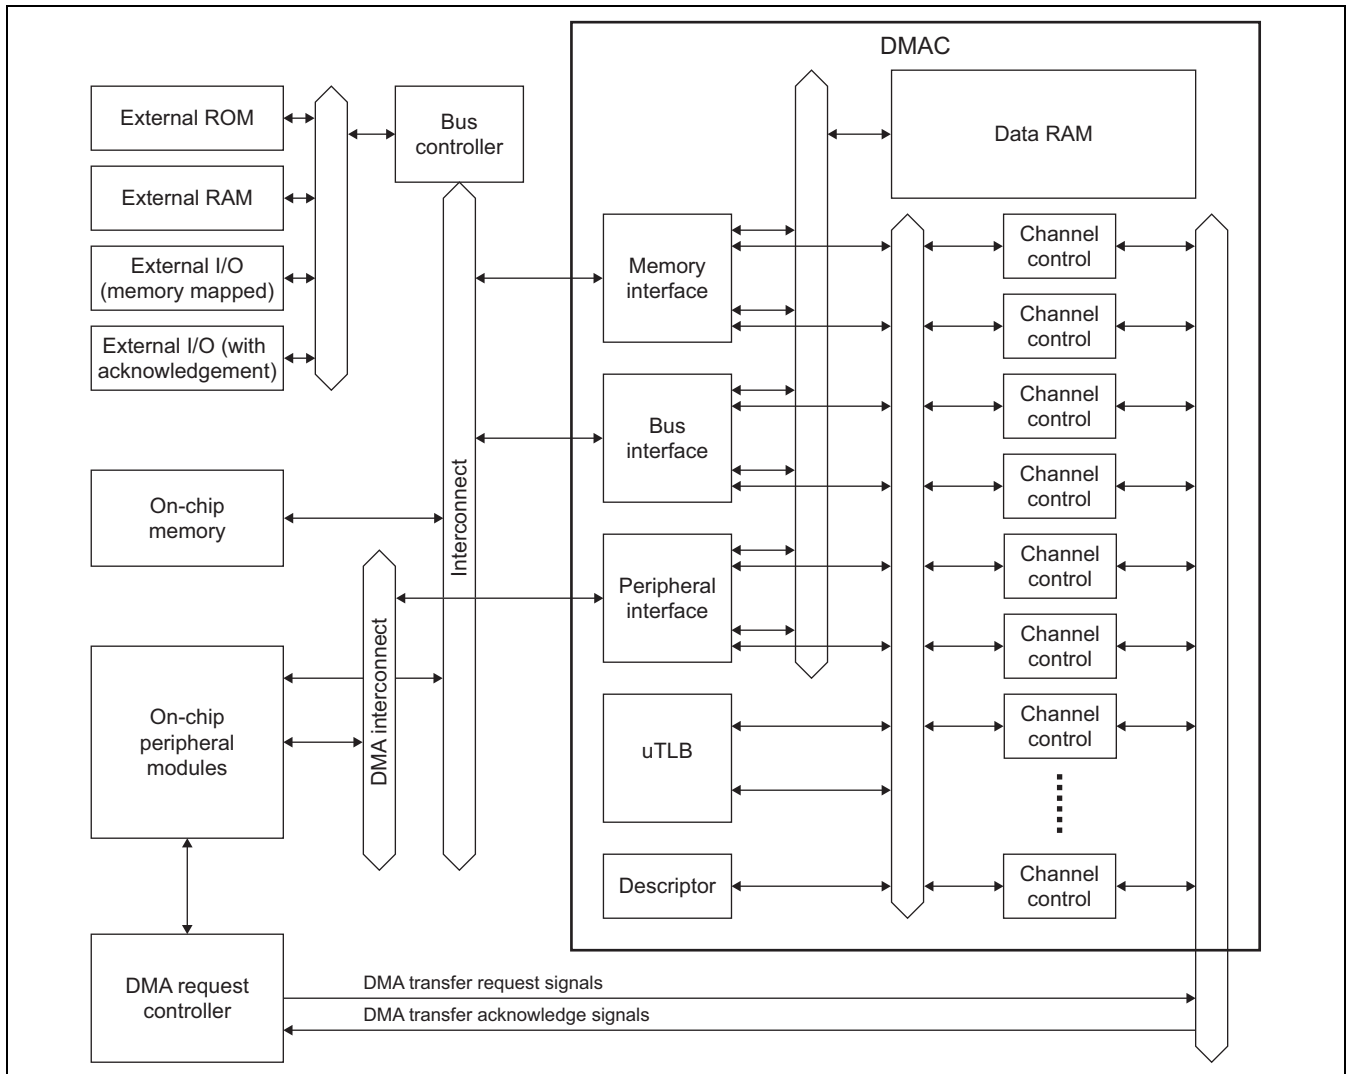

RZ/G1E

This LSI includes a direct memory access controller for audio (audio-DMAC). The audio-DMAC can be used in place of the CPU to handle high-speed data transfer to and from an external memory, the on-chip memory, memory-mapped external devices, or on-chip peripheral modules.

### 35.1 Features

- Up to 26 channels are available.  
RZ/G1H/M/N: 26 channels (channels 0 to 25)  
RZ/G1E: 13 channels (channels 0 to 12)
- 4-Gbyte physical address space
- Transfer data length: Byte, word (2 bytes), longword (4 bytes), 8 bytes, 16 bytes, 32 bytes, and 64 bytes
- Maximum number of transfer times: 16,777,216
- Address mode: Dual address mode
- Transfer requests:  
Requests from on-chip peripheral modules or auto requests can be selected. The following modules can issue on-chip peripheral module requests.  
SSI0 to SSI9, SCU0 to SCU9
- Selectable bus modes:  
Normal speed mode or slow mode can be selected for each channel.
- Either fixed priority or round-robin arbitration can be selected for use in arbitration among the transfer channels.
- Interrupt request:  
The audio-DMAC can be set up to generate an interrupt request for the CPU upon completion of transfer under the control of one stage of the descriptor memory, at the end of the data transfer, in response to an MMU error, and in response to an address error.
- Descriptor memory function:  
Up to 128 sets of the settings for the source address register, destination address register, and transfer count register are available (if use of the descriptor memory is only enabled for one channel) for use in setting up consecutive DMA transfers (the memory can hold register values for up to 256 stages of transfer when the external memory is selected). An infinite repeat mode is also available.

Figure 35.1 shows the block diagram of the audio-DMAC.

**Figure 35.1 Block Diagram of the Audio-DMAC**

### 35.2 Input/Output Pins

There are no external pins relevant to the audio-DMAC.

### 35.3 Register Descriptions

Table 35.1 lists the registers of the audio-DMAC. Table 35.2 shows the register states of the audio-DMAC in each operating mode.

Note: The number of the audio-DMAC channels and the registers in use depend on the product:  
 26 channels for the RZ/G1H and RZ/G1M/N (registers for both the higher- and lower-numbered sets of channels 0 to 12 and 13 to 25 are in use)  
 13 channels for the RZ/G1E (only the registers for the higher-numbered channels 0 to 12 are in use)

**Table 35.1 Register Configuration of the Audio-DMAC**

0	I13	0	R	Interrupt State in Channel 13 0: An interrupt is not present. 1: An interrupt is present.

### 35.3.3 DMA Secure Control Register for Lower-Numbered Channels (DMASEC\_L)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

DMASEC\_L is a 32-bit readable/writeable register that controls the security attribute of each of the lower-numbered channels. Only the initiator in the secure mode can change the setting of this register.

Only secure access is allowed to registers of channels with the secure mode setting. The following registers are protected by the secure mode.

DMASAR, DMADAR, DMATCR, DMATSR, DMACHCR, DMATCRB, DMATSRB, DMACHCRB, DMARS, DMABUFCR, DMADPBASE, DMADPCR, DMAFIXSAR, DMAFIXDAR, and DMAFIXDPBASE

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	S12	S11	S10	S9	S8	S7	S6	S5	S4	S3	S2	S1	S0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Descriptions
31 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

### 35.3.4 DMA Secure Control Register Higher-Numbered Channels (DMASEC\_U)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	—

DMASEC\_U is a 32-bit readable/writable register that controls the security attribute of each of the higher-numbered channels. Only the initiator in the secure mode can change the setting of this register.

Only secure access is allowed to registers of channels with the secure mode setting. The following registers are protected by the secure mode.

DMASAR, DMADAR, DMATCR, DMATSR, DMACHCR, DMATCRB, DMATSRB, DMACHCRB, DMARS, DMABUFCR, DMADPBASE, DMADPCR, DMAFIXSAR, DMAFIXDAR, and DMAFIXDPBASE

### 35.3.5 DMA Operation Register for Lower-Numbered Channels (DMAOR\_L)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

DMAOR\_L is a 16-bit readable/writable register that enables DMA transfer on all lower-numbered channels and specifies the method used to determine the priority levels for all lower-numbered DMA channels. This register also indicates address errors.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	PR[1:0]	—	—	—	—	—	—	AE	—	DME
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R/(W)*	R	R/W

Bit	Bit Name	Initial Value	R/W	Descriptions
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9, 8	PR[1:0]	00	R/W	Priority Mode Select the method for setting the order of priority of channels when transfer requests for multiple channels arrive simultaneously. 00: Fixed CH0 > CH1 > ... > CH11 > CH12 11: Round-robin priority Other than above: Setting prohibited
7 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2	AE	0	R/(W)*	Address Error Flag Indicates that an address error interrupt occurred during DMA transfer. This bit is set under the following conditions: The value set in DMASAR or DMADAR does not fall on a boundary corresponding to the transfer size. The source or destination for transfer is in an invalid space. The source or destination for transfer is in module stop mode. If this bit is set, DMA transfer through the channel is not possible even if the DE bit is set to 1. To clear the AE bit, write 0 to the AE bit after reading 1 from it or clear the CAE bit for each channel for which it is set. Clearing the AE bit clears the channel address error bits for all channels. 0: An audio-DMAC address error interrupt is not present. [Clearing condition] Writing CAE = 0 after reading CAE = 1 1: An audio-DMAC address error interrupt being generated during DMA transfer.
1	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

---

Bit	Bit Name	Initial Value	R/W	Descriptions
0	DME	0	R/W	<p>DMA Master Enable</p> <p>Enables or disables DMA transfer on all channels. If the DME bit and the DE bit in DMACHCR are both set to 1, DMA transfer is enabled. At this time all AE bits in DMAOR_L must have the value 0. For DMA transfer on a channel to then proceed, the TE bit in DMACHCR for the channel must also have the value 0. Clearing this bit during transfer aborts transfer on all channels.</p> <p>0: Disables DMA transfers on all channels</p> <p>1: Enables DMA transfers on all channels</p>

---

### 35.3.6 DMA Operation Register for Higher-Numbered Channels (DMAOR\_U)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	—

DMAOR\_U is a 16-bit readable/writable register that enables DMA transfer on all higher-numbered channels and specifies the method used to determine the priority levels for all higher-numbered DMA channels. This register also indicates address errors.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	PR[1:0]		—	—	—	—	—	AE	—	DME

### 35.3.7 DMA Channel Clear Register for Lower-Numbered Channels (DMACHCLR\_L)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

DMACHCLR\_L is a 32-bit writable register that initializes each of the lower-numbered channels.

When a bit of this register is set, the state of the corresponding channel is completely initialized.

This includes initialization of the following registers.

DMASAR, DMADAR, DMATCR, DMATSR, DMACHCR, DMATCRB, DMATSRB, DMACHCRB, DMARS, DMABUFGR, DMADPBASE, DMADPCR, DMAFIXSAR, DMAFIXDAR, and DMAFIXDPBASE

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12 to 0	CLR[12:0]	All 0	W	Writing to a bit leads to clearing of all registers for the corresponding channel. CLR[0] 0: Ignored 1: All registers for channel 0 are cleared. CLR[1] 0: Ignored 1: All registers for channel 1 are cleared. CLR[2] 0: Ignored 1: All registers for channel 2 are cleared. ... CLR[12] 0: Ignored 1: All registers for channel 12 are cleared. When writing to this register, confirm that the DE bit is set to 0.

### 35.3.8 DMA Channel Clear Register for Higher-Numbered Channels (DMACHCLR\_U)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	—

DMACHCLR\_U is a 32-bit writable register that initializes each of the higher-numbered channels.

When a bit of this register is set, the state of the corresponding channel is completely initialized.

This includes initialization of the following registers.

DMASAR, DMADAR, DMATCR, DMATSR, DMACHCR, DMATCRB, DMATSRB, DMACHCRB, DMARS, DMABUFCR, DMADPBASE, DMADPCR, DMAFIXSAR, DMAFIXDAR, and DMAFIXDPBASE

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12 to 0	CLR[25:13]	All 0	W	Writing to a bit leads to clearing of all registers for the corresponding channel. CLR[13] 0: Ignored 1: All registers for channel 13 are cleared. CLR[14] 0: Ignored 1: All registers for channel 14 are cleared. ... CLR[25] 0: Ignored 1: All registers for channel 25 are cleared. When writing to this register, confirm that the DE bit is set to 0.

### 35.3.9 DPRAM Secure Control Register for Lower-Numbered Channels (DMADPSEC\_L)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

DMADPSEC\_L is a 32-bit readable/writable register that controls the security attribute of the descriptor memory. Only the initiator in the secure mode can change the setting of this register.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16			
	SEC	—	—	—	—	—	—	SA[8:0]

Bit	Bit Name	Initial Value	R/W	Description
31	SEC	0	R/W	Security Attribute Setting for Descriptor Memory Specifies the security attribute of the address space used for the descriptor memory. 0: Non-secure 1: Secure
30 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24 to 16	SA[8:0]	H'000	R/W	Security Attribute Setting for Base Address of Descriptor Memory Specify the base address of the descriptor memory to be assigned the security attribute. H'000: H'A000 H'001: H'A004 ... H'1FF: H'A7FC
15 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8 to 0	SM[8:0]	H'000	R/W	Security Attribute Setting for Base Address Mask of Descriptor Memory Specify the security attribute base address mask of the descriptor memory. The range of memory to be assigned the security attribute is specified by this register. See Figure 35.4.

### 35.3.10 DPRAM Secure Control Register for Higher-Numbered Channels (DMADPSEC\_U)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	—

DMADPSEC\_U is a 32-bit readable/writeable register that controls the security attribute of the descriptor memory. Only the initiator in the secure mode can change the setting of this register.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16			
	SEC	—	—	—	—	—	—	SA[8:0]											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0			
R/W:	R/W	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W			
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0			
	—	—	—	—	—	—	—	SM[8:0]											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0			
R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W			

Bit	Bit Name	Initial Value	R/W	Description
31	SEC	0	R/W	Security Attribute Setting for Descriptor Memory Specifies the security attribute of the address space used for the descriptor memory. 0: Non-secure 1: Secure
30 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24 to 16	SA[8:0]	H'000	R/W	Security Attribute Setting for Base Address of Descriptor Memory Specify the base address of the descriptor memory to be assigned the security attribute. H'000: H'A000 H'001: H'A004 ... H'1FF: H'A7FC
15 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8 to 0	SM[8:0]	H'000	R/W	Security Attribute Setting for Base Address Mask of Descriptor Memory Specify the security attribute base address mask of the descriptor memory. The range of memory to be assigned the security attribute is specified by this register. See Figure 35.4.

### 35.3.11 DMA Source Address Registers 0 to 25 (DMASAR\_0 to DMASAR\_25)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Note: The availability of channels depends on the product as follows.

RZ/G1H and M/N: 26 channels (channels 0 to 25)

RZ/G1E: 13 channels (channels 0 to 12)

DMASAR is a 32-bit readable/writable register that specifies the source address of a DMA transfer. While a DMA transfer is in progress, this register indicates the next source address.

When the address mode is incrementation, sources in memory only have byte boundaries. For details, refer to Table 35.3.

### 35.3.12 DMA Destination Address Registers 0 to 25 (DMADAR\_0 to DMADAR\_25)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Note: The availability of channels depends on the product as follows.

RZ/G1H and M/N: 26 channels (channels 0 to 25)

RZ/G1E: 13 channels (channels 0 to 12)

DMADAR is 32-bit readable/writable register that specify the destination address of a DMA transfer. While a DMA transfer is in progress, this register indicates the next destination address.

When the address mode is incrementation, destinations in memory only have byte boundaries. For details, refer to Table 35.3.

**Table 35.3 SAR/DAR Address Restriction**

Resource Selection	Address Mode	Restriction
Auto request	Incrementation	No restriction (byte boundaries)
	Others	Boundary corresponding to the DMA transfer size
On-chip peripheral module request Transmission/DAR, Reception/SAR	All	Boundary corresponding to the DMA transfer size
On-chip peripheral module request Transmission/SAR, Reception/DAR	Incrementation	No restriction (byte boundaries)
	Others	Boundary corresponding to the DMA transfer size

**35.3.13 DMA Transfer Count Registers 0 to 25 (DMATCR\_0 to DMATCR\_25)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Note: The availability of channels depends on the product as follows.

RZ/G1H and M/N: 26 channels (channels 0 to 25)

RZ/G1E: 13 channels (channels 0 to 12)

DMATCR is a 32-bit readable/writable register that specifies the number of rounds of DMA transfer. The number of rounds of DMA transfer is 1 when the setting is H'00000001, 16,777,215 when the setting is H'00FFFFFF, and 16,777,216 (the maximum) when the setting is H'00000000. During a DMA transfer, this register indicates the remaining number of rounds of transfer.

The audio-DMAC includes independent data buffers for reading and writing. Therefore, the read transfer counter and write transfer counter have different values. This register indicates the counter value used in reading.

The eight higher-order bits of DMATCR are always read as 0, and the write value should always be 0.

### 35.3.14 DMA Transfer Count Registers B\_0 to 25 (DMATCRB\_0 to DMATCRB\_25)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Note: The availability of channels depends on the product as follows.

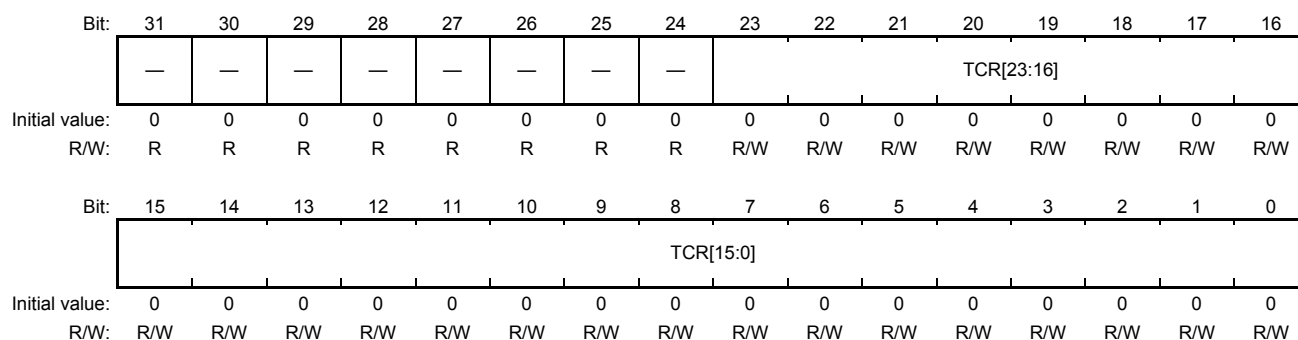

RZ/G1H and M/N: 26 channels (channel 0 to 25)

RZ/G1E: 13 channels (channel 0 to 12)

DMATCRB is a 32-bit readable/writable register that specifies the number of rounds of DMA transfer. The number of rounds of DMA transfer is 1 when the setting is H'00000001, 16,777,215 when the setting is H'00FFFFFF, and 16,777,216 (the maximum) when the setting is H'00000000. During a DMA transfer, this register indicates the remaining number of rounds of transfer.

The audio-DMAC includes independent data buffers for reading and writing. Therefore, the read transfer counter and write transfer counter have different values. This register indicates the counter value used in writing.

The eight higher-order bits of DMATCRB are always read as 0, and the write value should always be 0.

**35.3.15 DMA Transfer Size Registers 0 to 25 (DMATSR\_0 to DMATSR\_25)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Note: The availability of channels depends on the product as follows.

RZ/G1H and M/N: 26 channels (channel 0 to 25)

RZ/G1E: 13 channels (channel 0 to 12)

DMATSR is a 32-bit readable/writable register that specifies a total amount of memory to be transferred. The total size of DMA transfer is 1 byte when the setting is H'00000001, 4,294,967,295 bytes when the setting is H'FFFFFFF, and 4,294,967,296 bytes (the maximum) when the setting is H'00000000. During a DMA transfer, this register indicates the remaining amount of memory to be transferred. This register is used in total size transmission.

The audio-DMAC includes independent data buffers for reading and writing. Therefore, reading and writing will have different transfer sizes. This register indicates the value of the read transfer size.

**35.3.16 DMA Transfer Size Registers B\_0 to 25 (DMATSRB\_0 to DMATSRB\_25)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Note: The availability of channels depends on the product as follows.

RZ/G1H and M/N: 26 channels (channels 0 to25)

RZ/G1E: 13 channels (channels 0 to 12)

DMATSRB is a 32-bit readable/writable register that specifies a total amount of memory to be transferred. The total size of DMA transfer is 1 byte when the setting is H'00000001, 4,294,967295 bytes when the setting is H'FFFFFFF, and 4,294,967,296 bytes (the maximum) when the setting is H'00000000. During a DMA transfer, this register indicates the remaining amount of memory to be transferred. This register is used in total size transmission.

The audio-DMAC includes independent data buffers for reading and writing. Therefore, reading and writing will have different transfer sizes. This register indicates the value of the write transfer size.

### 35.3.17 DMA Channel Control Registers 0 to 25 (DMACHCR\_0 to DMACHCR\_25)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Note: The availability of channels depends on the product as follows.

RZ/G1H, M/N: 26 channels (channels 0 to 25)

RZ/G1E: 13 channels (channels 0 to 12)

DMACHCR is a 32-bit readable/writable register that controls the DMA transfer mode.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

11 to 8	RS[3:0]	0000	R/W	<p>Resource Selection</p> <p>Specify the source of transfer requests. Only change the transfer request source while the DMA enable bit (DE) is set to 0.</p> <p>0100: Auto request</p> <p>1000: Source is selected by the DMA extended resource selector.</p> <p>Other than above: Settings prohibited</p>
7 to 5	—	All 0	R	<p>Reserved</p> <p>These bits are always read as 0. The write value should always be 0.</p>
4, 3	TS[1:0]	00	R/W	<p>DMA Transfer Size</p> <p>See the description of TS[3:2] (bits 21 and 20).</p>
2	IE	0	R/W	<p>Interrupt Enable</p> <p>Specifies whether or not an interrupt request is generated for the CPU on completion of DMA transfer. When this bit is set to 1, an interrupt request (DEI) for the CPU is generated whenever the TE bit is set to 1.</p> <p>0: Interrupt request is disabled.</p> <p>1: Interrupt request is enabled.</p>

Bit	Bit Name	Initial Value	R/W	Descriptions
1	TE	0	R/(W)*	<p>Transfer End Flag</p> <p>When the descriptor memory is not in use, the TE bit is set to 1 when DMATCR becomes 0 on completion of the DMA transfer.</p> <p>When the descriptor memory is in use, the TE bit is set to 1 on completion of all transfers set up in the descriptor memory. The TE bit is not set to 1 in the following cases.</p> <ul style="list-style-type: none"> <li>• DMA transfer ends due to a DMA address error before DMATCR becomes 0.</li> <li>• DMA transfer is aborted by clearing the DE and DME bits in DMAOR.</li> </ul> <p>To clear the TE bit, start by reading it as 1, and then write 0 to it.</p> <p>When the TE bit is set to 1, transfer is not possible even if the DE bit is set to 1.</p> <p>0: DMA transfer is in progress or was aborted            [Clearing condition] Writing of 0 after reading of 1            1: DMA transfer ended on the specified count (TCR = 0)</p>
0	DE	0	R/W	<p>DMA Enable</p> <p>Enables or disables DMA transfer. In the auto request mode, a DMA transfer is started by setting the DE and DME bits in DMAOR to 1. At this time, the setting of both the AE and TE bits in DMAOR must be 0. In a peripheral module request, a DMA transfer starts if the transfer request is generated by the selected device or on-chip peripheral module after setting the DE and DME bits to 1. In this case too, the settings of both the TE and AE bits must be 0. Clearing the DE bit to 0 aborts all DMA transfer.</p> <p>Note: Ensure that the setting of the DE bit is actually 0 after clearing it.</p> <p>0: DMA transfer is disabled.            1: DMA transfer is enabled.</p>

Note: \* Writing 0 is possible to clear the flag.

### 35.3.18 DMA Channel Control Register B\_0 to 25 (DMACHCRB\_0 to DMACHCRB\_25)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Note: The availability of channels depends on the product as follows.

RZ/G1H and M/N: 26 channels (channels 0 to 25)

RZ/G1E: 13 channels (channels 0 to 12)

DMACHCRB is a 32-bit readable/writable register that controls the DMA transfer mode.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DCNT[7:0]								DPTR[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DRST	—	—	—	—	—	—	DTS	SLM[3:0]			PRI[3:0]				
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	W	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Descriptions
31 to 24	DCNT[7:0]	H'00	R/W	Number of Stages of Descriptor Memory Specify the number of stages of the descriptor memory as DCNT + 1. When the descriptor memory is enabled, a transfer end (TE) interrupt is only generated for the CPU on completion of transfer under control of the specified number of stages.
23 to 16	DPTR[7:0]	H'00	R	Descriptor Pointer This bit indicates the pointer to the next descriptor to be read. It is cleared to 0 when the last descriptor of the number of stages specified by DCNT[7:0] is read. It is also cleared to 0 when 1 is written to DRST.
15	DRST	0	W	Descriptor Reset Resets the descriptor pointer. Before the descriptor memory is used, the pointer must be reset by writing 1 to this bit. This bit is always read as 0.
14 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	DTS	0	R/W	Total Size Transmission under Descriptor Control This bit is only effective when total size transmission is selected. 0: The TCR fields of the descriptors are used as transfer count settings. 1: The TCR fields of the descriptors are used as total size settings.

Bit	Bit Name	Initial Value	R/W	Descriptions
7 to 4	SLM[3:0]	0000	R/W	<p>DMA Transfer Low-Speed Mode</p> <p>Specify the number of cycles of the clock (ZS<math>\phi</math>) for the DMA transfer. One round of DMA transfer is executed in the number of cycles of the clock specified by this bit.</p> <p>0000: Normal mode</p> <p>1000: On round in 256 cycles of the clock.</p> <p>1001: On round in 512 cycles of the clock.</p> <p>1010: On round in 1024 cycles of the clock.</p> <p>:</p> <p>1111: On round in 32768 cycles of the clock.</p> <p>Other than above: Setting prohibited</p>
3 to 0	PRI[3:0]	0000	R/W	<p>Channel Request Priority Setting</p> <p>These bits set the priority of requests for transfer on the given channel.</p> <p>1111: Highest priority</p> <p>:</p> <p>0111 to 0000: Lowest priority</p>

### 35.3.19 DMA Buffer Control Registers 0 to 25 (DMABUFCR\_0 to DMABUFCR\_25)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Note: The availability of channels depends on the product as follows.

RZ/G1H and M/N: 26 channels (channels 0 to 25)

RZ/G1E: 13 channels (channels 0 to 12)

DMABUFCR is a 32-bit readable/writable register that controls the upper limit on buffer size in and burst unit for the SDRAM.

Use this register when the upper limit on buffering requires control.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16				
	—	—	—	—	—	—	—	MBU[8:0]									—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0				
R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W				
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0				
	—	—	—	—	—	—	ULB[9:0]									—	—	—	—	
Initial value:	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0				
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W				

Bit	Bit Name	Initial Value	R/W	Descriptions
31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24 to 16	MBU[8:0]	H'080	R/W	Maximum Burst Unit for SDRAM This register is only effective for SDRAM access, and everything other than that is under control of the transfer size (unit). Settings bigger than UBL are prohibited. Power-of-two settings are recommended. Maximum value is 256 (bytes).
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	ULB[9:0]	H'100	R/W	Upper Limit on Buffer Size This register controls the upper limit value for buffering. Power-of-two settings are recommended. Maximum value is 512 (bytes).

### 35.3.20 DMA Extended Resource Selectors 0 to 25 (DMARS\_0 to DMARS\_25)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Note: The availability of channels depends on the product as follows.

RZ/G1H and M/N: 26 channels (channels 0 to 25)

RZ/G1E: 13 channels (channels 0 to 12)

DMARS is a 16-bit readable/writable register that specifies the on-chip peripheral module to be the source of the DMA transfer request for the given channel. DMARS\_0 specifies the source for channel 0, DMARS\_1 specifies the source for channel 1 and so on.

When bits MID and RID are set to a value other than the values listed in Table 35.4, the operation of this LSI is not guaranteed. Transfer requests from the source selected in DMARS are only valid when the resource selection bits (RS[3:0]) in DMACHCR have been set to B'1000. Otherwise, even if DMARS has been set, requests from the corresponding transfer request source are not accepted.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	MID[5:0]					RID[1:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Descriptions
15 to 8	—	—	R	Reserved These bits are always read as 0. The write value should always be 0.
7 to 2	MID[5:0]	000000	R/W	DMA Request Source Adoption ID5 to ID0 (MID) See Table 35.4.
1, 0	RID[1:0]	00	R/W	DMA Request Source Adoption ID1 and ID0 (RID) See Table 35.4.

**35.3.21 DMA Descriptor Base Address Registers 0 to 25 (DMADPBASE\_0 to DMADPBASE\_25)**

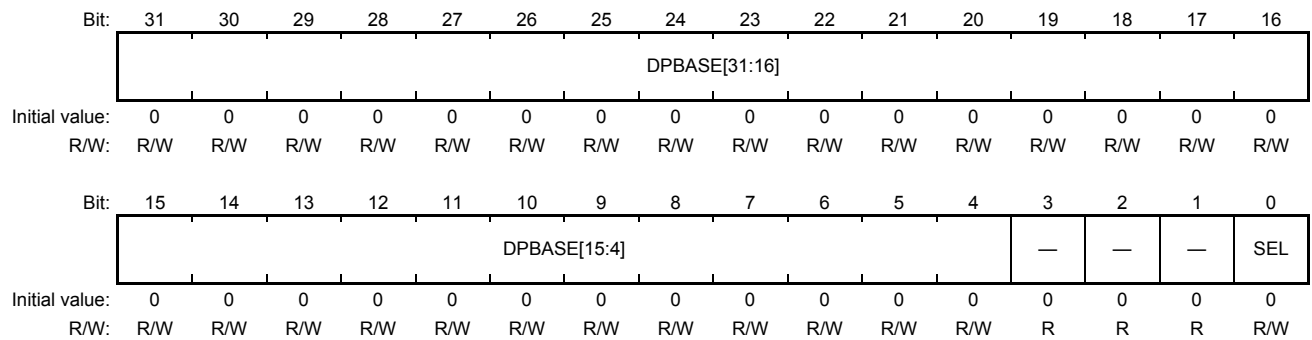

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Note: The availability of channels depends on the product as follows.

RZ/G1H and M/N: 26 channels (channels 0 to 25)

RZ/G1E: 13 channels (channels 0 to 12)

DMADPBASE specifies the base address of the descriptor memory. The address range of the descriptor memory is specified by setting this register.

Bit	Bit Name	Initial Value	R/W	Descriptions
31 to 4	DPBASE[31:4]	All 0	R/W	Base Address of Descriptor Memory Place each stage of the descriptor memory on a 16-byte boundary. Setting example When Built-in memory is used, [Audio-DMAC Lower]: H'EC70 A000 to H'EC70 A7FC [Audio-DMAC Higher]: H'EC72 A000 to H'EC72 A7FC When External memory is used, Other memory area on a 16-byte boundary
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SEL	0	R/W	Descriptor Memory Selection Select the memory to be used as descriptor memory. 0: Setting Prohibited 1: Built-in memory or External memory is used.

**35.3.22 DMA Descriptor Control Registers 0 to 25 (DMADPCR\_0 to DMADPCR\_25)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Note: The availability of channels depends on the product as follows.

RZ/G1H and M/N: 26 channels (channels 0 to 25)

RZ/G1E: 13 channels (channels 0 to 12)

DMADPCR is a 32-bit readable/writable register that controls the timing with which interrupts are output in read-out interrupt mode (descriptor mode 3).

Bit	Bit Name	Initial Value	R/W	Descriptions
31 to 24	DIPT[7:0]	H'00	R/W	Descriptor Read-out Interrupt Pointer The number of stages for which descriptor read-out interrupts are generated in descriptor mode 3. DIPT + 1 specifies the number of descriptor stages.
23 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

**35.3.23 DMA Fixed Source Address Registers 0 to 25 (DMAFIXSAR\_0 to DMAFIXSAR\_25)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

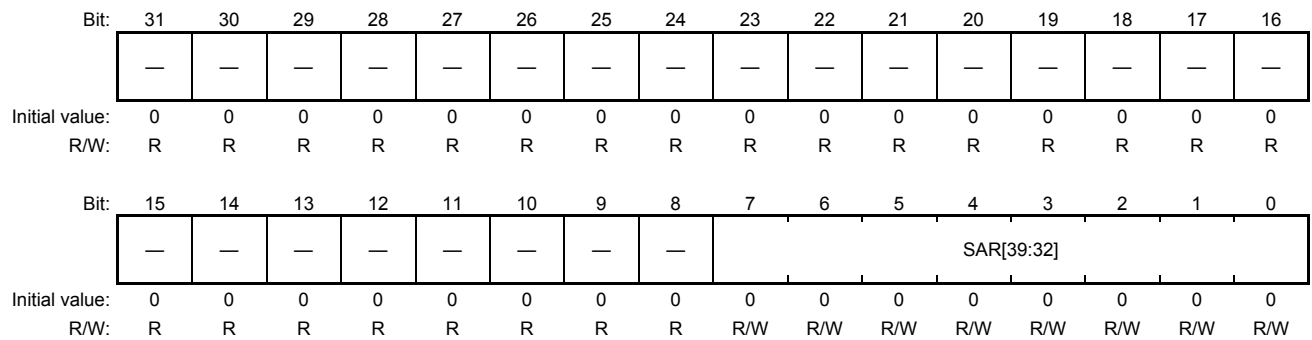

Note: The availability of channels depends on the product as follows.

RZ/G1H and M/N: 26 channels (channels 0 to 25)

RZ/G1E: 13 channels (channels 0 to 12)

DMAFIXSAR is a 32-bit readable/writable register that specifies the most significant 8 bits of the 40-bit source address for a DMA transfer.

This register is not incremented by carrying when DMASAR overflows.

**35.3.24 DMA Fixed Destination Address Registers 0 to 25 (DMAFIXDAR\_0 to DMAFIXDAR\_25)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

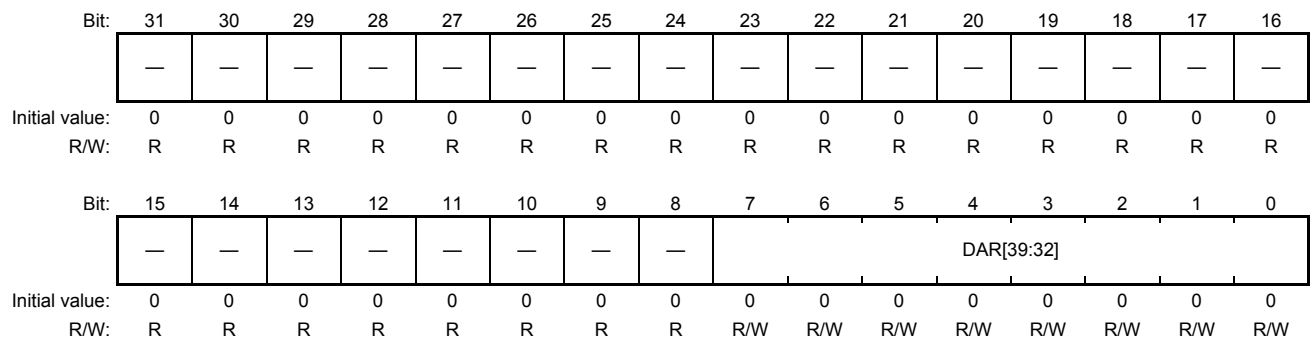

Note: The availability of channels depends on the product as follows.

RZ/G1H and M/N: 26 channels (channels 0 to 25)

RZ/G1E: 13 channels (channels 0 to 12)

DMAFIXDAR is a 32-bit readable/writable register that specifies the most significant 8 bits of the 40-bit destination address for a DMA transfer.

This register is not incremented by carrying when DMADAR overflows.

**35.3.25 DMA Fixed Descriptor Base Address Registers 0 to 25 (DMAFIXDPBASE\_0 to DMAFIXDPBASE\_25)**

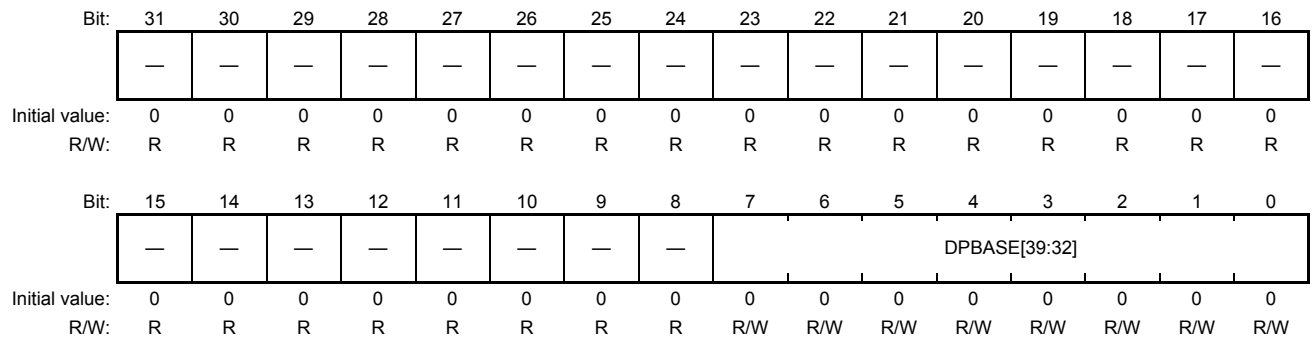

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Note: The availability of channels depends on the product as follows.

RZ/G1H and M/N: 26 channels (channels 0 to25)

RZ/G1E: 13 channels (channels 0 to 12)

DMAFIXDPBASE is a 32-bit readable/writable register that specifies the most significant 8 bits of the 40-bit descriptor base address for a DMA transfer.

**35.3.26 Descriptor Memory (DescriptorMEM)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

See section 35.4.4, Descriptor Memory for the descriptor memory.

## 35.4 Operation

RZ/G1H	RZ/G1N
RZ/G1M	RZ/G1E

When there is a DMA transfer request, the DMAC starts the transfer according to the predetermined channel priority; when the transfer end conditions are satisfied, it ends the transfer. Transfers can be requested in two modes: auto request and on-chip peripheral module request. The bus mode can be selected from normal speed mode and slow speed mode).

### 35.4.1 DMA Transfer Requests

Most commonly, DMA transfer requests are generated by either the source or destination for transfer, but they can also be generated by on-chip peripheral modules that are neither the source nor the destination. Transfers can be requested in two modes: auto request, and on-chip peripheral module request. The request mode is selected for each channel by DMARS.

#### (1) Auto-Request Mode

When there is no transfer request signal from an external source, as in a memory-to-memory transfer or a transfer between memory and an on-chip peripheral module unable to request a transfer, auto-request mode allows the audio-DMAC to automatically generate a transfer request signal internally. When the DE bit in DMACHCR and the DME bit in DMAOR are set to 1 for the target channel, the transfer begins so long as the CAE bit in DMACHCR is 0.

#### (2) On-Chip Peripheral Module Request Mode

In this mode, a transfer is performed at the transfer request signal of an on-chip peripheral module. The source (on-chip peripheral module) of the DMA transfer request is specified by DMARS.

When this mode is selected, if the DMA transfer is enabled (DE = 1, DME = 1, TE = 0, CAE = 0), a transfer is performed upon the input of a transfer request signal.

When a transmit data empty transfer request of the SCIF is set as the transfer request, the transfer destination must be the SCIF's transmit data register. Likewise, when receive data full transfer request of the SCIF is set as the transfer request, the transfer source must be the SCIF's receive data register. These conditions also apply to the other on-chip peripheral modules.

The number of the receive FIFO triggers can be set as a transfer request depending on an on-chip peripheral module. Data needs to be read after the DMA transfer is ended, because data may be left in the receive FIFO when the receive FIFO trigger condition is not satisfied.

Table 35.4 Selecting On-Chip Peripheral Module Request Modes

DMARS MID + RID	DMA Transfer Request Source	DMA Transfer Request Signal	Source	Destination	RZ/G Series Products			
					RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E

### 35.4.2 Channel Priority

When the audio-DMAC receives simultaneous transfer requests on two or more channels, it transfers data according to a predetermined priority. Two modes (fixed mode and round-robin mode) are selected by the PR[1:0] bits in DMAOR.

#### (a) Fixed Mode

In this mode, the priority levels among the channels remain fixed.

CH0 > CH1 > ... > CH11 > CH12, CH13 > CH14 > ... > CH24 > CH25

#### (b) Round-Robin Mode

In round-robin mode, each time data of one transfer unit (byte, word, longword, 8-byte or 16-byte units) is transferred on one channel, the priority is rotated. The channel on which the transfer was just finished rotates to the bottom of the priority. The priority of round-robin mode is CH0 > CH1 > ... > CH11 > CH12 and CH13 > CH14 > ... > CH24 > CH25 immediately after reset.

### 35.4.3 Slow Speed Mode

In the low-speed mode, a single round of DMA transfer is performed every time the number of clock cycles specified by the SLM bits in DMACHCRB elapse. This mode can be selected per DMA channel. Transfer on other channels can proceed after each round of transfer for a channel in the low-speed mode is completed.

Figure 35.2 Slow Speed Mode

### 35.4.4 Descriptor Memory

The descriptor memory function is selected by setting the DPM[1:0] bits in DMACHCR to B'01, B'10, or B'11. When DMATCR is set to 0 and the DMA transfer is completed, the next set of settings is read, and if only a single channel is enabled, the contents defined by up to 128 stages of descriptor memory can be consecutively transferred when the built-in descriptor memory is used. External memory can also be used as the descriptor memory. In that case, the contents defined by up to 256 stages of descriptor memory can be transferred.

The following initial settings are required to use the descriptor memory.

- Set the base address of the descriptor memory for the DMA transfer in DMADPBASE.
- Set the DRST bit in DMACHCRB to reset the descriptor memory.
- Set the number of stages of the descriptor memory in the DCNT bits of DMACHCRB.

The descriptor memory is shared between all channels. Ensure that the areas of descriptor memory for use by each of the channels do not overlap. It is necessary to arrange each stage of the descriptor memory on a 16-byte boundary.

There are two methods to activate the descriptor memory as follows.

- Specify the first DMA transfer settings in DMASAR, DMADAR, and DMATCR, and specify the subsequent settings in the descriptor memory. Then, set the DPB bit in DMACHCR to 0 to activate the descriptor memory. In this case, after completion of the transfer specified in DMASAR, DMADAR, and DMATCR, transfer continues after new settings are read from the descriptor memory. Note, however, that, when the operating mode of the descriptor memory is set to the repeat mode, the values specified in DMASAR, DMADAR, and DMATCR are not read, and the transfer starts and is repeated from the head of the descriptor memory.
- Write the DMA transfer settings to the descriptor memory, and write 1 to the DPB bit in DMACHCR to activate the descriptor memory. In this case, the DMA transfer starts from the first settings in the descriptor memory.

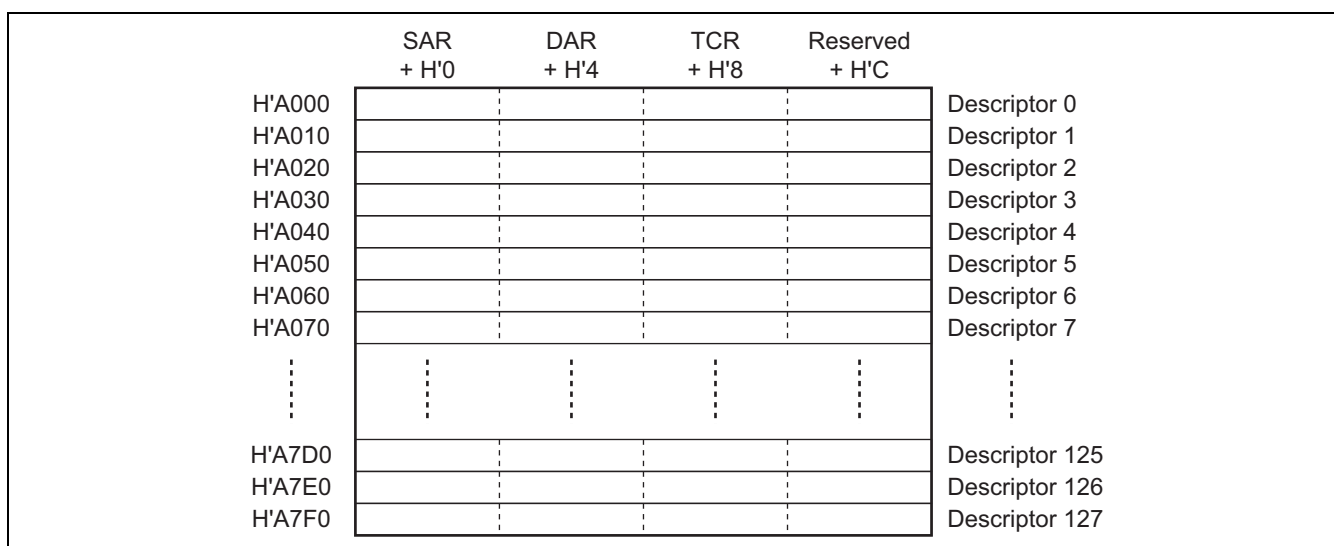

There are three operating modes of the descriptor memory, which can be selected by setting the DPM bits in DMACHCR.

For details on these operating modes, see the descriptions of each operating mode in this section.

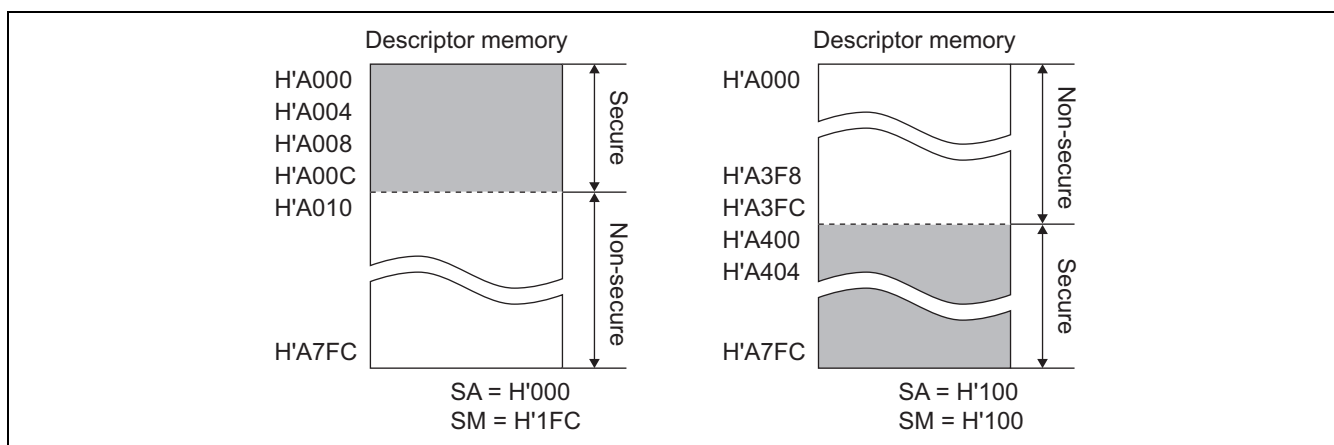

**(1) Configuration of Descriptor Memory**

Figure 35.3 shows the configuration of the built-in descriptor memory.

The capacity of the built-in descriptor memory is 16 bytes per stage × 128 stages.

**Figure 35.3 Configuration of Built-in Descriptor Memory**

**Figure 35.4 Example of DMADPSEC Setting**

**(2) Flow of Updating from Descriptor Memory**

The RPT bits in DMACHCR can be used to specify which registers are to be updated from the descriptor memory.

The DPTR bits in DMACHCRB are incremented when updating from the descriptor memory is completed. If the DPTR value matches the DCNT value, the DPTR value is reset to 0.

This flow is automatically processed by hardware.

**Figure 35.5 Flow of Updating from Descriptor Memory**

**(3) Operating Mode 1 of Descriptor Memory**

Set the DPM bits in DMACHCR to B'01 to select operating mode 1 (normal mode). This mode allows consecutive transfer under control of the descriptor memory.

In this mode, the DMA transfer is complete when the TE bit in DMACHCR is set to 1 after transfer under control of the number of stages of the descriptor memory specified in the DCNT bits in DMACHCRB.

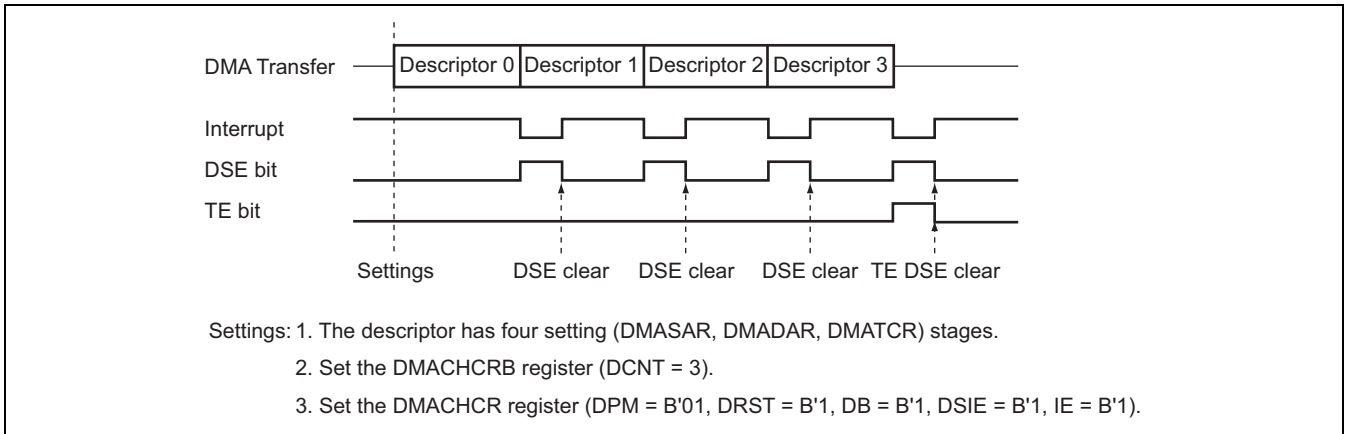

When the DSIE bit in DMACHCR is set to 1, a DSE interrupt is generated every time transfer under the control of one stage of descriptor memory is complete. If a first DSE interrupt has not been processed when a further DSE interrupt is generated, the contents of the next stage of the descriptor memory are not read and the DMA transfer is aborted. Clearing the DSE bit only causes clearing of the first interrupt and reading of the next stage of the descriptor memory.

Figure 35.6 is an example of transfer when operating mode 1 is selected and the TE and DSE bits are set to 1.

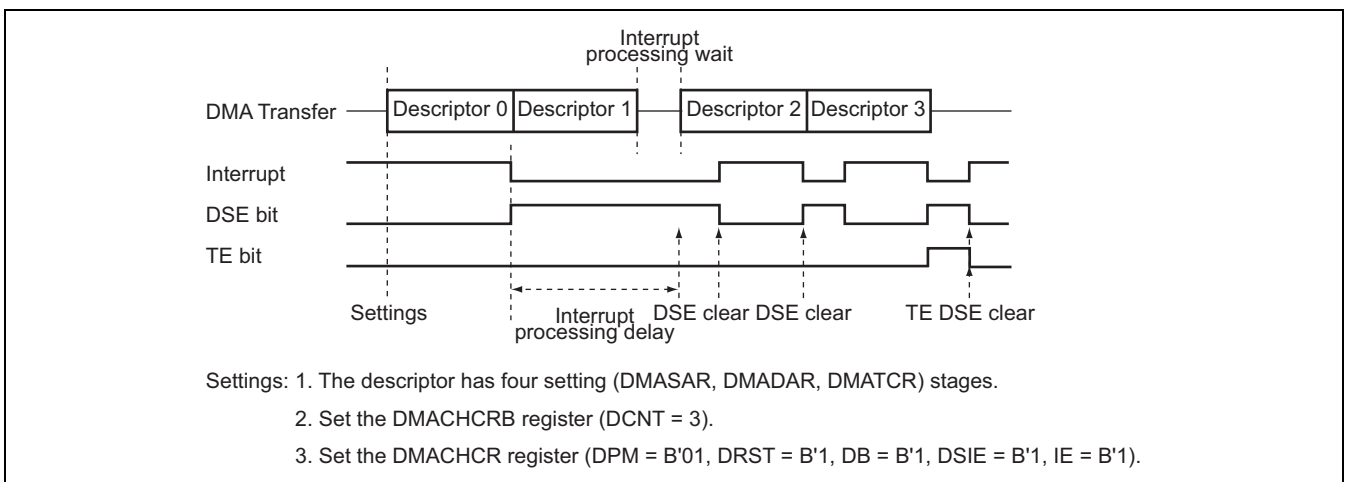

Figure 35.7 is an example of transfer when there is a delay in processing of the DSE interrupt when operating mode 1 is selected and the TE and DSE bits are set to 1.

Figure 35.8 is an example of transfer when operating mode 1 is selected and the TE bit is set to 1.

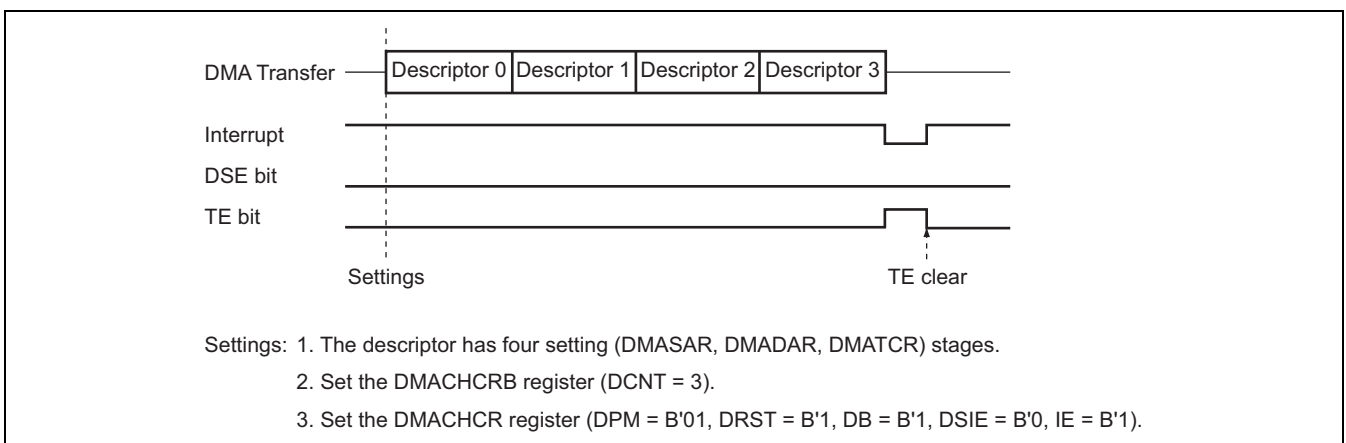

In each example, there are four descriptor stages.

**Figure 35.6 Operating Mode 1 (Example 1)**

**Figure 35.7 Operating Mode 1 (Example 2)**

**Figure 35.8 Operating Mode 1 (Example 3)**

#### (4) Operating Mode 2 of Descriptor Memory

Set the DPM bits in DMACHCR to B'10 to select operating mode 2 (repeat mode). This mode allows consecutive transfer under control of the descriptor memory.

In this mode, after transfer under control of the number of stages of descriptor memory specified in the DCNT bits in DMACHCRB, the TE bit in DMACHCR is set to 1. This operation is then repeated from the head of the descriptor memory.

When the DSIE bit in DMACHCR is set to 1, a DSE interrupt is generated every time transfer under the control of one stage of descriptor memory is complete. If a first DSE interrupt has not been processed when a further DSE interrupt is generated, the contents of the next stage of the descriptor memory are not read and the DMA transfer is aborted. Clearing the DSE bit only causes clearing of the first interrupt and reading of the next stage of the descriptor memory.

When the DSIE bit in DMACHCR is set to 0, after transfer under control of all stages of the descriptor memory is complete, the TE bit in DMACHCR is set to 1 and a TE interrupt is generated. If a TE interrupt has not been processed when a further interrupt is generated, the contents of the next stage of the descriptor memory are not read and the DMA transfer is aborted. Clearing the TE bit only causes clearing of the first interrupt and reading of the next stage of the descriptor memory.

To end operation in mode 2, change the mode to mode 1 by using the TE interrupt processing. When the mode is changed to mode 1, the DMA transfer is completed when the next TE interrupt is generated.

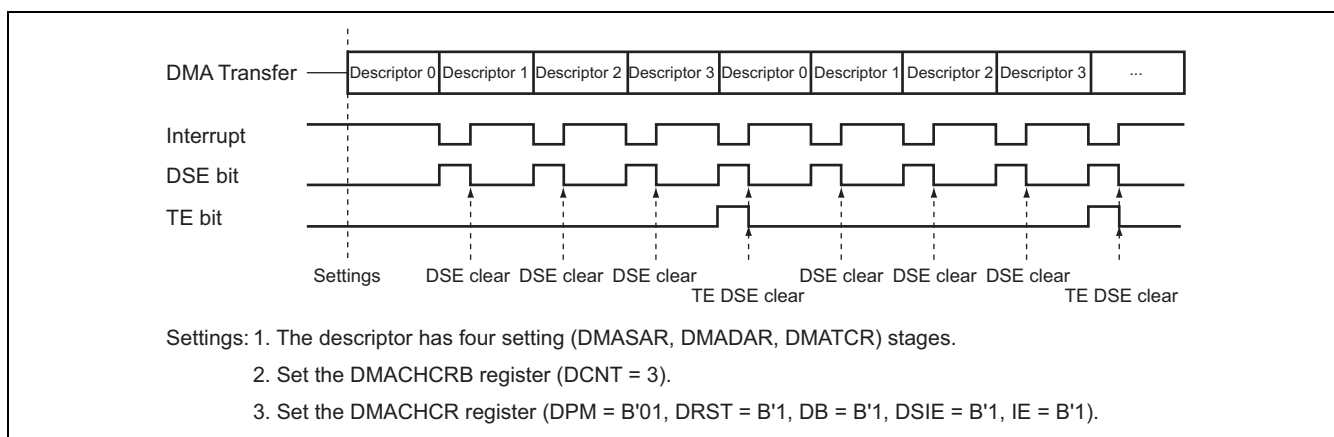

Figure 35.9 is an example of transfer when operating mode 2 is selected and the TE and DSE bits are set to 1.

Figure 35.10 is an example of transfer when there is a delay in processing of the DSE interrupt when operating mode 2 is selected and the TE and DSE bits are set to 1.

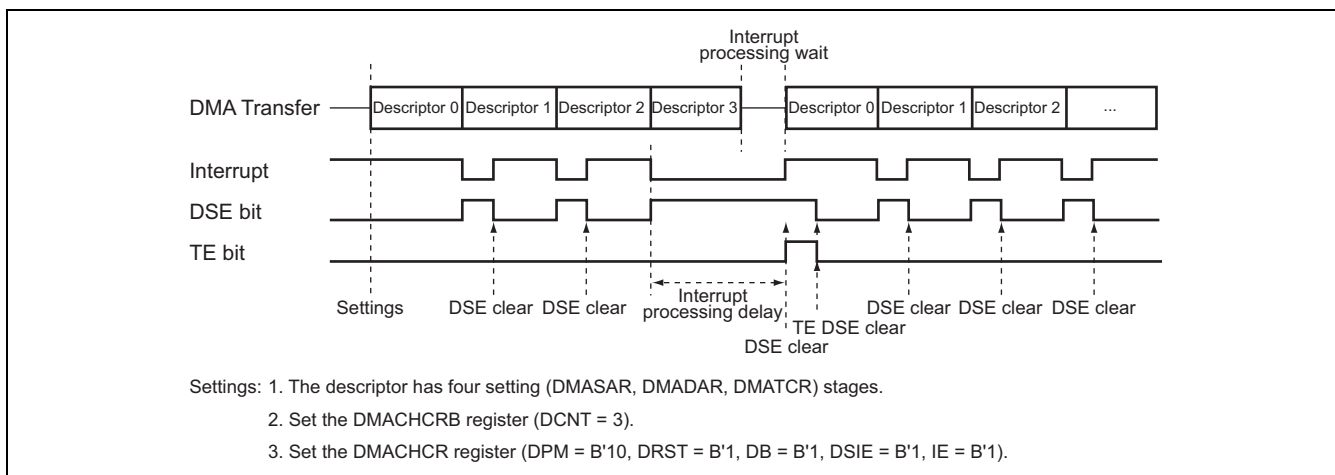

Figure 35.11 is an example of transfer when operating mode 2 is selected and the TE bit is set to 1.

Figure 35.12 is an example of transfer when there is a delay in processing of the DSE interrupt when operating mode 2 is selected and the TE is set to 1.

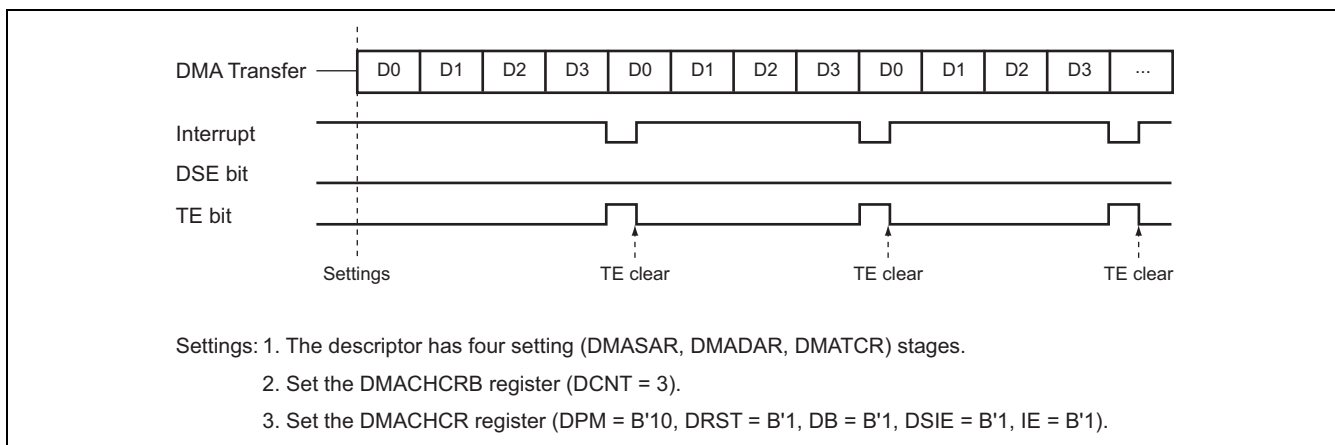

In each example, there are four descriptor stages.

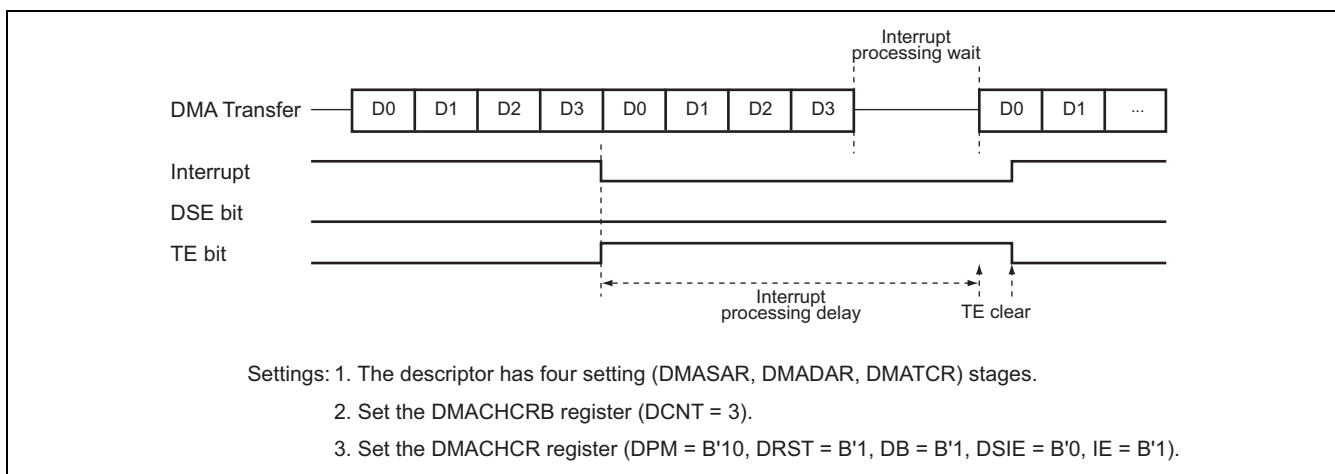

**Figure 35.9 Operating Mode 2 (Example 1)**

**Figure 35.10 Operating Mode 2 (Example 2)**

**Figure 35.11 Operating Mode 2 (Example 3)**

**Figure 35.12 Operating Mode 2 (Example 4)**

### (5) Operating Mode 3 of Descriptor Memory

Set the DPM bits in DMACHCR to B'11 to select operating mode 3 (infinite repeat mode). This mode allows consecutive transfer under control of the descriptor memory.

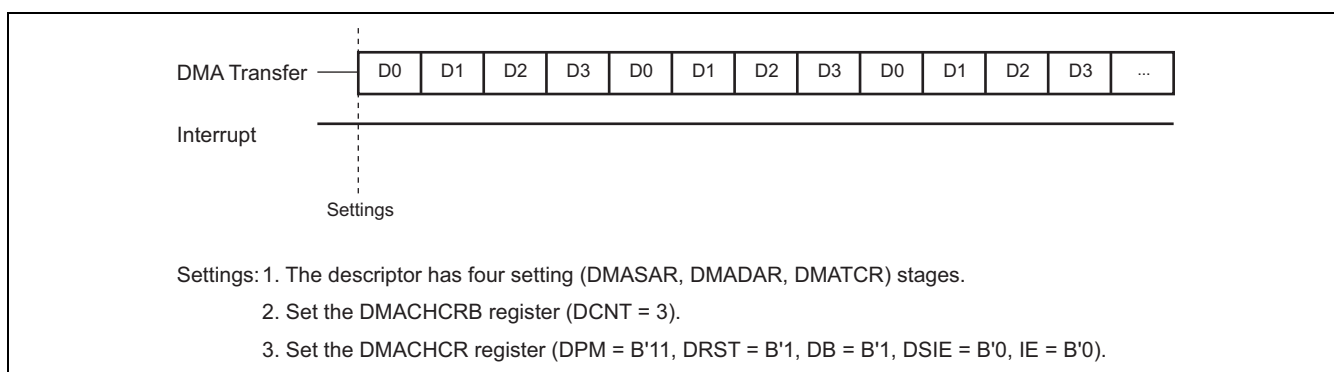

In this mode, after transfer under control of the number of stages of descriptor memory specified in the DCNT bits in DMACHCRB, the TE bit in DMACHCR is set to 1. This operation is then repeated from the head of the descriptor memory.

When the DSIE bit in DMACHCR is set to 1, a DSE interrupt is generated every time transfer under the control of one stage of descriptor memory is complete. Even if a first DSE interrupt has not been processed when a further DSE interrupt is generated, the DMA transfer is not aborted. Regardless of the number of DSE interrupts that have been generated, the DSE bit can be cleared by writing to it once. Similarly, even if a first TE interrupt has not been processed when a further TE interrupt is generated, the DMA transfer is not aborted. Regardless of the number of TE interrupts that have been generated, the TE bit can be cleared by writing to it once.

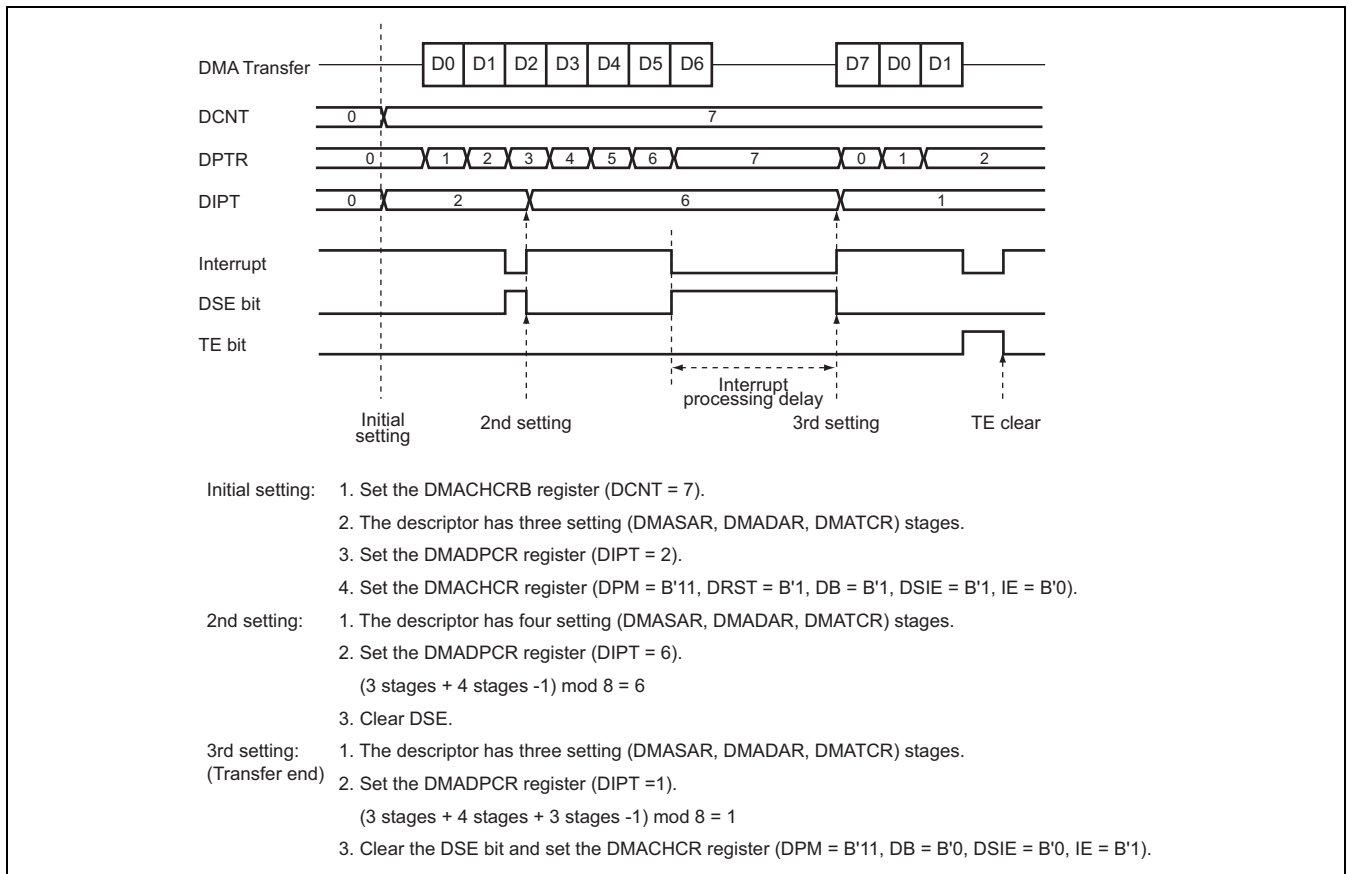

Figure 35.13 is an example of transfer when infinite repeat mode is selected.

Figure 35.14 is an example of transfer when read-out interrupt mode is selected.

In each example, there are four descriptor stages.

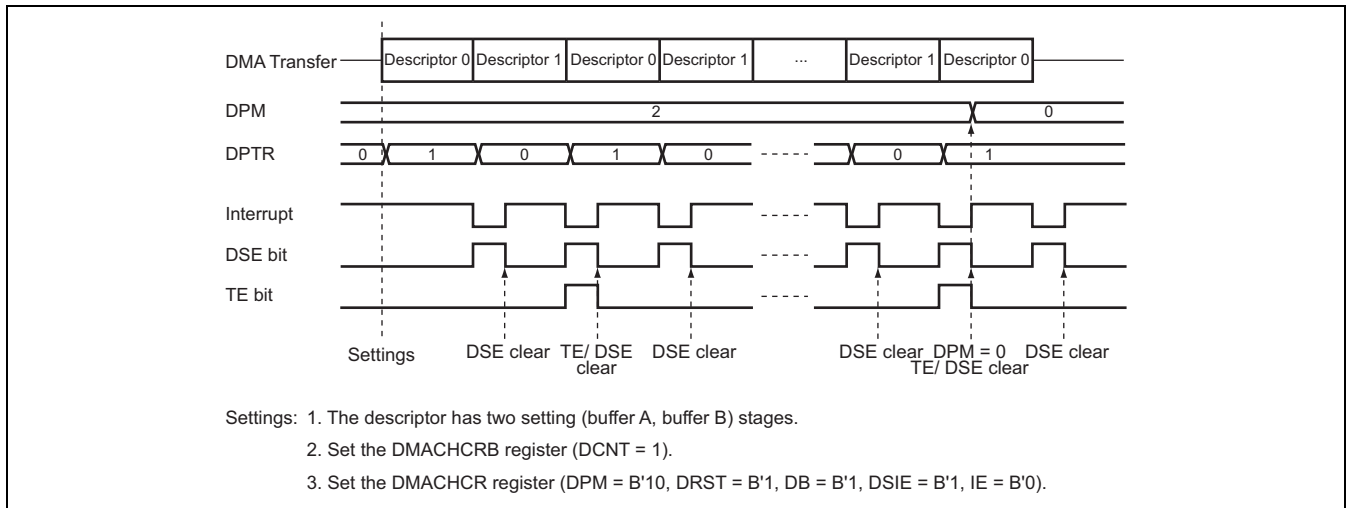

**Figure 35.13 Operating Mode 3 (Infinite Repeat Mode)**

**Figure 35.14 Operating Mode 3 (Read-Out Interrupt Mode)**

**(6) Using the Descriptor Memory for Double Buffering**

To use the descriptor memory for double buffering, set the number of stages of descriptor memory to 2, set the buffer configuration to the descriptor memory, and activate the memory in operating mode 2. The DSE interrupt is used in double buffering. To end the use of double buffering, disable the descriptor operating mode, which stops the transfer on completion of the transfer currently in progress.

**Figure 35.15 Using the Descriptor Memory for Double Buffering**

### 35.4.5 Transmission Flow

Set the transfer conditions as required in the following registers:

DMA source address register (DMASAR), DMA destination address register (DMADAR), DMA transfer count register (DMATCR), DMA Channel control register (DMACHCR), DMA operation register (DMAOR) and DMA extended resource selector (DMARS)

The DMAC then transmits data in the following order.

- A transfer request is generated and the controller checks whether the transfer is allowed (DE = 1, DME = 1, TE = 0, DSE = 0, CAE = 0). When a channel is in the auto request mode, the transfer starts automatically.
- The controller checks whether updating from the descriptor memory is required.  
Updating from the descriptor memory proceeds when the DPB bit in DMACHCR is set to 1 or the descriptor memory is enabled, if DMATCR is set to 0.  
For updating by using the descriptor memory, see section 35.4.4, Descriptor Memory.
- Check whether address translation by the IPMMU is required.  
Address translation by the IPMMU proceeds if the address exceeds the effective size for address translation when the DE bit in DMACHCR is enabled and updating of transfer settings from the descriptor memory is executed.
- Each time a transfer request is generated, the amount of data for a single round of transfer (specified by the TS[3:0] bits) is transmitted. The value in DMATCR is decremented by 1 every time the DMA transfer is completed.
- When the specified number of rounds of transfer are completed (the value in DMATCR is set to 0), the transfer ends normally. A TE interrupt is generated for the CPU upon the end of the transfer if the IE bit in DMACHCR is set to 1. If the descriptor memory is enabled, the processing differs with the mode of the descriptor memory. For more details, see section 35.4.4, Descriptor Memory.
- Transfer is aborted when the DMAC encounters an address error. Transfer is also aborted when the DE bit in DMACHCR or the DME bit in DMAOR is set to 0.

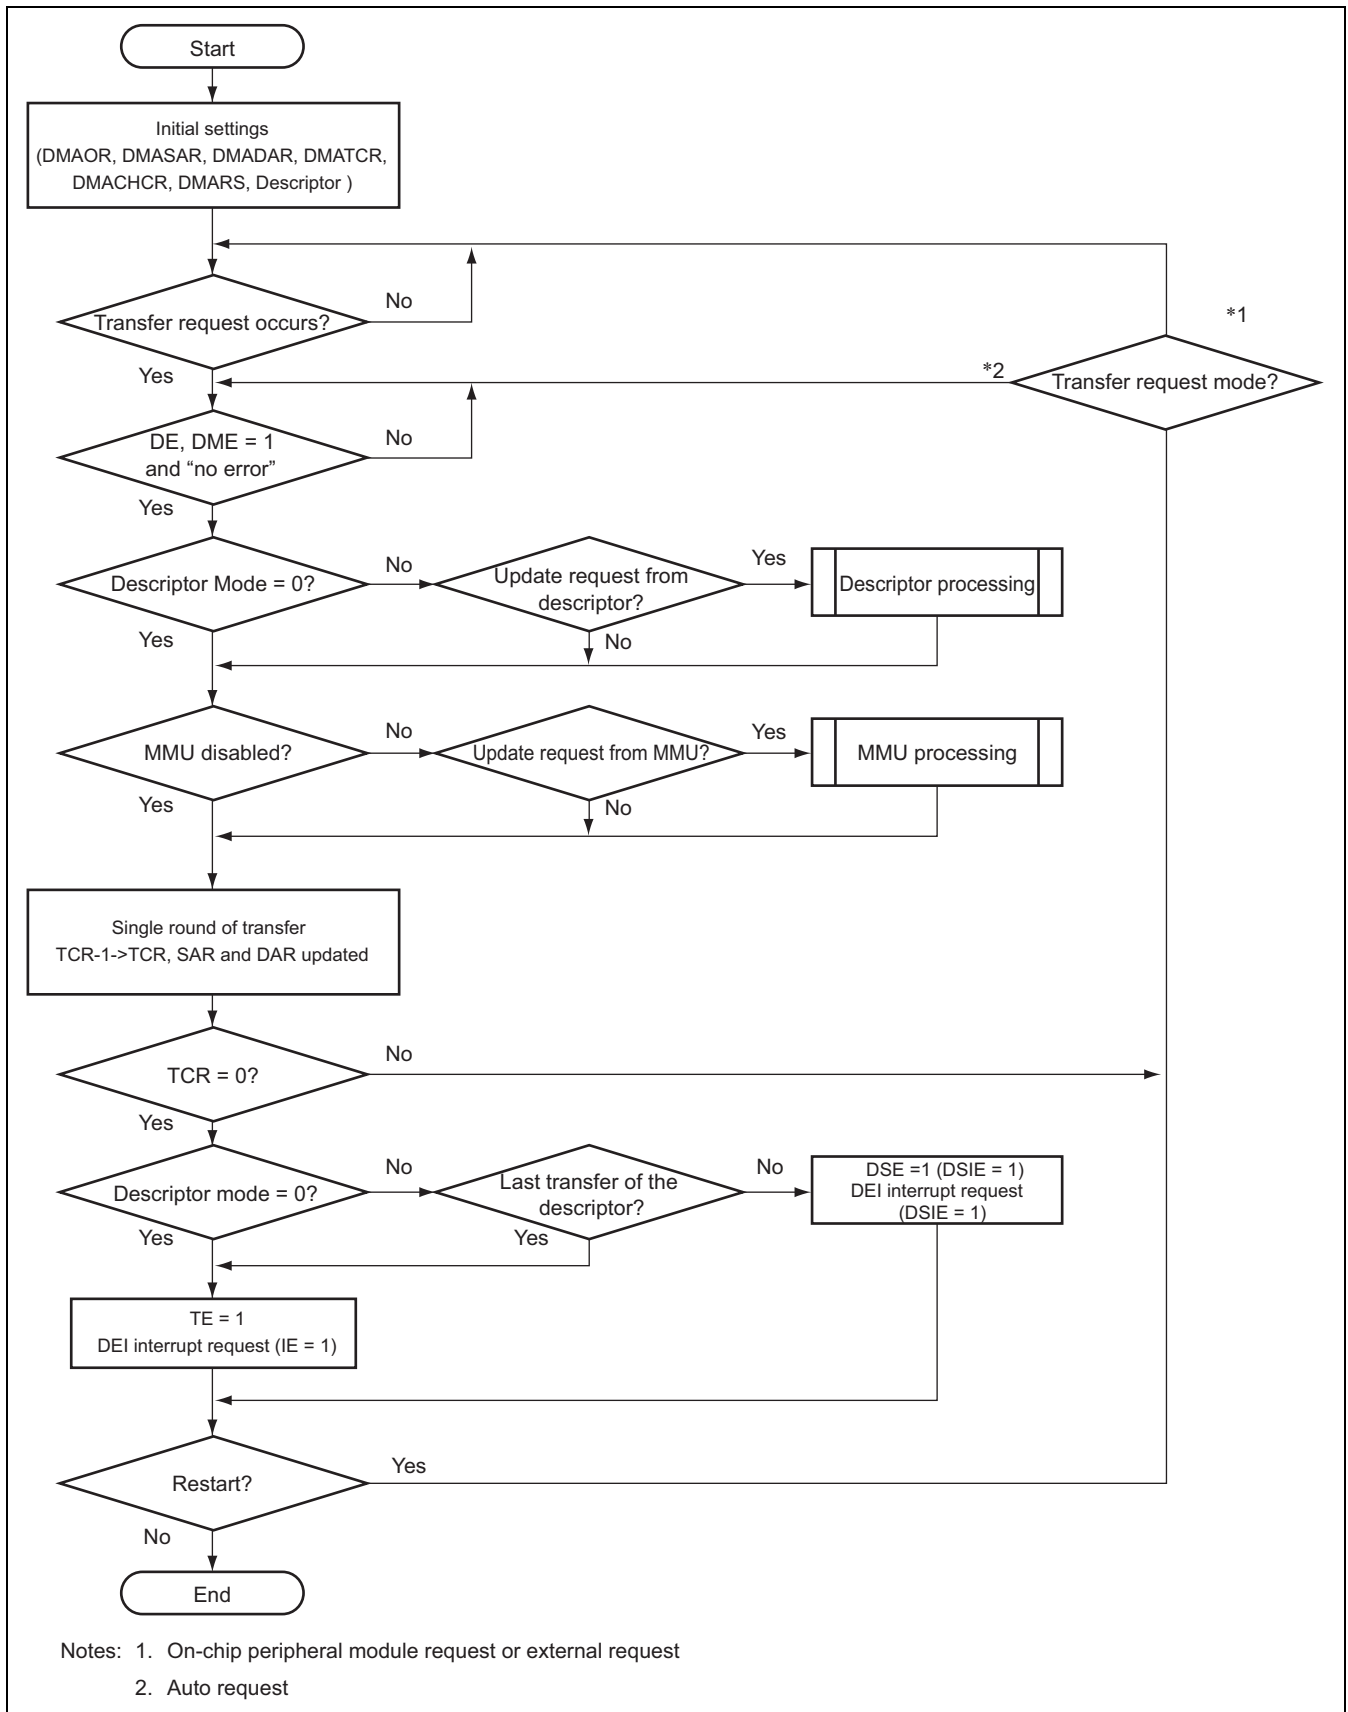

Figure 35.16 Transmission Flow

### 35.4.6 Total Size Transmission

The amount of data for total size transmission can be set in DMATSR (in bytes), and this setting is effective regardless of the size specified in the TS bits in DMACHCR. Thereby, the desired size can be transmitted in a single round of DMA transfer.

To use this function, make the settings for total size transmission in DMASAR, DMADAR, DMATSR, DMATSRB and DMACHCR.

Total size is set in the TCR (TSR) field of descriptors and 1 is set in DMACHCRB.DTS when total size transmission and descriptors are in use.

## 35.5 Usage Notes

RZ/G1H

RZ/G1N

RZ/G1M

RZ/G1E

Pay attention to the following notes when using the audio-DMAC.

### (1) DMA Transfer for Peripheral Modules

When executing DMA transfer for an on-chip peripheral module, set addresses on the appropriate boundary (in terms of the amount of data for each round of transfer) for the transfer source and destination addresses. Otherwise, an address error may occur.

### (2) Module Stop

While the audio-DMAC is operating, the module stop register (MSTPCR5) should not be set to stop the audio-DMAC. If the audio-DMAC is stopped in this way, results of the transfer that was in progress cannot be guaranteed.

### (3) Address Error

When a DMA address error is generated, reset the registers of the channel on which the error has occurred and then start transfer anew.

### (4) Aborting DMA Transfer

To abort a DMA transfer, disable the interrupt signal and set the DE bit in the DMA channel control register (DMACHCR) to 0 to disable the DMA transfer. If the TE and DSE bits are set when DMA transfer is aborted, these bits should be initialized. There is a possibility that TE and DSE will not be set with synchronized timing after transmission, so it's necessary to recognize the following three possibilities and take measures accordingly.

1. The DSE and TE bits are set to 1 before initialization of DMACHCR, but after the interrupt was disabled.  
The TE and DSE bits are initialized within the DMA transfer initialization sequence.
2. The DSE and TE bits are set to 1 and the controller fails to abort the transfer, after the interrupt was disabled.  
When the DE bit has become 0 after DMA transfer initialization, check the TE and DSE bits. If the TE or DSE bit is 1, go through the DMA transfer initialization process.
3. The TE and DSE bits are not cleared to 0 but the transfer is aborted, after the interrupt is disabled.  
The TE or DSE bits are not set because data for transfer still remain after transfer is aborted.

Note: Initialization of DMA transfer during execution of the last transfer leads to a delay in setting of the TE and DSE bits, so include a dummy read.

Figure 35.17 shows an example of processing to abort DMA transfer.

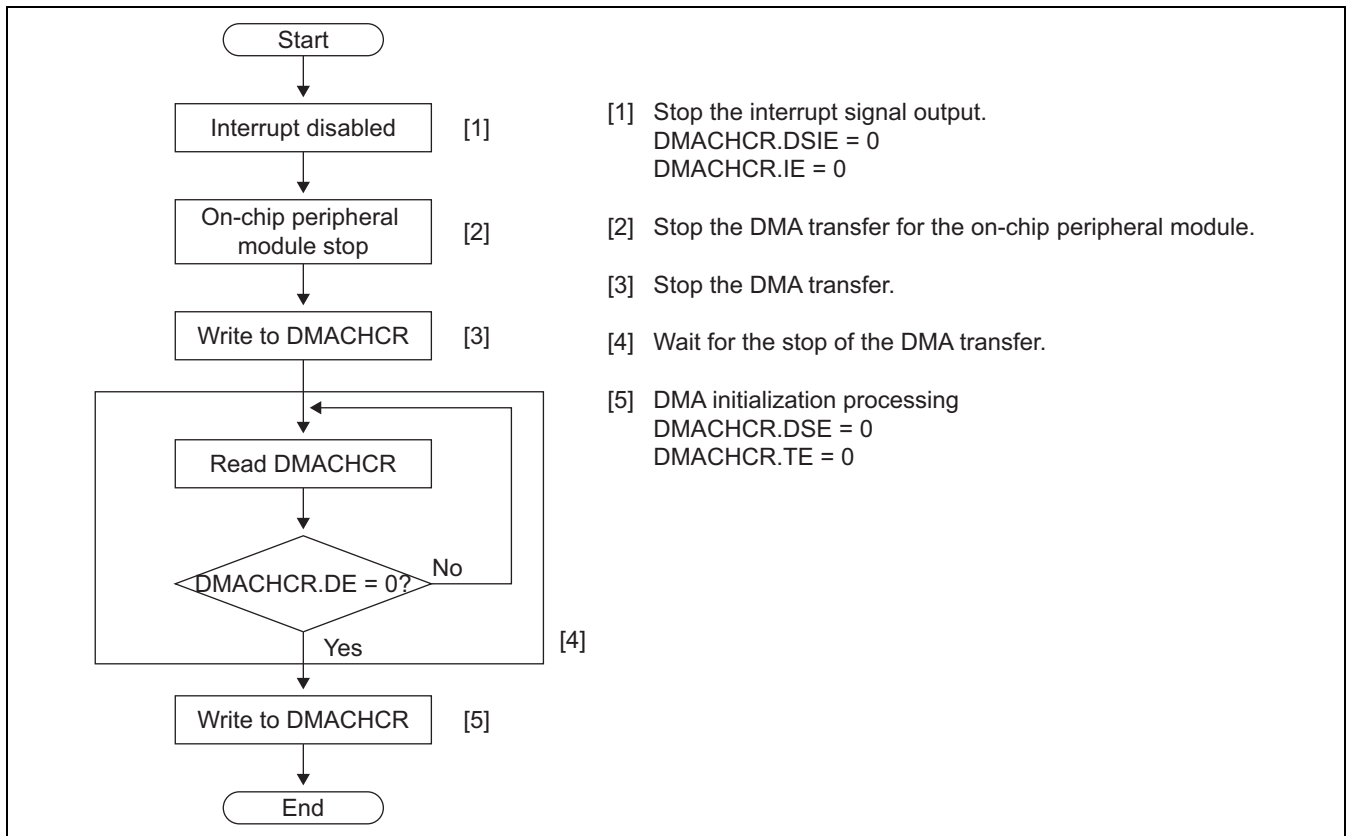

Figure 35.17 Example of Processing to Abort DMA Transfer

### (5) Descriptor Transfer

When using the descriptor transfer in cases where both conditions 1) and 2) apply, an incorrect DMA transfer proceeds before the correct transfer starts.

- Conditions

- The timing of the start of transfer is specified as being after the descriptor information is loaded, i.e. DPB = 1.  
Audio-DMAC: DMACHCR\_n.DPB = 1 (refer to the description of bit 22 in section 35.3.17)
- Address translation by the uTLB is enabled.

- Problem

When both conditions 1) and 2) apply, an incorrect DMA read transfer to the address formerly stored in DAR proceeds after DMA is enabled (DE = 1). Furthermore, if the address is undefined in the IPMMU, the DMA transfer may stop and operation of the DMAC may hang up without any indication of the error.

[Workarounds]

- Use the descriptor transfer with DPB = 0.
- Use the descriptor transfer with DPB = 1 and address translation by the uTLB disabled.
- When using the descriptor transfer with DBP = 1 and address translation by the uTLB enabled, write the same destination address as the first address in the descriptor to the corresponding DAR before enabling DMA (DE = 1). While the incorrect DMA read transfer still proceeds, the descriptor transfer is executed correctly as long as the address written to the corresponding DAR is a defined address.

## 36. Audio DMAC-Peripheral-Peripheral

RZ/G1H	RZ/G1N
RZ/G1M	RZ/G1E

### 36.1 Overview

The Audio DMAC-Peripheral-Peripheral module controls data transfer between the audio modules connected to the audio local bus.

#### 36.1.1 Features

- Number of channels: 29 channels
- Data transfer size: Longwords (4 bytes)
- Addressing mode: Dual addressing; fixed access size
- Transfer count: Not programmable
- Interrupt processing: None

#### 36.1.2 Block Diagram

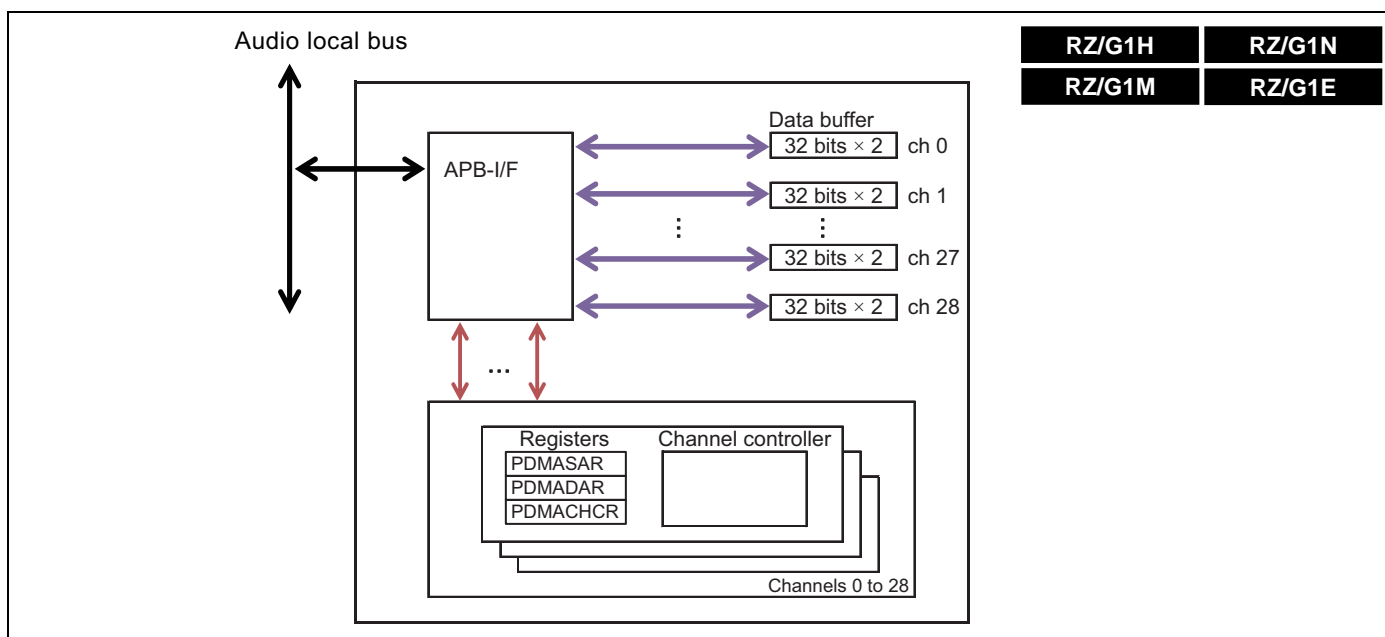

Figure 36.1 Block Diagram

#### 36.1.3 Input/Output Pins

No external pins are provided.

### 36.1.4 Register Configuration

**Table 36.1 List of Registers**

Register Name	Abbreviation	Access Type	Initial Value	Address	Access Size	RZ/G Series Products			
						RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
PDMA source address register	PDMASAR	R/W	H'0000_0000	H'EC740020 + H'10 × [n]	32	√	√	√	√
PDMA destination address register	PDMADAR	R/W	H'0000_0000	H'EC740024 + H'10 × [n]	32	√	√	√	√
PDMA channel control register	PDMACHCR	R/W	H'0000_0000	H'EC74002C + H'10 × [n]	32	√	√	√	√

- Notes:
1. n indicates the DMAC channel number (n = 0 to 28).
  2. Access the listed registers from the CPU in longword (32-bit) units; byte or word access is prohibited.
  3. Do not write to any addresses other than listed above. Operations cannot be guaranteed if writing is attempted. Values read from addresses other than those listed above are undefined.

## 36.2 Register Description

### [Legend]

Initial value: Register value after a reset

—: Undefined value

R/W: Readable/writable. The written value can be read.

R/WC1: Readable/writable. Writing 1 initializes the bit, and writing 0 is ignored.

R: Read-only. The write value should always be 0.

—/W: Write-only. The read value is undefined.

### 36.2.1 PDMA Source Address Register (PDMASAR)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

**Function:** Sets the DMA transfer source address.

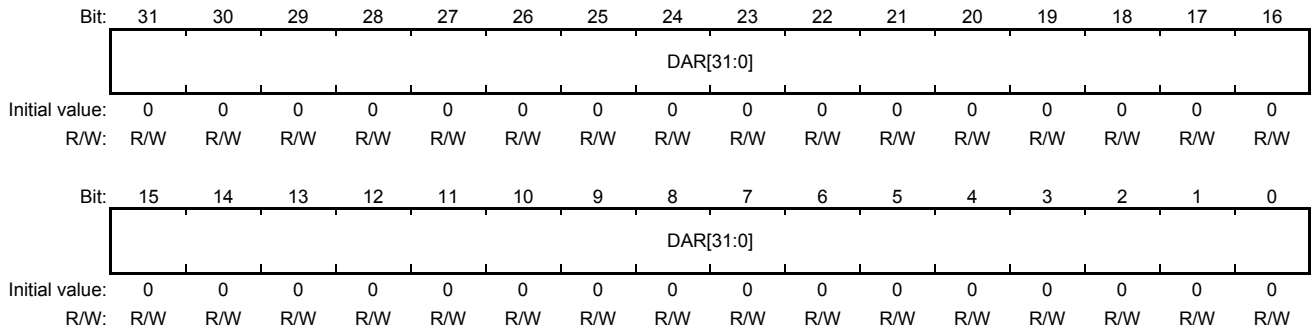

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SAR	All 0	R/W	Sets the DMA transfer source address.

**36.2.2 PDMA Destination Address Register (PDMADAR)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Function: Sets the DMA transfer destination address.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DAR	All 0	R/W	Sets the DMA transfer destination address.

### 36.2.3 PDMA Channel Control Register (PDMACHCR)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

**Function:** Selects the request sources of DMA transfer source and destination, and also starts or stops DMA.

Bit	Bit Name	Initial Value	R/W	Description
-----	----------	---------------	-----	-------------

31 — 0 R Reserved  
This bit is always read as 0. The write value should always be 0.

30 to 24 SRS H'00 R/W Transfer Source Request Source Select  
(setting H'00 to H'38 and the values with — are prohibited)

### 36.3.2 Setting Flow

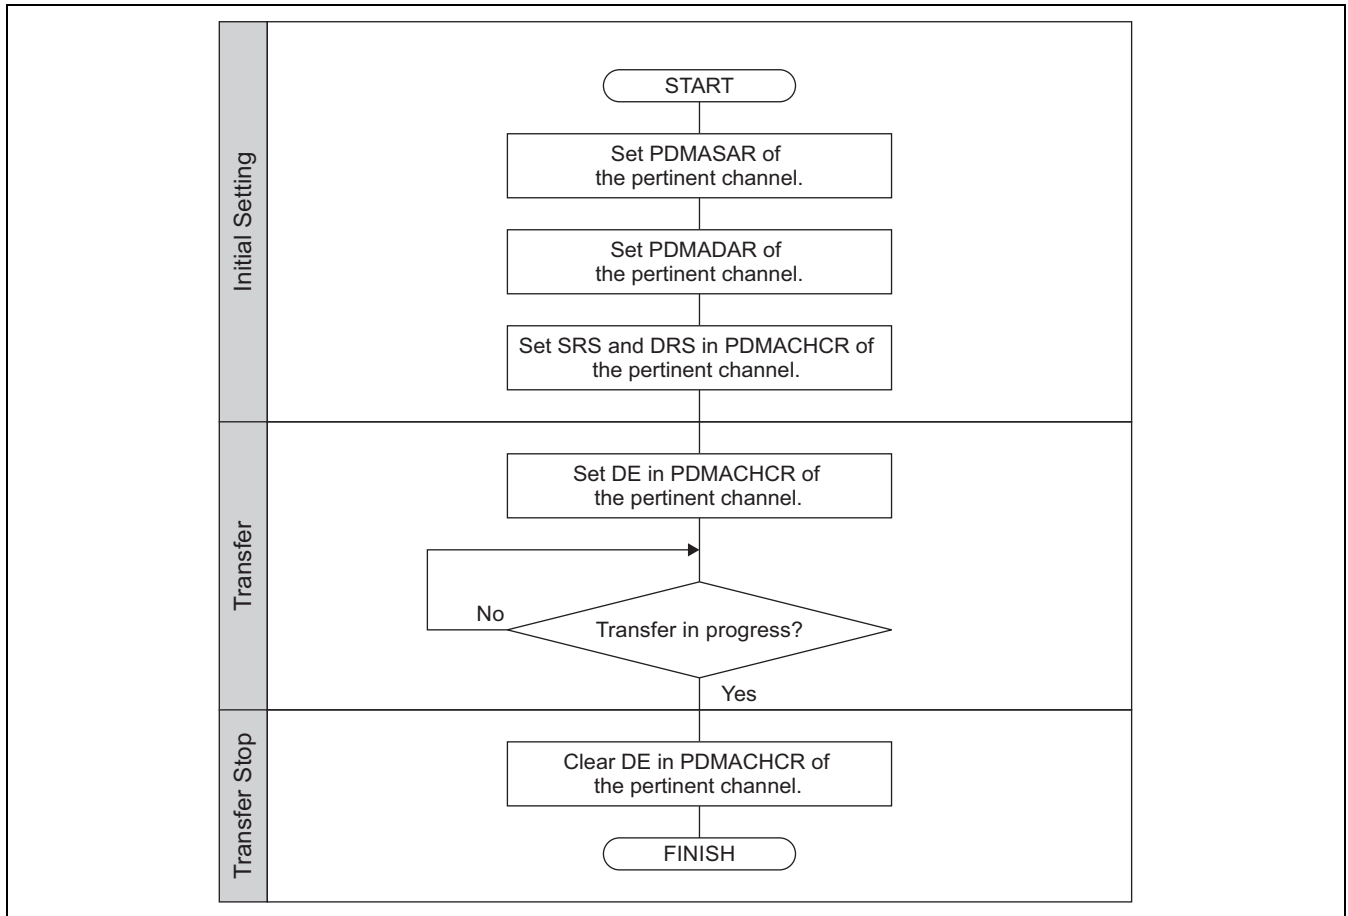

Figure 36.2 Setting Flow

# 37. Ethernet MAC Controller (Ether)

RZ/G1H	RZ/G1N
RZ/G1M	RZ/G1E

## 37.1 Overview

The Ether is a control unit which incorporates a function core conforming to the IEEE802.3u MAC (media access control) layer standard.

### 37.1.1 Features

- IEEE802.3u MAC (Ether) function
- Transmits and receives data frames
- Supports transfer at 10 and 100 Mbps
- Conforms to IEEE802.3u
- Reduced media independent interface (RMII)
- Magic packet detection
- Flow control conforming to IEEE802.3x or back pressure system
- On-chip DMA controller

Figure 37.1 shows a block diagram of the Ether. Table 37.1 lists the functions of each block.

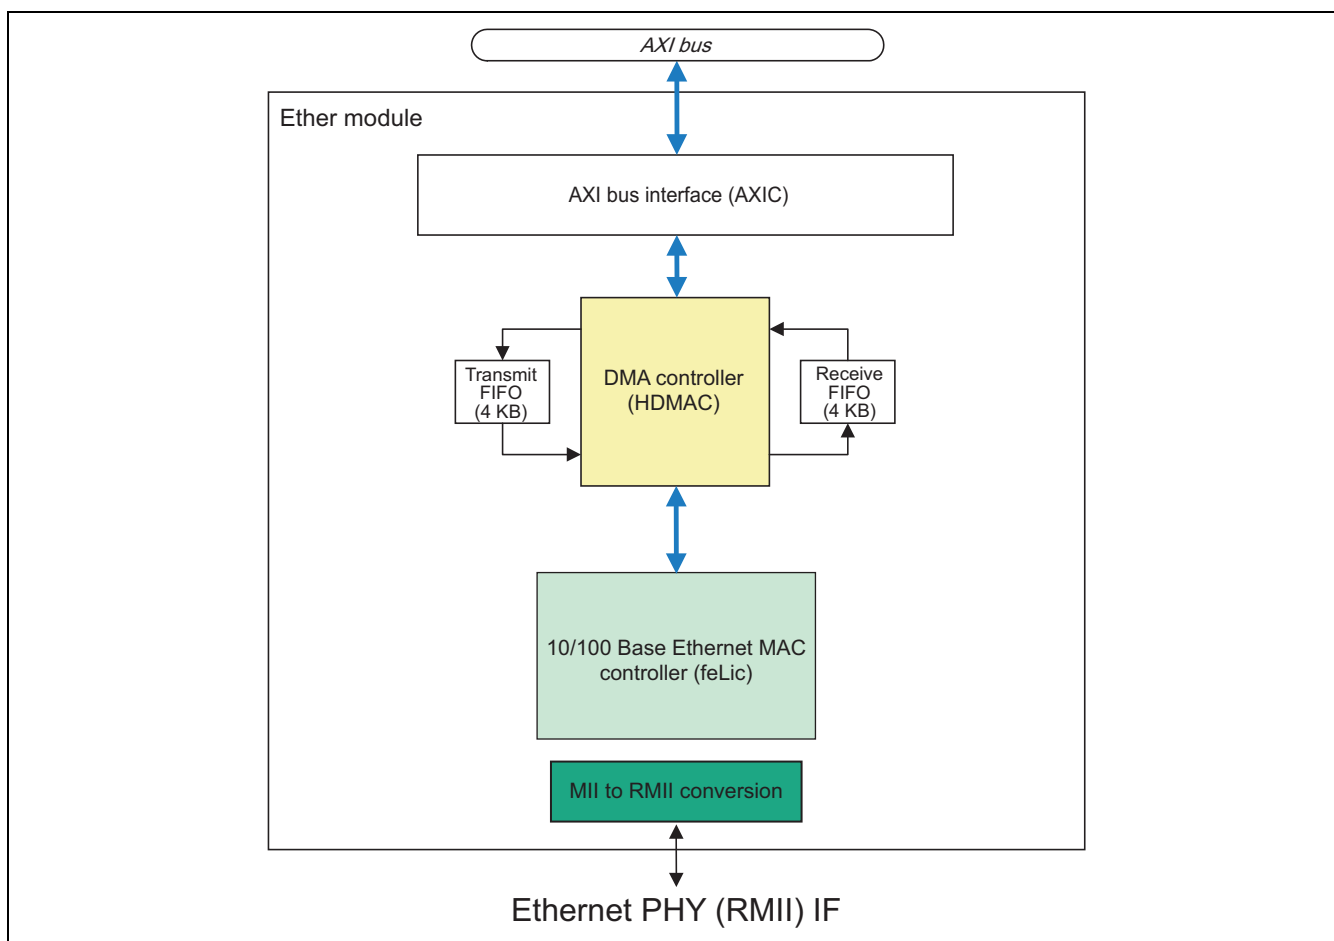

Figure 37.1 Block Diagram of Ether

**Table 37.1 Functions of Each Block**

<b>Block</b>	<b>Function</b>
AXI bus interface (AXIC)	<ul style="list-style-type: none"> <li>• Controls AXI bus interface.</li> </ul>
DMA controller (HDMAC)	<ul style="list-style-type: none"> <li>• DMA transfer of data transmitted from and received in the 10/100 Base Ethernet MAC controller between the transmit/receive buffer on memory and internal FIFOs For details, see section 37.8, HDMAC Function Specifications.</li> </ul>
10/100 Base Ethernet MAC controller (feLic)	<ul style="list-style-type: none"> <li>• Conforms to the IEEE802.3u MAC layer standard.</li> <li>• Transmits and receives data frames.</li> <li>• Supports transfer at 10/100 Mbps.</li> <li>• Magic packet detection</li> <li>• Flow control conforming to IEEE802.3x or back pressure system For details, see section 37.9, feLic Function Specifications.</li> </ul>
MII to RMI conversion	<ul style="list-style-type: none"> <li>• MII to RMI interface conversion</li> </ul>
Transmit/receive FIFO (TFIFO/RFIFO)	<ul style="list-style-type: none"> <li>• Transmit/receive FIFO for DMA controller Transmit FIFO depth: 4 Kbytes Receive FIFO depth: 4 Kbytes</li> </ul>

## 37.2 Input/Output Pins

Table 37.2 lists the external pin functions.

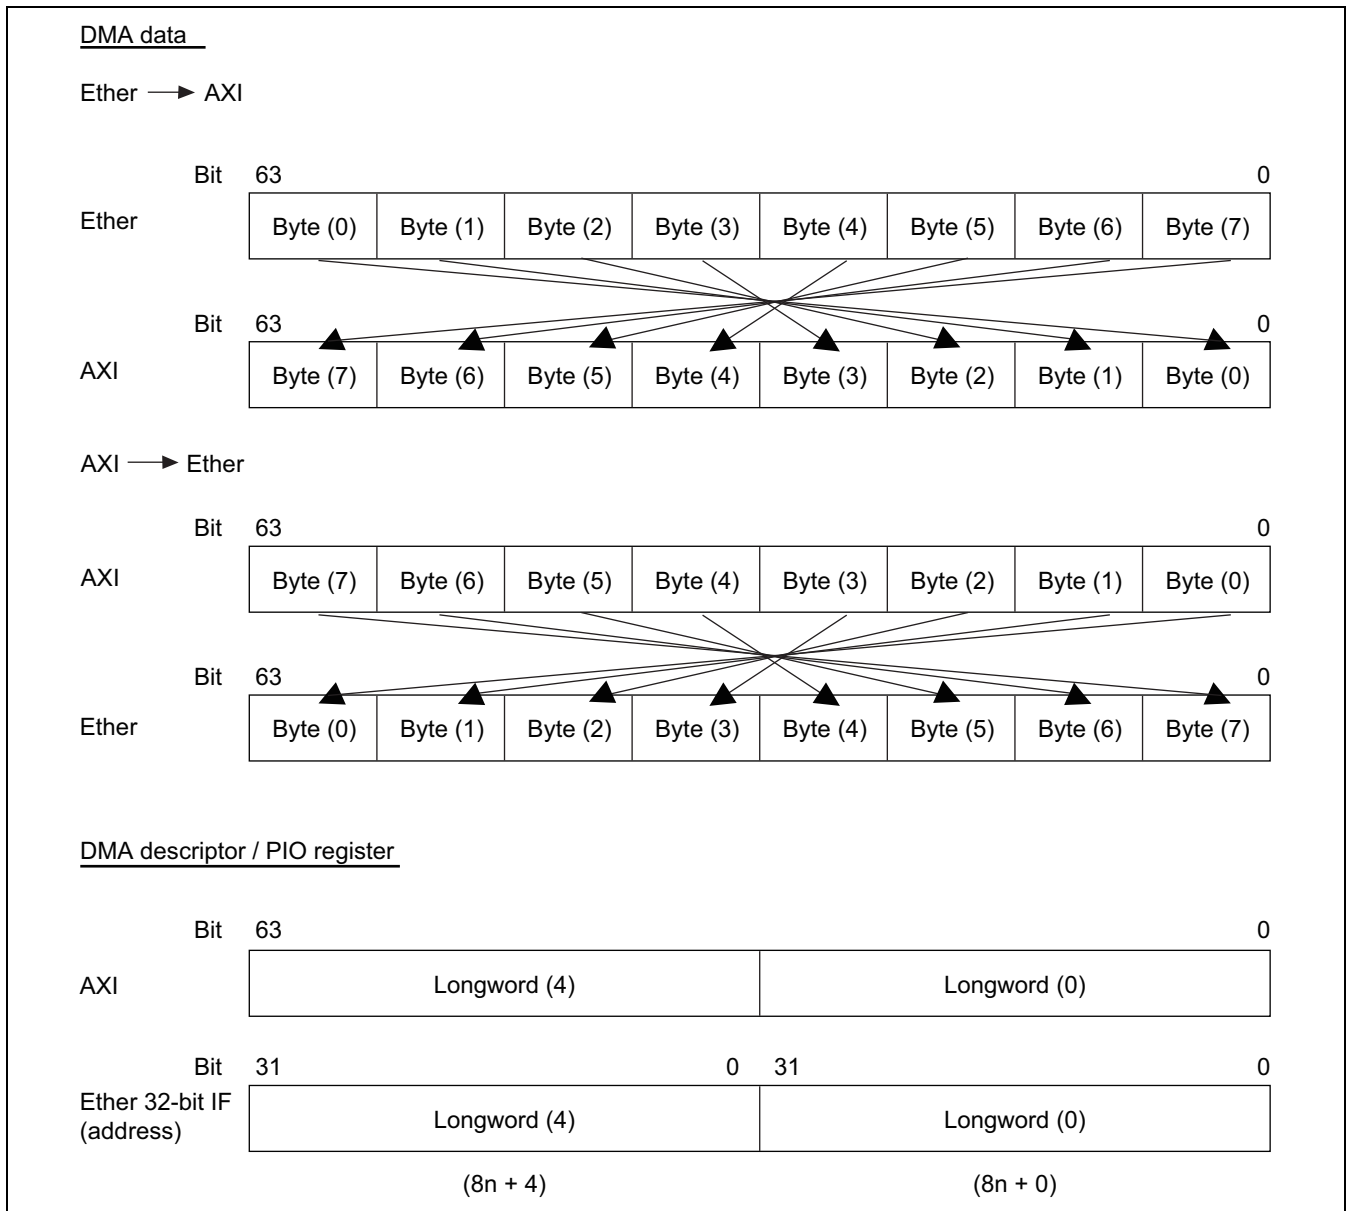

**Table 37.2 External Pin Function**

Pin Name	I/O	Function	RZ/G Series Products			
			RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
ETH_REF_CLK	Input	Reference input clock	√	√	√	√

### 37.3 Endian

<b>RZ/G1H</b>	<b>RZ/G1N</b>
<b>RZ/G1M</b>	<b>RZ/G1E</b>

The Ether has a 32-bit interface. Figure 37.2 shows data arrangement. The Ether allows endian conversion for DMA data through the setting of the CXR0 register of the HDMAC.

**Figure 37.2 Data Arrangement**

## 37.4 Register Descriptions

### (1) Notes on Register Access

To access the registers, the following restrictions and notes should be obeyed.

1. For the register bits not defined implicitly in this specifications document, the write value should always be 0, and the read value should always be handled as undefined.
2. Even when there are no restrictions on writing to each register, the undefined bits should be written to as described in the above restriction.
3. Each register is a 32-bit long and should be accessed in 32-bit units. Accordingly, any register cannot be partially read from or written to.

### (2) Register Configuration

Table 37.3 shows the configuration of HDMAC registers. Table 37.4 shows the configuration of feLic registers.

**Table 37.3 HDMAC Register Configuration**

Name	Abbreviation	R/W	Address	Access Size	Initial Value	RZ/G Series Products

### 37.4.1 HDMAC Operating Mode Setting Register (CXR0)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

CXR0 is used for specifying the operating mode of the HDMAC.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	DE	DL1	DL0	—	—	—	SWR
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value*	R/W	Description
31 to 7	—	All 0	R	Reserved
6	DE	0	R/W	DMA Data Endian Conversion 0: Does not perform endian conversion for DMA data. 1: Performs endian conversion for DMA data. Endian conversion for descriptors and registers is not performed. Note: Be sure to set this bit to 1 before operating the Ethernet MAC controller (Ether).
5, 4	DL1 and DL0	00	R/W	Transmit/Receive Descriptor Length Setting    Descriptor length 00:        16 bytes 01:        32 bytes 10:        64 bytes 11:        Reserved
3 to 1	—	All 0	R	Reserved
0	SWR	0	R/W	HDMAC/feLic Software Reset Writing 1 resets the HDMAC/feLic module except for CXR3, CXR4, CXR8, CXR13 and CXR14. Note: Registers should not be accessed until 64 clock cycles have elapsed after the SWR bit is set to 1. When writing to registers (except for the SWR bit), the transmitting and receiving function should be disabled.

Note: \* This register is initialized by an HDMAC/feLic software reset.

### 37.4.2 Transmit Activation Register (CXR1)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

CXR1 initiates transmission by the HDMAC.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TRNS
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value*	R/W	Description
31 to 1	—	All 0	R	Reserved
0	TRNS	0	R/W	Transmit Activation If 1 is written to this bit, the HDMAC accesses the transmit descriptor ring and transmits frames for all the valid descriptors. This bit is automatically cleared when transmission of all the valid frames has been completed, or the transmit descriptor depletion occurs. Note: Writing 0 is disabled.

Note: \* This register is initialized by an HDMAC/feLic software reset.

**37.4.3 Receive Activation Register (CXR2)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

CXR2 initiates reception by the HDMAC.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	R
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value*	R/W	Description
31 to 1	—	All 0	R	Reserved
0	R	0	R/W	<p>Receive Ready</p> <p>If 1 is written to this bit, the HDMAC accesses the receive descriptor ring and enters the receive wait state. For operation of this bit after completion of reception, which depends on the CXR11 settings, see section 37.4.12, Receive Activation Reset Method Setting Register (CXR11).</p> <p>If 0 is written to this bit, the HDMAC completes reception of the frame being processed, and then disables the receiving function.</p> <p>This bit is reset to 0 when the RACT bit of the fetched descriptor is 0 (when the receive descriptor depletion occurs).</p>

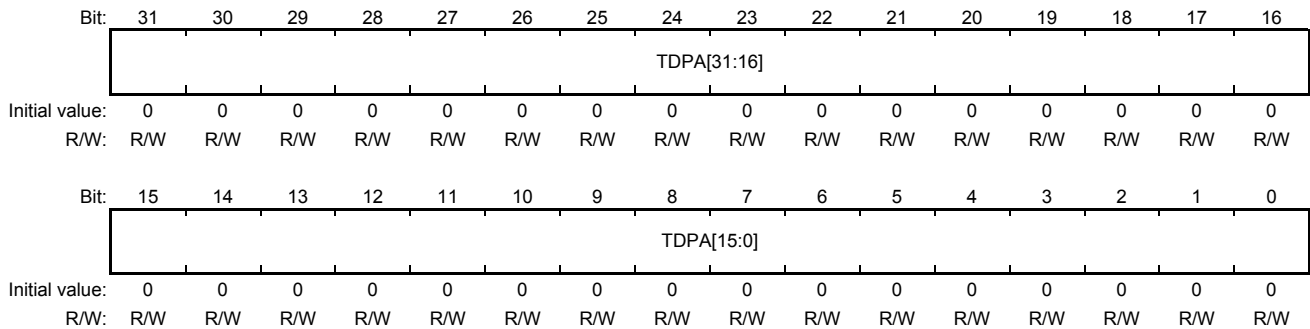

Note: \* This register is initialized by an HDMAC/feLic software reset.

### 37.4.4 Transmit Descriptor Start Address Setting Register (CXR3)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

CXR3 specifies the start address of the transmit descriptor ring. The start address of the descriptor ring should be aligned to the boundary consistent with the descriptor length specified by the DL bits in CXR0.

Writing to CXR3 should be performed before transmission is started. Writing to CXR3 after transmission has been started is prohibited and operation according to the written value cannot be guaranteed.

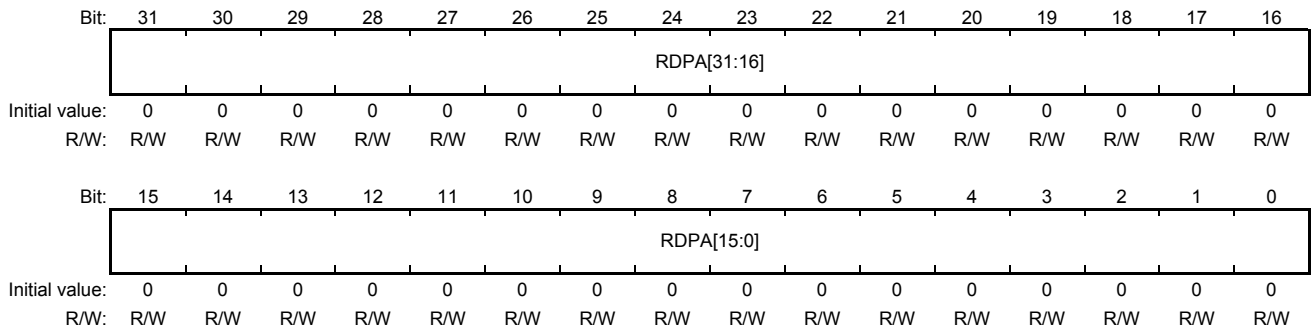

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	TDPA [31:0]	All 0	R/W	Transmit Descriptor Start Address Bits 3 to 0 should be set to 0 for alignment of the descriptor. Note: A value other than 0 must not be set to bits 3 to 0. Writing is prohibited after transmission has been started.

### 37.4.5 Receive Descriptor Start Address Setting Register (CXR4)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

CXR4 specifies the start address of the receive descriptor ring. The start address of the descriptor ring should be aligned to the boundary consistent with the descriptor length specified by the DL bits in CXR0.

Writing to CXR4 should be performed before reception is started. Writing to CXR4 after reception has been started is prohibited and operation according to the written value cannot be guaranteed.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	RDPA [31:0]	All 0	R/W	Transmit Descriptor Start Address Bits 3 to 0 should be set to 0 for alignment of the descriptor. Note: A value other than 0 must not be set to bits 3 to 0. Writing is prohibited after transmission has been started.

### 37.4.6 Status Register (CX5)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

CX5 is a register that indicates HDMAC interrupt sources.

The status sources are output to the INTC module by a signal of each source.

Each bit is cleared by writing 1 to the corresponding bit. The MINT bit is set to 0 by clearing CX21. Generation of interrupts can be masked by the corresponding bits in CX6.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	TWB	BINT	AIN	LKON	TABT	RABT	RFRMER	BER	MINT	FTC	TDE	TFE	FRC	RDE	RFE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TINT8	TINT7	TINT6	TINT5	TINT4	TINT3	TINT2	TINT1	RINT8	RINT7	RINT6	RINT5	RINT4	RINT3	RINT2	RINT1
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1

Bit	Bit Name	Initial Value*2	R/W	Description
31	—	0	R	Reserved
30	TWB	0	R/W*1	Indicates that write-back to the transmit descriptor whose TWBI bit is set has been performed. The interrupt can be generated every frame by so setting CX18. <Interrupt source>
29	BINT	0	R/W*1	Not used.
28	AIN	0	R/W*1	Not used.
27	LKON	0	R/W*1	Not used.
26	TABT	0	R/W*1	Transmit Abort Detect <Interrupt source>
25	RABT	0	R/W*1	Receive Abort Detect <Interrupt source>
24	RFRMER	0	R/W*1	Receive Frame Count Overflow Occurrence <Interrupt source>
23	BER	0	R/W*1	Indicates that a DMA error is input.
22	MINT	0	R	M Port Interrupt Occurrence <Interrupt source> Indicates that an interrupt signal from the feLic is asserted.
21	FTC	0	R/W*1	Frame Transmit Completion <Interrupt source> Indicates that transmission of all the frames specified by the transmit descriptor has been completed. This bit is not set for each frame.
20	TDE	0	R/W*1	Not used.
19	TFE	0	R/W*1	Transmit FIFO Underflow Error Occurrence <Interrupt source> Indicates that the transmit FIFO becomes empty during frame transmission.

Bit	Bit Name	Initial Value*2	R/W	Description
18	FRC	0	R/W*1	Frame Receive Completion <Interrupt source> Indicates that the receive descriptor is updated by frame reception. This bit is set when reception of one frame has been completed regardless of the setting of the RR bit in CXR11.
17	RDE	0	R/W*1	Receive Descriptor Depletion <Interrupt source> Indicates that the fetched receive descriptor is invalid. Occurrence of this source resets the R bit in CXR2 to 0.
16	RFE	0	R/W*1	Receive FIFO Overflow Error Occurrence <Interrupt source>
15 to 8	TINT8 to TINT1	All 0	R/W*1	Transmit Port Interrupt
7 to 0	RINT8 to RINT1	All 0	R/W*1	Receive Port Interrupt

- Notes: 1. These bits are cleared by writing 1 to the corresponding bits. Writing 0 has no meaning.  
2. This register is initialized by an HDMAC/feLic software reset.

### 37.4.7 Interrupt Mask Setting Register (CXR6)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

CXR6 is a register that masks the interrupts indicated by CXR5.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	TWB	BINT	AINT	LKON	TABT	RABT	RFRMER	BER	MINT	FTC	TDE	TFE	FRC	RDE	RFE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

20	TDE	0	R/W	
19	TFE	0	R/W	
18	FRC	0	R/W	
17	RDE	0	R/W	
16	RFE	0	R/W	
15 to 8	TINT8 to TINT1	All 0	R/W	
7 to 0	RINT8 to RINT0	All 0	R/W	

Note: \* This register is initialized by an HDMAC/feLic software reset.

### 37.4.8 Error Mask Setting Register (CX7)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

CX7 is a register that specifies whether or not to allow the status of the descriptor information (indicated by the RFS7 bit in RD0) to be reflected in the RFE bit in the receive descriptor 0 (RD0) as a summary.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	RINT8	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R

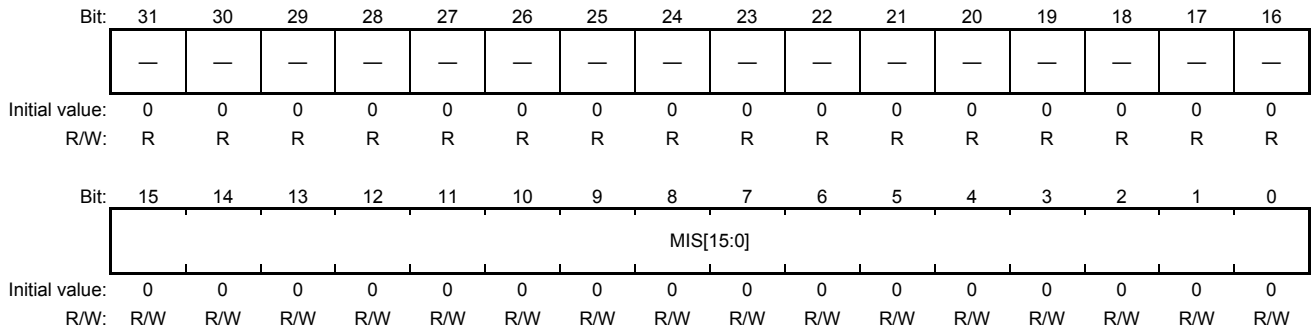

Bit	Bit Name	Initial Value*	R/W	Description
31 to 8	—	All 0	R	Reserved
7	RINT8	All 0	R/W	Receive Descriptor Error Flag (RFE) Mask 0: Allows RINT8 (RFS7 bit in RD0) to be reflected in RFE. 1: Does not allow RINT8 (RFS7 bit in RD0) to be reflected in RFE.
6 to 0	—	All 0	R	Reserved

Note: \* This register is initialized by an HDMAC/feLic software reset.

**37.4.9 Discarded Frame Counter Register (CXR8)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

CXR8 is a register that indicates the number of discarded frames.

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved
15 to 0	MIS[15:0]	H'0000	R/W	Discarded Frame Counter These bits indicate the number of frames which are discarded because the receive descriptor is disabled, for example. The counter stops counting when all bits are set to 1 (H'FFFF). Note: Writing any data clears these bits.

**37.4.10 Transmit FIFO Threshold Setting Register (CXR9)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

CXR9 is a register that specifies the threshold for the transmit FIFO.

Bit	Bit Name	Initial Value*	R/W	Description
31 to 11	—	All 0	R	Reserved
10 to 0	FO[10:0]	H'000	R/W	Transmit FIFO Threshold Setting            Threshold H'000:            Store and forward H'001:            4 bytes H'002:            8 bytes :                    : H'0FE:            1016 bytes H'0FF:            1020 bytes H'100:            1024 bytes :                    : H'1FE:            1040 bytes H'1FF:            2044 bytes H'200:            2048 bytes :                    : H'3FE:            4088 bytes 3 H'FF:            4092 bytes H'400 to H'7FF    Setting prohibited

Reading (transmission) is started when one frame data has been written to the FIFO or when data in the FIFO exceeds the above setting.

Using on the initial value (store and forward) is recommended to prevent from occurring underflow error on sending.

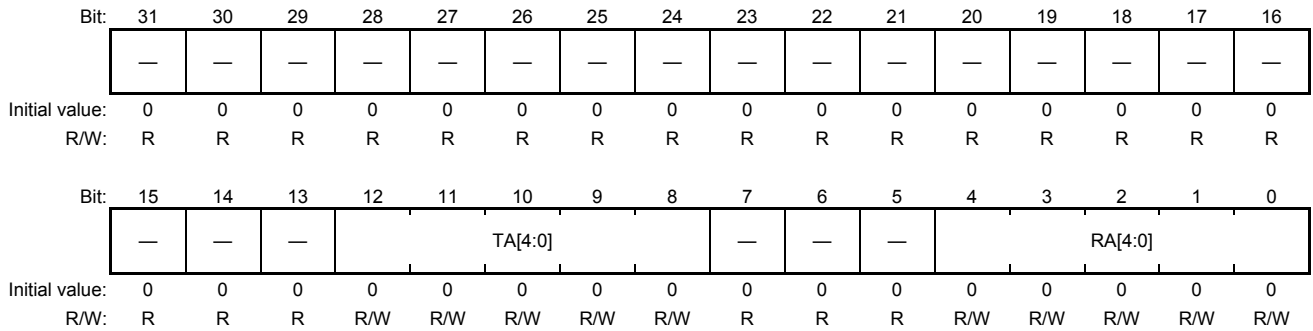

Note: Writing is disabled when the TRNS bit in CXR1 = 1.

Note: \* This register is initialized by an HDMAC/feLic software reset.

**37.4.11 External FIFO Depth Setting Register (CXR10)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

CXR10 is a register that specifies the depth of the transmit and receive FIFOs.

Bit	Bit Name	Initial Value*	R/W	Description
31 to 13	—	All 0	R	Reserved
12 to 8	TA[4:0]	H'00	R/W	Transmit FIFO Depth Setting      Depth H'00:          256 bytes H'01:          512 bytes H'02:          768 bytes H'03:          1024 bytes :                : H'07:          2048 bytes :                : H'0F:          4096 bytes H'10 to H'1F: Setting prohibited Note: Writing to bits 12 to 8 is disabled when the TRNS bit in CXR1 = 1.
7 to 5	—	All 0	R	Reserved
4 to 0	RA[4:0]	H'00	R/W	Receive FIFO Depth Setting      Depth H'00:          256 bytes H'01:          512 bytes H'02:          768 bytes H'03:          1024 bytes :                : H'07:          2048 bytes :                : H'0F:          4096 bytes H'10 to H'1F: Setting prohibited Note: Writing to bits 4 to 0 is disabled when the R bit in CXR2 = 1.

Note: \* This register is initialized by an HDMAC/feLic software reset.

**37.4.12 Receive Activation Reset Method Setting Register (CXR11)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

CXR11 is a register that specifies a method for resetting the receive ready bit (R bit in CXR2).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RNR	RR
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

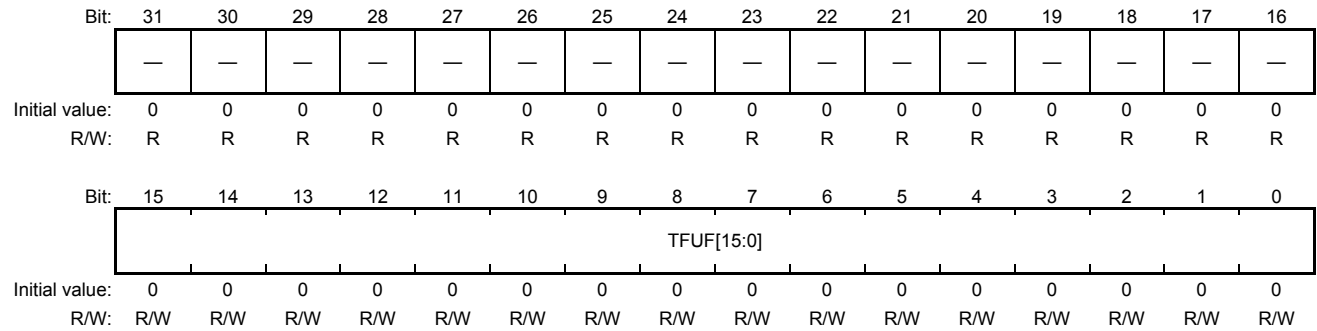

Bit	Bit Name	Initial Value*	R/W	Description
31 to 2	—	All 0	R	Reserved
1	RNR	0	R/W	Not used. This bit should always be set to 0.
0	RR	0	R/W	Receive Ready Reset 0: (initial value) Automatically clears the receive ready bit (R bit in CXR2) by hardware. The receive ready bit (R bit in CXR2) is automatically cleared by receiving one frame, thus disabling reception of the following frames. In this mode, interrupt control for each frame is possible. 1: Normal operating mode Resets the receive ready bit (R bit in CXR2) by software. After 1 is written to the receive ready bit (R bit in CXR2), the HDMAC automatically fetches the receive descriptor and receives frames until 0 is written to the receive ready bit (R bit in CXR2). Continuous reception of multiple frames is possible. Note that the receive ready bit (R bit in CXR2) is reset to 0 when the RACT bit in the fetched descriptor is 0. Note: Writing to this bit is disabled when the R bit in CXR2 = 1.

Note: \* This register is initialized by an HDMAC/feLic software reset.

### 37.4.13 Transmit FIFO Underflow Counter Register (CXR13)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

CXR13 is a register that indicates the number of times the transmit FIFO underflow occurs.

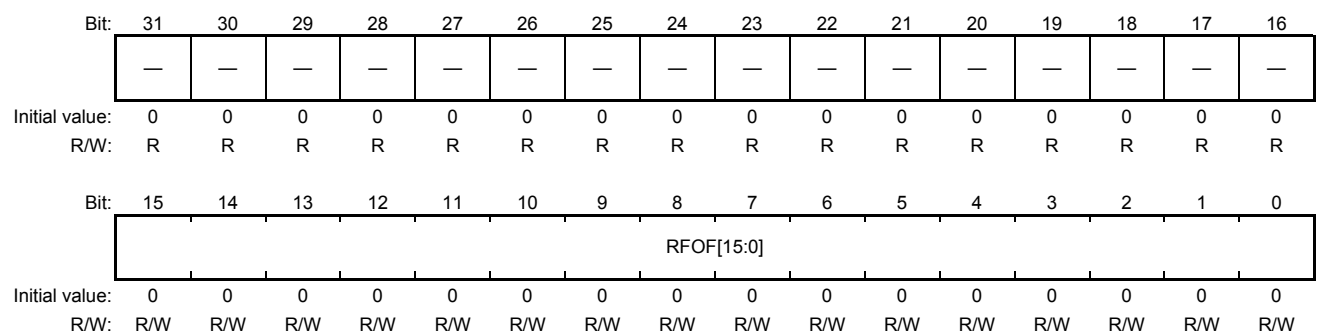

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved
15 to 0	TFUF[15:0]	H'0000	R/W	Transmit FIFO Underflow Counter The counter stops counting when all bits are set to 1 (H'FFFF). Note: Writing any data clears these bits.

### 37.4.14 Receive FIFO Overflow Counter Register (CXR14)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

CXR14 is a register that indicates the number of times the receive FIFO overflow occurs.

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved
15 to 0	RFOF[15:0]	H'0000	R/W	Receive FIFO Overflow Counter The counter stops counting when all bits are set to 1 (H'FFFF). Note: Writing any data clears these bits.

**37.4.15 RMI Mode Register (CXR15)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

CXR15 sets the RMI mode.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RMI
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value*	R/W	Description
31 to 1	—	All 0	R	Reserved
0	RMI	0	R/W	RMI Mode Specification 0: (initial value) 1: RMI mode Be sure to set this bit to 1 before operating the Ethernet MAC controller (Ether).

Note: \* This register is initialized by an HDMAC/feLic software reset.

**37.4.16 Receive FIFO Busy Transmit Threshold Setting Register (CXR16)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

CXR16 is a register that specifies the threshold value for sending the receive FIFO busy to the feLic based on the number of frames and number of data bytes stored in the receive FIFO.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	RFF[2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	RFD[2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value*	R/W	Description
31 to 19	—	All 0	R	Reserved
18 to 16	RFF[2:0]	111	R/W	Busy Transmit Threshold based on the Number of Receive Frames Setting Threshold 000: Transmits the busy when two frames have been stored. 001: Transmits the busy when four frames have been stored. 010: Transmits the busy when six frames have been stored. : 110: Transmits the busy when 14 frames have been stored. 111: Transmits the busy when 16 frames have been stored.
15 to 3	—	All 0	R	Reserved
2 to 0	RFD[2:0]	111	R/W	Busy Transmit Threshold based on the Amount of Data in the Receive FIFO Setting Threshold 000: Transmits the busy when 224 (256 – 32) bytes have been stored. 001: Transmits the busy when 480 (512 – 32) bytes have been stored. 010: Transmits the busy when 736 (768 – 32) bytes have been stored. 011: Transmits the busy when 992 (1024 – 32) bytes have been stored. : 110: Transmits the busy when 1760 (1792 – 32) bytes have been stored. 111: See the following note. Note: The set value to these bits should be smaller than the set value to the RA bits in CXR10. If the former and latter values are equal, the busy will be sent out when (receive FIFO depth – 64 bytes) have been stored in the receive FIFO, not when (receive FIFO depth – 32 bytes) have been stored. For example, when the RA bits in CXR10 and RFD bits in CXR16 are both 7, the busy will be sent out when 1984 (= 2048 – 64) bytes have been stored in the receive FIFO.

Note: \* This register is initialized by an HDMAC/feLic software reset.

**37.4.17 Transmit Interrupt Mode Setting Register (CXR18)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

CXR18 is used for setting transmit interrupt operating mode for the HDMAC.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	TIM	—	—	—	TIS
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value*	R/W	Description
31 to 5	—	All 0	R	Reserved
4	TIM	0	R/W	Transmit Interrupt Mode 0: Mode in which the interrupt is issued each time a frame has been transmitted. 1: Mode in which the interrupt is issued when write-back to the descriptor whose TWBI bit is set has been completed.
3 to 1	—	All 0	R	Reserved
0	TIS	0	R/W	Interrupt Mode Enable 0: TIM setting is disabled. 1: TIM setting is enabled.

Note: \* This register is initialized by an HDMAC/feLic software reset.

## 37.4.18 feLic Operating Mode Setting Register (CXR20)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

CXR20 is a register that specifies the operating mode of the feLic. Some mode bits in this register should not be modified while the transmitting and receiving functions are enabled.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	TPC	ZPF	PFR	RXF	TXF

Bit	Bit Name	Initial Value*2	R/W	Description
31 to 21	—	All 0	R	Reserved
20	TPC	0	R/W	PAUSE Frame Transmission 0: Transmission of a PAUSE frame is enabled even during a PAUSE period. 1: Transmission of a PAUSE frame is disabled during PAUSE period.
19	ZPF	0	R/W	PAUSE Frame Enable with TIME = 0 0: Control of a PAUSE frame whose TIME parameter value is 0 is disabled. 1: Control of a PAUSE frame whose TIME parameter value is 0 is enabled.
18	PFR	0	R/W	PAUSE Frame Receive Mode 0: PAUSE frame is not transferred to the upper module. 1: PAUSE frame is transferred to the upper module.
17	RXF	0	R/W	Operating Mode for Reception Flow Control 0: Reception flow control is disabled. 1: Reception flow control is enabled.
16	TXF	0	R/W	Operating Mode for Transmission Flow Control 0: Transmission flow control is disabled. 1: Transmission flow control is enabled.
15 to 13	—	All 0	R	Reserved
12	CER	0	R/W	CRC Error Frame Receive Mode 0: Normal mode (an error frame is regarded as an error). 1: Mode in which the received frame with a CRC error is not regarded as an error.
11, 10	—	All 0	R	Reserved
9	MPM	0	R/W	Magic Packet Detection Enable 0: Magic packet detection is disabled. 1: Magic packet detection is enabled.
8, 7	—	All 0	R	Reserved

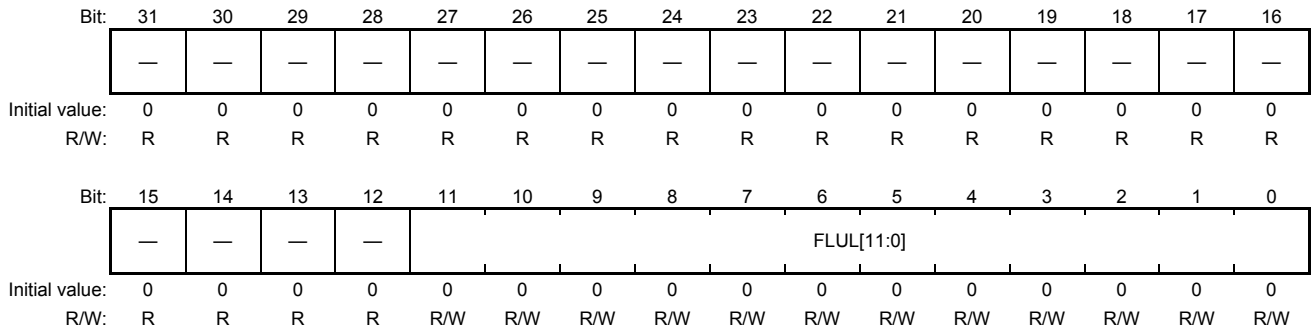

Bit	Bit Name	Initial Value*2	R/W	Description
6	RPE	0	R/W	<p>Reception Enable</p> <p>0: Receiving function is disabled after completion of current frame reception.</p> <p>1: Frame receiving function is enabled and receive data is transferred to the HDMAC.</p>
5	TPE	0	R/W	<p>Transmission Enable</p> <p>0: Transmitting function is disabled after completion of current frame transmission.</p> <p>1: A frame transmit request from the HDMAC is enabled.</p>
4	—	0	R	Reserved
3	ILB	0	R/W*1	<p>feLic Loopback Mode</p> <p>0: The feLic enters normal mode.</p> <p>1: The feLic enters loopback mode.</p>
2	OLB	0	R/W*1	<p>10-Base T or 100-Base TX Transfer Setting (Transfer at 10 or 100 Mbps)</p> <p>0: Transfer is 10-base T (i.e. at 10 Mbps).</p> <p>1: Transfer is 100-base TX (i.e. at 100 Mbps).</p>
1	DPM	0	R/W*1	<p>Duplex Mode</p> <p>0: The feLic enters half-duplex mode. Note that feLic loopback mode should not be specified during this mode.</p> <p>1: The feLic enters full-duplex mode.</p>
0	PRM	0	R/W*1	<p>Promiscuous Mode</p> <p>0: The feLic enters normal mode. (When the MPM bit is set, the feLic operates in normal mode regardless of the status of this bit.)</p> <p>1: The feLic enters promiscuous mode.</p>

Notes: 1. Bits 3 to 0 should not be modified while the transmitting and receiving functions are enabled.  
2. This register is initialized by an HDMAC/feLic software reset.

**37.4.19 Long Frame Length Check Value Setting Register (CXR2A)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

CXR2A is a register that specifies the upper limit of the receive frame length used for checking the length.

Bit	Bit Name	Initial Value*	R/W	Description
31 to 12	—	All 0	R	Reserved
11 to 0	FLUL[11:0]	H'000	R/W	Frame Length Upper Limit The specified value is used as the frame length check value. When the received frame length value exceeds this value, it is regarded as RINT4 (frame length error). (See below.) Setting Check Value H'000 to H'5EE: 1518 bytes H'5EF: 1519 bytes : : H'7FF: 2047 bytes H'800 to H'FFF: 2048 bytes Note: The CXR20 register should not be modified while the receiving function is enabled.

Note: \* This register is initialized by an HDMAC/feLic software reset.

**37.4.20 Status Register (CXR21)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

CXR21 is a register that indicates the feLic status.

The status sources are output to the INTC module by a signal of each source.

Each bit is cleared by writing 1 to the corresponding bit. Generation of interrupts can be masked by the corresponding bits in CXR22.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	BCR	PRO	—	LNK	MPR	FCD
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R/W*1	R/W*1	R	R/W*1	R/W*1	R/W*1

Bit	Bit Name	Initial Value*2	R/W	Description
31 to 6	—	All 0	R	Reserved
5	BCR	0	R/W*1	Reserved
4	PRO	0	R/W*1	PAUSE Frame Retransmit Retry Over <Interrupt Source> Indicates that the PAUSE frame retransmission count has reached the upper limit of retransmission set in the CXR81 register.
3	—	0	R	Reserved
2	LNK	0	R/W*1	LINK Signal Change Interrupt <Interrupt Source> Indicates that the LINK signal output from the PHY has changed from high to low or low to high.
1	MPR	0	R/W*1	Magic Packet Receive Interrupt <Interrupt Source> Indicates that a magic packet has been received. (This bit is cleared by writing 1 to the bit; however, the MAGIC signal is not cleared because it is an external output signal.)
0	FCD	0	R/W*1	Illegal Carrier Detection Interrupt <Interrupt Source> Indicates that an illegal carrier is detected on the line.

- Notes: 1. These bits are cleared by writing 1 to the corresponding bits. Writing 0 has no meaning.  
2. This register is initialized by an HDMAC/feLic software reset.

### 37.4.21 Interrupt Mask Setting Register (CXR22)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

CXR22 is a register that masks the interrupts indicated by CXR21.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	BCRE	PROE	—	LNKE	MPRE	FCDE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value*	R/W	Description
31 to 6	—	All 0	R	Reserved
5	BCRE	0	R/W	Reserved
4	PROE	0	R/W	PAUSE Frame Retransmit Retry Over Interrupt Enable 0: Disables an interrupt indicated by the corresponding bit in CXR21. 1: Enables an interrupt indicated by the corresponding bit in CXR21.
3	—	0	R	Reserved
2	LKNE	0	R/W	LINK Signal Change Interrupt Enable 0: Disables an interrupt indicated by the corresponding bit in CXR21. 1: Enables an interrupt indicated by the corresponding bit in CXR21.
1	MPRE	0	R/W	Magic Packet Receive Interrupt Enable 0: Disables an interrupt indicated by the corresponding bit in CXR21. 1: Enables an interrupt indicated by the corresponding bit in CXR21.
0	FCDE	0	R/W	Illegal Carrier Detection Interrupt Enable 0: Disables an interrupt indicated by the corresponding bit in CXR21. 1: Enables an interrupt indicated by the corresponding bit in CXR21.

Note: \* This register is initialized by an HDMAC/feLic software reset.

**37.4.22 MII Control Register (CXR23)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

CXR23 is a register that controls the MII interface to access the PHY register.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	MDI	MDO	MMD	MDC
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	—	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value*	R/W	Description
31 to 4	—	All 0	R	Reserved
3	MDI	—	R	MII Management Data In Read data from MII
2	MDO	0	R/W	MII Management Data Out Write data to MII
1	MMD	0	R/W	MII Management Mode 1: Data is written to MII. 0: Data is read from MII.
0	MDC	0	R/W	MII Management Clock Clock for MII

Note: \* This register is initialized by an HDMAC/feLic software reset.

**37.4.23 PHY Status Register (CXR2B)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

CXR2B is a register that can monitor the PHY status signal.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	LINK
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value*	R/W	Description
31 to 1	—	All 0	R	Reserved
0	LINK	—	R	The status of the PHY output LINK signal can be monitored. See the specifications of the PHY to be connected.

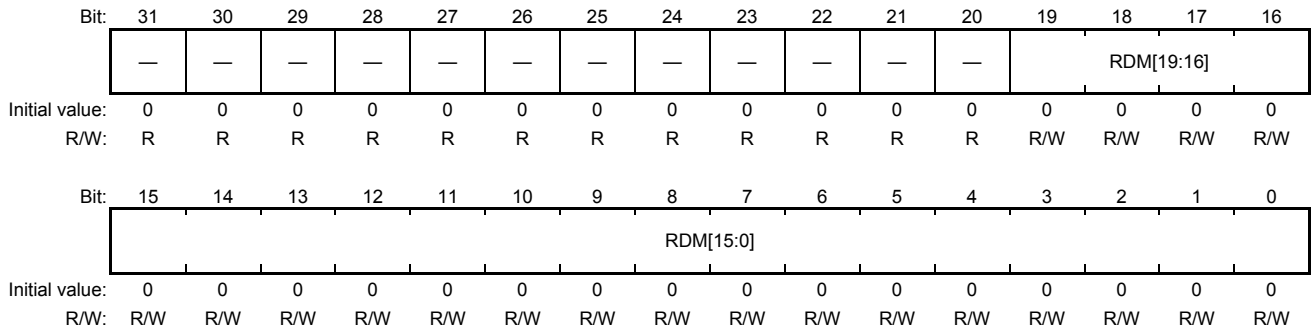

Note: \* This register is initialized by an HDMAC/feLic software reset.

**37.4.24 Random Number Generating Counter Upper Limit Setting Register (CXR30)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

CXR30 is a register that can set the upper limit of the counter used for the random number generator.

Bit	Bit Name	Initial Value*	R/W	Description
31 to 20	—	All 0	R	Reserved
19 to 0	RDM[19:0]	H'00000	R/W	Upper limit of the Counter used for the Random Number Generator H'00000: Setting for normal operation H'00001 to H'FFFFE: Counter upper limit Note: Since the operation of the feLic random number generator depends on the value set to this register, take care when setting a value other than 0.

Note: \* This register is initialized by an HDMAC/feLic software reset.

**37.4.25 IPG Counter Setting Register (CXR70)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

CXR70 is a register that specifies the IPG (inter packet gap) value.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	IPG[4:0]				
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	0	1	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value*	R/W	Description
31 to 5	—	All 0	R	Reserved
4 to 0	IPG[4:0]	H'14	R/W	These bits set the IPG value in 40 ns units. Setting      IPG value H'00 to H'06: 400 ns H'07:        440 ns :            : H'13:        920 ns H'14:        960 ns (default) :            : H'1F:        1440 ns

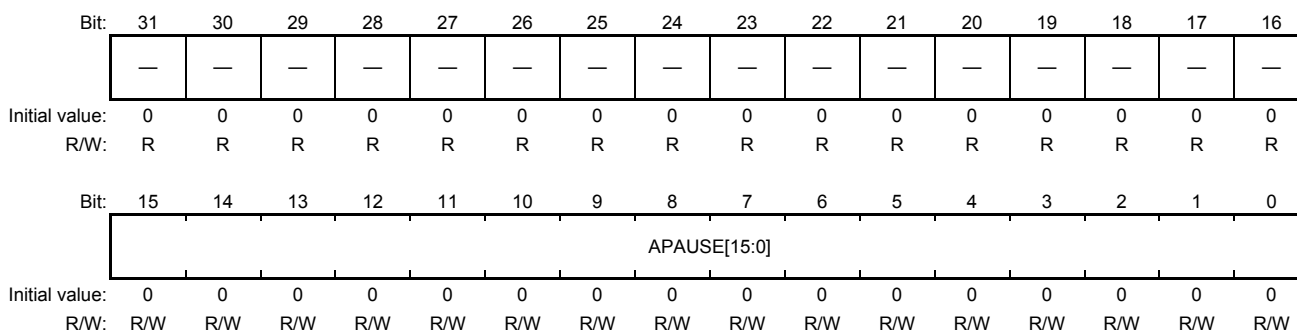

Note: The CXR20 register should not be modified while the transmitting and receiving functions are enabled.

Note: \* This register is initialized by an HDMAC/feLic software reset.

### 37.4.26 Automatic PAUSE Parameter Setting Register (CXR71)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

CXR71 is used to set the TIME parameter value of an automatic PAUSE frame. When an automatic PAUSE frame is transmitted, the value set in this register is used as the TIME parameter of the PAUSE frame.

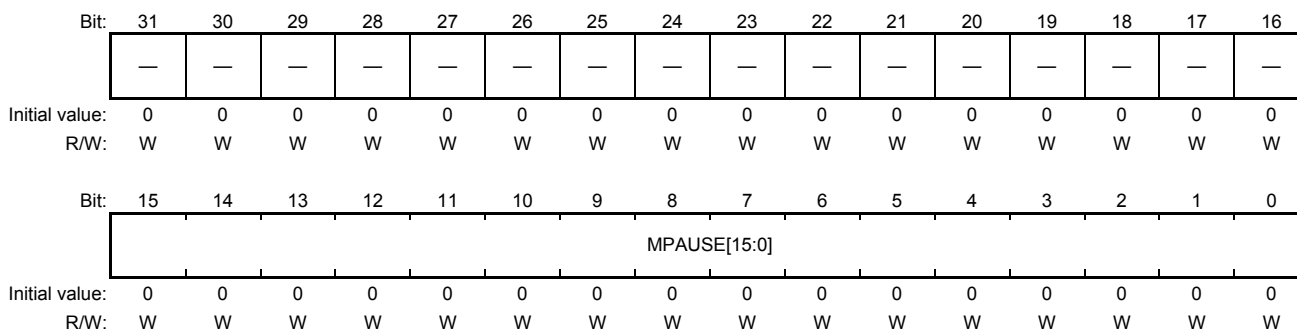

Bit	Bit Name	Initial Value*	R/W	Description
31 to 16	—	All 0	R	Reserved
15 to 0	APAUSE[15:0]	H'0000	R/W	TIME Parameter Value of an Automatic PAUSE Frame One bit is equivalent to 512 bit-time.

Note: \* This register is initialized by an HDMAC/feLic software reset.

### 37.4.27 Manual PAUSE Parameter Setting Register (CXR72)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

CXR72 is used to set the TIME parameter value of a manual PAUSE frame. When a manual PAUSE frame is transmitted, the value set in this register is used as the TIME parameter of the PAUSE frame.

Bit	Bit Name	Initial Value*	R/W	Description
31 to 16	—	All 0	W	Reserved
15 to 0	MPAUSE[15:0]	H'0000	W	TIME Parameter Value of an Manual PAUSE Frame One bit is equivalent to 512 bit-time.

Notes: This register can't be read.

\* This register is initialized by an HDMAC/feLic software reset.

**37.4.28 Receive PAUSE Frame Counter Register (CXR80)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

CXR80 is used to the counter of received the PAUSE frame.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	RPAUSE[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

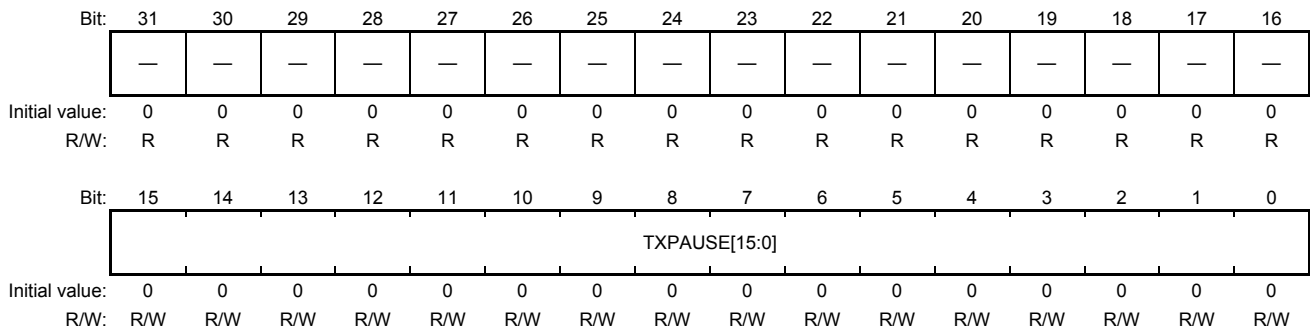

Bit	Bit Name	Initial Value*	R/W	Description
31 to 8	—	All 0	R	Reserved
7 to 0	RPAUSE[7:0]	H'00	R	Received PAUSE frame Counter

- Notes: Writing to this register has no meaning.  
 \* This register is initialized by an HDMAC/feLic software reset.

**37.4.29 PAUSE Frame Retransmit Count Setting Register (CXR81)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

CXR81 is used to set the upper limit of the automatic PAUSE frame retransmission count. For details of this register, see section 37.9.2 (6), Flow Control Conforming to IEEE802.3.

Bit	Bit Name	Initial Value*1	R/W	Description
31 to 16	—	All 0	R	Reserved
15 to 0	TXPAUSE[15:0]	H'0000	R/W	Upper Limit of PAUSE Frame Retransmission Setting Retransmit count H'0000: Unlimited*2 H'0001: 1 : : H'FFFF: 65535  Note: The CXR20 register should not be modified while the transmitting function is enabled.

- Notes: 1. This register is initialized by an HDMAC/feLic software reset.  
 2. When using in unlimited setting, the time parameter MPAUSE of CXR71 should be set other than zero.

### 37.4.30 PAUSE Frame Retransmit Counter Register (CXR82)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

CXR82 is used to the counter of retransmitting of the PAUSE frame. For details of this register, see section 37.9.2 (6), Flow Control Conforming to IEEE802.3.

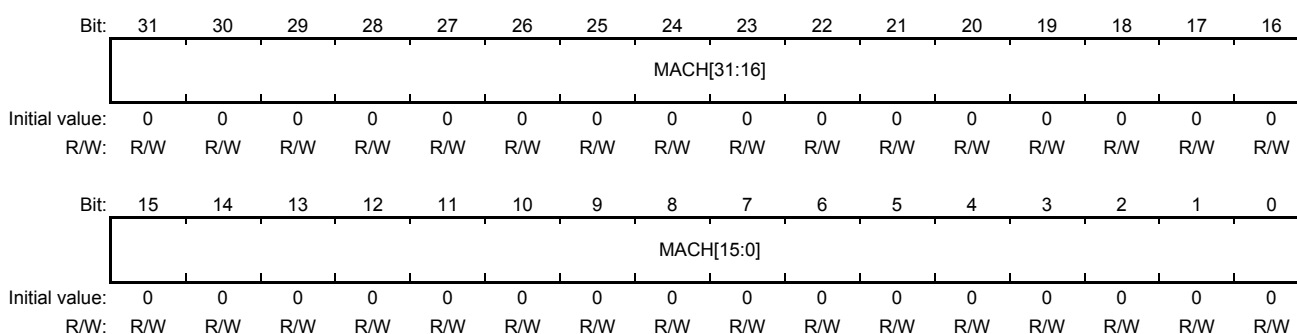

Bit	Bit Name	Initial Value*	R/W	Description
31 to 8	—	All 0	R	Reserved
15 to 0	TXP[15:0]	H'0000	R	PAUSE Frame Retransmit Counter

Notes: Writing to this register has no meaning.  
 \* This register is initialized by an HDMAC/feLic software reset.

### 37.4.31 MAC Address High Register (CXR24)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

CXR24 is used to set the upper 32 bits of the universal MAC address.

Bit	Bit Name	Initial Value*	R/W	Description
31 to 0	MACH[31:0]	H'00000000	R/W	MAC Address Upper 32 Bits

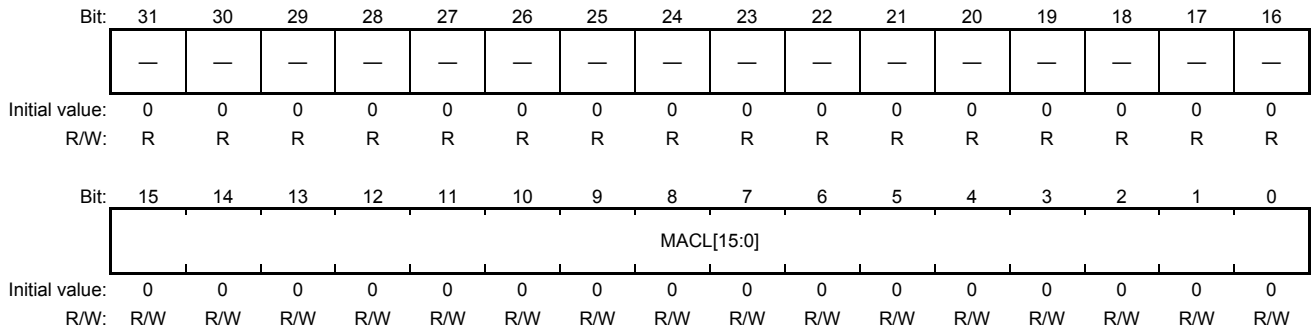

Note: These bits should not be written to while the transmission enable and reception enable bits in CXR20 are set.

Note: \* This register is initialized by an HDMAC/feLic software reset.

**37.4.32 MAC Address Low Register (CXR25)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

CXR25 is used to set the lower 16 bits of the universal MAC address.

Bit	Bit Name	Initial Value*	R/W	Description
31 to 16	—	All 0	R	Reserved
15 to 0	MACL[15:0]	H'0000	R/W	MAC Address Lower 16 Bits

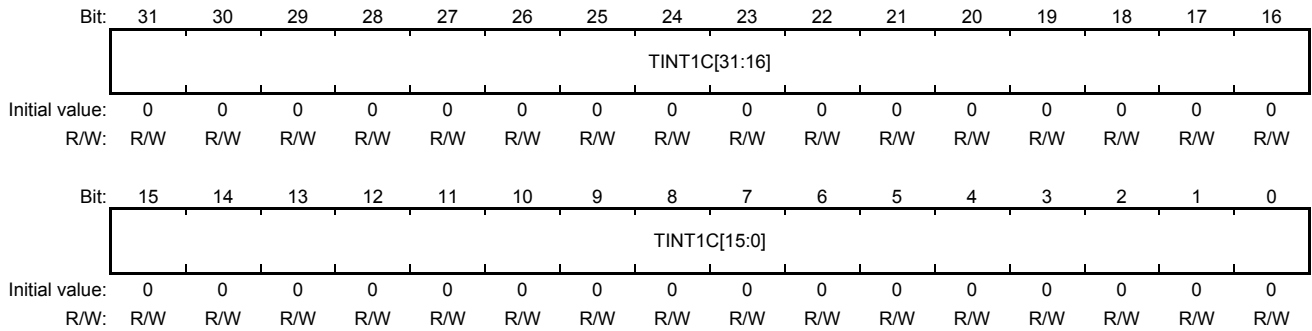

Note: These bits should not be written to while the transmission enable and reception enable bits in CXR20 are set.

Note: \* This register is initialized by an HDMAC/feLic software reset.

**37.4.33 TINT1 Count Register (CX40)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

CXR40 is a register with which the TINT1 source signal count value can be read and referred to.

Bit	Bit Name	Initial Value*	R/W	Description
31 to 0	TINT1C[31:0]	H'00000000	R/W	TINT1 (Transmit Timeout) Counter This counter is not automatically updated after incremented to H'FFFFFFFF. To update the counter continuously and restart increment from H'00000000, write-access to the counter and clear it. Note: Cleared by write access.

Note: \* This register is initialized by an HDMAC/feLic software reset.

**37.4.34 TINT2 Count Register (CX41)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

CXR41 is a register with which the TINT2 source signal count value can be read and referred to.

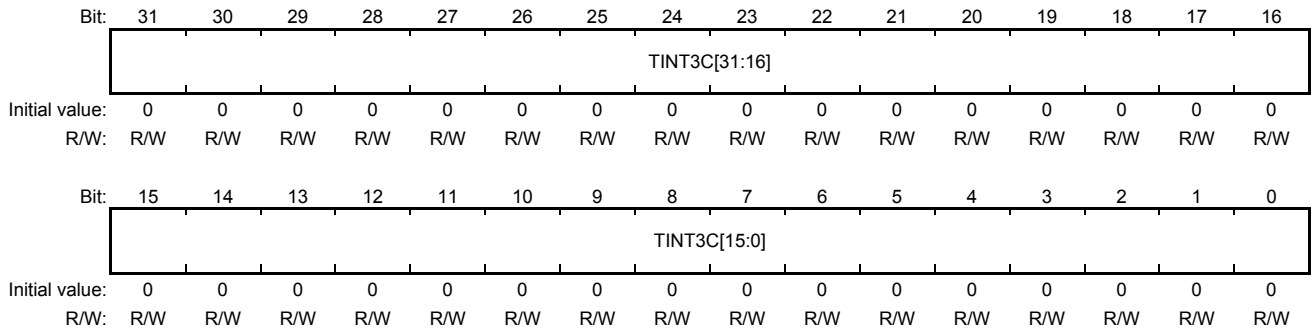

Bit	Bit Name	Initial Value*	R/W	Description
31 to 0	TINT2C[31:0]	H'00000000	R/W	TINT2 (Collision Detection during Frame Transmission) Counter This counter is not automatically updated after incremented to H'FFFFFFFF. To update the counter continuously and restart increment from H'00000000, write-access to the counter and clear it. Note: Cleared by write access.

Note: \* This register is initialized by an HDMAC/feLic software reset.

**37.4.35 TINT3 Count Register (CX42)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

CXR42 is a register with which the TINT3 source signal count value can be read and referred to.

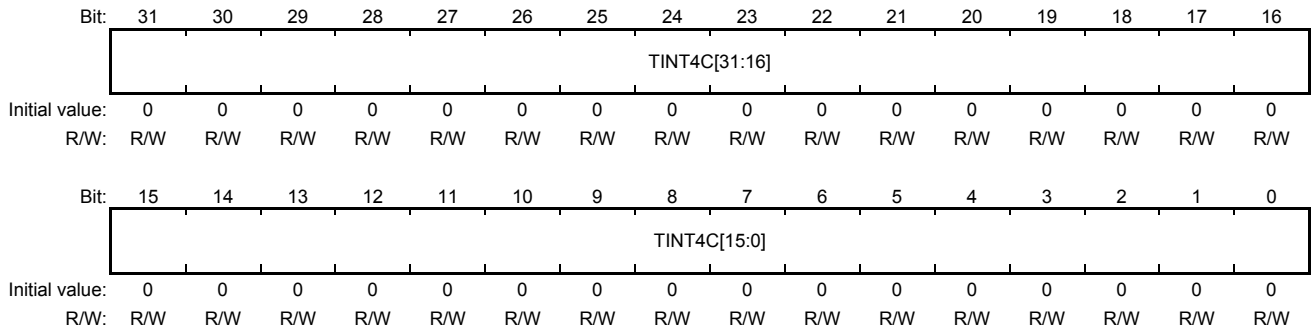

Bit	Bit Name	Initial Value*	R/W	Description
31 to 0	TINT3C[31:0]	H'00000000	R/W	<p>TINT3 (Carrier Loss during Frame Transmission) Counter</p> <p>This counter is not automatically updated after incremented to H'FFFFFFFF. To update the counter continuously and restart increment from H'00000000, write-access to the counter and clear it.</p> <p>Note: Cleared by write access.</p>

Note: \* This register is initialized by an HDMAC/feLic software reset.

**37.4.36 TINT4 Count Register (CX43)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

CXR43 is a register with which the TINT4 source signal count value can be read and referred to.

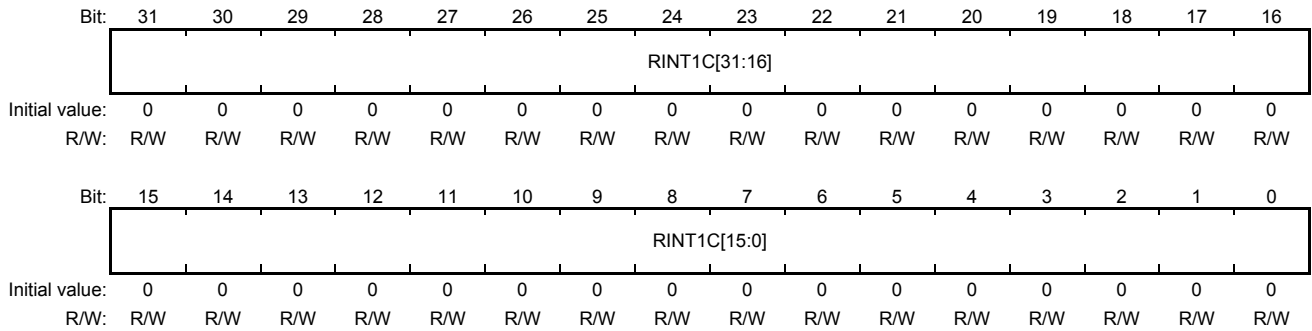

Bit	Bit Name	Initial Value*	R/W	Description
31 to 0	TINT4C[31:0]	H'00000000	R/W	TINT4 (Carrier not Detected) Counter  This counter is not automatically updated after incremented to H'FFFFFFF. To update the counter continuously and restart increment from H'00000000, write-access to the counter and clear it.  Note: Cleared by write access.

Note: \* This register is initialized by an HDMAC/feLic software reset.

**37.4.37 RINT1 Count Register (CX50)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

CX50 is a register with which the RINT1 source signal count value can be read and referred to.

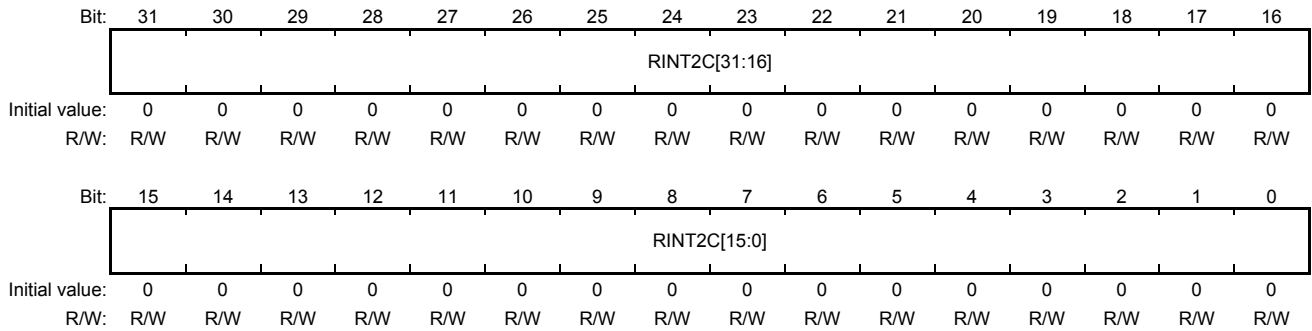

Bit	Bit Name	Initial Value*	R/W	Description
31 to 0	RINT1C[31:0]	H'00000000	R/W	RINT1 (CRC Error) Counter  This counter is not automatically updated after incremented to H'FFFFFFF. To update the counter continuously and restart increment from H'00000000, write-access to the counter and clear it.  Note: Cleared by write access.

Note: \* This register is initialized by an HDMAC/feLic software reset.

**37.4.38 RINT2 Count Register (CX51)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

CXR51 is a register with which the RINT2 source signal count value can be read and referred to.

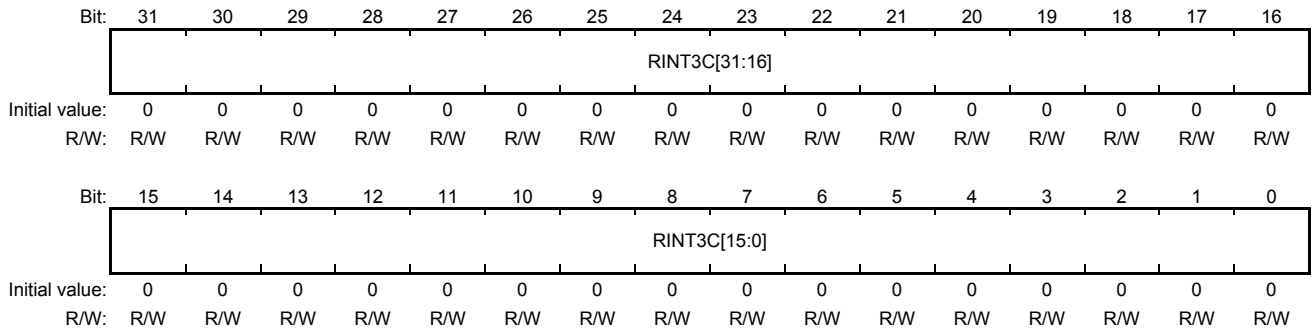

Bit	Bit Name	Initial Value*	R/W	Description
31 to 0	RINT2C[31:0]	H'00000000	R/W	RINT2 (Frame Receive Error) Counter  This counter is not automatically updated after incremented to H'FFFFFFF. To update the counter continuously and restart increment from H'00000000, write-access to the counter and clear it.  Note: Cleared by write access.

Note: \* This register is initialized by an HDMAC/feLic software reset.

**37.4.39 RINT3 Count Register (CX52)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

CX52 is a register with which the RINT3 source signal count value can be read and referred to.

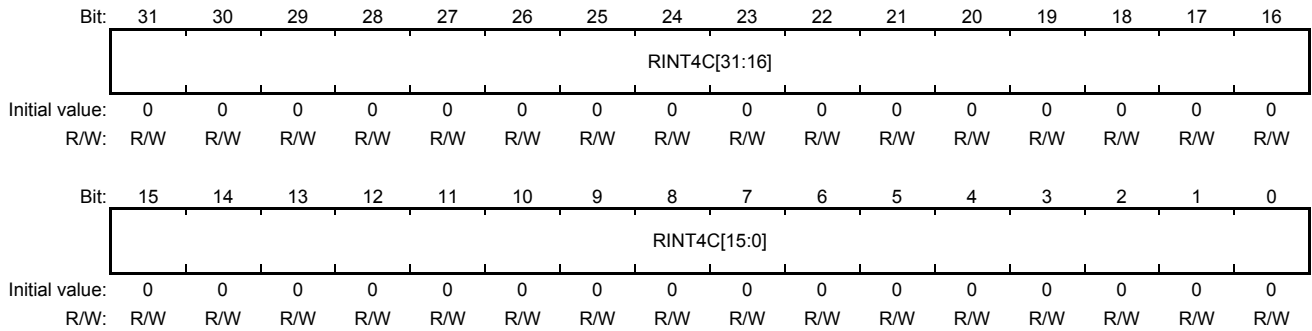

Bit	Bit Name	Initial Value*	R/W	Description
31 to 0	RINT3C[31:0]	H'00000000	R/W	RINT3 (Frame Length Error: less than 64 bytes) Counter  This counter is not automatically updated after incremented to H'FFFFFFF. To update the counter continuously and restart increment from H'00000000, write-access to the counter and clear it.  Note: Cleared by write access.

Note: \* This register is initialized by an HDMAC/feLic software reset.

**37.4.40 RINT4 Count Register (CX53)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

CX53 is a register with which the RINT4 source signal count value can be read and referred to.

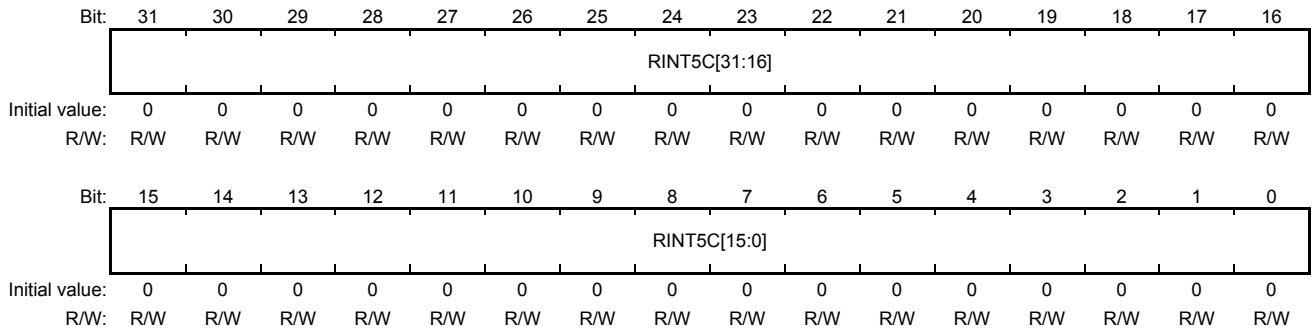

Bit	Bit Name	Initial Value*	R/W	Description
31 to 0	RINT4C[31:0]	H'00000000	R/W	RINT4 (Frame Length Error: 1518 bytes or more) Counter This counter is not automatically updated after incremented to H'FFFFFFFF. To update the counter continuously and restart increment from H'00000000, write-access to the counter and clear it. Note: Cleared by write access.

Note: \* This register is initialized by an HDMAC/feLic software reset.

**37.4.41 RINT5 Count Register (CX54)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

CXR54 is a register with which the RINT5 source signal count value can be read and referred to.

Bit	Bit Name	Initial Value*	R/W	Description
31 to 0	RINT5C[31:0]	H'00000000	R/W	RINT5 (Fractional Number Bit Error) Counter  This counter is not automatically updated after incremented to H'FFFFFFFF. To update the counter continuously and restart increment from H'00000000, write-access to the counter and clear it.  Note: Cleared by write access.

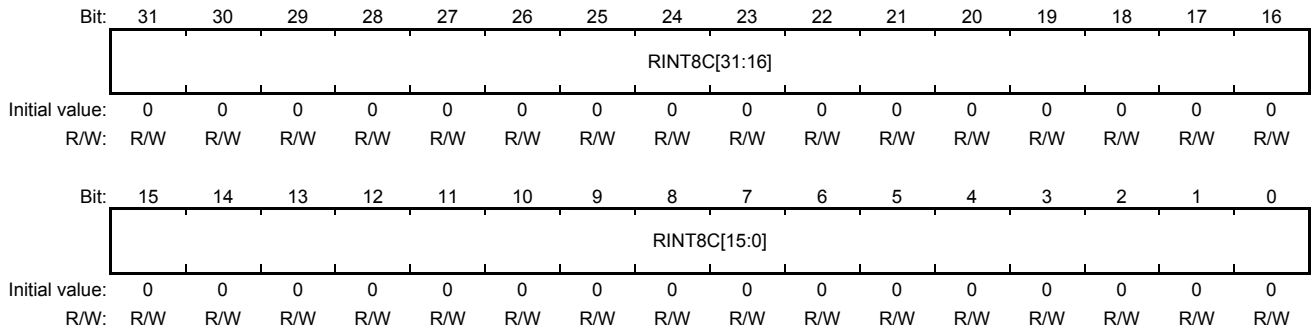

Note: \* This register is initialized by an HDMAC/feLic software reset.

**37.4.42 RINT8 Count Register (CX55)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

CX55 is a register with which the RINT8 source signal count value can be read and referred to.

Bit	Bit Name	Initial Value*	R/W	Description
31 to 0	RINT8C[31:0]	H'00000000	R/W	RINT8 (Multicast Frame Reception) Counter  This counter is not automatically updated after incremented to H'FFFFFFF. To update the counter continuously and restart increment from H'00000000, write-access to the counter and clear it.  Note: Cleared by write access.

Note: \* This register is initialized by an HDMAC/feLic software reset.

## 37.5 Data Format

RZ/G1H

RZ/G1N

RZ/G1M

RZ/G1E

### 37.5.1 Ethernet Packet

#### (1) Transmit Packet

Figure 37.3 shows the data format of a transmit packet. Table 37.5 shows the field definition of a transmit packet.

## 37.6 Software Control Flow

### 37.6.1 Ether Software Control Flow

#### (1) Example of Ethernet Transmission and Reception Procedure

Figure 37.5 shows an example of initialization procedure for Ethernet transmission and reception. Figure 37.6 shows an example of Ethernet transmission and reception procedure.

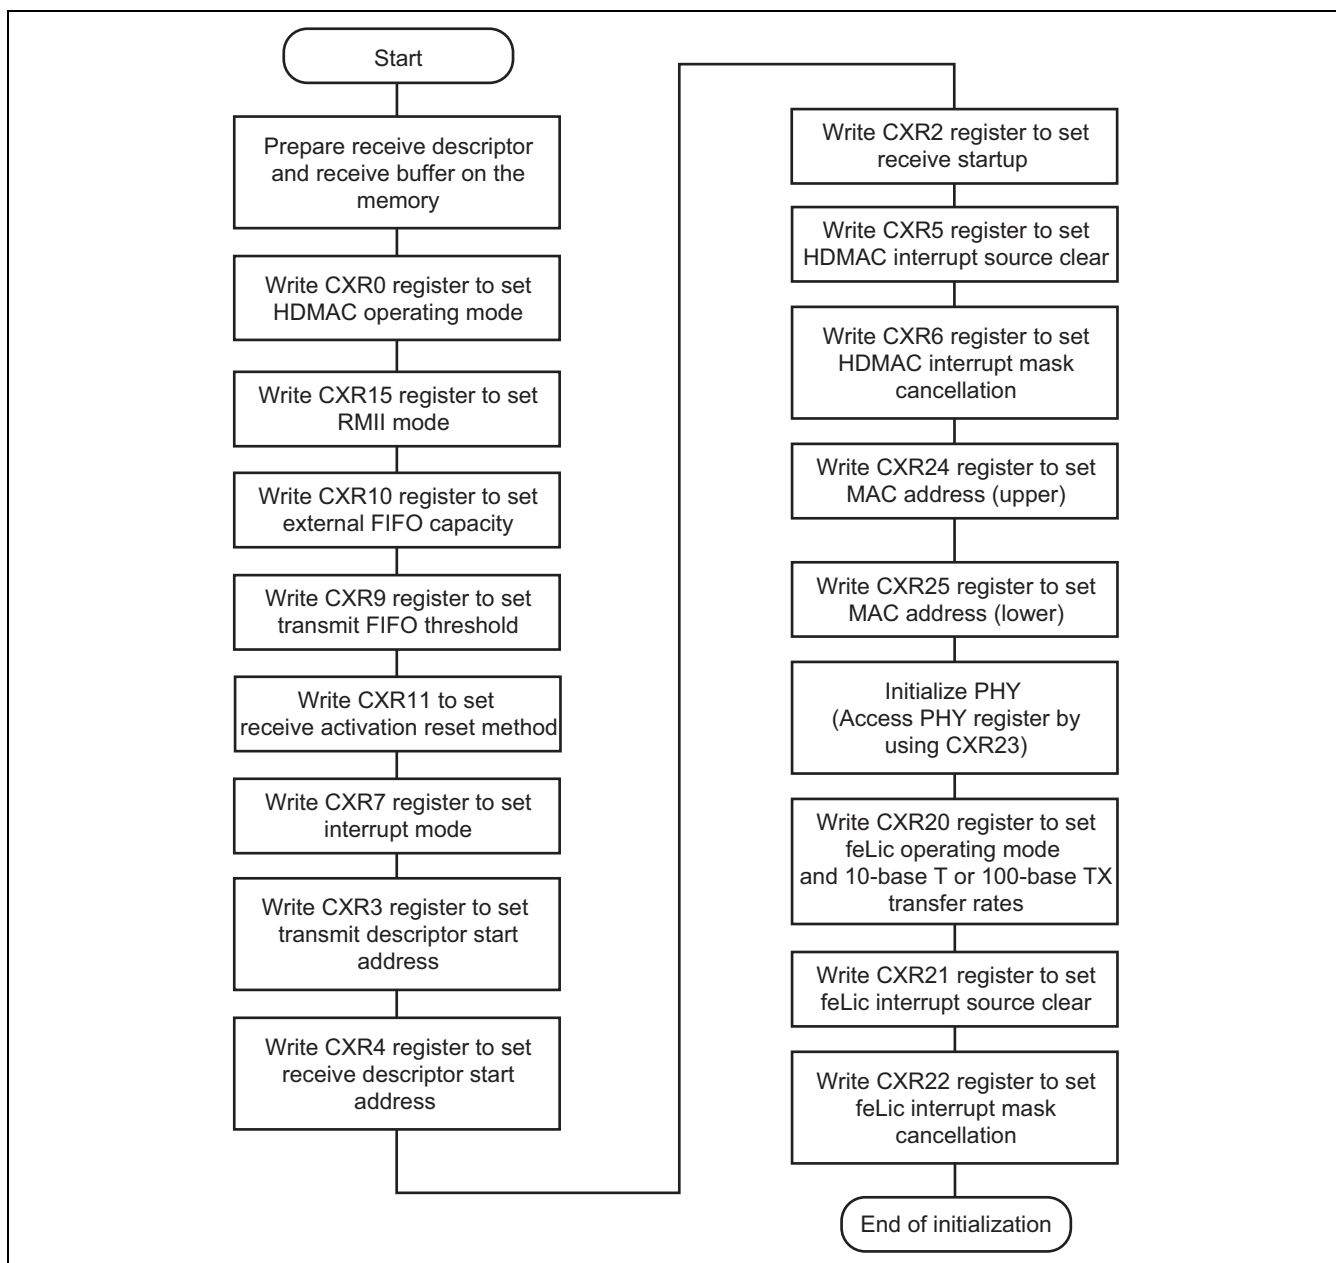

Figure 37.5 Initialization Procedure for Ethernet Transmission and Reception

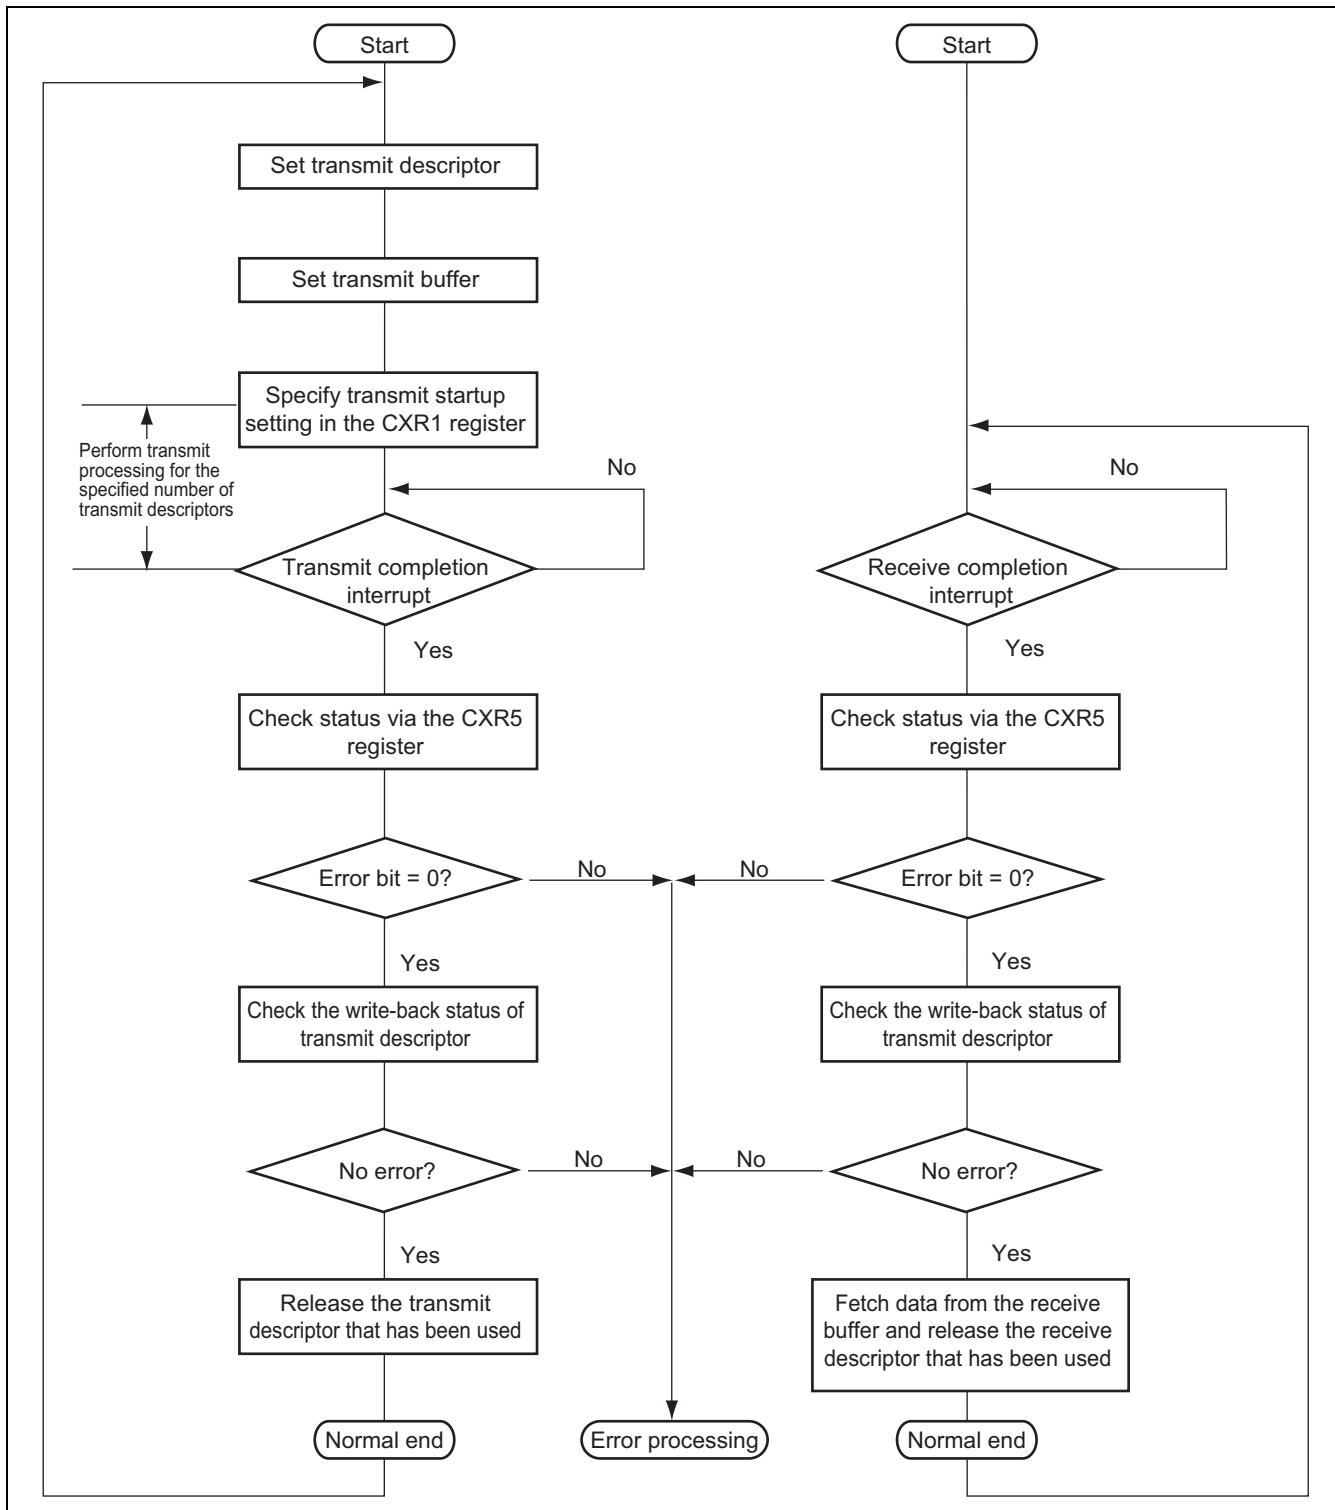

Figure 37.6 Ethernet Transmission and Reception Procedure

**(2) Example of PHY Register Accessing Procedure**

The PHY register is accessed by using the CXR23 register. This access should be performed using the MII management frame format as shown in Figure 37.7. Figure 37.8 shows an example of 1-bit data writing procedure to achieve the MII management frame. Figure 37.9 shows an example of bus releasing procedure. Figure 37.10 shows an example of 1-bit data reading procedure. Figure 37.11 shows an example of single bus releasing procedure.

Access Type	MII Management Frame							
Item	PRE	ST	OP	PHYAD	REGAD	TA	DATA	IDLE
Number of Bits	32	2	2	5	5	2	16	
Read	1..1	01	10	AAAAA	RRRRR	Z0	D...D	
Write	1..1	01	01	AAAAA	RRRRR	10	D...D	X

## Legend:

PRE: 32 consecutive 1s

ST: Write B'01 to indicate the start of a frame

OP: Write a code to indicate an access type

PHYAD: Write B'00001 if a PHY-LSI address is 1 (write sequentially from MSB). The values of these bits change according to the PHY-LSI address.

REGAD: Write B'00001 when a register address is 1 (write sequentially from MSB). The value of these bits change according to the PHY-LSI address.

TA: Data transmit source switch time on the MII interface.

(a) Write B'10 during write

(b) Release bus (indicated as Z0) during read

DATA: 16-bit data. Written to or read sequentially from MSB.

(a) Write 16-bit data during write

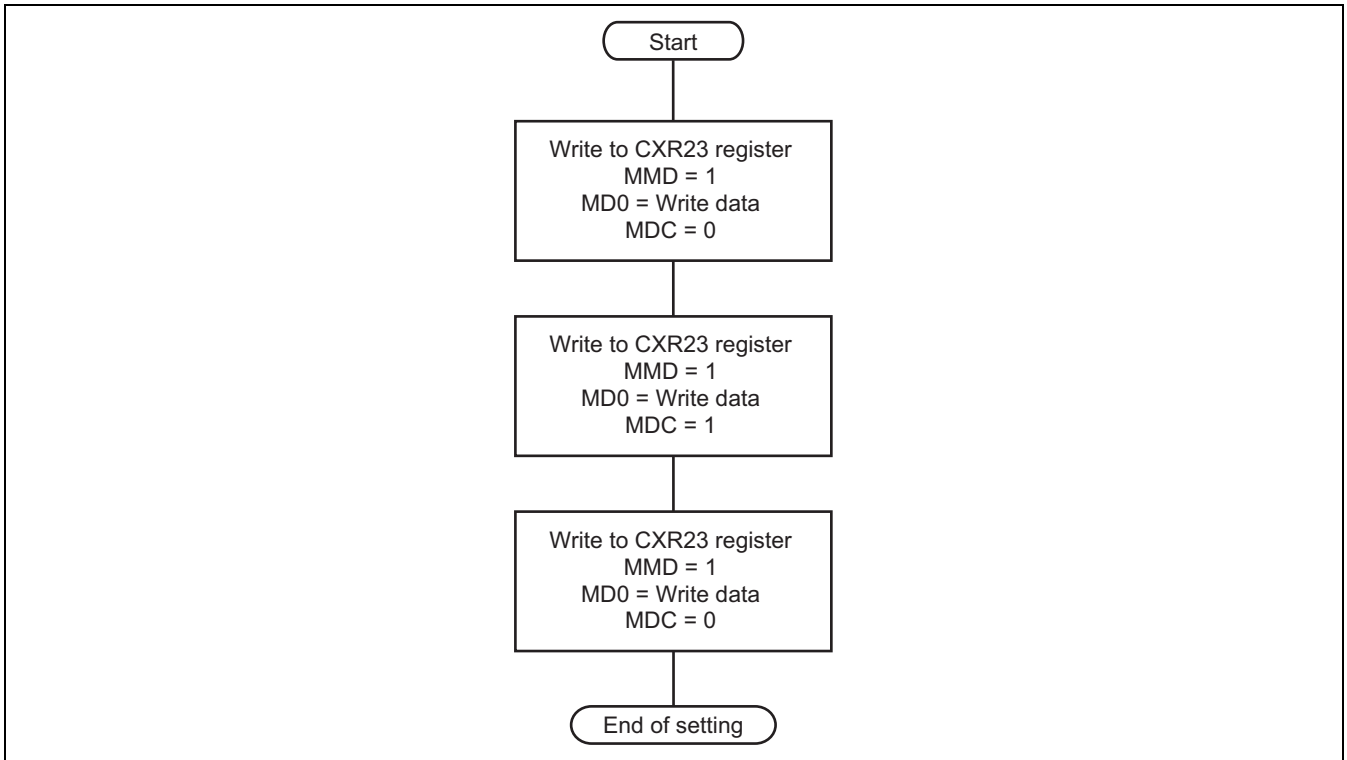

(b) Read 16-bit data during read

IDLE: Wait time until next MII management format is input

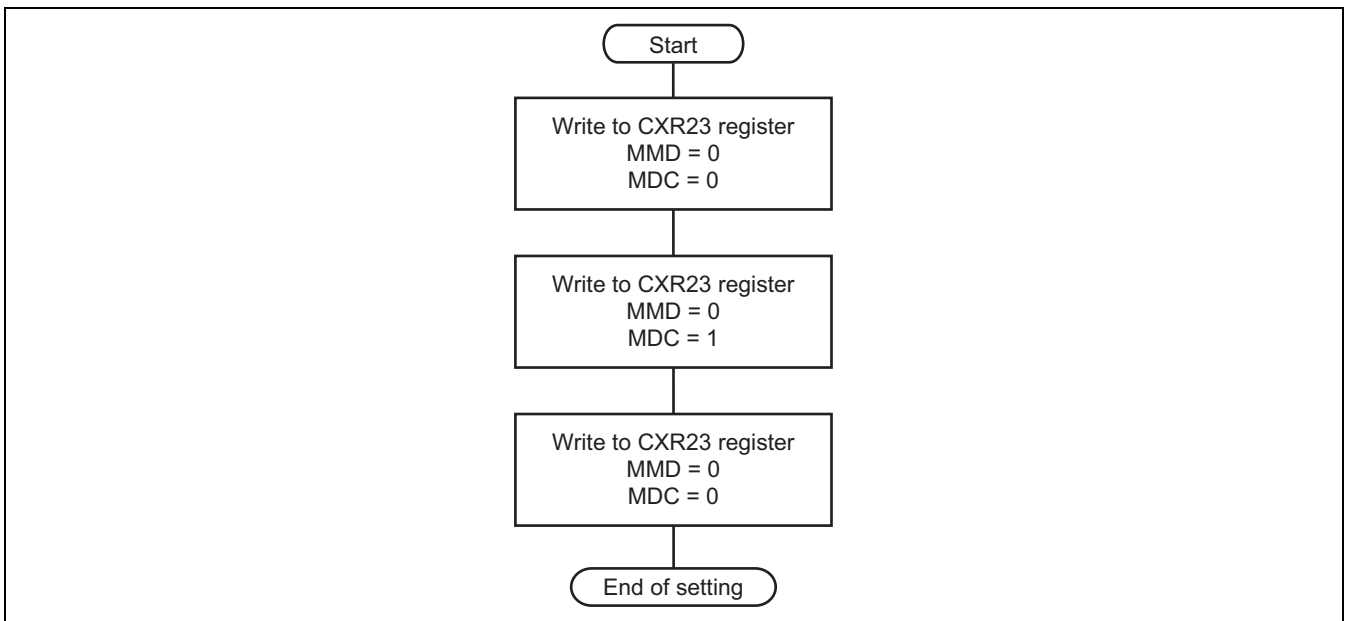

(a) Release a single bus (indicated as X) during write

(b) Control not required because a bus has been released using the TA bits during read

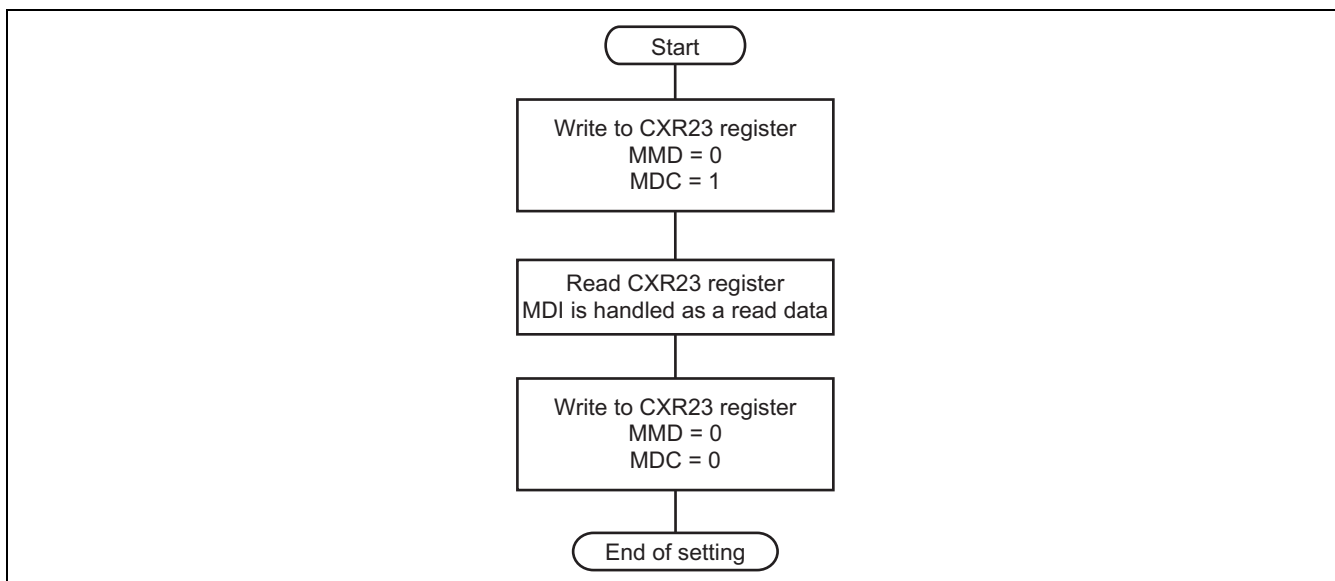

**Figure 37.7 MII Management Frame Format**

### (3) Example of the Procedure for Setting 10-Base T or 100-Base TX Transfer Rates

An example of the procedure for setting 10-base T and 100-base TX transfer rates is given below. Follow this procedure when setting the transfer rate.

This section describes the procedure during operation. For the initial settings, follow the flow in subsection (1), Example of Ethernet Transmission and Reception Procedure, above.

1. Detecting the PHY chip link being down  
Use the CXR2B or CXR21 register to detect the PHY chip link being down.
2. On finding the linking from the PHY chip down  
On detecting the link from the PHY chip being down, proceed with processing for that situation in accord with the PHY chip specification.
3. Transfer Rate Settings  
Make settings on the feLic side as required by the state of the PHY chip. Use the OLB bit in the CXR20 register to set the transfer rate.

## 37.7 Notes

RZ/G1H

RZ/G1N

RZ/G1M

RZ/G1E

### 37.7.1 Software Reset

The ether can be software-reset by setting the SWR bit in the CXR0 register of the HDMAC to 1. If software reset is applied during DMA transfer, the current DMA transfer can be completed but the data transferred by DMA transfer cannot be guaranteed.

### 37.7.2 Standby

If the ether is requested to enter the standby state, the ether first completes the current AXI bus operation, and then enters the standby state. After returning from the standby state, the ether should be reset and initialized.

### 37.7.3 Input Signal on the ETH\_RX\_ER Pin

If an error signal received from PHY is not at the active level for more than one cycle of the RMI reference clock at 50 MHz, the signal is not detected as an error signal.

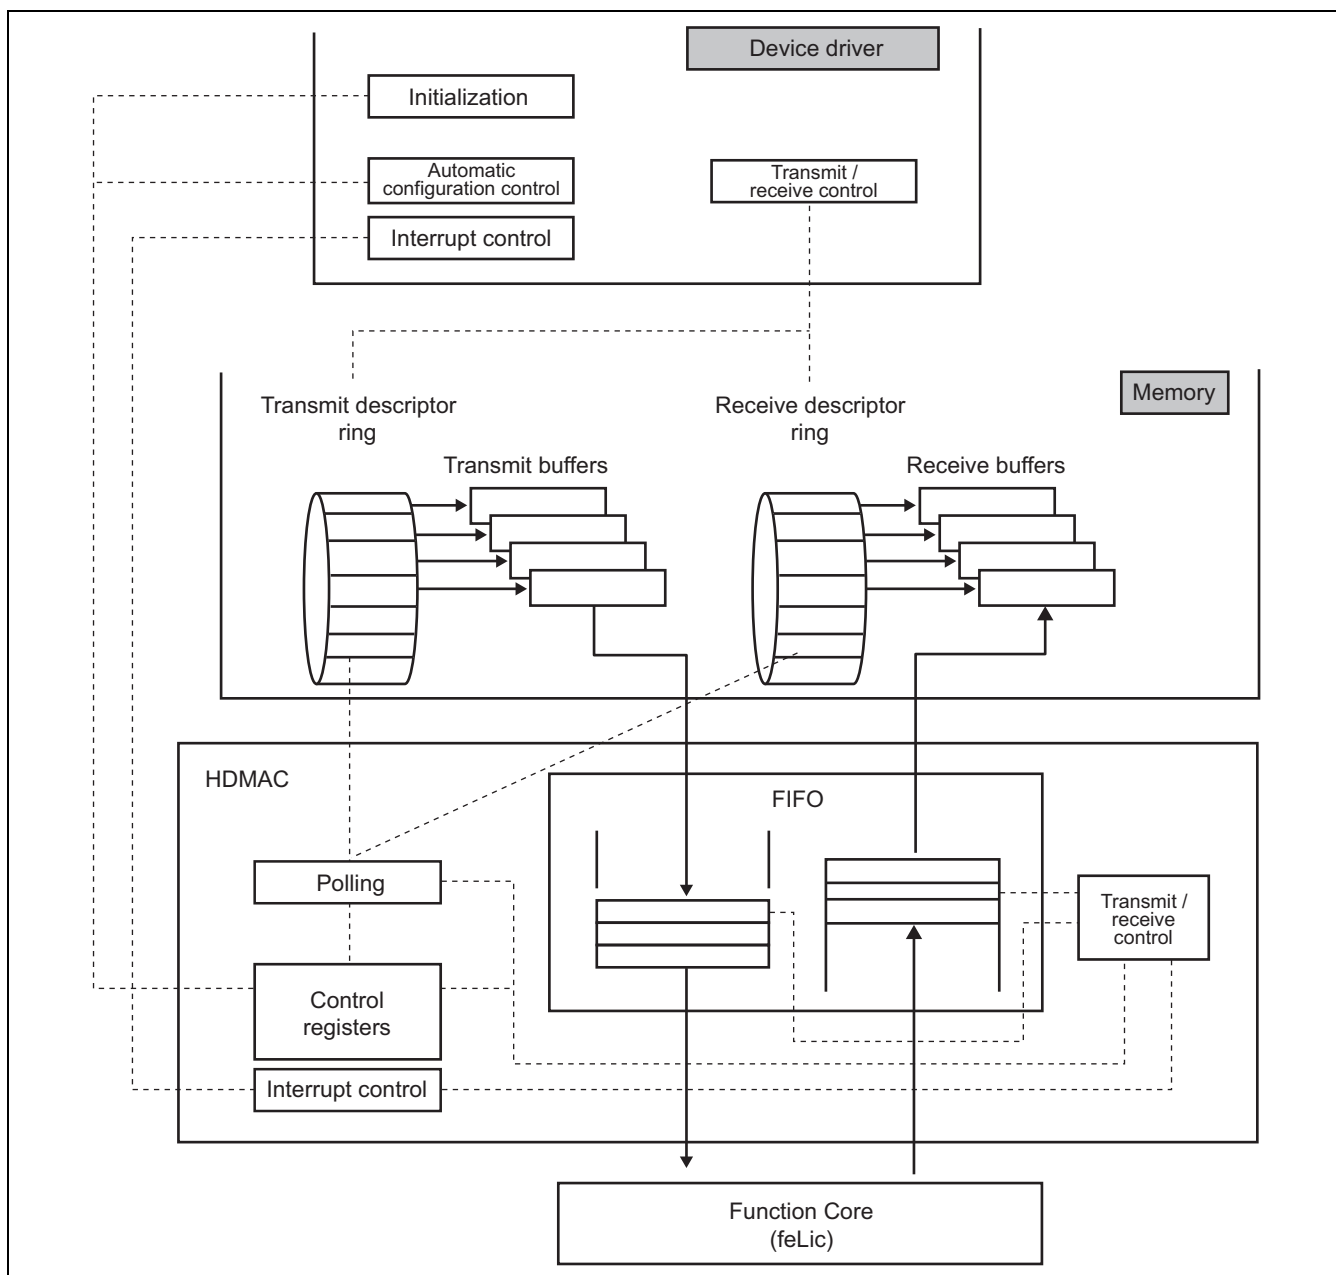

### 37.8 HDMAC Function Specifications

RZ/G1H	RZ/G1N
RZ/G1M	RZ/G1E

#### 37.8.1 Operation

##### (1) Basic Operation

Figure 37.12 shows an image of control between this logic core (HDMAC) and device driver (software).

**Figure 37.12 Image of Control between Device Driver and HDMAC**

The device driver should create the transmit and receive descriptor rings and their corresponding transmit and receive buffers on the memory.

During transmission, this logic core fetches the transmit descriptor to obtain the transmit buffer address and the number of transmit bytes, and transmits data from the transmit buffer to the function core via the transmit FIFO. During

reception, this logic core fetches the receive descriptor to obtain the receive buffer address and buffer size, and stores data received from the function core in the receive buffer via the receive FIFO.

## (2) Descriptor Rings

There is no restriction on the number of descriptors. It is recommended, however, that multiple descriptors are provided.

This logic core uses the descriptor from the start descriptor to the last descriptor sequentially. If it reaches the last descriptor, it returns to use the start descriptor.

The start descriptor address is specified by the start address setting registers (CXR3 and CXR4). The last descriptor is specified by the descriptor ring end bits (TDL, RDL) = 1 in the descriptor. The descriptor boundary is specified by the descriptor length bits (DL) in the operating mode setting register (CXR0).

There is no restriction on the number of receive descriptors in terms of a ring configuration. Note that if only one receive descriptor is used, a receive descriptor depletion occurs when one frame has been received. (For details, refer to section 37.8.1 (8) (g), Receive Descriptor Depletion.)

For details on the descriptor description format, refer to section 37.8.2, Transmit Descriptors, and section 37.8.3, Receive Descriptors.

## (3) Multiple Frames and Multiple Buffers

Multiple frames and multiple buffers enable consecutive frame transmission and reception.

In the receiver, a frame can be divided and stored in multiple buffers separately by specifying the frame in multiple descriptors.

In the transmitter, a frame is specified by a descriptor.

During transmission, after having transmitted data (frame) specified by a transmit descriptor, this logic core fetches the next descriptor. This logic core then determines that there is data (frame) to be transmitted next if the TACT bit in the fetched transmit descriptor is 1 and transmits the data (frame). If the TACT bit in the fetched transmit descriptor is 0, this logic core completes the transmit operation.

Note that bits 29 and 28 in the transmit descriptor TD0 should be set to 11. Otherwise, correct operation cannot be guaranteed.

During reception, after having received a frame, this logic core fetches the next receive descriptor. This logic core determines that the reception is ready if the RACT bit in the fetched receive descriptor is 1 and stores the received frame. If the RACT bit in the fetched receive descriptor is 0, this logic core determines that the receive descriptors have been depleted and completes the receive operation.

If this logic core receives a frame longer than the buffer length specified in the receive descriptor, it stores the frame up to the specified buffer length and then fetches the next receive descriptor. If this logic core further receives a frame longer than the buffer length specified in the fetched receive descriptor, it stores the frame up to the specified buffer length and then fetches the following descriptor. If this logic core receives a frame whose frame length is within the buffer size specified by the fetched receive descriptor, it stores the last byte of the frame and writes back the number of bytes so far stored in the receive buffer to the receive frame length (RFL) in the receive descriptor. The logic core then fetches the next descriptor to prepare for the next frame reception.

Note that correct operation cannot be guaranteed if the receive buffer length is specified as 0 in the receive descriptor.

#### **(4) DMA Operation**

##### **(a) Burst Operation**

This logic core accesses the descriptors and buffers in longword units via DMA transfer.

During descriptor (16 bytes as standard) fetch, 16-byte DMA transfer is performed per bus acquisition.

During transmit descriptor write back, 4-byte DMA transfer is performed per bus acquisition.

During receive descriptor write back, 8-byte DMA transfer is performed per bus acquisition.

During buffer data transfer, a maximum of 32-byte DMA transfer is performed per bus acquisition.

If the remaining data in a frame to be transferred is 17 to 32 bytes, 32-byte DMA transfer is performed per bus acquisition.

If the remaining data in a frame to be transferred is 9 to 16 bytes, 16-byte DMA transfer is performed per bus acquisition.

If the remaining data in a frame to be transferred is 5 to 8 bytes, 8-byte DMA transfer is performed per bus acquisition.

If the remaining data in a frame to be transferred is 1 to 4 bytes, 4-byte DMA transfer is performed per bus acquisition.

##### **(b) DMA Operation Error Report**

If a DMA error is detected during DMA operation, the BER bit in the status register (CXR5) is set to 1 to generate an interrupt. After interrupt, DMA operation should be restarted by a reset (system reset or software reset).

#### **(5) Transmit and Receive Buffers**

A transmit buffer address and transmit buffer length to be specified by a transmit descriptor can be set in byte units. However, if 1 to 16 bytes is specified as the transmit buffer length, the transmit buffer address should be aligned on a 32-byte boundary. Note that correct operation cannot be guaranteed if 0 byte is specified as the transfer buffer length.

A receive buffer address to be specified by a receive descriptor should be aligned on a 32-byte boundary to prevent the DMA burst operation from being performed beyond SDRAM boundary.

In addition, if the number of data bytes remaining in a frame to be transferred cannot be divided by DMA burst bytes (32 bytes), the receive buffer length to be specified by the receive descriptor should be specified on a 32-byte boundary since extra data is transmitted.

For example, if the number of last data bytes remaining in a receive frame is 17 bytes, invalid data is written in the 18th to 32nd bytes in the corresponding address of the receive buffer since 32-byte DMA burst transfer is performed.

#### **(6) Endian**

Endian conversion can be used for the data arrangement in the transmit and receive buffers according to the DE bit setting in the operating mode setting register (CXR0).

Note that only the endian of the data in the transmit and receive buffers can be changed. Endian of descriptors and registers cannot be changed.

Note: Be sure to set DE bit to 1 before operating the Ethernet MAC controller (Ether).

#### **(7) Transmit Operation**

##### **(a) Normal Transmit Operation**

This logic core starts the transmit processing when 1 is written to the TRNS bit in the transmit activation register (CXR1).

This logic core fetches a descriptor next to the previous descriptor from the transmit descriptor ring.

If the TACT bit in the fetched transmit descriptor is 1, data in the transmit buffer is read out and written in the transmit FIFO sequentially according to the specified transmit buffer address and the number of bytes.

If the TACT bit in the fetched transmit descriptor is 0, the TRNS bit in the transmit activation register (CXR1) is cleared to 0 and transmit processing is completed without any operation.

When data of the buffer length indicated by the descriptor has been transmitted to the function core via the transmit FIFO (normally completed or aborted), the transmit descriptor is written back to, and the next descriptor is fetched.

While the TACT bit in the fetched transmit descriptor is 1, the transmit descriptor fetch and DMA transfer are performed continuously.

If the TACT bit in the fetched transmit descriptor is 0, the FTC bit in the status register (CXR5) is set to 1 to indicate the completion of transmission thus requesting an interrupt to the CPU, and simultaneously the TRNS bit in the transmit activation register (CXR1) is cleared to 0 to stop transmit processing.

If data in the transmit FIFO exceeds the threshold (changes according to the register setting), if data of a frame has been stored, or if the transmit FIFO becomes full, the function core is activated and data in the transmit FIFO is transmitted to the function core synchronously with the RDY signal in the function core.

When a transmit completion signal or abort signal is input from the function core, the above transmit operation is ended.

#### **(b) Continuous Frame Transmit Operation**

Multiple frames can be specified in a transmit descriptor.

This logic core clears the TACT bit in the transmit descriptor to 0 when data transmission indicated in the transmit descriptor has been completed, and fetches the next transmit descriptor. While the TACT bit in the fetched descriptor is 1, the frame transmission is performed continuously. When the TACT bit in the transmit descriptor is 0, the FTC bit in the status register (CXR5) is set to 1 to indicate the transmission completion thus requesting an interrupt to the CPU, and the TRNS bit in the transmit activation register (CXR1) is cleared to 0 to stop transmit processing.

Generation of a transmit completion interrupt (the FTC bit in CXR1 is set to 1) informs the CPU that all the specified frames have been transmitted.

#### **(c) Transmit Abort**

If this logic core receives an abort signal (ATABT) from the function core during frame transmission, it aborts data transmission of the corresponding frame from transmit FIFO to the function core.

When the transmission is aborted, this logic core clears the TACT bit in the transmit descriptor to 0, sets bit 8 in the transmit frame status (TFS) to 1.

The following operations are the same as (1) Normal Transmit Operation or (2) Continuous Frame Transmit Operation described above.

When detected the TACT bit in the fetched transmit descriptor is 0, the FTC bit in the status register (CXR5) is set to 1 to indicate the transmission completion, and TABT bit is also set to 1 to indicate the transmission abort to requesting an interrupt to the CPU.

#### **(d) Transmit FIFO Underflow**

This logic core does not transmit data to the function core until data in the transmit FIFO exceeds the specified threshold (changes according to the register setting), data of a frame is stored in the transmit FIFO, or the transmit FIFO becomes full to prevent the transmit FIFO from underflow.

An underflow will occur if the transmit FIFO becomes empty (there is no data to be transmitted) because the bus mastership cannot be obtained.

In this case, the TFE bit in the status register (CXR5) is set to 1 to indicate transmit FIFO underflow and an interrupt is requested to the CPU.

The frame where an underflow occurred is transmitted to the function core in the same way as the normal frame. After the frame transmission, the TACT bit in the transmit descriptor is cleared to 0 and transmit frame status (TFS) is set to 1. The following operations are the same as (1) Normal Transmit Operation or (2) Continuous Frame Transmit Operation described above.

#### (e) Transmit Frame Retry

If this logic core receives an ATRTRY signal from the function core after having transmitted the last byte of a frame to the function core, this logic core fetches the start descriptor of the current frame again, and re-transmits the data of the current frame from the start to last bytes to the transmit FIFO.

### (8) Receive Operation

#### (a) Normal Receive Operation

This logic core starts receive processing when 1 is written to the R bit in the receive activation register (CXR2).

This logic core fetches the receive descriptor (Nth receive descriptor) next to the previous receive descriptor ((N - 1)th receive descriptor) from the receive descriptor ring, and enters the receive wait state.

In the receive wait state, if the receive FIFO contains data of 32 bytes or more or the last byte, data is transferred from the receive FIFO to the receive buffer.

When the receive buffer specified by the receive descriptor becomes full, this logic core writes 0 to the RACT bit in the receive descriptor and fetches the (N + 1)th receive descriptor. If the RACT bit in the (N + 1)th receive descriptor is 1, this logic core enters the receive wait state again.

If the last byte of a frame has been transferred, this logic core writes 0 and 1 in the RACT bit and the RFP[0] bit in the receive descriptor, respectively, sets the FRC bit in the status register (CXR5) to 1 to indicate the completion of frame reception, requests an interrupt to the CPU, and finally fetches the (N + 2)th receive descriptor.

If the RACT bit in the (N + 2)th receive descriptor is 1, this logic core enters the receive wait state. Contrarily, if the RACT bit in the (N + 2)th receive descriptor is 0, a receive descriptor depletion occurs. (For details, refer to section 37.8.1 (8) (g), Receive Descriptor Depletion.)

#### (b) Continuous Frame Receive Operation

As described in (1) Normal Receive Operation, when a frame has been received and the last byte of the frame has been transferred, this logic core writes 0 and 1 in the RACT bit and RFP[0] bit in the Nth receive descriptor, respectively, sets the FRC bit in the status register (CXR5) to 1 to indicate the completion of frame reception, generates an interrupt to the CPU, fetches the (N + 1)th receive descriptor, and enters the receive wait state.

When the last byte in the (N + 1)th receive descriptor has been transferred, this logic core writes 0 and 1 in the RACT bit and RFP[0] bit in the (N + 1)th receive descriptor, respectively, sets the FRC bit in the status register (CXR5) to 1 to indicate the completion of frame reception, generates an interrupt to the CPU, fetches the (N + 2)th receive descriptor, and enters the receive wait state.

This logic core then receives frames continuously until the RACT bit in the fetched descriptor is cleared to 0 (a receive descriptor depletion occurs).

**(c) Receive Operation of Multiple Frames and Multiple Buffers**

If the byte count of the received Mth frame is greater than the buffer length specified by the Nth receive descriptor, this logic core transfers data of the specified receive buffer length and then writes 0s in the RACT bit and RFP[0] bit in the Nth receive descriptor and fetches the (N + 1)th receive descriptor.

With the (N + 1)th receive descriptor, this logic core performs the data transfer of the same frame (Mth frame). If the byte count of the received Mth frame is greater than the buffer length specified by the (N + 1)th receive descriptor, this logic core transfers data of the specified receive buffer length and writes 0s in the RACT bit and RFP[0] bit in the (N + 1)th receive descriptor and fetches the (N + 2)th receive descriptor as described above. Contrarily, if the byte count of the received Mth frame is smaller than the buffer length specified by the (N + 1)th receive descriptor, this logic core, after having transferred the last byte, writes 0 and 1 in the RACT bit and RFP[0] bit in the (N + 1)th receive descriptor, sets the FRC bit in the status register (CRX5) to 1 to indicate the completion of frame reception, generates an interrupt to the CPU, fetches the (N + 2)th receive descriptor, and enters the receive wait state, as described in (1) Normal Receive Operation.

**(d) Receive Abort**

If this logic core receives a receive abort (ARABT) signal from the function core during frame reception, it aborts reception of the corresponding frame data from the function core.

This logic core transfers data stored in the receive FIFO before receive abortion to the receive buffer. When the last byte has been transferred, this logic core clears the RACT bit in the receive descriptor to 0, sets bit 8 of receive frame status in the receive descriptor to 1, sets the FRC and RABT bits in the status register (CRX5) to 1s to indicate the frame transmission completion and receive abort detection, respectively, and finally generates an interrupt to the CPU.

If this logic core receives an ARABT signal from the function core while the number of data bytes of the stored frame in the receive FIFO is less than 16 bytes, this logic core deletes the corresponding frame.

**(e) Receive FIFO Overflow**

If the receive FIFO becomes full because the bus mastership cannot be obtained, an overflow error occurs because the next data cannot be stored in the receive FIFO.

If an overflow error occurs, the receive FIFO terminates the data reception and sets the RFE bit in the status register (CXR5) to 1 to indicate the receive FIFO overflow, and generates an interrupt to the CPU. When the transfer of the byte immediately before the overflow has been completed, this logic core writes 0 and 1 to the RACT bit and bit 9 of receive frame status (RFS) in the receive descriptor, respectively, sets the FRC and RFE bits in the status register (CXR5) to 1s to indicate the frame reception completion and receive FIFO overflow, respectively, and finally generates an interrupt to the CPU.

While the receive FIFO is full, the next frame is received but discarded. Simultaneously, the discarded frame counter register (CXR8) is incremented.

If the receive FIFO becomes not full after data has been transferred from the receive FIFO to the receive buffer, this logic core restarts the reception from the start byte of the next receive frame.

The number of frames that can be simultaneously stored in the receive FIFO is limited to 16 frames due to the frame management restriction. Accordingly, this logic core cannot receive a frame if 16 frames have been stored in the receive FIFO. If this logic core receives the start data of the 17th frame, it sets the RFRMER bit in the status register (CXR5) to 1 to indicate the receive frame count overflow, and generates an interrupt to the CPU.

This logic core receives the next frame but discards it, and simultaneously increments the discarded frame counter register (CXR8).

If a space of 1 frame or more is produced in the receive FIFO after data has been transferred from the receive FIFO to the receive buffer, this logic core restarts the reception from the start byte of the next receive frame.

**(f) Flow Control Support**

This function core provides an ARBSY signal to inform the function core of the receive FIFO status. It can output the ARBSY signal based on the data amount stored in the receive FIFO according to the setting of the receive FIFO busy transmit threshold setting register (CXR16).

Accordingly, the flow can be controlled by sending "BUSY" to the function core before the receive FIFO overflows.

The BUSY status can be cancelled when the data byte count or the frame count in the receive FIFO become (the byte count value causing a transition to the BUSY state – 32 bytes) or smaller and (the frame count value causing a transition to the BUSY state – 1 frame) or smaller, respectively.

**(g) Receive Descriptor Depletion**

When this logic core has transferred data of the Mth frame to the receive buffer specified by the Nth receive descriptor, it fetches the (N + 1)th receive descriptor to prepare for the reception of the (M + 1)th frame.

If the RACT bit of the fetched descriptor ((N + 1)th descriptor) is 0, this logic core regards it as receive descriptor depletion, sets the RDE bit in the status register (CXR5) to 1 to indicate the receive descriptor depletion, and generates an interrupt to the CPU.

Simultaneously, this logic core clears the R bit in the receive activation register (CXR2) to 0 and terminates the receive processing. In this case, data transfer from the function core to the receive FIFO continues.

In this situation, the CPU should clear the interrupt source and reset the receive descriptor correctly.

If the valid receive descriptor is set before a receive FIFO overflow occurs, a frame reception can be continued without data loss.

**37.8.2 Transmit Descriptors**

Figure 37.13 shows a transmit descriptor format.

If 1 to 16 bytes is specified as the transmit buffer length, the transmit buffer address should be aligned on a 32-byte boundary. Note that correct operation cannot be guaranteed if 0 byte is specified as the transfer buffer length.

**Figure 37.13 Transmit Descriptor Format**

**(1) Transmit Descriptor 0 (TD0)**

Table 37.7 shows a definition of transmit descriptor 0. (A bit to be written back to is underlined.)

**Table 37.7 Definition of Transmit Descriptor 0**

Bit	Bit Name	Initial Value	R/W	Definition
<u>31</u>	TACT	Undefined	R/W	Descriptor Valid Indicates that the corresponding descriptor is valid. This bit is set to 1 by a driver, and reset (cleared to 0) by this logic core when a frame transmission has been completed or a frame transmission has been aborted for some reason.
30	TDL	Undefined	R/W	Descriptor Ring End Set to 1 to indicate that the corresponding descriptor is an end of the transmit descriptor ring.
29, 28	TFP	Undefined	R/W	Position in a Frame 11: Indicate that the information in this descriptor includes one whole frame. This field should be set to 11.
<u>27</u>	TFE	Undefined	R/W	Transmit Frame Error Set to 1 to indicate that an error occurs in TFS.
26	TWBI	Undefined	R/W	Write-Back Completion Interrupt Request (Enabled according to CXR18 settings) 0: nop 1: Requests an interrupt after a write-back to this descriptor has been completed.
<u>25 to 0</u>	TFS	Undefined	R/W	Transmit Frame Status Bit 8: Set to 1 to indicate that the underflow occurs shown as an abort signal is set to 1 during transmission of the frame, (TFE set source). Bits 7 to 0: Set to 1 to indicate that a corresponding bit among TINT8 to TINT1 is set to 1.

**(2) Transmit Descriptor 1 (TD1)**

Table 37.8 shows a definition of transmit descriptor 1.

**Table 37.8 Definition of Transmit Descriptor 1**

Bit	Bit Name	Initial Value	R/W	Definition
31 to 16	TBL	Undefined	R/W	Buffer length: Indicates the valid byte count in the target transmit buffer.
15 to 0	—	Undefined	R/W	Reserved

**(3) Transmit Descriptor 2 (TD2)**

Table 37.9 shows a definition of transmit descriptor 2.

**Table 37.9 Definition of Transmit Descriptor 2**

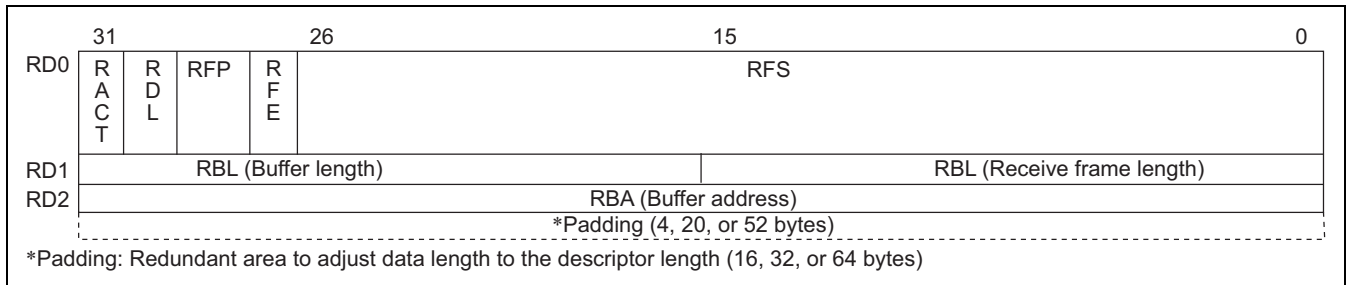

Bit	Bit Name	Initial Value	R/W	Definition
31 to 0	TBA	Undefined	R/W	Buffer address: Indicates the start address of the transmit buffer.

### 37.8.3 Receive Descriptors

Figure 37.14 shows a receive descriptor format.

A receive buffer address specified by a receive descriptor should be aligned on a 32-byte boundary. Note that correct operation cannot be guaranteed if 0 byte is specified as the receive buffer length (RBL).

**Figure 37.14 Receive Descriptor Format**

**(1) Receive Descriptor 0 (RD0)**

Table 37.10 shows a definition of receive descriptor 0. (A bit to be written back to is underlined.)

**Table 37.10 Definition of Receive Descriptor 0**

Bit	Bit Name	Initial Value	R/W	Definition
<u>31</u>	RACT	Undefined	R/W	Descriptor Valid Indicates that the corresponding descriptor is valid. This bit is set to 1 by a driver, and reset (cleared to 0) by this logic core when a frame transmission has been completed or the receive buffers have become full.
30	RDL	Undefined	R/W	Descriptor Ring End Set to 1 to indicate that the corresponding descriptor is an end of the receive descriptor ring.
<u>29, 28</u>	RFP	Undefined	R/W	Position in a Frame 10: Indicate that the information in this descriptor includes the start of a frame. 11: Indicate that the information in this descriptor includes one whole frame. 01: indicate that the information in this descriptor includes the end of a frame. 00: Indicate that the information in this descriptor is other than above.
<u>27</u>	RFE	Undefined	R/W	Receive Frame Error Set to 1 to indicate that an error occurs in RFS.
<u>26 to 0</u>	RFS	Undefined	R/W	Receive Frame Status Bit 9: Set to 1 to indicate that an aborted frame is written back due to a receive FIFO overflow (FRE setting source). Bit 8: Set to 1 to indicate that an abort signal is set to 1 during frame reception (RFE set source). Bits 7 to 0: Set to 1 to indicate that a corresponding bit among RINT8 to TINT1 is set to 1 (RFE setting sources specified by CXR7).

**(2) Receive Descriptor 1 (RD1)**

Table 37.11 shows a definition of receive descriptor 1. (A bit to be written back to is underlined.)

**Table 37.11 Definition of Receive Descriptor 1**

Bit	Bit Name	Initial Value	R/W	Definition
31 to 16	RBL	Undefined	R/W	Buffer length Indicate the byte count in the target receive buffer. The buffer length should be specified by 32 bytes x n.
<u>15 to 0</u>	RFL	Undefined	R/W	Receive Frame Length Indicate the receive frame length (bytes) stores in the receive buffer. This receive frame length does not include the number of bytes for padding specified in the CXRS5. This receive frame length is written back in the receive descriptor that includes the last of a frame.

**(3) Receive Descriptor 1 (RD2)**

Table 37.12 shows a definition of receive descriptor 2.

**Table 37.12 Definition of Receive Descriptor 2**

Bit	Bit Name	Initial Value	R/W	Definition
31 to 0	RBA	Undefined	R/W	Buffer Address These bits indicate the start address of a receive buffer. The buffer address should be aligned on a 32-byte boundary.

**37.8.4 Error Detection and Report**

The error sources are classified into two types: those detected by the HDMAC and those detected and reported by the feLic.

Each error is described below. If an error is detected, the detected error is indicated in the status register (CXR5) and an interrupt signal is output.

**(1) Error Sources Detected by the HDMAC****(a) Descriptor Depletion**

If no descriptor whose descriptor valid bit is set can be detected during frame reception, a receive descriptor depletion error occurs and the R bit in the receive activation register (CXR2) is reset to complete the receive processing.

**(b) External FIFO Underflow/Overflow**

If a transmit FIFO becomes empty during frame transmission, an underflow error occurs because there is no data to be transmitted.

If a receive FIFO becomes full during frame reception, an overflow error occurs because the next receive data cannot be stored in the receive FIFO.

If an underflow error in a transmit FIFO or an overflow error in a receive FIFO is detected, it is indicated in the status register (CXR5).

**(2) Error Sources Detected and Reported by the Function Core (feLic)****(a) Transmit Interrupt**

Interrupt sources detected by the function core (feLic) during frame transmission are reported to the transmit descriptor of the corresponding frame and status register (CXR5) as TINT1 to TINT8, or transmit abort detect (TABT).

**(b) Receive Interrupt**

Interrupt sources detected by the function core (feLic) during frame reception are reported to the receive descriptor of the corresponding frame and status register (CXR5) as RINT1 to RINT8, and receive abort detect (RABT).

**(c) MPORT Interrupt (MINT)**

If an error is detected other than during transmission or reception, it is reported as an MPORT interrupt.

For details on TINT, RINT, and MINT bits, see the Function Core Function Specifications.

**(3) Error Log Information**

This logic core provides the following log collection registers.

1. Discarded frame counter register (CXR8)
2. Transmit FIFO underflow counter register (CXR13)
3. Receive FIFO overflow counter register (CXR14)

### 37.8.5 Firmware/Software Interface

#### (1) Interrupts

Interrupts sources in this logic module are as follows.

1. RINT1 to RINT8
2. TINT1 to TINT8
3. Receive FIFO overflow
4. Receive descriptor depletion
5. Frame receive completion
6. Transmit FIFO underflow
7. Transmit descriptor depletion (not used)
8. Frame transmit completion
9. M port interrupt
10. DMA error
11. Receive frame count overflow
12. Receive abort detection
13. Transmit abort detection
14. External EXIN signal assertion detection (not used)
15. Transmit descriptor write-back

The above interrupt sources are indicated in the status register (CXR5). An interrupt source (other than M port interrupt signal (MINT) bit) can be reset by writing 1 to the corresponding bit in the CXR5 register. An M port interrupt signal (MINT) can be reset by resetting the corresponding source in the function core. The above interrupt sources can be separately masked by setting the interrupt mask register (CXR6).

### 37.9 feLic Function Specifications

RZ/G1H	RZ/G1N
RZ/G1M	RZ/G1E

#### 37.9.1 Configuration

Figure 37.15 shows a block diagram of feLic.

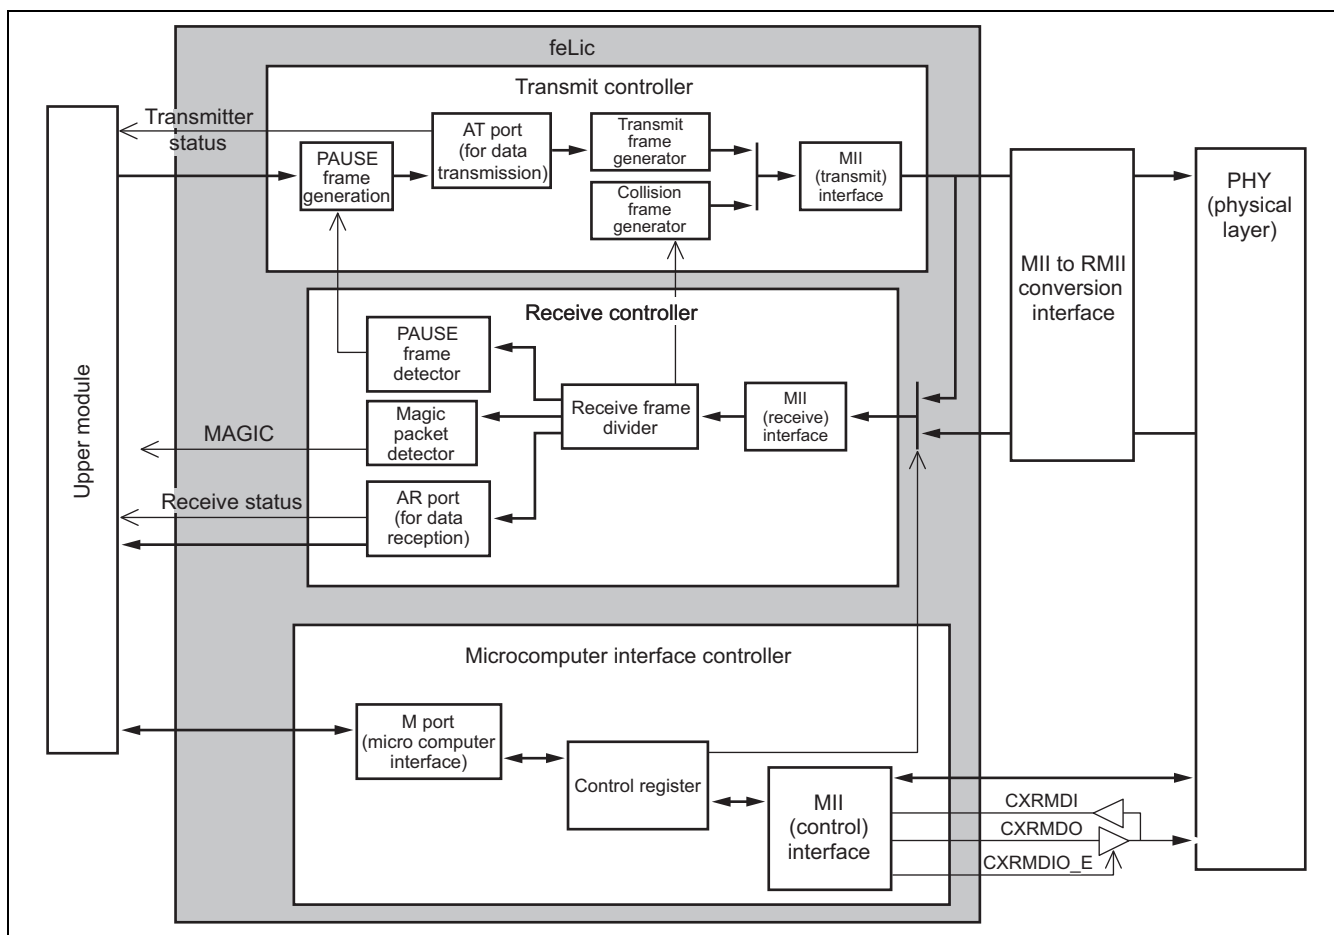

Figure 37.15 feLic Block Diagram

#### 37.9.2 feLic Function

##### (1) Transmit Controller

The transmit controller assembles data received from AT port into the IEEE802.3 format frames, and transmits them via the MII interface.

The main functions of the transmit controller are listed below.

1. Assembles data received from the AT port into the IEEE802.3 format frames and transmits them.
2. Performs CRC calculation and adds it to the frame.
3. Retransmits frames (up to 15 times) when a collision occurs.
4. Provides the MII interface function conforming to the IEEE802.3u.
5. Performs serial and parallel conversion according to the PHY chip speed.
6. Provides transmit frame data padding function.

7. Generates a PAUSE frame.

## (2) Receive Controller

Upon receiving a frame via the MII interface, the receive controller checks the frame address to see if the address matches the self-node; it also checks CRC and the frame length of the data and transfers the data to the AR port.

The main functions of the receive controller are listed below.

1. Checks the format of the received frame header.
2. Checks the CRC and frame length of the received frame data.
3. Transfers frames addressed to itself, multicast frames, and broadcast frames to the AR port.
4. Provides the MII interface function conforming to the IEEE802.3u.
5. Performs serial and parallel conversion according to the PHY chip speed.
6. Monitors a magic packet.
7. Analyzes a PAUSE frame.

## (3) Microcomputer Interface Controller

The microcomputer interface controller incorporates a function to interface to the upper microprocessor. The data width of the M port is 32 bits. The M port operates synchronously with the external clock. The upper microprocessor controls the registers in this microcomputer interface controller block and the registers in PHY via the MII interface.

The main functions of the microcomputer interface controller are listed below.

1. Controls the operation of transmitter and receiver.
2. Accesses the PHY registers via the serial bus.

## (4) Magic Packet Monitor Function

The receive controller monitors the magic packet and report the magic packet detection to an external device in magic packet monitor mode. This function becomes effective by the MPM bit in the CXR20 register. When the magic packet is detected, "ETH\_MAGIC" signal that is an output is asserted and the CXR21 register is updated. Their detecting functions are explained as follows.

### (a) Assertion by the ETH\_MAGIC signal

ETH\_MAGIC signal that is an output signal of the feLic is asserted synchronizing with the rising edge of the received clock from PHY. Detection of the magic packet can be informed to external circuits by using this signal. The ETH\_MAGIC signal is negated by the hardware reset and the software reset of the HDMAC/feLic using CXR0 register.

### (b) Assertion by the CXR21 register

Updating CXR21 can assert as software interruption. The detecting information is cleared by writing a 1 to the corresponding bit. Note that if a magic packet is received again, CXR21 register is not updated while the ETH\_MAGIC signal is asserting. Set the feLic again after clearing by the procedure described (1).

## (5) Transmit and Receive Status Statistical Function

The interrupt source signals (TINT/RINT) to be output to the upper modules can be counted and referenced as statistical information by accessing a register via the M port.

The interrupt source signal counting starts after reset (includes a soft reset by CXR0 register) and the count value can be cleared only by a write access.

## (6) Flow Control Conforming to IEEE802.3

As the flow control during full-duplex operation, the flow control conforming to IEEE802.3x is supported. Transmission of a PAUSE frame used in flow control is performed in the following methods. These methods can be used by mutually combining.

### (a) Automatic PAUSE Frame Transmission

A PAUSE frame is transmitted automatically by asserting the ARBSY signal. Note that as the Timer value included in the PAUSE frame, the value set in the automatic PAUSE parameter setting register (see CXR71) is used. If the ARBSY signal is not negated when the time indicated by the Timer value has passed after transmitting a PAUSE frame, a PAUSE frame is transmitted again. The number of PAUSE frame re-transmissions (upper limit) can be specified from 1 to 65535 times by setting the PAUSE frame retransmit count setting register (CXR81). If the number of PAUSE frame re-transmissions reaches the upper limit, the following PAUSE frame re-transmissions will not be performed.

Transmission can be restarted when ARBSY signal is negated once and then asserted again thus resetting the PAUSE frame re-transmission counter (CXR82). In addition, it is possible not to set the upper limit of the re-transmissions (unlimited).

### (b) Manual PAUSE Frame Transmission

This method can send the PAUSE frame by calling of software. Set the Timer value to the CXR72 register to sending the PAUSE frame. It is sent just one time (one frame) in this method.

### (c) PAUSE Timer Value

For the PAUSE frame whose Timer value is 0, it is possible to enable or disable the PAUSE frame control.

- During transmission
  - When control of a PAUSE frame whose Timer value is 0 is enabled, a PAUSE frame with Timer value 0 is transmitted if the ARBSY signal is negated before the time indicated by the Timer value has passed.
  - When control of a PAUSE frame whose Timer value is 0 is disabled, the next frame will not be transmitted until the time indicated by the Timer value has passed.
- During reception
  - When control of a PAUSE frame whose Timer value is 0 is enabled, a PAUSE frame is set in the receive wait counter even if the time indicated by Timer value is 0. (The receive wait state is cancelled.)
  - When control of a PAUSE frame whose Timer value is 0 is disabled, the PAUSE frame is discarded if the time indicated by Timer value is 0.

### (d) PAUSE Frame Reception

When a PAUSE frame is received, this logic function suspends transmission of the next frame until the time indicated by the Timer value has passed. However, transmission of the frame being transmitted continues. A number of the PAUSE frame receiving is counted to CXR80.

## (7) Back-Pressure Flow Control

As the flow control during half-duplex operation, the back-pressure flow control is supported. This method generates a pseudo collision (transmits a collision frame) to stop the frame reception if the remaining space in the FIFO is not sufficient when the frame is received. This method does not refer to the DA.

### 37.9.3 Detailed Description of Transmit and Receive Controllers

#### (1) Transmit Controller

The transmit controller assembles the transmit data from the AT port into the frames based on the appropriate format and transmits them via the MII interface. Here, an error may occur according to the status of the communication lines. If an error of TINT1 to RINT8 occurs, the transmission is aborted and the error source is reported to the upper block using the abort signal (ARABT). If the transmission is completed normally, it is reported via the transmit completion signal (ATCOMP).

The conditions of generating each error source and operation are described below.

- TINT1: Transmit timeout  
When a collision occurs (the COL signal assertion) during frame transmission, the transmission is retried after the back-off time has passed. A transmit timeout is generated if a collision occurs again during the 15th transmission retry.
- TINT2: Collision detection during frame transmission  
Generated if a delay collision described in the IEEE802.3 standard occurs.  
Description in the standard: It is regarded as a delay collision if a collision occurs after the collision window at 512-bit time from the transmission start.
- TINT3: Carrier loss during frame transmission  
Generated when a carrier is lost (the CRS signal is negated) during frame transmission.
- TINT4: Carrier not detected  
Generated when a carrier is not detected (the CRS signal is not asserted) during preamble field transmission.
- TINT5: Not assigned
- TINT6: Not assigned
- TINT7: Not assigned
- TINT8: Not assigned

If any transmit error described above occurs, the feLic enters the wait state for the next frame transmission request and starts the next frame transmission when the next frame transmission is requested.

#### (2) Receive Controller

The receive controller transfers a frame received via the MII interface to the AR port. Here, an error may occur according to the status of the communication lines. If an error of RINT1 to RINT4 occurs, the reception is aborted and the error source is reported to the upper block using the abort signal (ARABT). RINT5 indicates that a fractional number bit error has occurred. Note, however, that a frame with an RINT5 error but with no CRC error can be received normally. A frame with RINT8 can also be received normally. RINT8 is an error source allowing normal frame reception and is reported by using the receive completion signal (ARCOMP) when the frame destination address is a multicast address.

The conditions of generating each error source and operation are described below.

- RINT1: CRC error  
Generated when an error is detected in the FCS field in the receive frame.
- RINT2: Frame receive error  
Reported when the RX\_ER signal in the MII interface is asserted during frame reception. For details on the RX\_ER signal assertion, see the Data Book of the PHY to be connected.
- RINT3: Frame length error  
Reported when the receive frame length is less than 64 bytes.
- RINT4: Frame length error

Reported when the receive frame length exceeds the value specified in the CXR2A register. An excess of data field over the specified frame length is discarded in the feLic and will not be transferred to the upper block.

- RINT5: Fractional number bit error

Reported when the received frame length is not the multiple of an octet. In this case, the last 1 to 4 octets in the data field will not be transferred to the upper block.

- RINT6: Not assigned
- RINT7: Not assigned

- RINT8: Multicast frame reception

Reported when the frame destination address is a multicast address. This error source is reported with a receive completion signal only when other error source is not generated.

If any receive error described above occurs, the feLic enters the wait state for the next frame reception and starts the next frame reception when the next frame is received.

### 37.10 MII-RMII Interface Conversion

RZ/G1H	RZ/G1N
RZ/G1M	RZ/G1E

This LSI supports an RMII interface. The RMII signals are generated by converting the MII signals in the MII-RMII conversion circuit.

#### (1) Clock

ETH\_REFCLK (50 MHz) from the RMII interface is divided and ET\_TX-CLK/ET\_RX-CLK (25 MHz or 2.5 MHz) is output.

#### (2) Reception

Waveforms received from the RMII interface are converted to MII waveforms and output (10 Mbps or 100 Mbps). Illegal carrier detection signal received from the RMII interface is converted to MII signal and output. ETH\_RX\_ER signal received from the RMII interface is converted to MII interface signal and output.

Note: Illegal carrier detection is not generated from preamble detection to reception completion.

#### (3) Transmission

Transmit waveforms from the MII interface is converted to the RMII interface waveforms and output (10 Mbps or 100 Mbps). The collision signal, ET\_COL, is generated by AND operation of the ET\_CRS and ET\_TX-EN signals.

#### (4) Full-Duplex/Half-Duplex Selection

In full-duplex transfer mode, the assertion of the COL is suppressed. Figure 37.16 shows a schematic of the conversion circuit.

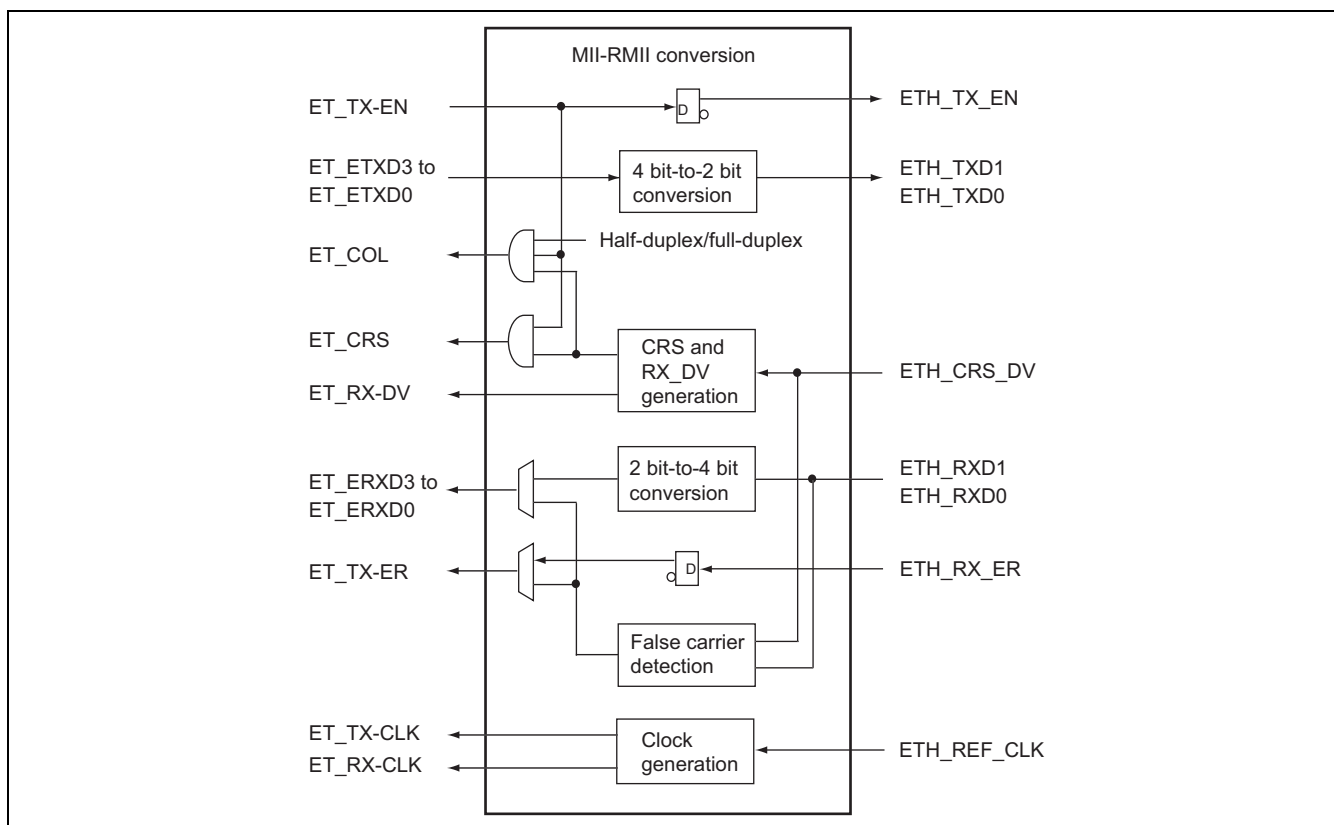

Figure 37.16 MII-RMII Conversion Circuit

## 37A. EthernetAVB

RZ/G1H

RZ/G1N

RZ/G1M

RZ/G1E

### 37A.1 Overview

The EthernetAVB includes an Ethernet controller (E-MAC) that conforms to the definition of the MAC (Media Access Control) layer for Ethernet in the IEEE 802.3 standard.

When connected with a physical-layer LSI chip (PHY-LSI) that complies with the standard, the E-MAC is able to transmit and receive Ethernet (IEEE 802.3) frames. The E-MAC has a single MAC layer interface.

The EthernetAVB has a dedicated direct memory access controller (AVB-DMAC) for transferring transmitted Ethernet frames to and received Ethernet frames from respective storage areas in the URAM at high speed.

The AVB-DMAC is compliant with the following three standards formulated for IEEE 802.1BA: the IEEE 802.1AS timing and synchronization protocol, the IEEE 802.1Qav real-time transfer, and the IEEE 802.1Qat stream reservation protocol.

In this section, URAM refers to the local RAM and external memory.

Descriptors are recommended to be located at addresses H'00 EE0E 8000 to H'00 EE0E BFFF.

#### 37A.1.1 Specifications (Functions)

Table 37A.1 lists the specifications of the EthernetAVB module.

**Table 37A.1 Specifications (Functions)**

Item	Description
Protocol	Flow control conforming with the IEEE 802.3x standard
Data transmission and reception	Transmission and reception of Ethernet (IEEE 802.3) frames
Transfer speed	Supports transfer at 100 and 1000 Mbps
Mode	Full-duplex mode
Interface	Supports the IEEE 802.3 standard MII (Media Independent Interface) and GMII (Gigabit Media Independent Interface)
Summary of the EthernetAVB function	An intelligent frame separation DMAC (AVB-DMAC) conforming with the following standards stipulated for IEEE 802.1BA: IEEE 802.1AS (time synchronization protocol) IEEE 802.1Qav (real-time transfer) IEEE 1722 (AVTP presentation timestamp) IEEE 802.1Qat is supported by software. Descriptor management system Identification and sorting of frame data, and extraction and gathering of valid data Controllable interrupt frequency (reducing the load on the CPU)
Magic Packet™	Detection of Magic Packets™* and output of a detected signal

Note: \* Magic Packet™ is a trademark of Advanced Micro Devices, Inc.

### 37A.1.2 Block Diagram

Figure 37A.1 is a block diagram of the EthernetAVB.

R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
24	LBME	0	R/W	Loopback Mode Enable This bit enables loopback mode. In loopback mode, the transmission lines are internally connected to the reception lines. When loopback mode is to be used, the Ethernet transmission clock must be supplied to the GMII or MII interface. A received clock signal is not required. Writing to this bit is only possible when the current operating mode is configuration mode. 0: Normal operation 1: Loopback mode is enabled. Note: Data for transmission are still output normally. To eliminate effects on external modules, pin control should be applied to block the output of data.
23 to 18	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
17, 16	CSEL[1:0]	00	R/W	gPTP Clock Select These bits select the clock source for the gPTP timer. Writing to these bits is only possible when the current operating mode is configuration mode. 00: Setting prohibited 01: High-speed peripheral bus clock 10: Ethernet transmission clock (125 MHz at 1000 Mbps, 25 MHz at 100 Mbps) 11: GMII reference clock (AVB_GTXREFCLK)
15 to 9	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

Bit	Bit Name	Initial Value	R/W	Description
8	DTSR	0	R/W	<p>Data Transmission Suspend Request</p> <p>This bit can suspend access to the URAM.</p> <p>The access is suspended on completion of the transfer of the AXI transaction currently being transferred.</p> <p>This function disables access to the URAM without affecting normal operation of the AVB-DMAC. Use this bit when exclusive control over the contents of the URAM is necessary, for example, in checking its integrity.</p> <p>Note that the transmission and reception queues are not processed while access is suspended.</p> <p>Change neither the AVB-DMAC settings nor the mode while access is suspended.</p> <p>0: Normal operation 1: Requests suspension</p>
7 to 2	—	All 0	R/W	<p>Reserved</p> <p>These bits are read as 0. The write value should be 0.</p>
1, 0	OPC[1:0]	00	R/W	<p>Operating Mode Configuration</p> <p>These bits specify the operating mode.</p> <p>For the operating modes, see section 37A.3.1.1, Operating Modes.</p> <p>Writing to these bits is possible in any of the operating modes, but should not be done after the application system has issued a Power Off request.</p> <p>00: Reset mode 01: Configuration mode 10: Operation mode 11: Reserved</p>

### 37A.2.2 Descriptor Base Address Table Register (DBAT)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

The DBAT register specifies the base address of the descriptor table in the URAM. For the structure of this table, see section 37A.3.3, Descriptors. Writing to this bit is only possible when the current operating mode is configuration mode.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	TA[31:0]	H'0000 0000	R/W	Descriptor Base Table Address Base address of the descriptor table in the URAM Note: The setting of this bit must be a multiple of four (i.e. bit 0 and bit 1 must be set to 0).

### 37A.2.3 Descriptor Base Address Load Request Register (DLR)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

The DLR register is used to issue a request to load the values from the current descriptor address register q (CDARq) for each queue to the descriptor base address table register (DBAT).

Setting a bit to 1 issues a request for loading the descriptor base address for the queue q. If transfer is currently in progress, loading is executed on completion of transfer for the current frame. Completion of loading leads to automatic setting of the corresponding bit to 0.

For the transmission queues, base address load requests are executed even while fetching is in progress (the transmit start request bit in the transmit configuration control register (TCCR.TSRQt) is 1). Therefore, be sure to check that fetching is not in progress before issuing a request.

Writing to a bit of this register is only possible when the current operating mode is operation mode. Only 1 can be written to this bit.

**37A.2.5 Current Descriptor Address Register q (CDARq) (q = 0 to 21)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

The CDARq register indicates the current descriptor address.

CDAR0 to CDAR3 indicate the addresses of the current descriptors for the corresponding transmission queues while CDAR4 to CDAR21 indicate the addresses of the current descriptors for the corresponding reception queues.

If the operating mode is changed to operation mode, the contents of the register for the queue to be used are set in the descriptor base address table register (DBAT).

Also, when the descriptor base address load request register (DLR) issues a load request, the contents of the descriptor base address table register (DBAT) are set in to the corresponding CDAR registers.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CDA[31:0]	H'0000 0000	R	<p>Current Descriptor Address</p> <p>The address of the current descriptors for the transmission queues.</p> <p>Conditions for updating:</p> <ul style="list-style-type: none"> <li>These bits are set to 0 when the operating mode is not operation mode. This register is updated in response to processing of the descriptor for a queue.</li> </ul>

### 37A.2.8 Receive Queue Configuration Register i (RQCi) (i = 0 to 4)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

The RQC0 register is used to set up reception queues 0 to 3.

The RQC1 register is used to set up reception queues 4 to 7.

The RQC2 register is used to set up reception queues 8 to 11.

The RQC3 register is used to set up reception queues 12 to 15.

The RQC4 register is used to set up reception queues 16 to 17.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	UFCC3[1:0]		—	—	RSM3[1:0]		—	—	UFCC2[1:0]		—	—	RSM2[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
11, 10	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
9, 8	RSM1[1:0]	00	R/W	Receive Synchronous Mode (Receive Queue 1+i×4) These bits set receive synchronous mode. Set B'00 in this bit. For receive synchronous mode, see section 37A.3.4.3 (3), Mode with Write-Back. Writing to the bits is only possible when the current operating mode is configuration mode. 00: Mode with write-back Other than 00: Setting prohibited
7, 6	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
5, 4	UFCC0[1:0]	00	R/W	Unread Frame Counter Configuration (Receive Queue 0+i×4) These bits set the unread frame counter used in reception queue 0+i×4. With the AVB-DMAC, four patterns of settings are available for the unread frame counter. Use the unread frame counter warning level configuration register (UFCW) and the unread frame counter stop level configuration register (UFCS) to set the warning level and stop level of the unread frame counter. Set the pattern number 0 set in the unread frame counter warning level configuration register (UFCW) and unread frame counter stop level configuration register (UFCS) in this bit. When the value is B'00, the stop function is disabled. Writing to the bits is only possible when the current operating mode is configuration mode.
3, 2	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
1, 0	RSM0[1:0]	00	R/W	Receive Synchronous Mode (Receive Queue 0+i×4) These bits set receive synchronous mode. Set B'00 in this bit. For receive synchronous mode, see section 37A.3.4.3 (3), Mode with Write-Back. Writing to the bits is only possible when the current operating mode is configuration mode. 00: Mode with write-back Other than 00: Setting prohibited

### 37A.2.9 Receive Padding Configuration Register (RPC)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

The RPC register is used to set padding for received frames.

Note: Padding can be used to extend frame lengths, but frame lengths should not exceed 4 Kbytes.

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
23 to 16	DCNT[7:0]	H'00	R/W	Stored Data Counter These bits specify the amount of the frame data (1 to 255) to be stored following the padding. Counting by one indicates one word (4 bytes). For example, when these bits are set to 47, the amount of data is 47 words (= 188 bytes). When these bits are 0, all received data have been stored following the initial padding. Writing to the bits is only possible when the current operating mode is configuration mode. For details on padding, see section 37A.3.4.3 (2) (c), Padding.
15 to 11	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
10 to 8	PCNT[2:0]	001	R/W	Stored Padding Counter These bits specify the amount of padding to be appended to the URAM. Counting by one indicates one word (4 bytes). For example, when these bits are set to 1, the amount of padding is one word (= 4 bytes). Writing to the bits is only possible when the current operating mode is configuration mode. For details on padding, see section 37A.3.4.3 (2) (c), Padding.
7 to 0	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

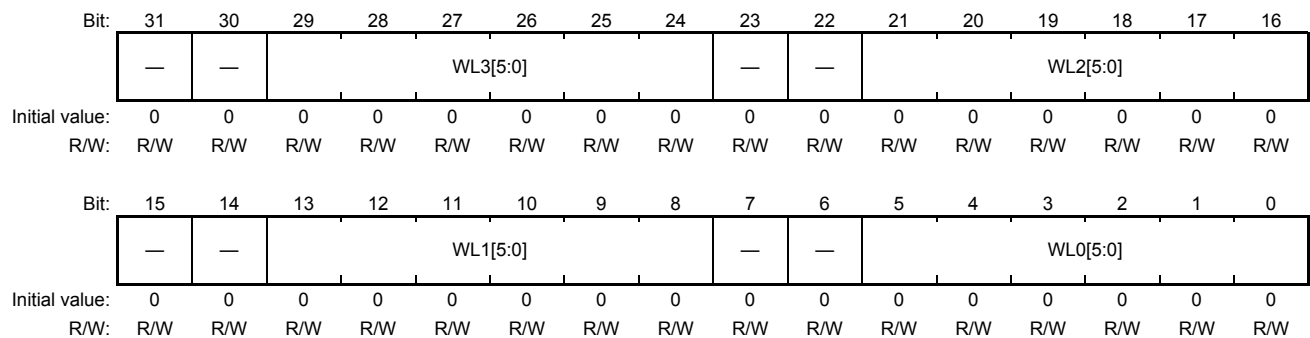

### 37A.2.10 Unread Frame Counter Warning Level Configuration Register (UFCW)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

The UFCW register sets the warning levels for the number of unread frames.

One of the four warning levels from 0 to 3 can be set for each reception queue. When these bits are set to 0, the stop function is disabled. The level to be used is specified by the receive queue configuration register  $i$  (RQCi) ( $i = 0$  to 4).

Writing to the bits is only possible when the current operating mode is configuration mode.

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
29 to 24	WL3[5:0]	000000	R/W	Warning Level 3 Unread frame count warning level 3
23, 22	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
21 to 16	WL2[5:0]	000000	R/W	Warning Level 2 Unread frame count warning level 2
15, 14	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
13 to 8	WL1[5:0]	000000	R/W	Warning Level 1 Unread frame count warning level 1
7, 6	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
5 to 0	WL0[5:0]	000000	R/W	Warning Level 0 Unread frame count warning level 0

### 37A.2.11 Unread Frame Counter Stop Level Configuration Register (UFCS)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

The UFCS register sets the stop levels for unread frames.

One of the four stop levels from 0 to 3 can be set for each reception queue. When these bits are set to 0, the stop function is disabled. The level to be used is specified by the receive queue configuration register *i* (RQCi) (*i* = 0 to 4).

Writing to the bits is only possible when the current operating mode is configuration mode.

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
29 to 24	SL3[5:0]	000000	R/W	Stop Level 3 Unread frame count stop level 3
23, 22	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
21 to 16	SL2[5:0]	000000	R/W	Stop Level 2 Unread frame count stop level 2
15, 14	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
13 to 8	SL1[5:0]	000000	R/W	Stop Level 1 Unread frame count stop level 1
7, 6	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
5 to 0	SL0[5:0]	000000	R/W	Stop Level 0 Unread frame count stop level 0

### 37A.2.12 Unread Frame Counter Register i (UFCVi) (i = 0 to 4)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

The UFCV0 register indicates the number of unread frames in reception queues 0 to 3.

The UFCV1 register indicates the number of unread frames in reception queues 4 to 7.

The UFCV2 register indicates the number of unread frames in reception queues 8 to 11.

The UFCV3 register indicates the number of unread frames in reception queues 12 to 15.

The UFCV4 register indicates the number of unread frames in reception queues 16 and 17.

For a description of how to use unread frames, refer to section 37A.3.4.4, Unread Frame Counters.

#### Conditions for updating:

The bits are set to 0 when the operating mode is not operation mode and when the descriptor base address load request register (DLR) issues a base address load request.

The number is incremented when data received in reception queue r are stored normally. The maximum increment is H'3F. If the value exceeds H'3F, incrementation will not proceed.)

The number is decremented by the value written to the unread frame counter decrement register i (UFCDi).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	CV3[5:0]						—	—	CV2[5:0]

	—	—	CV1[5:0]						—	—	CV0[5:0]					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	All 0	R	Reserved These bits are read as 0.
29 to 24	CV3[5:0]	000000	R	Unread Frame Count 3+4×i Number of unread frames in reception queue 3+4×i
23, 22	—	All 0	R	Reserved These bits are read as 0.
21 to 16	CV2[5:0]	000000	R	Unread Frame Count 2+4×i Number of unread frames in reception queue 2+4×i
15, 14	—	All 0	R	Reserved These bits are read as 0.
13 to 8	CV1[5:0]	000000	R	Unread Frame Count 1+4×i Number of unread frames in reception queue 1+4×i

Bit	Bit Name	Initial Value	R/W	Description
7, 6	—	All 0	R	Reserved These bits are read as 0.
5 to 0	CV0[5:0]	000000	R	Unread Frame Count $0+4 \times i$ Number of unread frames in reception queue $0+4 \times i$

**37A.2.13 Unread Frame Counter Decrement Register i (UFCDi) (i = 0 to 4)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

The UFCD0 register is used to decrement unread counters in reception queues 0 to 3.

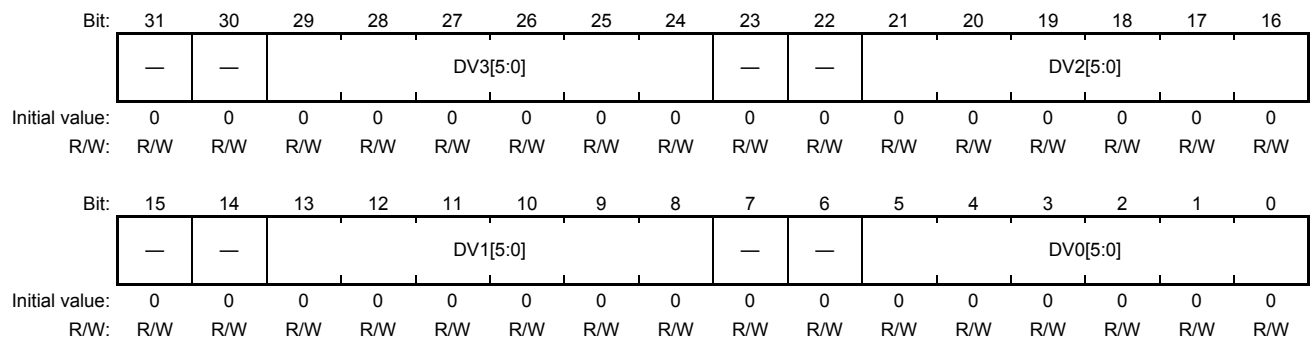

The UFCD1 register is used to decrement unread counters in reception queues 4 to 7.

The UFCD2 register is used to decrement unread counters in reception queues 8 to 11.

The UFCD3 register is used to decrement unread counters in reception queues 12 to 15.

The UFCD4 register is used to decrement unread counters in reception queues 16 and 17.

Write H'3F to these bits to reset the unread counters in reception queue r (r = 0 to 17). These bits are always read as 0.

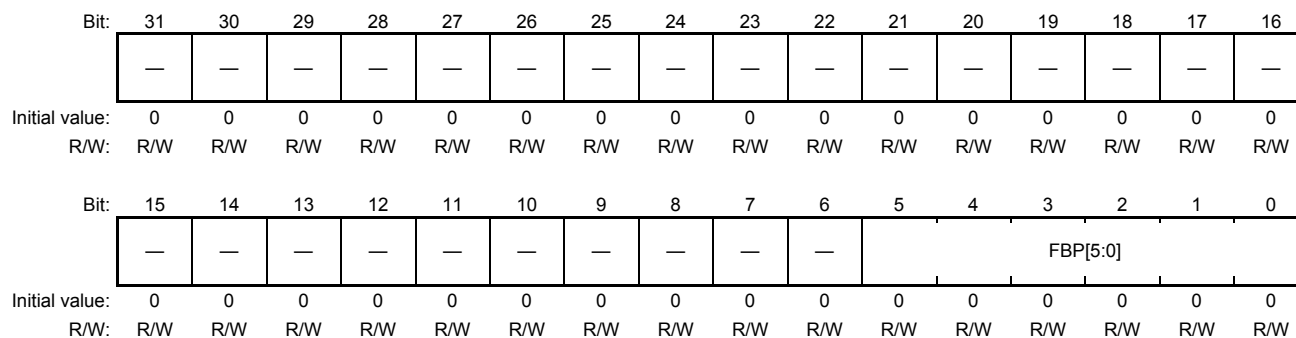

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
29 to 24	DV3[5:0]	000000	R/W	Unread Frame Decrement Value 3+4×i Unread frame decrement value for reception queue 3+4×i
23, 22	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
21 to 16	DV2[5:0]	000000	R/W	Unread Frame Decrement Value 2+4×i Unread frame decrement value for reception queue 2+4×i
15, 14	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
13 to 8	DV1[5:0]	000000	R/W	Unread Frame Decrement Value 1+4×i Unread frame decrement value for reception queue 1+4×i
7, 6	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
5 to 0	DV0[5:0]	000000	R/W	Unread Frame Decrement Value 0+4×i Unread frame decrement value for reception queue 0+4×i

### 37A.2.14 Separation Filter Offset Register (SFO)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

The SFO register sets an offset into frames for use by the separation filter.

Note: Received frames having fewer bytes than the setting of these bits + 8 bytes are judged to be non-matching by the separation filter. In this case, the data will either be sorted into a reception queue or discarded in accord with the setting of the separation filtering select bits in the receive configuration register (RCR.ESF).

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
5 to 0	FBP[5:0]	000000	R/W	First Byte Position These bits set the position in Ethernet frames of the first byte of the bytes to be used by the separation filter. When these bits are 0, the separation filter starts from the start of each Ethernet frame (first byte of the destination address). For bytes in Ethernet frames, see Figure 37A.2, Operating Mode of AVB-DMAC, in section 37A.3.1, AVB-DMAC Operating Modes. Writing to the bits is only possible when the current operating mode is configuration mode. For separation filtering, see section 37A.3.4.1 (1), Separation Filtering.

### 37A.2.15 Separation Filter Pattern Register i (SFPi) (i = 0 to 31)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

A pair of SFPi registers set the pattern for the separation filters to be used by the corresponding reception queues 2 to 17 (for streams 0 to 15).

Each queue shares a 64-bit setting; reception queue 2 (for stream 0) uses SFP0 and SFP1, reception queue 17 (for stream 15) uses SFP30 and SFP31, and so on.

The separation filter passes a frame when, after masking by the mask value set in the separation filter mask register (SFMi), data from received frames match the value defined in these bits.

SFPi.FP[7:0] (where i is an even number) are used for the byte of Ethernet frame data specified by the separation filter offset register, while SFPi.FP[63:56] (where i is the corresponding odd number) are used for the byte at the address specified by the separation filter offset register (SFO) + 7.

Writing to the bits is only possible when the current operating mode is configuration mode.

For separation filtering, see section 37A.3.4.1 (1), Separation Filtering.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	FP[31:0]	H'0000 0000	R/W	Separation Filter Pattern These bits set the pattern of the separation filter. The 64-bit filter pattern is set for each queue.

**37A.2.16 Separation Filter Mask Register i (SFMi) (i = 0 or 1)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

A pair of SFMi registers sets the mask value for the separation filter used by the corresponding reception queue 2 to 17 (stream 0 to 15).

SFM0.CFM[7:0] are used for bytes of Ethernet frame data specified by the separation filter offset register, while SFM1.CFM[63:56] are used for the separation filter offset register (SFO) + 7.

Frame data at the positions of mask bits that are set to 0 are masked; that is, they do not affect pattern-matching by the separation filter.

Writing to the bits is only possible when the current operating mode is configuration mode.

For separation filtering, see section 37A.3.4.1 (1), Separation Filtering.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CFM[31:0]	H'0000 0000	R/W	Separation Filter Mask These bits set the mask value for the separation filter.

### 37A.2.17 Transmit Configuration Register (TGC)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

The TGC register is used to make settings related to transmission for the AVB-DMAC.

Bit	Bit Name	Initial Value	R/W	Description
31 to 22	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
21, 20	TBD3[1:0]	00	R/W	Transmit FIFO Size (Stream Class A) These bits set the sizes of the transmission FIFO buffers for use with each of the transmission queue 3 (for stream class A). Writing to these bits is only possible when the current operating mode is configuration mode. Set these bits to B'10.
19, 18	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
17, 16	TBD2[1:0]	00	R/W	Transmit FIFO Size (Stream Class B) These bits set the sizes of the transmission FIFO buffers for use with each of the transmission queue 2 (for stream class B). Writing to these bits is only possible when the current operating mode is configuration mode. Set these bits to B'10.
15, 14	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
13, 12	TBD1[1:0]	00	R/W	Transmit FIFO Size (Network Control) These bits set the sizes of the transmission FIFO buffers for use with each of the transmission queue 1 (for network control). Writing to these bits is only possible when the current operating mode is configuration mode.
11, 10	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
9, 8	TBD0[1:0]	00	R/W	Transmit FIFO Size (Best Effort) These bits set the sizes of the transmission FIFO buffers for use with each of the transmission queue 0 (for best effort). Writing to these bits is only possible when the current operating mode is configuration mode.

Bit	Bit Name	Initial Value	R/W	Description
7, 6	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
5, 4	TQP[1:0]	00	R/W	Transmit Queue Priority These bits set the priority of the transmission queues. 00: Non-AVB mode: Q3 → Q2 → Q1 → Q0 01: AVB mode 1: Q3 (CBS) → Q2 (CBS) → Q1 → Q0 10: Setting prohibited 11: AVB mode 2: Q1 → Q3 (CBS) → Q2 (CBS) → Q0 For the credit-based shaping (CBS) algorithm, see section 37A.3.6, CBS (Credit-Based Shaping). The CBS algorithm is not applied in non-AVB mode (i.e. when the value is B'00). Writing to the bits is only possible when the current operating mode is configuration mode.
3	TSM3	0	R/W	Transmit Synchronous Mode (Stream Class A) Set these bits to 0. 0: With write-back 1: Setting prohibited
2	TSM2	0	R/W	Transmit Synchronous Mode (Stream Class B) Set these bits to 0. 0: With write-back 1: Setting prohibited
1	TSM1	0	R/W	Transmit Synchronous Mode (Network Control) Set these bits to 0. 0: With write-back 1: Setting prohibited
0	TSM0	0	R/W	Transmit Synchronous Mode (Best Effort) Set these bits to 0. 0: With write-back 1: Setting prohibited

### 37A.2.18 Transmit Configuration Control Register (TCCR)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

The TCCR register controls transmission by the AVB-DMAC and is used to make related settings.

#### Conditions for updating:

The bit is set to 0 when the operating mode is not operation mode, when a descriptor of type EEMPTY, FEMPTY or LEMPTY (no usable data) is processed, when an EOS descriptor is processed, and when a descriptor with defective data is processed.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TFR	TFEN	—	—	—	—	TSRQ3	TSRQ2	TSRQ1	TSRQ0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
9	TFR	0	R/W	Time Stamp FIFO Release This bit releases the oldest entry in the time-stamp FIFO. For a description of how to use the time-stamp FIFO, see section 37A.3.5.4, Time Stamping in Transmission. 0: (Not operating) 1: Releases the oldest entry in the time-stamp FIFO.
8	TFEN	0	R/W	Time Stamp FIFO Enable This bit enables storage in the time-stamp FIFO. When it is set, time-stamp information is stored for descriptors with DESCR.TSR set to 1 (for DESCR.TSR, see section 37A.3.5.2 (2), Configuration of Transmission Frame Data Descriptors. When 0 is set in this bit, no entries are made in the time-stamp FIFO. For a description of how to use the time-stamp FIFO, see section 37A.3.5.4, Time Stamping in Transmission. 0: Recording of transmission time stamps in the time-stamp FIFO is disabled. 1: Recording of transmission time stamps in the time-stamp FIFO is enabled.
7 to 4	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

Bit	Bit Name	Initial Value	R/W	Description
3	TSRQ3	0	R/W	<p>Transmit Start Request (Queue 3 (Stream Class A))</p> <p>This bit issues a request to start transmission for transmission queue 3.</p> <p>When read, this bit being set to 1 indicates that transmission queue t has a frame that has not yet been fetched to the transmission FIFO.</p> <p>Frame transmission by the E-MAC is processed independently from fetching to the transmission FIFO. The timing of transmission from a queue depends on the priority order of transmission.</p> <p>For the scheduling of transmission queues, see section 37A.3.5.1, Transmission Modes.</p> <p>Writing to this bit is only possible when the current operating mode is operation mode.</p> <p>Only 1 can be written to the bit. Writing 0 to the bit has no effect.</p> <p>0: Transmission queue is empty or stopped.</p> <p>1: When written: A transmission start request is issued.</p> <p>When read: Fetching of data for transmission is pending.</p>

**37A.2.20 Time Stamp FIFO Access Register 0 (TFA0)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

TFA0 indicates the nanosecond portion of the timestamp value.

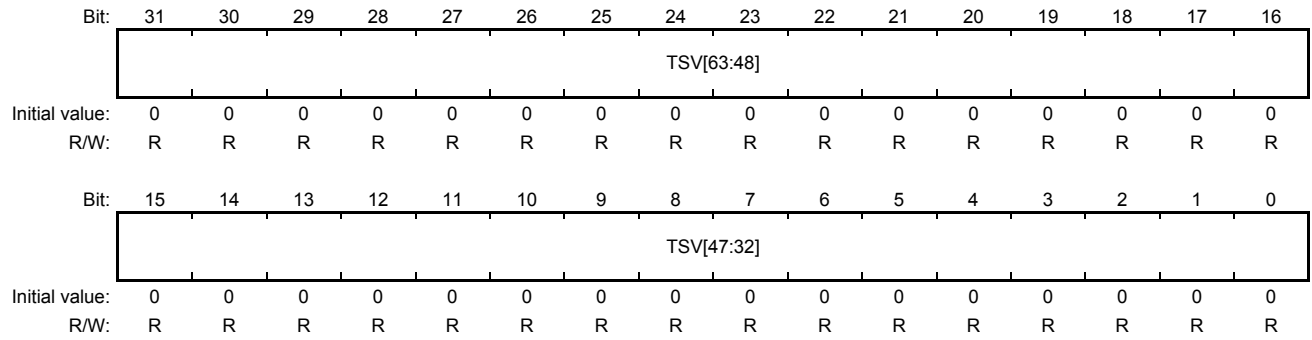

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	TSV[31:0]	H'0000 0000	R	<p>Time Stamp Value</p> <p>These 80 bits consist of TFA0.TSV[31:0], TFA1.TSV[63:32], and TFA2.TSV[79:64], which together indicate the oldest time stamp value stored in the time-stamp FIFO.</p> <p>Once the time-stamp FIFO is full, no further time-stamp values are stored.</p> <p>Conditions for updating:</p> <ul style="list-style-type: none"> <li>The bits are set to H'0000 0000 when the operating mode is not operation mode.</li> <li>The register is updated whenever a value is stored in the time-stamp FIFO (when the time-stamp FIFO count bit in the transmit status register (TSR.TFFL) changes from 0 to 1).</li> <li>The register is updated when the oldest entry is released (when the time stamp FIFO release bit in the transmit configuration control register (TCCR.TFR) is set to 1).</li> </ul>

**37A.2.21 Time Stamp FIFO Access Register 1 (TFA1)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

The TFA1 register indicates the lower 32 bits of the second portion of the timestamp value.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	TSV[63:32]	H'0000 0000	R	Time Stamp Value For details, see section 37A.2.20, Time Stamp FIFO Access Register 0 (TFA0).

### 37A.2.22 Time Stamp FIFO Access Register 2 (TFA2)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

The TFA2 register indicates the timestamp tag and higher 16 bits of the second portion of the timestamp value.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	TST[9:0]									
Initial value:	0	0	0	0	0	0	0									
R/W:	R	R	R	R	R	R	R									
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TSV[79:64]															
Initial value:	0															
R/W:	R															

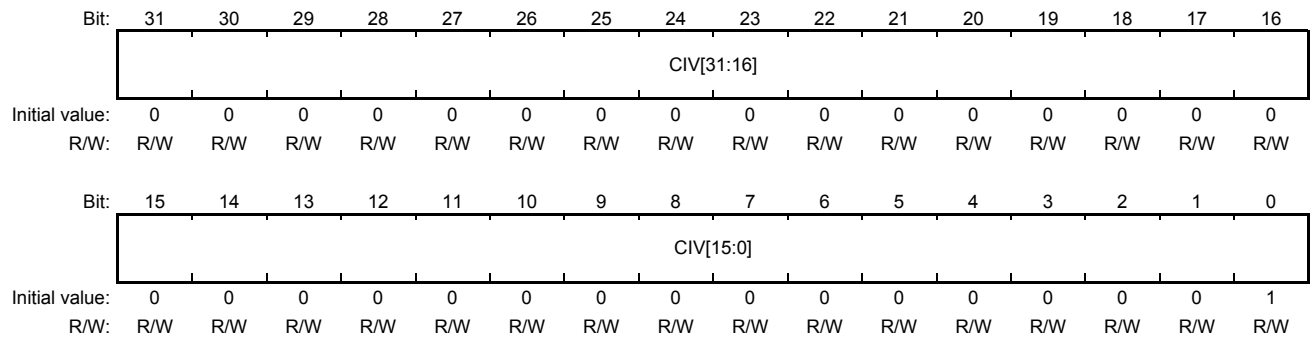

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved These bits are read as 0.
25 to 16	TST[9:0]	H'000	R	<b>Time Stamp Tag</b> These bits indicate the contents of the DESCR.TAG bit within the descriptor for frame transmission. These values are used to check the correlation between frames within the transmission queue and the time-stamp values (accessible through time stamp FIFO access register i (TFAi)) which can be placed in the FIFO. For the tagging of frames in transmission, see section 37A.3.5.4, Time Stamping in Transmission. Conditions for updating: <ul style="list-style-type: none"> <li>• The bits are set to 000H when the operating mode is not operation mode.</li> <li>• Updated when a value is stored in the time-stamp FIFO (when the value of the time stamp FIFO count bit in the transmit status register (TSR.TFFL) changes from 0 to 1).</li> <li>• Updated when the oldest entry has been released (1 is set in the time stamp FIFO release bit in the transmit configuration control register (TCCR.TFR)).</li> </ul>
15 to 0	TSV[79:64]	H'0000	R	<b>Time Stamp Value</b> For details, see section 37A.2.20, Time Stamp FIFO Access Register 0 (TFA0).

**37A.2.23 CBS Increment Value Register c (CIVRc) (c = 0 or 1)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

The CIVR0 register sets the increment in the CBS algorithm for transmission queue 2 (for stream class B).

The CIVR1 register sets the increment in the CBS algorithm for transmission queue 3 (for stream class A).

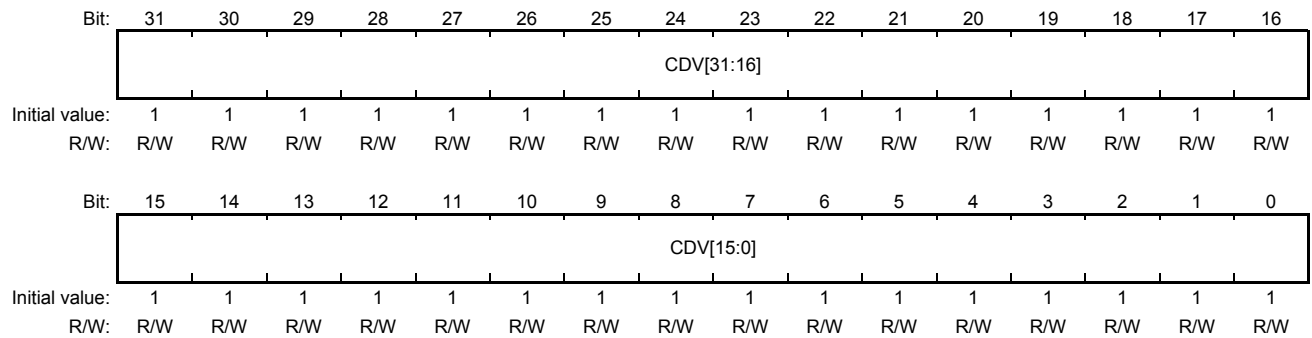

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CIV[31:0]	H'0000 0001	R/W	<p>CBS Increment Value</p> <p>CBS increment value (1 to H'FFFF)</p> <p>These bits define the increment value related to idleSlope for the CBS algorithm.</p> <p>Set a value in the range from H'0000 0001 to H'0000 FFFF.</p> <p>The value to be written to these bits depends on the Ethernet bit rate and HPφ (high-speed peripheral clock). For details, see section 37A.3.6, CBS (Credit-Based Shaping).</p>

**37A.2.24 CBS Decrement Value Register c (CDV<sub>Rc</sub>) (c = 0 or 1)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

The CDVR<sub>0</sub> register sets the decrement in the CBS algorithm for transmission queue 2 (for stream class B).

The CDVR<sub>1</sub> register sets the decrement in the CBS algorithm for transmission queue 3 (for stream class A).

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CDV[31:0]	H'FFFF FFFF	R/W	<p>CBS Decrement Value</p> <p>Setting value: -1 to -65536 (H'FFFF FFFF to H'FFFF 0000)</p> <p>These bits set the decrement for the CBS algorithm.</p> <p>These bits define the decrement value related to sendSlope for CBS algorithm.</p> <p>The value to be written to these bits depends on the Ethernet bit rate and HP<math>\phi</math> (high-speed peripheral clock). For details, see section 37A.3.6, CBS (Credit-Based Shaping).</p>

**37A.2.25 CBS Upper Limit Register c (CULc) (c = 0 or 1)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

The CUL0 register sets the upper limit for credit values calculated by using the CBS algorithm for transmission queue 2 (for stream class B).

The CUL1 register sets the upper limit for credit values calculated by using the CBS algorithm for transmission queue 3 (for stream class A).

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	ULV[31:0]	H'7FFF FFFF	R/W	<p>CBS Upper Limit</p> <p>These bits set the upper limit for credit values calculated by using the CBS algorithm.</p> <p>The setting is a limiting value for error detection and does not normally affect operation of the algorithm.</p> <p>Write a positive value to these bits.</p> <p>For details, see section 37A.3.6, CBS (Credit-Based Shaping).</p>

**37A.2.26 CBS Lower Limit Register c (CLLc) (c = 0 or 1)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

The CUL0 register sets the lower limit for credit values calculated by using the CBS algorithm for transmission queue 2 (for stream class B).

The CUL1 register sets the lower limit for credit values calculated by using the CBS algorithm for transmission queue 3 (for stream class A).

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	LLV[31:0]	H'8000 0001	R/W	<p>CBS Lower Limit</p> <p>These bits set the lower limit for credit values calculated by using the CBS algorithm.</p> <p>The setting is a limiting value for error detection and does not normally affect operation of the algorithm.</p> <p>Write a negative value to these bits.</p> <p>For details, see section 37A.3.6, CBS (Credit-Based Shaping).</p>

**37A.2.27 Descriptor Interrupt Control Register (DIC)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

The DIC register is used to control descriptor interrupts 1 to 15.

When an interrupt source flag is set (a bit from DPF1 to DPF15 bits in the descriptor interrupt status register (DIS) = 1) while the interrupt is enabled, the interrupt is issued.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
6	DPF6	0	R/W	Descriptor Interrupt Status6 0: The interrupt is not pending. 1: The interrupt is pending.
5	DPF5	0	R/W	Descriptor Interrupt Status5 0: The interrupt is not pending. 1: The interrupt is pending.
4	DPF4	0	R/W	Descriptor Interrupt Status4 0: The interrupt is not pending. 1: The interrupt is pending.
3	DPF3	0	R/W	Descriptor Interrupt Status3 0: The interrupt is not pending. 1: The interrupt is pending.
2	DPF2	0	R/W	Descriptor Interrupt Status2 0: The interrupt is not pending. 1: The interrupt is pending.
1	DPF1	0	R/W	Descriptor Interrupt Status1 0: The interrupt is not pending. 1: The interrupt is pending.
0	—	0	R/W	Reserved These bits are read as 0. The write value should be 0.

#### DPF1 to DPF15 Descriptor Interrupt Status Bits:

When DESC.R.DIE is 1 to 15, the corresponding bit indicates completion of the processing of a descriptor within the reception or transmission queue.

When DESC.R.DIE is 0, the descriptor interrupt is not generated.

Only 0 can be written to these bits.

#### [Conditions for Changing]

- A bit is set to 0 when the operating mode is not operation mode.
- A bit is set to 1 when a descriptor with DESC.R.DIE set to the corresponding number from 1 to 15 is processed.

**37A.2.29 Error Interrupt Control Register (EIC)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

The EIC register controls the AVB-DMAC-related error interrupts.

### 37A.2.31 Receive Interrupt Control Register 0 (RIC0)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

The RIC0 register controls the AVB-DMAC receive interrupts.

When an interrupt source flag is set (a bit from among the receive interrupt status bits in the receive interrupt status register (RIS0.FR0 to 17) = 1) while the interrupt is enabled, the interrupt is issued.

0	FRF0	0	R/W	Receive Frame Interrupt Status 0 (Best Effort) 0: The interrupt is not pending. 1: The interrupt is pending.

#### FRF0 to FRF17 Receive Frame Interrupt Status Bits 0 to 17:

Each bit indicates that a corresponding frame has been stored normally in reception queues 0 to 17 and that data are ready for CPU processing.

Only 0 can be written to the bit.

#### [Conditions for Changing]

- A bit is set to 0 when the operating mode is not operation mode.
- A bit is set to 0 when a value is written to the unread frame counter decrement register  $i$  (UFCD $i$ ) ( $i = 0$  to 4), and this decrements the value of unread frame counter register  $i$  (UFCV $i$ ) ( $i = 0$  to 4) to 0.
- When a frame is stored normally in a reception queue, the corresponding bit is set to 1.

**37A.2.33 Receive Interrupt Control Register 1 (RIC1)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

The RIC1 register controls the AVB-DMAC receive interrupts.

Bit	Bit Name	Initial Value	R/W	Description
13	QFF13	0	R/W	Receive Queue 13 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
12	QFF12	0	R/W	Receive Queue 12 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
11	QFF11	0	R/W	Receive Queue 11 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
10	QFF10	0	R/W	Receive Queue 10 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
9	QFF9	0	R/W	Receive Queue 9 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
8	QFF8	0	R/W	Receive Queue 8 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
7	QFF7	0	R/W	Receive Queue 7 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
6	QFF6	0	R/W	Receive Queue 6 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
5	QFF5	0	R/W	Receive Queue 5 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
4	QFF4	0	R/W	Receive Queue 4 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
3	QFF3	0	R/W	Receive Queue 3 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
2	QFF2	0	R/W	Receive Queue 2 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
1	QFF1	0	R/W	Receive Queue 1 (Network Control) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
0	QFF0	0	R/W	Receive Queue 0 (Best Effort) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.

**QFF0 to 17 Receive 0 to 17 Full Interrupt Status Bits:**

These bits indicate that reception queue *r* did not have space for storing a received frame.

A reception queue is treated as full when it has no descriptors (descriptor type (DESCR.DT) = FEMPTY, FEMPTY\_IS, FEMPTY\_IC, or FEMPTY\_ND) available or reaches the set level for stopping.

Note: If no FEMPTY descriptors or no empty space for descriptors remains in the queue during storing of a divided frame (see section 37A.3.4.3 (1) (b) Storing Frame Data as Divided Frames, for storing a frame as a divided frame), an error frame is stored in the queue. Such error frames are treated as descriptor sequence errors.

**[Conditions for Changing]**

- A bit is set to 0 when the operating mode is not operation mode.
- A bit is set to 1 when reception queue *r* has no space available for storage.
- A bit is set to 1 when the unread frame counter (unread frame counter register *i* (UFCVi) (*i* = 0 to 4)) reaches the set level for stopping.

**37A.2.37 Transmit Interrupt Control Register (TIC)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

The TIC register controls the AVB-DMAC transmit interrupts.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Bit Name	Initial Value	R/W	Description
1, 0	TCR[1:0]	00	R/W	<p>Timer Control Request</p> <p>These bits issue requests for controlling the gPTP timer.</p> <p>Writing to the bits is only possible when the current operating mode is operation mode.</p> <p>Do not write to the bit when the gPTP timer clock select bit in the AVB-DMAC mode register is B'00. Write to these bits while GCCR.TCR is B'00.</p> <p>[Conditions for Changing]</p> <ul style="list-style-type: none"> <li>— The bits are set to B'00 when the operating mode is not operation mode.</li> <li>— The bits are also set to B'00 on completion of the requested processing.</li> </ul> <p>00: Timer control is not requested.            01: gPTP/AVTP presentation time reset            10: Setting prohibited            11: Captures the value set in the TCSS bit.</p>

**37A.2.41 gPTP Maximum Transit Time Configuration Register (GMTT)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

The GMTT register sets the maximum time for transitions of the gPTP timer.

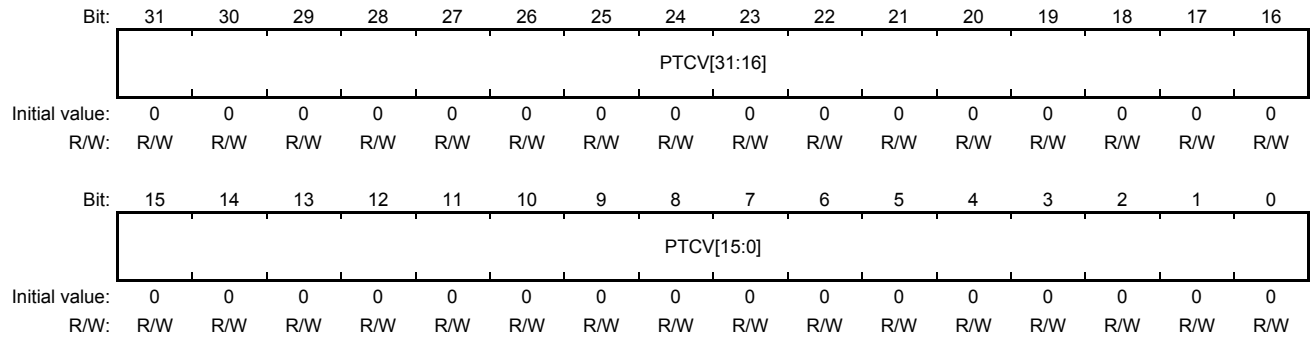

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	MTTV[31:0]	H'0000 0000	R/W	<p>Maximum Transit Time</p> <p>These bits set the maximum transition time for use in calculating AVTP presentation time.</p> <p>Write the desired setting to the bits, then issue the configuration request by setting the maximum transit time configuration request bit in the gPTP configuration control register (GCCR.LMTT) to 1.</p>

Note: Do not write a value to these bits when the operating mode is operation mode and the maximum transit time configuration request bit (GCCR.LMTT) is 1.

**37A.2.42 gPTP Presentation Time Comparison Register (GPTC)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

The GPTC register sets a value for comparison with presentation times in the gPTP timer.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	PTCV[31:0]	H'0000 0000	R/W	<p>Presentation Time Comparison Value</p> <p>These bits set a value for comparison with AVTP timer values to which a maximum transit time is not appended.</p> <p>Write the desired setting to the bits, then issue the configuration request by setting the presentation time comparison value configuration request bit in the gPTP configuration control register (GCCR.LPTC) to 1.</p>

**Note:** Do not write a value to these bits when the operating mode is operation mode and the presentation time comparison value configuration request bit (GCCR.LPTC) is 1.

### 37A.2.43 gPTP Timer Increment Configuration Register (GTI)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

The GTI register sets the increment for the gPTP timer.

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
27 to 0	TIV[27:0]	H'000 0001	R/W	gPTP Timer Increment Value When the gPTP clock select bits in the AVB-DMAC mode register (CCC.CSEL) are selecting a clock signal, these bits set the value by which the timer is incremented each time a cycle of that clock signal elapses. Write the desired setting to the bits, then issue the configuration request by setting the timer increment value configuration request bit in the gPTP configuration control register (GCCR.LTI) to 1.

Note: Do not write a value to these bits when the operating mode is operation mode and the timer increment value configuration request bit (GCCR.LTI) is 1.

Do not write 0 to the bits.

Keep comparison value in the following range

$$x \leq \text{comparison\_value} \leq 2^{32} - x$$

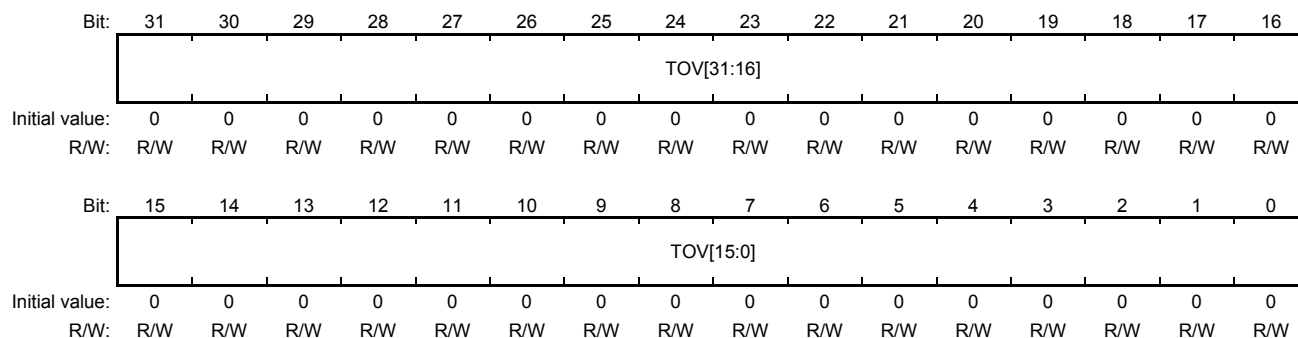

, where x is amount of nanoseconds of the configured increment value in GTI.TIV

**37A.2.44 gPTP Timer Offset Configuration Register i (GTOi) (i = 0 to 2)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

The GTOi register sets an offset value for the gPTP timer.

The offset value is added to the combination of bits 0 to 31 in GTO0, 32 to 63 in GTO1, and 64 to 79 in GTO2, which together make up the gPTP timer.

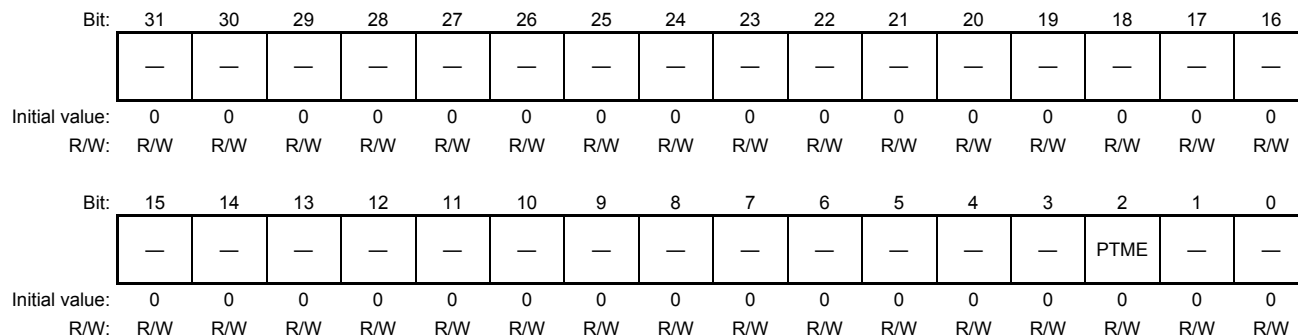

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	TOV[31:0]	H'0000 0000	R/W	<p>Timer Offset Value</p> <p>This is an 80-bit value consisting of the settings in GTO0.TOV[31:0], GTO1.TOV[63:32], and GTO2.TOV[79:64], and is used to set an offset for adding to the value of the gPTP timer.</p> <p>Write the desired setting to the bits, then issue the configuration request by setting the timer offset value configuration request bit in the gPTP configuration control register (GCCR.LTO) to 1.</p>

Note: Do not write a value to these bits when the operating mode is operation mode and the timer offset value configuration request bit (GCCR.LTO) is 1. Write H'0000 to GTO2.TOV[95:80]. Set a value in the range from 0 to 10<sup>9</sup>-1 (H'0000 0000 to H'3B9A C9FF) in GTOi.TOV[31:0].

**37A.2.45 gPTP Interrupt Control Register (GIC)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

The GCI register is used to control gPTP-related interrupts.

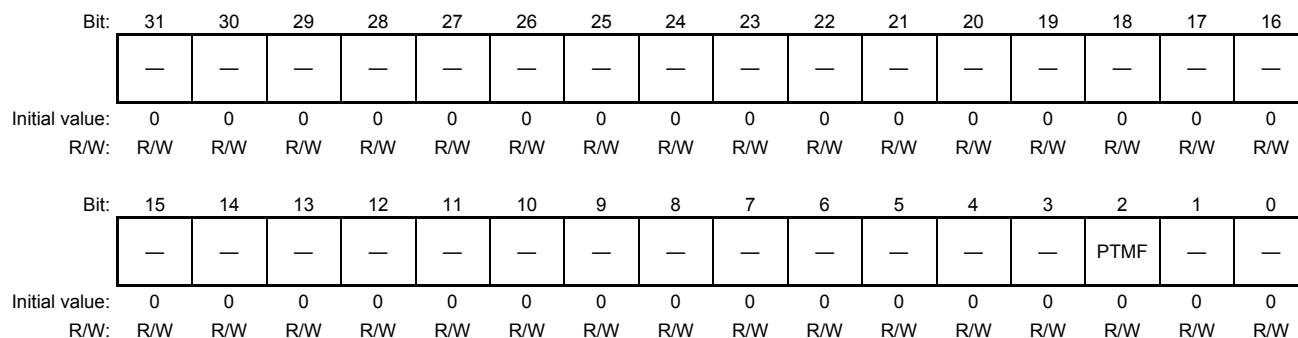

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
2	PTME	0	R/W	Presentation Time Match Interrupt Enable When this bit is 1, setting of the presentation time match interrupt flag in the gPTP interrupt status register (GIS.PTMF) to 1 leads to generation of that interrupt. 0: Disabled 1: Enabled
1, 0	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

### 37A.2.46 gPTP Interrupt Status Register (GIS)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

The GIC register indicates the state of the gPTP-related interrupt.

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
2	PTMF	0	R/W	Presentation Time Match Interrupt Flag This bit indicates that the value of the AVTP timer exceeds the value of the gPTP presentation time comparison register (GPTC). Only 0 can be written to the bit. [Conditions for Changing] <ul style="list-style-type: none"> <li>— The bit is set to 0 when the operating mode is not operation mode.</li> <li>— The bit is set to 1 when the AVTP timer value is greater than or equal to the value of the gPTP presentation time comparison register (GPTC).</li> </ul> 0: The interrupt is not pending. 1: The interrupt is pending.
1, 0	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

**37A.2.47 gPTP Timer Capture Register i (GCTi) (i = 0 to 2)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

The GCTi registers form an 80-bit register that captures the gPTP timer value.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CTV[31:0]	H'0000 0000	R/W	<p><b>gPTP Timer Capture Value</b></p> <p>These 80 bits consist of GCT0.CTV[31:0], GCT1.CTV[63:32 and GCT2.CTV[79:64], which together indicate captured timer values.</p> <p>When B'00 (value of the gPTP timer) or B'01 (adjusted gPTP timer value) is selected by the timer capture source select bits in the gPTP configuration control register, the corresponding 80-bit values are stored in these bits.</p> <p>When B'10 (AVTP presentation time) is selected by the timer capture source select bit, the corresponding 32-bit values are stored in these bits.</p> <p>Actual writing of the timer value specified by the timer capture source select bits (GCCR.TCSS) proceeds when B'11 (timer capture request) is written to the timer control request bits in the gPTP configuration control register (GCCR.TCR).</p> <p>Do not read the value while the value of the timer control request bits (GCCR.TCR) is B'11, because this indicates that storage is still in progress.</p>

### 37A.2.48 E-MAC Mode Register (ECMR)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

ECMR is used to specify the operating mode of the E-MAC. The settings in this register are normally made in the initialization process following a reset.

The operating mode settings must not be changed while transmission or reception is enabled (i.e. while the RE or TE bit in this register is 1).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	TRCC M	—	—	RCSC	—	DPAD	RZPF	—	PFR	RXF	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	MPDE	—	—	RE	TE	—	—	—	DM	PRM
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
26	TRCCM	0	R/W	Counter Clear Mode This bit sets the method for clearing the counter register. Refer to the descriptions of the counter registers. 0: Writing to a counter register leads to the register being cleared to 0. 1: Reading from a counter register leads to the register being cleared to 0.
25, 24	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
23	RCSC	0	R/W	Checksum Calculation Setting this bit to 1 enables automatic calculation of checksums for data in received frames. Only the data field of an Ethernet frame without a VLAN field is in the scope of checksum calculation. Specifically, the checksum is calculated from the data field, which follows the length/type field and is followed by the CRC field. Calculation only involves 16-bit addition; it does not involve bit inversion. 0: Checksums are not automatically calculated. 1: Checksums are automatically calculated.
22	—	0	R/W	Reserved This bit is read as 0. The write value should be 0.

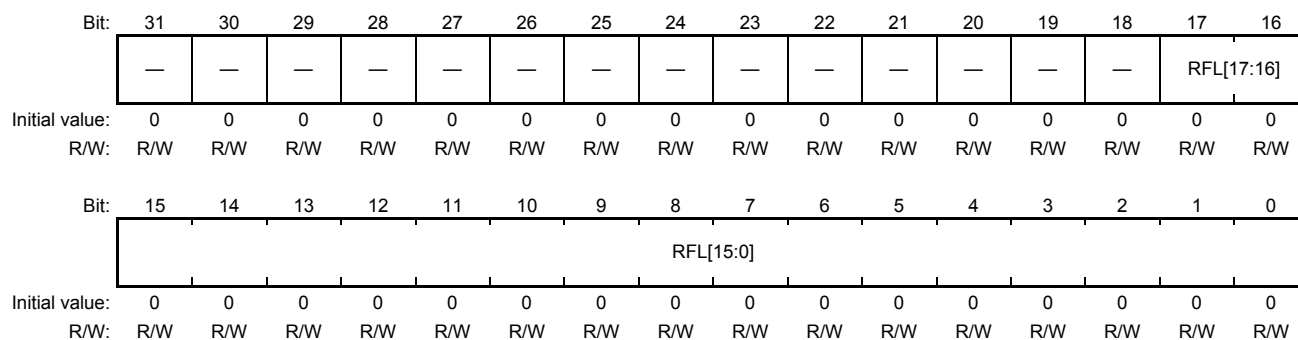

Bit	Bit Name	Initial Value	R/W	Description
21	DPAD	0	R/W	<p>Data Padding</p> <p>This bit specifies padding or non-padding of data when less than 60 bytes are to be transmitted.</p> <p>When this bit is set to 1, data are transmitted without padding; when it is set to 0, data are padded to make up 60-byte units for transmission.</p> <p>0: Padding to make up 60 bytes is inserted in data for transmission when fewer than 60 bytes are to be transmitted.</p> <p>1: Padding is not inserted in data for transmission when fewer than 60 bytes are to be transmitted and the data are transmitted without being changed.</p>
20	RZPF	0	R/W	<p>PAUSE Frame Reception with Time = 0</p> <p>When the RZPF bit is set to 0, received PAUSE frames with the Timer value 0 are discarded.</p> <p>When the RZPF bit is set to 1, release from the transmission wait state follows reception of a PAUSE frame with the Timer value 0.</p> <p>0: Reception of PAUSE frames with the TIME parameter value 0 is disabled.</p> <p>1: Reception of PAUSE frames with the TIME parameter value 0 is enabled.</p>
19	—	0	R/W	<p>Reserved</p> <p>This bit is read as 0. The write value should be 0.</p>
18	PFR	0	R/W	<p>PAUSE Frame Receive Mode</p> <p>This bit specifies whether PAUSE frames are transferred to the AVB-DMAC.</p> <p>0: PAUSE frames are not transferred to the AVB-DMAC.</p> <p>1: PAUSE frames are transferred to the AVB-DMAC.</p>
17	RXF	0	R/W	<p>Operating Mode for Flow Control in Reception</p> <p>When the RXF bit is set to 1 and a PAUSE frame is received, a next frame to be transmitted is not transmitted until the time indicated by the Timer value in the PAUSE frame has elapsed. However, the transmission of a current frame is continued. The number of received PAUSE frames is also counted. For details, see section 37A.2.57, PAUSE Frame Receive Counter (PFRCR).</p> <p>Setting this bit to 0 disables PAUSE frame detection.</p> <p>0: Detection of PAUSE frames is disabled.</p> <p>1: Flow control for the receiving port is enabled.</p>
16 to 10	—	All 0	R/W	<p>Reserved</p> <p>These bits are read as 0. The write value should be 0.</p>
9	MPDE	0	R/W	<p>Magic Packet™ Detection Enable</p> <p>The MPDE bit enables or disables Magic Packet™ detection by hardware to allow activation via the Ethernet connection.</p> <p>0: Magic Packet™ detection is not enabled.</p> <p>1: Magic Packet™ detection is enabled.</p>
8, 7	—	All 0	R/W	<p>Reserved</p> <p>These bits are read as 0. The write value should be 0.</p>

Bit	Bit Name	Initial Value	R/W	Description
6	RE	0	R/W	<p>Reception Enable</p> <p>If this bit is switched from reception being enabled (RE = 1) to reception being disabled (RE = 0) while a frame is being received, reception will continue until reception of the frame is completed.</p> <p>0: Reception is disabled. 1: Reception is enabled.</p>
5	TE	0	R/W	<p>Transmission Enable</p> <p>If this bit is switched from transmission being enabled (TE = 1) to transmission being disabled (TE = 0) while a frame is being transmitted, transmission will continue until transmission of that frame is completed.</p> <p>0: Transmission is disabled. 1: Transmission is enabled.</p>
4 to 2	—	All 0	R/W	<p>Reserved</p> <p>These bits are read as 0. The write value should be 0.</p>
1	DM	0	R/W	<p>Duplex Mode</p> <p>This bit should always be set to 1. The value after reset is 0.</p> <p>0: Value after reset 1: Full-duplex operation</p> <p>This bit should always be set to 1.</p>
0	PRM	0	R/W	<p>Promiscuous Mode</p> <p>Setting the PRM bit enables all Ethernet frames to be received. All Ethernet frames mean all receivable frames, irrespective of differences of destination address (exclude PAUSE frame).</p> <p>0: Normal operation 1: Promiscuous mode operation</p>

### 37A.2.49 Receive Frame Length Register (RFLR)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

The RFLR register specifies the maximum length (in bytes) of frames that can be received by this LSI. Settings in this register must not be changed while reception is enabled (while the RE bit in the E-MAC mode register (EMCR) is 1).

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
17 to 0	RFL[17:0]	H'0 0000	R/W	Receive Frame Length Frame data described here refers to all fields from the destination address up to the CRC data. Frame contents from the destination address up to the data are actually transferred to memory. CRC data are not included in the transfer. When more data than the specified number of bytes are received, the portion of data that exceeds the specified value and more 8 byte length is discarded. CAUTION: The prepared descriptor data size is just the specified value (RFLR.RFL). Therefore descriptor data size must be more than RFLR.RFL + 8 if you will receive such the long frame. H'00000 to H'005EE: 1,518 bytes H'005EF: 1,519 bytes H'005F0: 1,520 bytes : : H'007FF: 2,047 bytes H'00800: 2,048 bytes : : H'01000: 4,096 bytes : : H'10000: 65,535 bytes : : H'20000 to H'3FFFF: 131,072 bytes

### 37A.2.50 E-MAC Status Register (ECSR)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

The ECSR register indicates the state of the E-MAC. The CPU can be notified of the state. For bits associated with interrupts, the interrupt can be enabled or disabled by the corresponding bit in the E-MAC Interrupt Permission Register (ECSIPR) described in section 37A.2.51.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	PHYI	LCHNG	MPD	ICD
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
3	PHYI	0	R/W	PHY interrupt terminal state bit This bit indicates the state of input to the PHY interrupt pin (AVB_PHY_INT) from the PHY-LSI. 0: PHY interrupt terminal (AVB_PHY_INT) is not asserted. 1: PHY interrupt terminal (AVB_PHY_INT) is asserted.
2	LCHNG	0	R/W	Link signal change bit This bit indicates a transition of the link status signal (AVB_LINK) input from the PHY-LSI from high to low or low to high. However, signal changes may also be detected at times when the link status signal (AVB_LINK) function is selected. To check the current link state, refer to the link status pin state bit in the PHY status register (PSR.LMON). 0: The change of Link status signal (AVB_LINK) is not detected. 1: The change of Link status signal (AVB_LINK) is detected.
1	MPD	0	R/W	Magic Packet™ Detection This bit indicates that a Magic Packet™ has been detected on the line. Writing 1 to this bit clears it to 0. 0: A Magic Packet™ has not been detected. 1: A Magic Packet™ has been detected.

---

Bit	Bit Name	Initial Value	R/W	Description
0	ICD	0	R/W	<p>Illegal Carrier Detection</p> <p>This bit indicates that the PHY-LSI has detected an illegal carrier on the line. If a change in the signal input from the PHY-LSI occurs in a period shorter than the software recognition period, the correct information may not be obtained. Refer to the timing specification for the PHY-LSI used.</p> <p>Writing 1 to this bit clears it to 0.</p> <p>0: PHY-LSI has not detected an illegal carrier on the line.</p> <p>1: PHY-LSI has detected an illegal carrier on the line.</p>

---

### 37A.2.51 E-MAC Interrupt Permission Register (ECSIPR)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

The ECSIPR register enables or disables the states indicated by the ECSR register as interrupt sources. Each effective bit disables or enables interrupts corresponding to the bits in ECSR.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
1	MPDIP	0	R/W	Magic Packet™ Detect Interrupt Enable Setting this bit to 1 selects interrupt generation on setting of the Magic Packet™ detection bit (ECSR.MPD) in the E-MAC status register to 1. 0: Interrupts on setting of the MPD bit is disabled. 1: Interrupts on setting of the MPD bit is enabled.
0	ICDIP	0	R/W	Illegal Carrier Detect Interrupt Enable Setting this bit to 1 selects interrupt generation on setting of the illegal carrier detection bit (ECSR.ICD) in the E-MAC status register to 1. 0: Interrupts on setting of the ICD bit is disabled. 1: Interrupt on setting of the ICD bit is enabled.

### 37A.2.52 PHY Interface Register (PIR)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

The PIR register provides a means of access to the PHY-LSI internal registers via the MII.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	MDI	MDO	MMD	MDC
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	—	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
3	MDI	—	R/W	MII Management Data-In This bit indicates the level of the AVB_MDIO pin.
2	MDO	0	R/W	MII Management Data-Out This bit holds data for output from the AVB_MDIO pin. The AVB_MDIO pin outputs data when the MMD bit is set to 1 (to specify writing as the direction). Data are not output while the MMD bit is set to 0 (to specify reading as the direction).
1	MMD	0	R/W	MII Management Mode This bit specifies the direction for data through MDIO (reading or writing). 0: Read direction is specified. 1: Write direction is specified.
0	MDC	0	R/W	MII Management Data Clock Values set in this bit are output on the AVB_MDC pin to supply the MII with the management data clock. For the method of access to the MII registers, see section 37A.3.13, Connection to PHY-LSI.

**37A.2.53 PHY Status Register (PSR)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

The PSR register is a read-only register that can read interface signals from the PHY-LSI.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	LMON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are read as 0.
0	LMON	0	R	Link Status Pin State The Link state can be read by connecting the Link signal output from the PHY-LSI to the link status pin (AVB_LNK) pin. For the active sense, refer to the specifications of the PHY-LSI to be connected. 0: The link status signal (AVB_LNK) is at the low level. 1: The link status signal (AVB_LNK) is at the high level.

**37A.2.54 PHY\_INT Polarity Register (PIPR)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

The PIPR register is used to set the active sense of the AVB\_PHY-INT pin.

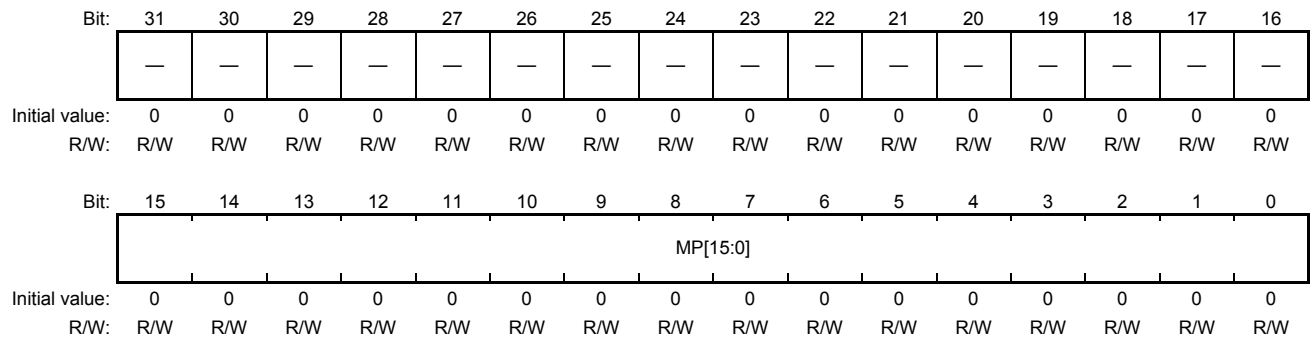

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PHYIP
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
0	PHYIP	0	R/W	PHY Interrupt Input Pin Polarity This bit sets the active sense of the PHY interrupt pin (AVB_PHY-INT). For the active sense, refer to the specifications of the PHY-LSI to be connected. 0: PHY interrupt pin (AVB_PHY-INT) is active low (the low level triggers the interrupt state) 1: PHY interrupt pin (AVB_PHY-INT) is active high (the high level triggers the interrupt state)

**37A.2.55 Manual PAUSE Frame Register (MPR)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

The MPR register is used to set the value for the TIME parameter of manually generated PAUSE frames. When a PAUSE frame is manually transmitted, the value set in this register is used as its TIME parameter.

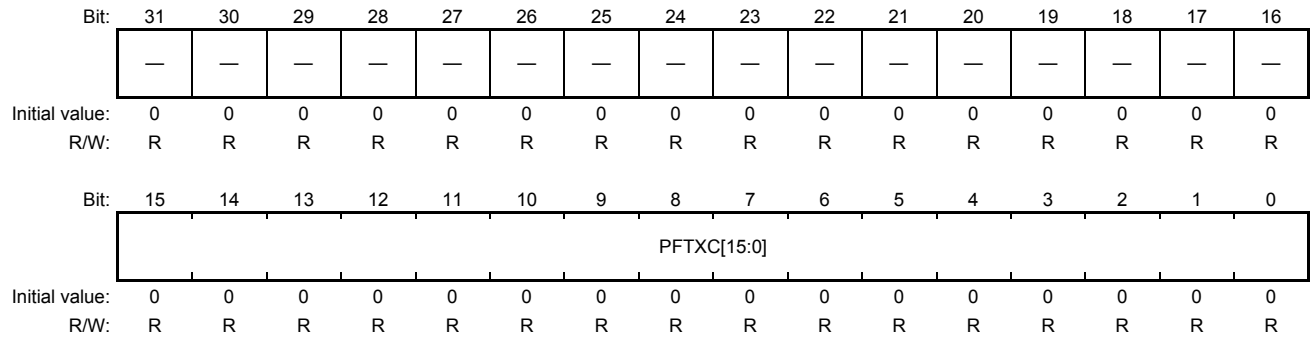

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
15 to 0	MP[15:0]	H'0000	R/W	Manual PAUSE These bits set the value of the TIME parameter in manually generated PAUSE frames. The unit for the setting is 512 bit time. These bits set the TIME parameter value of a manual PAUSE frame. H'0000: — H'0001: 1 × 512 bit time H'0002: 2 × 512 bit time : : H'FFFF: 65535 × 512 bit time A bit time changes relative to the transfer speed as follows. 1000 Mbps: 1 bit time = 1 ns 100 Mbps: 1 bit time = 10 ns

**37A.2.56 PAUSE Frame Transmit Counter (PFTCR)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

The PFTCR register is a counter that indicates the number of times PAUSE frames have been transmitted.

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
15 to 0	PFTXC[15:0]	H'0000	R	PAUSE Frame Transmit Counter Counter for counting the number of transmitted PAUSE frames The bits are cleared to 0 when they are read. If counting up and clearing of the counter coincide, clearing the counter takes priority.

**37A.2.57 PAUSE Frame Receive Counter (PFRCR)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

The RFRCCR register is a counter that indicates the number of times PAUSE frames have been received.

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
15 to 0	PFRXC[15:0]	H'0000	R	PAUSE Frame Receive Counter These bits indicate the number of PAUSE frames that have been received when flow control in reception is enabled (the RXF bit in ECMR = 1). The bits are cleared to 0 when they are read. If counting up and clearing the counter coincide, clearing the counter takes priority.

**37A.2.58 E-MAC Mode Register 2 (GECMR)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

The GECMR register specifies the operating mode for the E-MAC.

The setting in the GECMR register must not be changed while transmission or reception is enabled.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SPEED
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

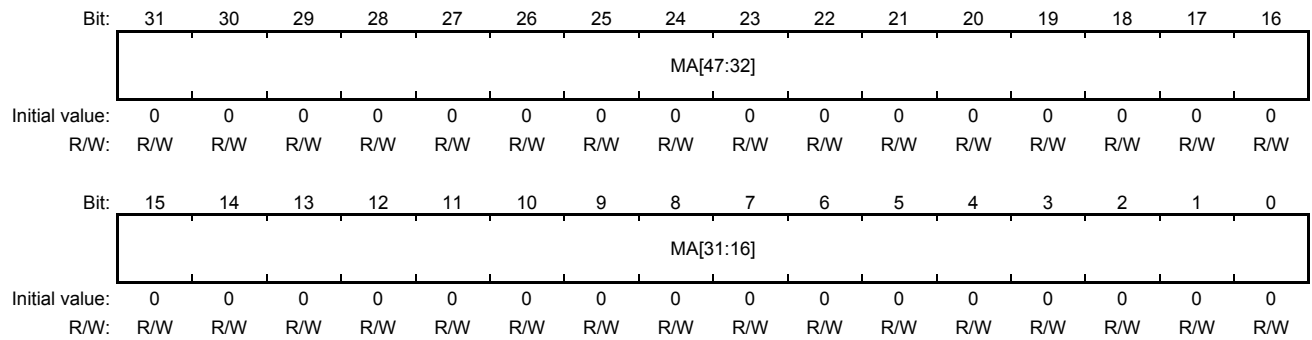

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
0	SPEED	0	R/W	Transfer Speed Setting This bit sets the transfer rate. 0: Transfer is at 100 Mbps. 1: Transfer is at 1000 Mbps.

### 37A.2.59 E-MAC Address High Register (MAHR)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

The MAHR register specifies the 32 higher-order bits of the 48-bit E-MAC address. The settings in this register are normally made in the initialization process after a reset.

The settings in this register must not be changed while transmission or reception is enabled.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	MA[47:16]	H'0000 0000	R/W	E-MAC Address Bits 47 to 16 These bits are used to set the 32 higher-order bits of the E-MAC address. For example, if the E-MAC address is 01-23-45-67-89-AB (hexadecimal), set H'0123 4567 in the MAHR register.

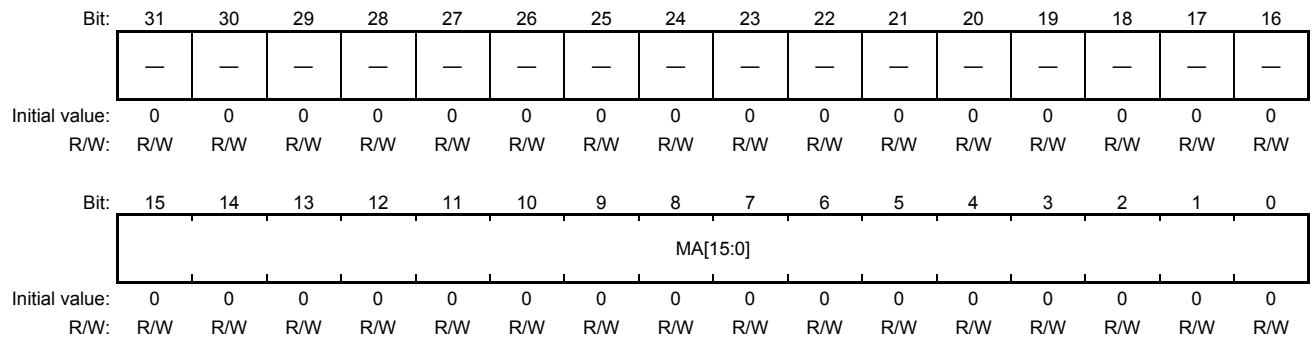

### 37A.2.60 E-MAC Address Low Register (MALR)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

The MALR register specifies the 16 lower-order bits of the 48-bit E-MAC address. The settings in this register are normally made in the initialization process after a reset.

The settings in this register must not be changed while transmission or reception is enabled.

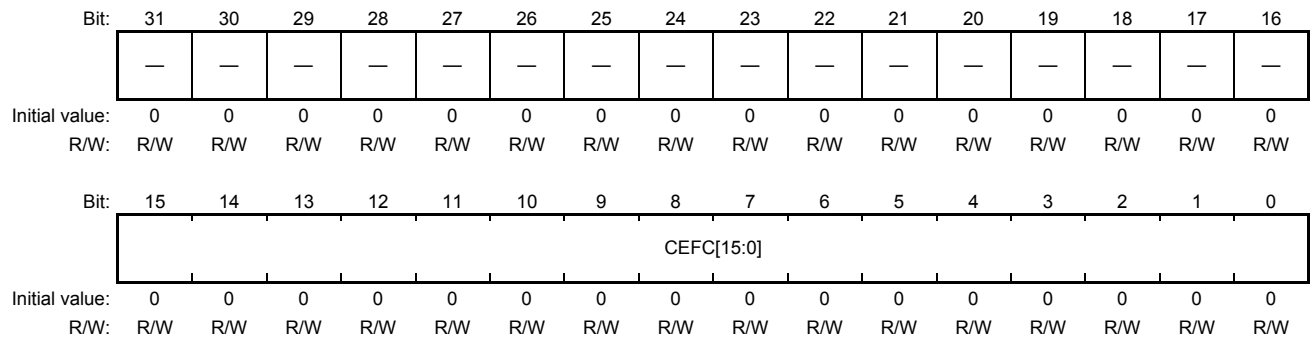

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
15 to 0	MA[15:0]	H'0000	R/W	E-MAC Address Bits 15 to 0 These bits are used to set the 16 lower-order bits of the E-MAC address. For example, if the E-MAC address is 01-23-45-67-89-AB (hexadecimal), set H'89AB in the MALR register.

**37A.2.61 CRC Error Frame Receive Counter Register (CEFCR)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

The CEFCR register is a counter that indicates the number of times frames with CRC errors were received. Counting up stops when the value in this register reaches H'0000 FFFF.

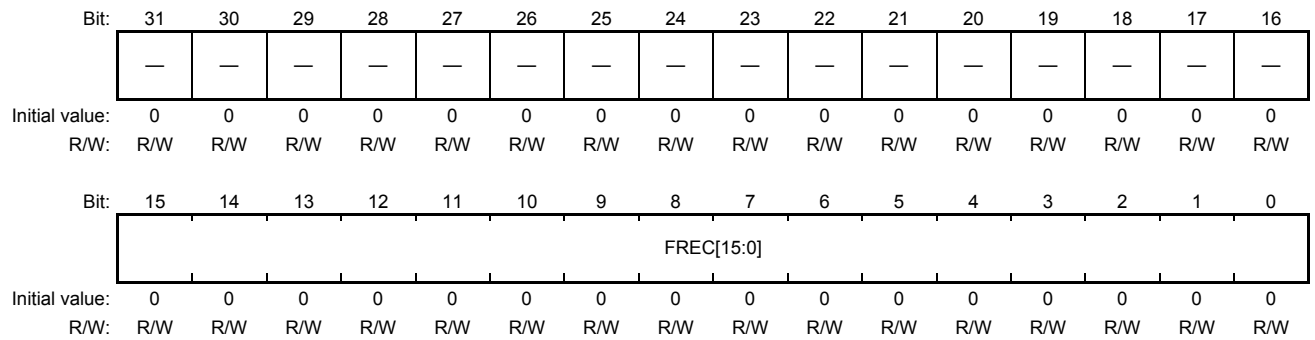

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
15 to 0	CEFC[15:0]	H'0000	R/W	CRC Error Frame Counter These bits indicate the number of received frames having CRC errors. The bits are cleared to 0 when they are read while the counter clear mode bit (TRCCM) in the E-MAC mode register is set to 1. When TRCCM = 0, they are cleared to 0 by the writing of any value to this register.

**37A.2.62 Frame Receive Error Counter Register (FRECR)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

The FRECR register is a counter that indicates the number of frames for which receive errors were generated by input on the AVB\_RX\_ER pin from the PHY-LSI. Counting up stops when the value in this register reaches H'0000 FFFF.

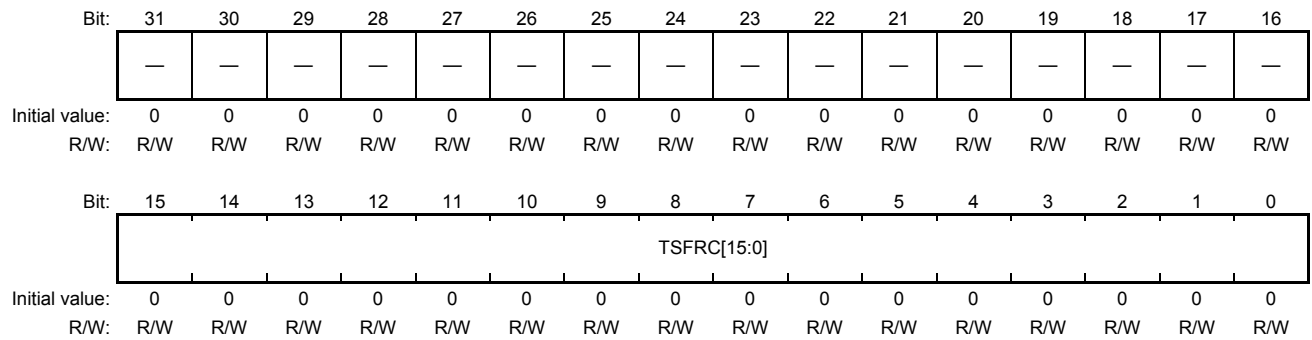

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
15 to 0	FREC[15:0]	H'0000	R/W	Frame Receive Error Counter These bits indicate the number of errors during frame reception. The bits are cleared to 0 when they are read while the counter clear mode bit (TRCCM) in the E-MAC mode register is set to 1. When TRCCM = 0, they are cleared to 0 by the writing of any value to this register.

**37A.2.63 Too-Short Frame Receive Counter Register (TSFRCR)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

The TSFRCR register is a counter that indicates the number of received frames that were fewer than 64 bytes in length. Counting stops when the value in this register reaches H'0000 FFFF.

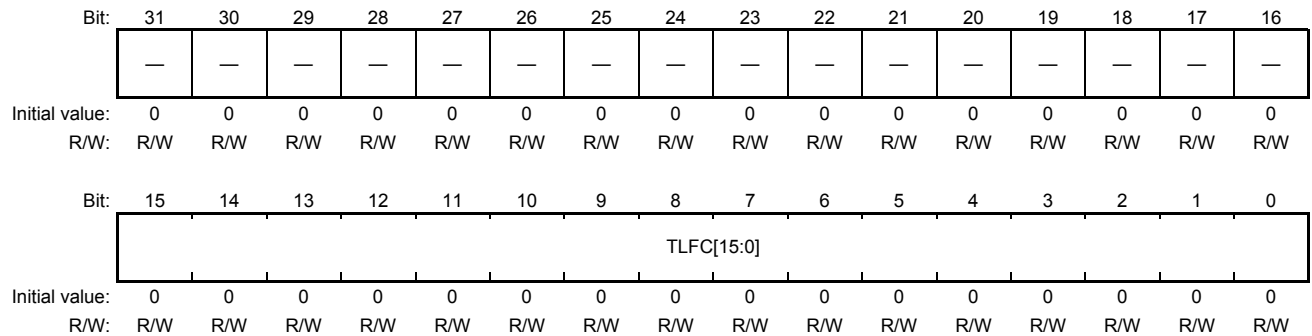

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
15 to 0	TSFRC[15:0]	H'0000	R/W	Too-Short Frame Receive Counter These bits indicate the number of received frames that were fewer than 64 bytes in length. The bits are cleared to 0 when they are read while the counter clear mode bit (TRCCM) in the E-MAC mode register is set to 1. When TRCCM = 0, they are cleared to 0 by the writing of any value to this register.

**37A.2.64 Too-Long Frame Receive Counter Register (TLFRCR)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

The TLFRCR register is a counter that indicates the number of received frames that were longer than the value specified in the receive frame length register (RFLR). Counting up stops when the value in the TLFRCR register reaches H'0000 FFFF.

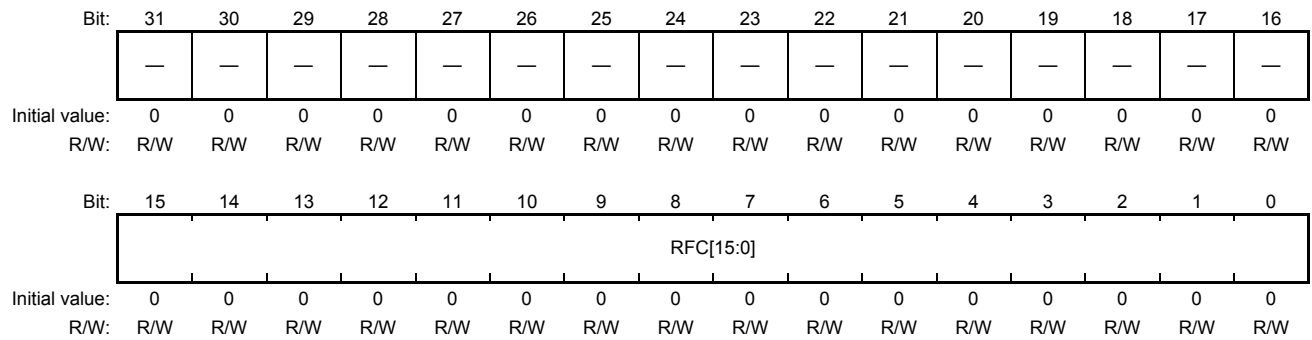

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
15 to 0	TLFC[15:0]	H'0000	R/W	Too-Long Frame Receive Counter These bits indicate the number of received frames that were longer than the value in RFLR. The bits are cleared to 0 when they are read while the counter clear mode bit (TRCCM) in the E-MAC mode register is set to 1. When TRCCM = 0, they are cleared to 0 by the writing of any value to this register.

**37A.2.65 Residual-Bit Frame Receive Counter Register (RFCR)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

The RFCR register is a counter that indicates the number of received frames containing “residual bits” (trailing bits not making up an 8-bit unit). Counting up stops when the value in this register reaches H'0000 FFFF.

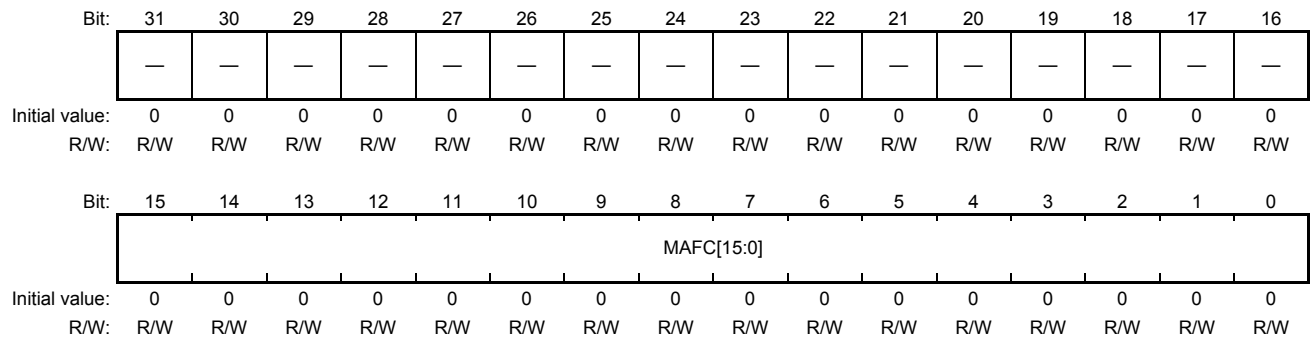

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
15 to 0	RFC[15:0]	H'0000	R/W	Residual-Bit Frame Receive Counter These bits indicate the number of received frames containing residual bits. The bits are cleared to 0 when they are read while the counter clear mode bit (TRCCM) in the E-MAC mode register is set to 1. When TRCCM = 0, they are cleared to 0 by the writing of any value to this register.

**37A.2.66 Multicast Address Frame Receive Counter Register (MAFCR)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

The MAFCR register is a counter that indicates the number of received frames for which a multicast address was specified. Counting up stops when the value in this register reaches H'0000 FFFF.

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
15 to 0	MAFC[15:0]	H'0000	R/W	Multicast Address Frame Counter These bits indicate the number of multicast frames that have been received. The bits are cleared to 0 when they are read while the counter clear mode bit (TRCCM) in the E-MAC mode register is set to 1. When TRCCM = 0, they are cleared to 0 by the writing of any value to this register.

### 37A.3 Operation

RZ/G1H

RZ/G1N

RZ/G1M

RZ/G1E

The EthernetAVB consists of the following functional units:

- DMA transfer controller (AVB-DMAC): Handles DMA transfer between the data storage areas for reception and transmission in the URAM and the reception and transmission FIFO buffers
- MAC controller (E-MAC): Handles transfer between the reception and transmission FIFO buffers and the GMII or MII

Using its direct memory access (DMA) function, the AVB-DMAC handles DMA transfer of frame data between the destinations for storing Ethernet frame data for transmission and reception in the URAM and the FIFO buffers for reception and transmission. Data cannot be directly read from or written to the FIFO buffers.

To handle DMA transfer, the AVB-DMAC requires information that includes the addresses for storage of data for transmission and received data. These data are referred to as descriptors. The AVB-DMAC reads data for transmission from the storage area for data to be transmitted according to the information in descriptors and writes received data to the storage area for received data accompanied by information in descriptors. The descriptors are placed in the URAM. Arranging multiple descriptors in descriptor lists allows the continuous reception or transmission of multiple Ethernet frames.

The E-MAC supports a GMII and MII, which provides an interface format for the externally connected PHY-LSI. The E-MAC constructs Ethernet frames from data written to the transmission FIFO and transmits these frames to the GMII or MII. It also performs CRC checking of Ethernet frames received from the GMII or MII and writes the frames to the reception FIFO.

### 37A.3.1 AVB-DMAC Operating Modes

Figure 37A.2 illustrates the operating modes of the AVB-DMAC.

Transitions of AVB-DMAC operating mode are under the control of the items listed below.

- CPU operating mode (hardware reset and power-down mode)
- Configuration of the operating mode configuration bits (CCC.OPC) in the AVB-DMAC mode register

The current operating mode can be confirmed by reading the operating mode status bits in the AVB-DMAC status register (CSR.OPS).

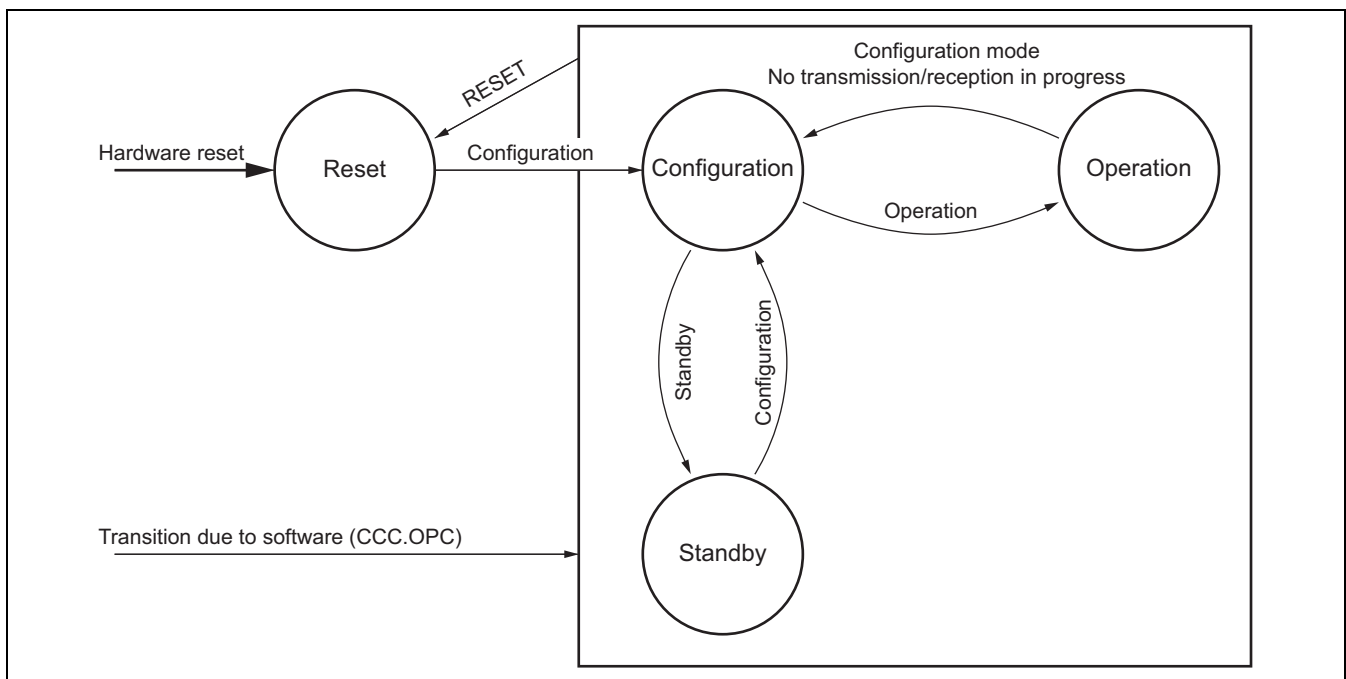

Figure 37A.2 Operating Mode of AVB-DMAC

#### 37A.3.1.1 Operating Modes

##### (1) Reset mode

After a hardware reset, the AVB-DMAC enters reset mode.

In reset mode, only the AVB-DMAC operating mode control function is controllable and other functions are all stopped. This mode is designed for reduced power when the Ethernet function is not necessary.

##### (2) Configuration mode

In configuration mode, various settings for the AVB-DMAC can be made.

The operation of most functions is stopped and all status registers are initialized to their reset values. The E-MAC functions in this mode.

##### (3) Operation mode

In operation mode, all functions of the AVB-DMAC can operate. Ethernet communications can only proceed in this mode.

##### (4) Standby mode

In standby mode, the E-MAC can only be used to control the operating mode. Other functions cannot be used.

### 37A.3.1.2 How to Set the Operating Mode

Set the operating mode configuration bits in the AVB-DMAC mode register (CCC.OPC) to select the operating mode. Furthermore, the current operating mode can be checked by reading the operating mode status bits in the AVB-DMAC status register (CSR.OPS).

Transitions other than from operation mode to configuration mode are made after the value is written to the operating mode configuration bits (CCC.OPC) (Figure 37A.3).

For transitions from operation mode to configuration mode, follow the procedure in Figure 37A.4 because any transmission and reception in progress will be executed before the transition to configuration mode.

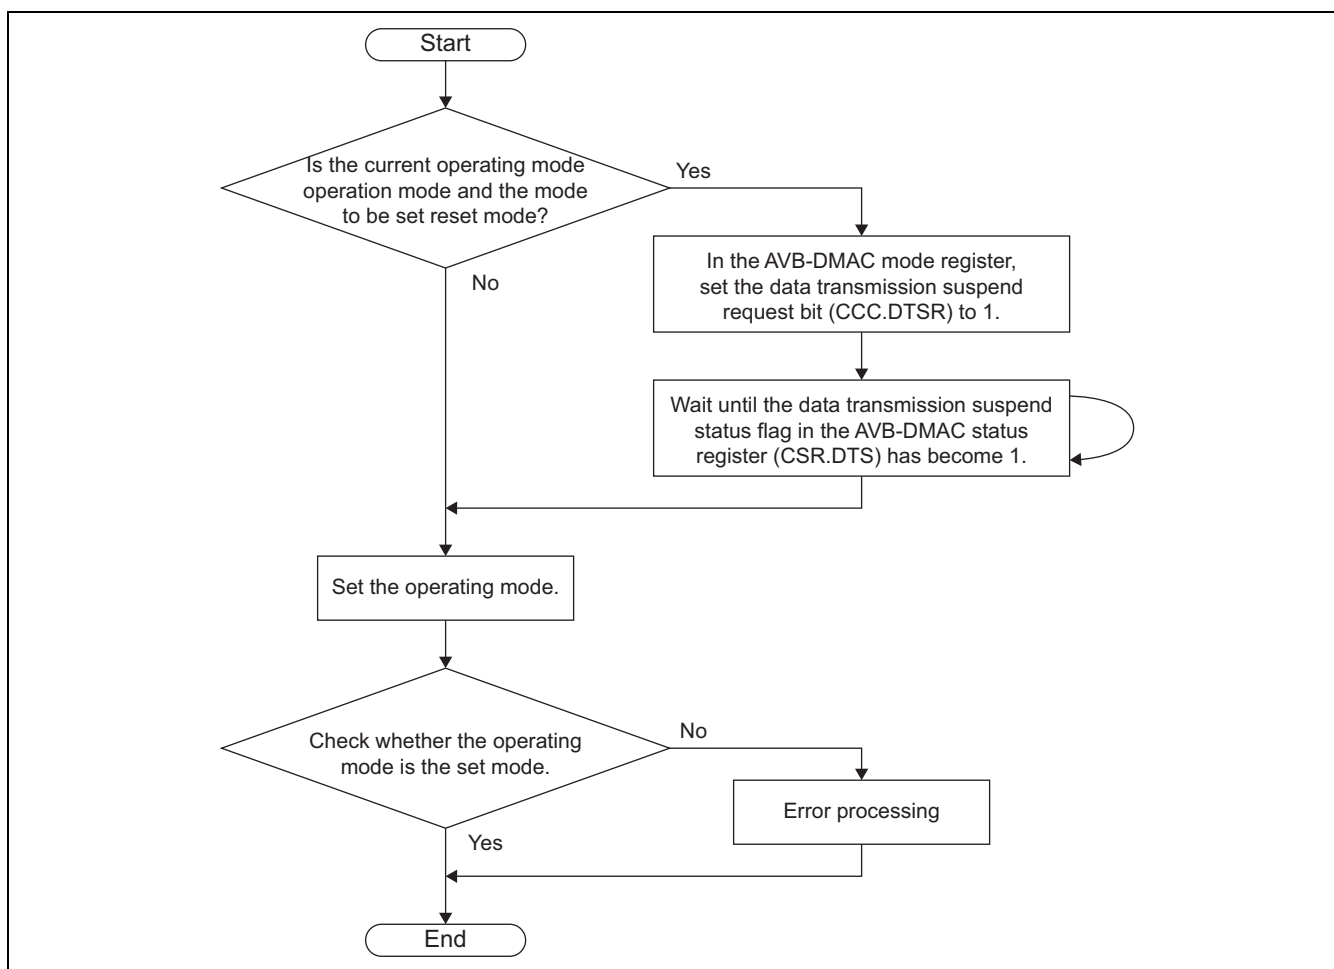

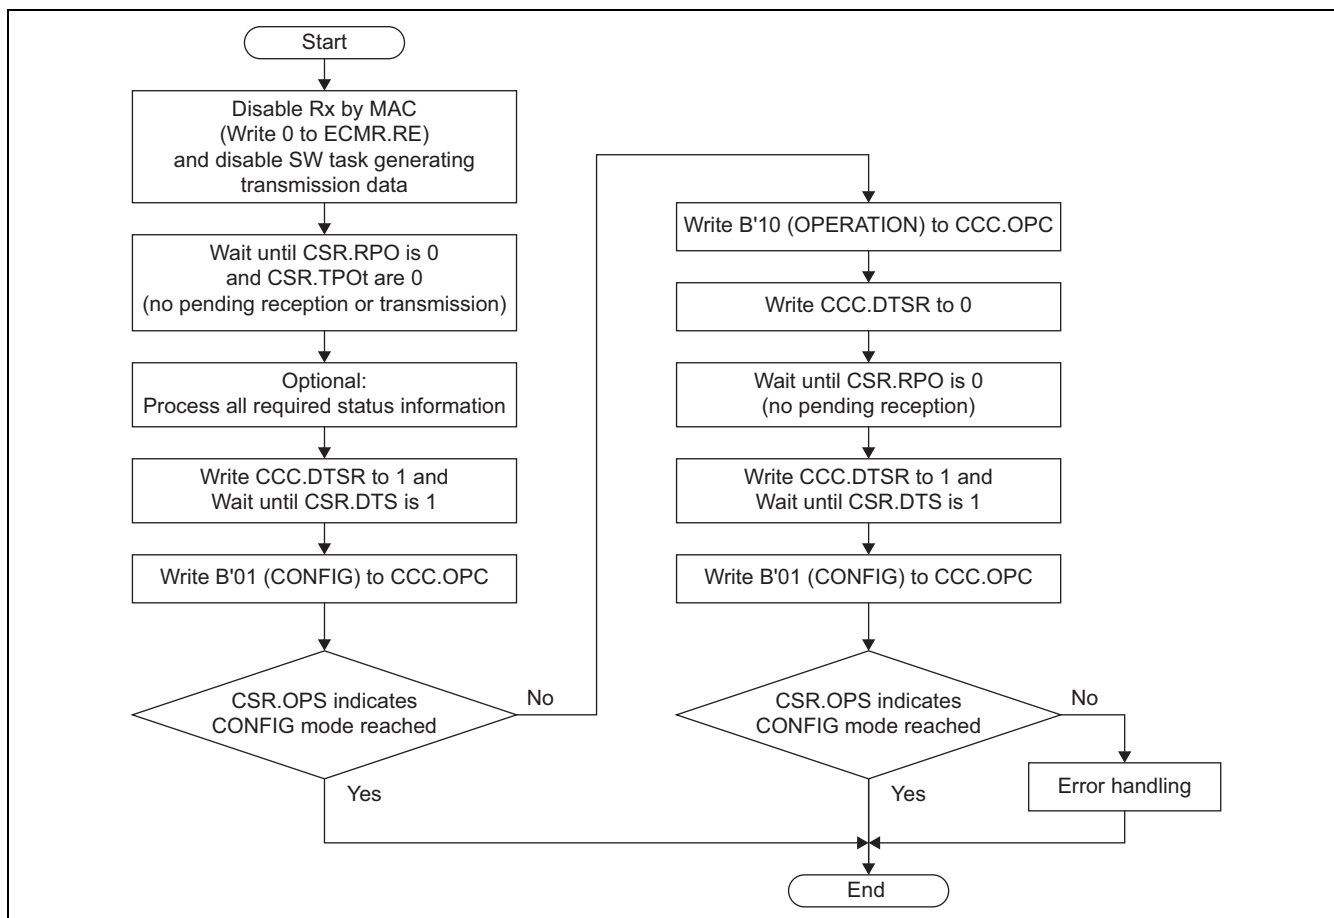

Figure 37A.3 Flow for Transitions of Operating Mode (Other than from Operation Mode to Configuration Mode)

**Figure 37A.4 Flow for Transitions of Operating Mode (from Operation Mode to Configuration Mode)**

In the transition from operation mode to configuration mode, the AVB-DMAC executes the following operations before the transition is completed. Read the operating mode status bits in the AVB-DMAC status register (CSR.OPS) to check that the transition to configuration mode has been completed.

- If the transfer of a frame between the reception FIFO and URAM is in progress, this is completed (other received frames remaining in the FIFO and any frames that are subsequently received by the E-MAC are discarded).
- If the transfer of a frame is in progress between the transmission FIFO and URAM, this is completed (frames for transmission remaining in the URAM will not be transmitted).
- All frames for transmission in the transmission FIFO are transferred to the E-MAC.

Notes: When the operating mode shifts to configuration mode, all status registers are cleared.

We recommend following the procedure below in the case of this transition.

1. Disable reception.
2. Since reception actually stopping after being disabled requires time, wait for an interval equivalent to that for reception of a maximum length packet.
3. Stop the software task that is generating data for transmission.
4. Wait until the receive process status bit (CSR.RPO) and the transmit process status bits (CSR.TPO0 to 3) in the AVB-DMAC status register are set to 0.
5. Capture all of the required status information.
6. Set the operating mode configuration bits in the AVB-DMAC mode register (CCC.OPC) to initiate the transition to configuration mode.

### 37A.3.1.3 Operating Mode Transitions Due to Hardware

The following hardware factors can also initiate transitions of the AVB-DMAC operating mode.

**(1) Hardware reset**

Resetting of the LSI chip leads to resetting of the entire EthernetAVB module. The operating mode shifts to reset mode.

**(2) Transition during power-off by module standby**

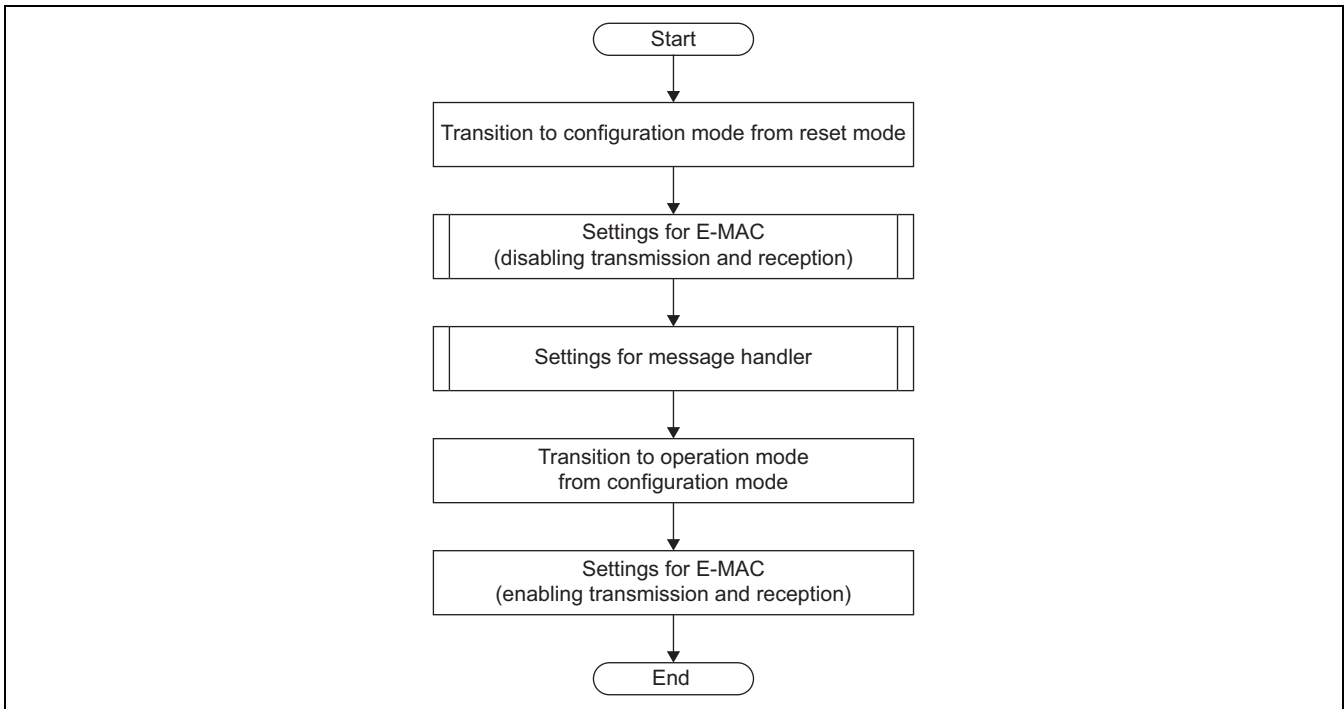

This transition is triggered by module standby of CPG during the power-off sequence.

The AVB-DMAC completes the bus master access in progress, and then shifts to reset mode. At this time, the operating mode configuration bits in the AVB-DMAC mode register (CCC.OPC) are set to B'00.

### 37A.3.2 Common Control for Transmission and Reception

#### 37A.3.2.1 Initialization Procedure

Figure 37A.5 shows the overall initialization procedure in outline.

**Figure 37A.5 Outline of the Initialization Procedure**

#### (1) Initializing the Receiver Section

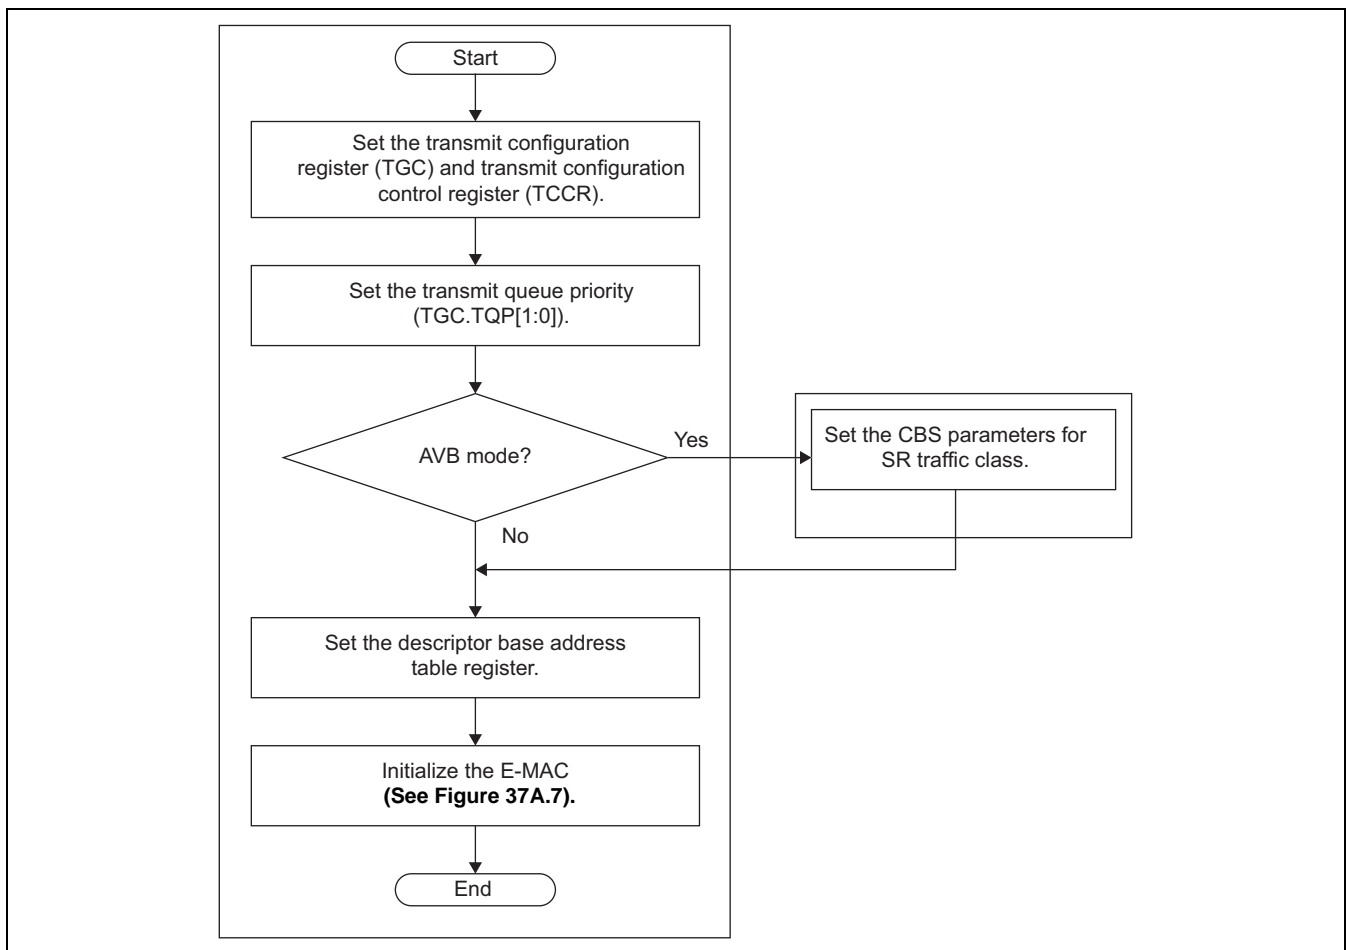

Before starting reception, follow the procedure below.

Keep the operating mode to configuration mode, and do not enable reception until the settings for the AVB-DMAC are completed.

- Set the operating mode to configuration mode.
- Set AVB filtering for network control frames and AVB stream frames to suit the specifications of the product the chip will be used in.
- Create a descriptor chain for each queue to be used.
- Set the base address for table address in the descriptor base address table register (DBAT).
- Specify the maximum frame length with the receive frame length upper limit register (RFLR).
- Specify whether padding is to be used with the receive padding configuration register (RPC).
- Set the unread frame counter for each queue with unread frame counter registers (UFCVs) 0 to 4.

## (2) Initializing the Transmitter Section

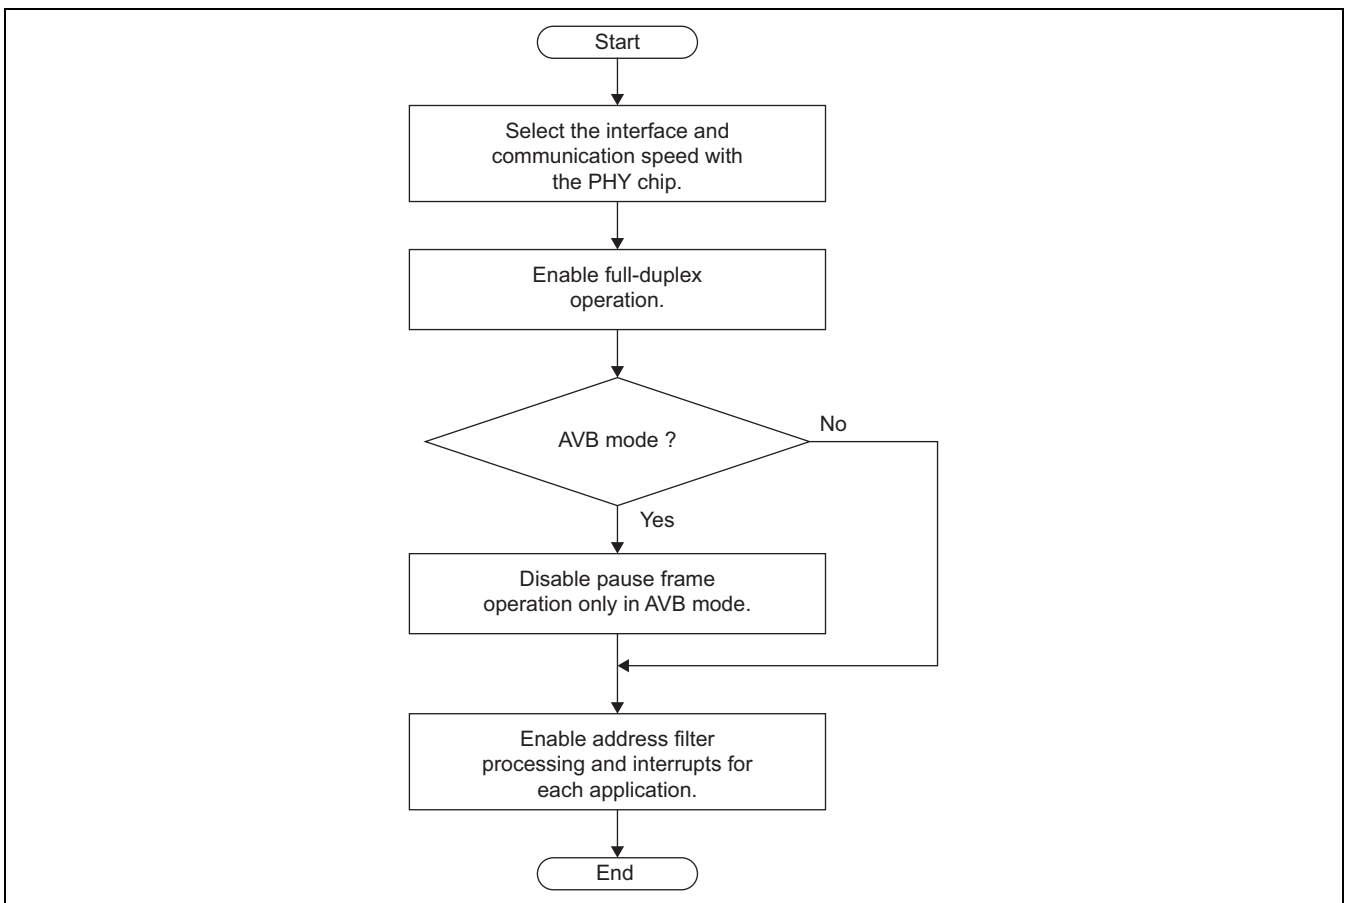

Figure 37A.6 illustrates initialization of the transmitter section.

**Figure 37A.6 Procedure for Initializing the Transmitter Section**

### (3) Initializing the E-MAC Section

Figure 37A.7 illustrates initialization of the E-MAC section.

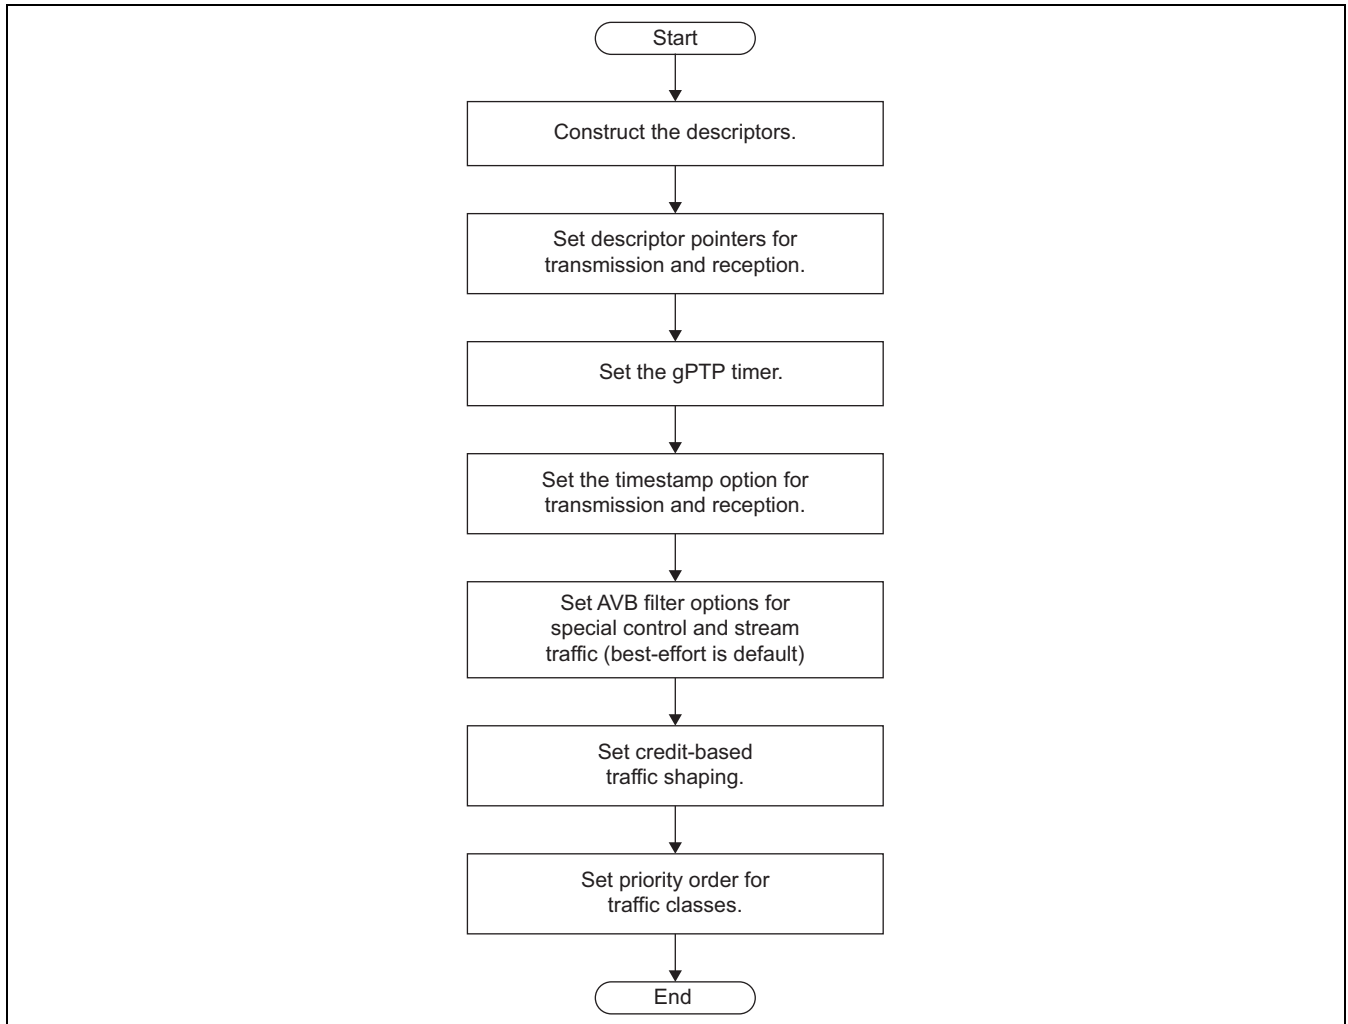

**Figure 37A.7 Procedure for Initializing the E-MAC Section**

#### (4) Initialization of the Application Unit

Figure 37A.8 illustrates initialization of the application unit.

For a description of how to set up the descriptors and the CBS traffic shaping parameters, see section 37A.3.3, Descriptors, and section 37A.3.6, CBS (Credit-Based Shaping).

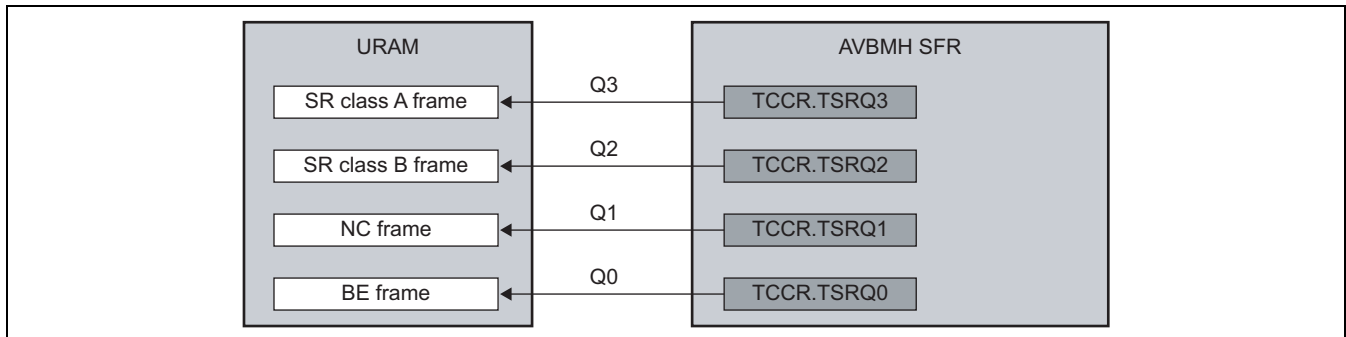

**Figure 37A.8 Initializing the Sections for Use by the Application**

### (5) Relationship between Transmission Queue Numbers and Traffic Classes

In fetching, the relationships between the transmission queues and traffic classes are fixed, so the priority specified by the transmit queue priority bits in the transmit configuration register (TGC.TQP) has no effect.

**Figure 37A.9 Class Associations of Queues for the Scheduler**

In fetching, the credit values for stream classes A and B are not taken into account. Behavior depends on the setting of the transfer FIFO size configuration bits in the transfer configuration registers (TGC.TBDt) and on the frame size that can be fetched to the transmission FIFO.

When the transmit queue priority bits in the transmit configuration register (TGC.TQP) are B'00 or B'01, the priority order is Q3 → Q2 → Q1 → Q0.

When the transmit queue priority bits in the transmit configuration register (TGC.TQP) are B'11, the priority order is Q1 → Q3 → Q2 → Q0.

### 37A.3.2.2 Checking Integrity

The AVB-DMAC is capable of detecting and identifying errors produced in the processing of Ethernet frames and in the transfer of frame data for transmission and reception.

#### (1) Concept of Integrity Checking in Reception

The aim of integrity checking in reception is preventing the storage of error frames in the URAM. If an error frame is stored in the URAM, software can get information to identify the frame as an error frame.

Note: If a special descriptor chain is to be used for separation of received headers from the associated data, an error that breaks the sequence may lead to storage space for synchronization running out. In such cases, software interaction or re-synchronization via the EOS descriptor is required.

#### (2) Concept of Integrity Checking in Transmission

The purpose of integrity checking in transmission is to prevent the transmission of broken frames.

Since transmission of a frame by the E-MAC can neither be stopped nor disabled once it has started, this check involves intensive monitoring for problems that can arise during fetching.

#### (3) Items for Monitoring in Both Reception and Transmission

##### (a) Errors in access to the URAM for reading of descriptors

The same descriptor may be processed again because the current descriptor address (CDARq.CDA) was not changed. If this problem occurs in a divided frame, the sequence may be broken.

##### In reception

- The received frame will be lost.
- The same problem will occur for the next frame of data received for the same queue.

##### In transmission

- The transmit start request bit in the transmit configuration control register (TCCR.TSRQt) is set to 0.
- The frame will be lost from the transmission FIFO.

Errors in access to read descriptors from the URAM are detected from the response signal of the AXI-Bus.

##### (b) Illegal configuration of a descriptor by an application

The same descriptor may be processed again because the current descriptor address (CDARq.CDA) was not changed. If this problem occurs in a divided frame, the sequence may be broken.

##### In reception

- The received frame will be lost.
- The same problem will occur for the next frame of data received for the same queue.

##### In transmission

- The transmit start request bit in the transmit configuration control register (TCCR.TSRQt) is set to 0.
- The frame will be lost from the transmission FIFO.

##### (c) Errors in access to the URAM for writing of descriptors

As in the case where no error occurs, the current descriptor address (CDARq.CDA) and the transmit start request bit in the transmit configuration control register (TCCR.TSRQt) are updated.

As DESCR.DT was not updated, hardware and software synchronization may have been destroyed.

Errors in access to write descriptors to the URAM are detected from the response signal of the AXI-Bus.

#### (4) Items for Monitoring in Reception

##### (a) Errors in access to the URAM for writing of data or time stamps

- As in the case where no error occurs, the current descriptor address (CDARq.CDA) is updated.
- DESC.R.EI is set to indicate incorrect contents.
- This problem occurring in a divided frame may break the descriptor sequence, making the queue unusable.

Errors in access to write data or descriptors to the URAM are detected from the response signal of the AXI-Bus.

##### (b) Error of the Reception FIFO

- Received frames are all invalidated.
- All frames stored as received frames are discarded. At this time, the number of frames and queue information cannot be captured.

If the reception FIFO RAM faults, AVB-DMAC detects the fault as error of the reception FIFO.

#### (5) Items for Monitoring in Transmission

##### (a) Errors in Access for Reading Data from the URAM

- Data that have already been fetched are discarded from the transmission FIFO.
- When an error of this type occurs during processing of an FSINGLE or FEND descriptor:  
As in the case where no error occurs, the current descriptor address (CDARq.CDA) and the transmit start bit in the transmit configuration control register (TCCR.TSRQt) are updated. Fetching resumes after the error frame.
- When an error of this type occurs during processing of an FSTART or FMID descriptor:  
The current descriptor address (CDARq.CDA) is not updated.  
The transmit start bit in the transmit configuration control register (TCCR.TSRQt) is set to 0.

Errors in access to read data from the URAM are detected from the response signal of the AXI-Bus.

##### (b) Overflow of the Transmission FIFO

- As in the case where no error occurs, the current descriptor address (CDARq.CDA) and the transmit start bit in the transmit configuration control register (TCCR.TSRQt) are updated. Fetching resumes after the error frame.
- The frame will be discarded from the FIFO.

##### (c) Frame size error during transmission

- As in the case where no error occurs, the current descriptor address (CDARq.CDA) and the transmit start bit in the transmit configuration control register (TCCR.TSRQt) are updated. Fetching resumes after the error frame.

A transmit frame size error is detected when the size setting in one or more (in the case of a divided frame) descriptors for frame transmission is 1966 or more bytes. Such frames are cut out and transmitted.

##### (d) Damaged Data in the Transmission FIFO

- Fetching is not affected by damaged data.
- Since damaged data from the FIFO is only detected during frame transmission, an error frame may be transmitted.

If damaged data in the transmission FIFO is an error due to the transmission FIFO, this is detected by the AVB-DMAC.

### 37A.3.3 Descriptors

#### 37A.3.3.1 Data Representation in URAM

The AVB-DMAC transfers data for transmission and received data to and from the application software via the URAM.

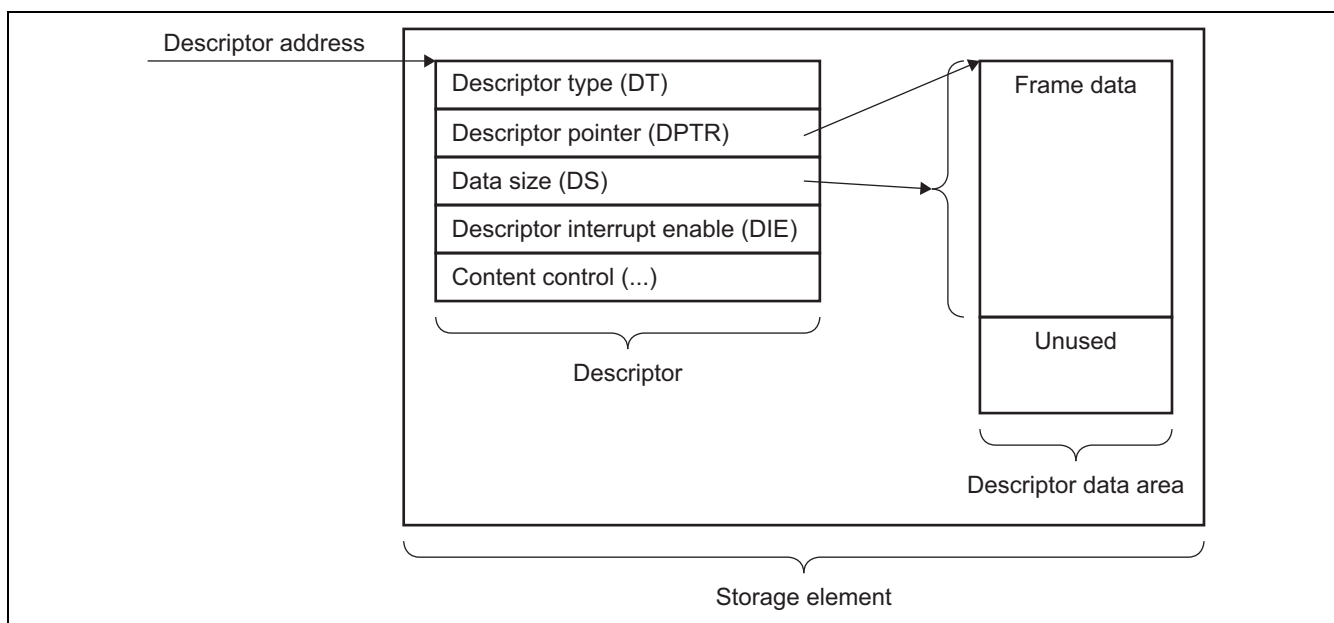

The memory in the URAM for use by the AVB-DMAC is configured with control structures referred to as descriptors and associated areas to which the frame data are allocated. Dividing the memory into a control area and data area allows the flexible allocation of frame data to the URAM. This enables sharing of the areas to which frame data are allocated and the use of non-contiguous areas. Frame data can be copied without using the CPU. Arbitration that ensures hardware and software access to the memory area is also available without access to registers of the AVB-DMAC.

Figure 37A.10 shows an example of the memory maps for descriptors and the descriptor data area in the URAM.

A descriptor consists of its type (DESCR.DT), which controls the descriptor functions, a descriptor pointer (DESCR.DPTR) indicating the start address for storage of the frame data in the descriptor area, and the data size field (DESCR.DS), indicating the amount of frame data. Post-processing interrupt generation can be set up for each descriptor. Enabling and disabling of the interrupt is controlled by the descriptor interrupt enable bits (DESCR.DIE).

The descriptor may also hold information related to content. This information does not affect general descriptor functions. It provides information other than the frame data proper, such as on the state of reception.

For details, see section 37A.3.4.2, Setting Up Reception Descriptors, and section 37A.3.5.2, Setting Up Transmission Descriptors.

**Figure 37A.10 Outline of Storage Element Used for Receive and Transmit Queues**

The descriptor must be aligned with a 32-bit boundary in the URAM.

Descriptors are generally configured of 64 bits, but are configured of 160 bits when reception and storage of gPTP time stamps is enabled.

The frame data must also be aligned with a 32-bit boundary in the URAM.

The amount of data in the frame is defined by the data size bits (DESCR.DS). In reception, these bits indicate the upper limit on the size of frames to be received. If the data size is not aligned with a 32-bit boundary, the bytes to the next 32-bit boundary in the data area will be an unused area.

### 37A.3.3.2 Using Descriptor Chains in Queues

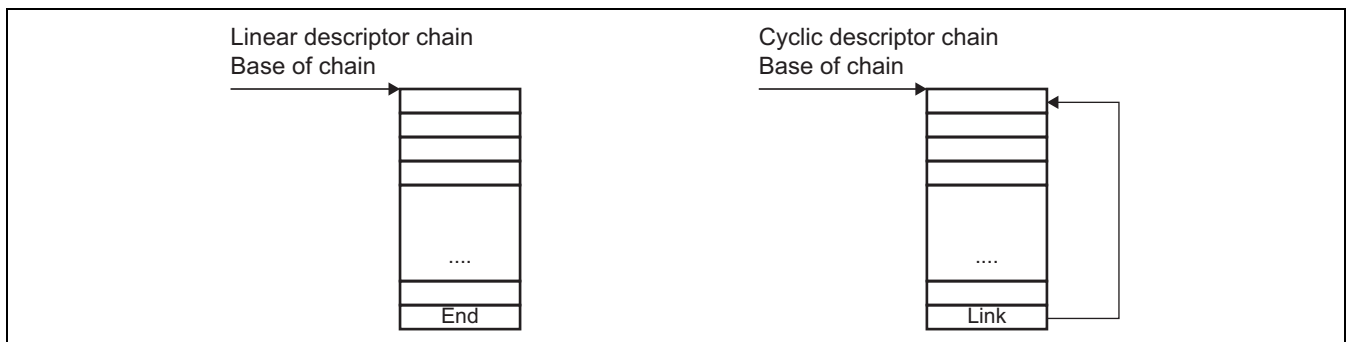

Transmission and reception descriptors in the URAM are grouped into queues. Each queue handles frames so that they are transmitted in order of priority and received separately. A queue is capable of controlling one or more frames. Accordingly, multiple descriptors can be assigned to one queue. A combination of multiple descriptors is referred to as a descriptor chain.

For a descriptor chain, the three general descriptor types listed below are defined. For details on these descriptor types, see section 37A.3.3.6, Descriptor Type.

- Descriptors that define frame data
- Descriptors that control the descriptor chain itself (e.g. LINK, EOS).
- Descriptors that arbitrate access by hardware or software

Figure 37A.11 shows the two basic topologies for descriptor chains. In the simplified examples in the figure, all descriptors allocated to the chain are stored in the array.

- For a linear descriptor chain, the last descriptor in the array is a control descriptor indicating the end of the descriptors (e.g. EEMPTY).
- For a cyclic descriptor chain, the last descriptor in the array is a control descriptor that returns to the first descriptor in the array (e.g. LINK).

**Figure 37A.11 Outline of the Basic Descriptor Chains**

The relationship between queues and descriptor chains is defined by the base addresses of chains. A queue is connected to one descriptor chain over one round of processing. There is also a method of switching to a different chain while in operation mode.

There are no restrictions on the number of link descriptors and their locations within the chain. The last descriptor of a designed chain determines the topology.

Which chain structure is to be used or which topology is suitable depends on the application. A description of how to design descriptor chains to suit various applications is given in section 37A.3.4 (2), Setting Up Reception Descriptors, and section 37A.3.5 (2), Setting Up Transmission Descriptors.

### 37A.3.3.3 Descriptor Base Address Table

The base address table in the URAM contains the address of the first descriptor of all chains to be handled by the respective queues.

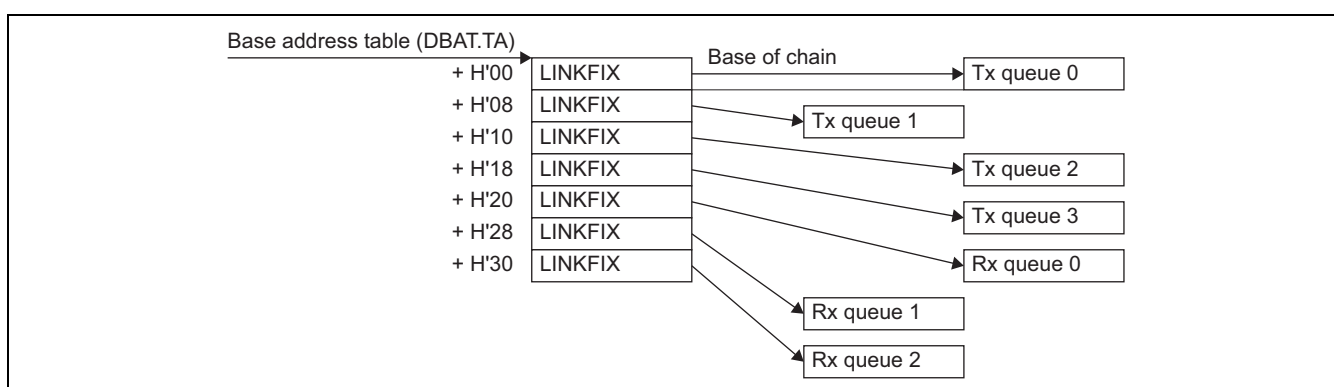

Entries 0 to 3 are used to access transmission queues 0 to 3. Subsequent entries are used to access reception queues. Entry 4 thus corresponds to reception queue 0.

The configuration of entries in the base address table is the same as the configuration of link descriptors. We recommend using the descriptor type (DESCR.DT) LINKFIX. Processing of this link descriptor does not change it, so it does not require updating. The first descriptor of a chain performs hardware and software synchronization. If the application requires hardware and software synchronization for the base addresses, use the descriptor type (DESCR.DT) LINK.

The CPU is only capable of using LINKFIX and LINK as descriptor types (DESCR.DT) of descriptors in the base address table.

Set the location of the base address table in the URAM in the descriptor base address table register (DBAT).

Figure 37A.12 shows an example of a base address table for controlling four transmission and three reception queues. The boxes to the right of the table represent descriptor chains with the desired topologies.

**Figure 37A.12 Example of a Base Address Table for Reception and Transmission Queues**

Note: The size of the descriptors in the base address table is always eight bytes even if the queue itself includes extended descriptors.

### 37A.3.3.4 Descriptor Chain Processing

The descriptor that is currently processed or will be processed when the related queue gets active is the current descriptor. The current descriptor address for use by a queue q can be checked in the current descriptor address register q (CDARq).

Current descriptors are stored in registers or in descriptors as described below in the given situations.

- In the descriptor base address table registers for all q queues (DBAT) (DBAT.TA+8\*q) when the operating mode shifts to operation mode.
- In the descriptor base address table register (DBAT) (DBAT.TA+8\*q) when a base address load request is issued for a queue q by setting the corresponding bit (DLR.LBAq) in the descriptor base address load request register (DLR).
- In DESC.RDPTR for a link descriptor (LINK, LINKFIX) to be processed.
- After a descriptor has been processed, the current descriptor for the same queue is incremented by the size of the descriptors being handled by the queue (8 bytes for normal descriptors and 20 bytes for extended descriptors). The AVB-DMAC updates the descriptor type and informs the CPU that the descriptor has been processed.

### 37A.3.3.5 Descriptor Interrupts

A descriptor is able to issue a descriptor interrupt on completion of its processing. The setting of the descriptor interrupt enable bits (DESCR.DIE) in each descriptor selects disabling or generation of the descriptor interrupt.

The descriptor interrupt is a common resource that is shared between reception and transmission queues. Software control of the descriptor interrupt provides a flexible method of application-specific flag processing.

Figure 37A.13 illustrates the way in which the AVB-DMAC generates descriptor interrupts (or sets bits in the descriptor interrupt status register (DIS.DPFi)). Processing of a descriptor with the value i in the descriptor interrupt enable bits (DESCR.DIE) leads to the corresponding bit in the descriptor interrupt status register (DIS.DPFi) being set.

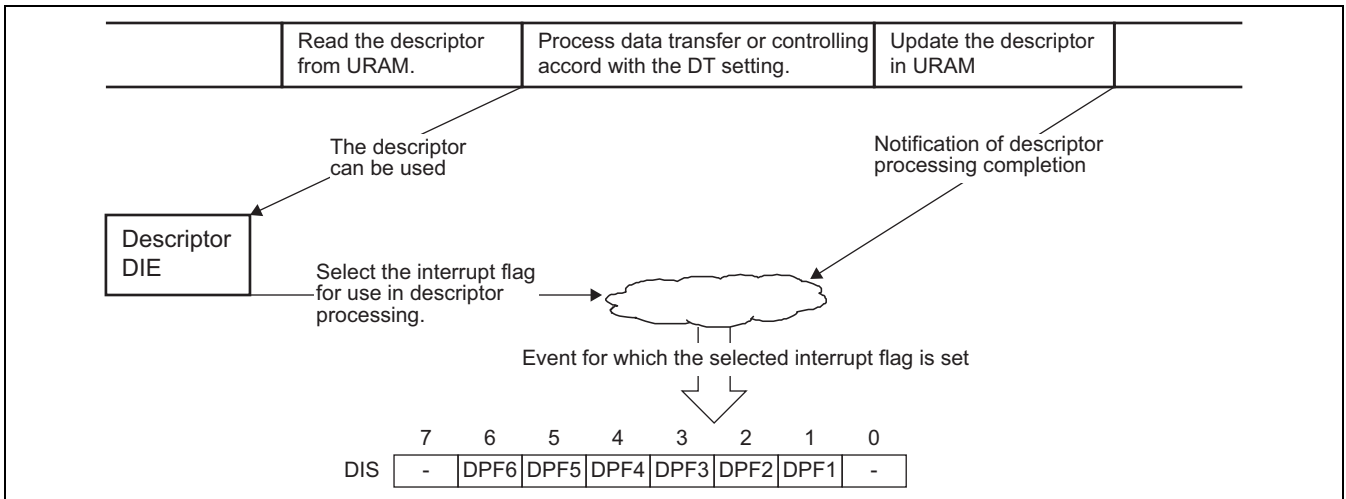

Figure 37A.13 Method of Descriptor Interrupt Generation

### 37A.3.3.6 Descriptor Type

The descriptor types (indicated by the DESCR.DT bits) supported by the AVB-DMAC fall into the following three categories.

- Definitions of frame data
- Control of descriptor chains
- Hardware and software arbitration

Table 37A.5 is a summary of the descriptor types available for the AVB-DMAC. Entries under “Name” are the names of the descriptor types and the values under “DT” are the corresponding values to be set in the descriptor type field (DESCR.DT). A given descriptor may be handled differently according to whether it is in a transmission or reception queue, so the transmission and reception columns list the scopes of control and processing of the descriptor types.

The abbreviations defined below are used in the transmission and reception columns.

#### Definition of SW:

- The descriptor is processed by software.
- Software has access to and may modify the descriptor and descriptor data area.
- This descriptor cannot be changed by hardware (AVB-DMAC).

#### Definition of HW:

- The descriptor is processed by hardware (AVB-DMAC).
- Software must modify neither the descriptor nor the descriptor data area.
- Hardware (AVB-DMAC) processes this descriptor and subsequently changes the descriptor type.

#### Invalid:

This descriptor type is not used in transfer in the given direction (transmission or reception).

Do not write this value to the descriptor type (DESCR.DT) field for transfer in the given direction.

Hardware does not process these descriptor types in the cases listed as invalid. The current descriptor address (CDARq.CDA) will not be changed when processing of a queue for the given direction arrives at a descriptor with this type setting.

**Table 37A.5 Summary of Descriptor Types**

Name	DT	Description	Reception	Transmission
Frame data				
FSTART	5	Frame Start The descriptor points to valid data for a frame. The frame starts with the given data and continues with that indicated by the next descriptor.	SW	HW
FMID	4	Frame Middle The descriptor points to valid data for a frame. The frame started with a previous descriptor and continues to the data indicated by the next descriptor.	SW	HW
FEND	6	Frame End The descriptor points to valid data for a frame. The frame continues from the previous descriptor and ends with the data indicated by in this descriptor.	SW	HW
FSINGLE	7	Frame Single The descriptor points to valid data for a complete frame.	SW	HW
Chain control				
LINK	8	Link Defines the next descriptor in the chain.	HW	HW
LINKFIX	9	Fixed Link Same as LINK, but not changed by AVB-DMAC after processing.	SW	SW
EOS	10	End Of Set Control element to split a descriptor chain. The chain stops and waits for user interaction.	HW	HW
HW/SW arbitration				
FEMPTY	12	Frame Empty A descriptor related to frame data but not containing valid data for a frame	HW	SW
FEMPTY_IS	13	Frame Empty Incremental Start A descriptor related to frame data but not containing valid data for a frame. DESCR.DPTR sets the base address of an "incremental data area" in the URAM.	HW	Invalid
FEMPTY_IC	14	Frame Empty Incremental Continue A descriptor related to frame data but not containing valid data for a frame. Data is stored to the incremental data area in the URAM.	HW	Invalid
FEMPTY_ND	15	Frame Empty No Data storage A descriptor related to frame data but not containing valid data for a frame. The descriptor is processed in the same way as FEMPTY but data are not stored in the URAM.	HW	Invalid
LEEMPTY	2	Link Empty A link descriptor for processing by the AVB-DMAC	SW	SW
EEMPTY	3	EOS Empty An EOS descriptor for processing by the AVB-DMAC	SW	SW
DT0	0	Reserved	Invalid	Invalid
DT1	1	Reserved	Invalid	Invalid
DT11	11	Reserved	Invalid	Invalid

### 37A.3.3.7 Layout of General Descriptors in the URAM

The AVB-DMAC updates processed descriptors in the URAM. The field to be changed in the descriptor being updated depends upon whether the direction is transmission or reception and the queue mode. Other fields will not be changed. There are no restrictions on the values set in unused descriptor fields (indicated by “—” in the figure).

#### (1) Frame Data Descriptors

The allocation of bits in the frame data descriptors (FSTART, FMID, FEND, and FSINGLE) is shown below.

- Normal descriptor (usable in both reception and transmission)

- Extended descriptor (usable only in reception)

**Table 37A.6 Contents of Frame Data Descriptors (DESCR)**

Bit Name	Function
DT[3:0]	Descriptor Type 5: FSTART 4: FMID 6: FEND 7: FSINGLE For details, see section 37A.3.4.2, Setting Up Reception Descriptors, and section 37A.3.5.2, Setting Up Transmission Descriptors.
DIE[3:0]	Descriptor Interrupt Enable B'0000: Descriptor interrupt is disabled. B'0001 to B'1111: The corresponding descriptor interrupt is generated (DIS.DPFi).
—	Content Control For details, see section 37A.3.4.2, Setting Up Reception Descriptors, and section 37A.3.5.2, Setting Up Transmission Descriptors.
DS[11:0]	Data Size Size of the data area/frame data for the descriptor (in bytes)
DPTR[31:0]	Descriptor Pointer Pointer to the data area for the descriptor Register an address on a 32-bit boundary.
TS[79:0]	Time Stamp Time stamp of the received frame (only available in extended descriptors)

Note: Register an address aligned with a 32-bit boundary as the descriptor pointer (DESCR.DPTR).

Some bits in extended descriptors are reserved (The reserved bits (above DESCR.TS[79:64]) in an extended descriptor are set to H'0000 after the time stamp is stored).

**(2) Hardware/Software Arbitration Descriptors (Only for Reception)**

The allocation of bits in the descriptors for hardware/software arbitration (FEMPTY, FEMPTY\_IS, FEMPTY\_IC, and FEMPTY\_ND) is shown below.

The allocation of bits in the arbitration descriptors for use in reception is the same as in frame data descriptors.

- Normal descriptor

- Extended descriptor (usable only in reception)

**Table 37A.7 Contents of Hardware/Software Arbitration Descriptors (DESCR)**

Bit Name	Function
DT[3:0]	Descriptor Type 12: FEMPTY 13: FEMPTY_IS 14: FEMPTY_IC 15: FEMPTY_ND For details, see Table 37A.5, Summary of Descriptor Types.
DIE[3:0]	Descriptor Interrupt Enable B'0000: Descriptor interrupt is disabled. B'0001 to B'1111: The corresponding descriptor interrupt is generated (DIS.DPFi).
—	Content Control For details, see section 37A.3.4.2, Setting Up Reception Descriptors, and section 37A.3.5.2, Setting Up Transmission Descriptors.
DS[11:0]	Data Size Size of the data area/frame data for the descriptor (in bytes)
DPTR[31:0]	Descriptor Pointer Pointer to the data area for the descriptor Register an address on a 32-bit boundary.
TS[79:0]	Time Stamp Time stamp of the received frame (only available in extended descriptors)

Note: Register an address aligned with a 32-bit boundary as the descriptor pointer (DESCR.DPTR).  
When the descriptor is an extended descriptor, it has a 12-byte unused area.

In an FEMPTY descriptor, the descriptor type (DT), descriptor interrupt enable (DIE), data size (DS), and descriptor pointer (DPTR) fields are used.

In an FEMPTY\_IS descriptor, the descriptor type (DT), descriptor interrupt enable (DIE), and descriptor pointer (DPTR) fields are used.

In an FEMPTY\_IC descriptor, the descriptor type (DT) and descriptor interrupt enable (DIE) are used.

In an FEMPTY\_ND descriptor, the descriptor type (DT), descriptor interrupt enable (DIE), and data size (DS) are used.

**(3) Link Descriptors**

The allocation of bits in the link descriptors (LINK and LINKFIX) is shown below.

- Normal descriptor

**Table 37A.8 Contents of Link Descriptors (DESCR)**

Bit Name	Function
DT[3:0]	Descriptor Type 8: LINK 9: LINKFIX For details, see Table 37A.5, Summary of Descriptor Types.
DIE[3:0]	Descriptor Interrupt Enable B'0000: Descriptor interrupt is disabled. B'0001 to B'1111: The corresponding descriptor interrupt is generated (DIS.DPFi).
DPTR[31:0]	Descriptor Pointer Pointer to the data area for the descriptor Register an address on a 32-bit boundary.

Note: Register an address aligned with a 32-bit boundary as the descriptor pointer (DESCR.DPTR).

**(4) Other Descriptors**

The allocation of bits in the other descriptors (EOS, FEMPTY (only for transmission), LEMPTY, and EEMPTY) is shown below.

	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
+0	DT[3:0]				DIE[3:0]				—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
+4	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

**Table 37A.9 Contents of Other Descriptors (DESCR)**

Bit Name	Function
DT[3:0]	Descriptor Type 10: EOS 12: FEMPTY (only for transmission) 2: LEMPTY 3: EEMPTY For details, see Table 37A.5, Summary of Descriptor Types.
DIE[3:0]	Descriptor Interrupt Enable B'0000: Descriptor interrupt is disabled. B'0001 to B'1111: The corresponding descriptor interrupt is generated (DIS.DPFi).

### 37A.3.3.8 How to Use Frame Data Descriptors

The descriptor data area size field (DESCR.DS) can specify up to 2048 bytes of Ethernet frame data per data area. Settings higher than 2048 (bytes) cannot be made.

In general, Ethernet frames are not of uniform length. The AVB-DMAC is capable of dividing frame data into multiple descriptors in order to minimize the memory capacity for frame data. This function allows processing of frames that are longer than the limit for descriptor data areas. Division can also be applied to frames on the basis of their data structures.

To handle frames and descriptors, four descriptor types (DESCR.DT) as FSTART, FEND, FMID and FSINGLE are defined.

Figure 37A.14 shows the mapping of frame data by frame data descriptors. The descriptor data areas are allocated to the URAM. For frames that require division into four or more data areas, additional FMID descriptors can be added as required.

**Figure 37A.14 Mapping of Frame Data**

For reception, set the descriptor data areas to the maximum size (i.e. give DESCR.DS its maximum value). The AVB-DMAC will store received frame data in the given area. If a received frame has more data than the maximum size, the AVB-DMAC will divide the data up.

For transmission, set the descriptor data area size field to the actual data size. The AVB-DMAC modifies the descriptor type (DESCR.DT) to FEMPTY after processing the relevant descriptor. The data size (DESCR.DS) and descriptor pointer (DESCR.PTR) fields retain their settings.

A descriptor data area including unused space produces an empty space between data areas. In reception, an “incremental data area” can be used to prevent empty spaces. For incremental data areas, see section 37A.3.4.3 (2), Incremental Data Areas.

As well as reducing the memory capacity taken up by the descriptor area in the URAM, division into frames can be used to identify different sections of data (e.g. for separating a header and data).

### 37A.3.3.9 How to Use Chain Control Descriptors

#### (a) Link Descriptors

The link descriptors can be used to set up cyclic descriptor chains (for details, see section 37A.3.3.2, Using Descriptor Chains in Queues)

After a LINK descriptor is processed, its descriptor type (DESCR.DT) is changed to LEMPTY. The descriptor pointer (DESCR.PTR) retains its setting.

After processing of a LINKFIX descriptor, the descriptor type (DESCR.DT) is not updated. Software can change the descriptor type (DESCR.DT), descriptor interrupt enable (DESCR.DIE), and descriptor pointer (DESCR.DPTR). However, DESCR.DT should not be modified by software. Take care to check the current descriptor address register (CDARq.CDA) before changing the descriptor pointer (DESCR.DPTR).

#### (b) EOS Descriptor

Use the EOS descriptor to divide a descriptor chain into various segments. The queue can continue even after an EOS descriptor.

In transmission, the response to an EOS descriptor is clearing of the transmit start request bit in the transmit configuration control register (TCCR.TSRQq) to 0.

In reception, the response is generation of a receive queue full interrupt (RIS2.QFFr), although if the frame currently being received is being divided for storage (received data such as those where some storage is in FMID- or FEND-type frames), the data are not completely stored.

### 37A.3.3.10 How to Use Hardware and Software Arbitration Descriptors

In hardware processing of descriptors, the empty descriptor types (FEMPTY, LEMPTY, and EEMPTY) are used to distinguish various descriptors. For software, they can be used to initiate checking for empty spaces, etc.

#### (a) FEMPTY, FEMPTY\_IS, FEMPTY\_IC, and FEMPTY\_ND

These descriptor types (DESCR.DT) are used for descriptors that do not contain effective data. Of these, only FEMPTY is used in transmission. The descriptor pointer of a FEMPTYxxx descriptor refers to a descriptor data area.

#### (b) LEMPTY

This descriptor type (DESCR.DT) is assigned to LINK descriptors after they have been processed. The descriptor pointer (DESCR.DPTR) of an LEMPTY descriptor still points to the linked descriptor.

#### (c) EEMPTY

This descriptor type (DESCR.DT) is assigned to EOS descriptors after they have been processed. The descriptor pointer (DESCR.DPTR) of an EEMPTY descriptor is not used.

### 37A.3.3.11 Synchronization between Descriptor Access by Hardware and Software

The allocation of descriptor types (DESCR.DT) to the URAM can be used to set up the primary synchronization between hardware and software. By this, the number of CPU accesses to registers of EthernetAVB can be minimized and performance can be increased.

Basic concepts of synchronization:

- Each descriptor type in the set is exclusively for processing by hardware or software, depending on the direction of transfer (see Table 37A.5, Summary of Descriptor Types).
- Software must not change a descriptor assigned to hardware processing (the hardware does not change descriptors assigned to software processing).

In the case of software processing, the software must process the information in the descriptor and the corresponding frame data before changing the descriptor type. If a descriptor type for hardware is set in DESCR.DT, the software should not change any part of the descriptor or of the corresponding frame data.

### 37A.3.3.12 Tips for Optimizing Performance in Handling Descriptors

The following items are recommended as ways to ensure the optimal use of data structures in the URAM.

They are not requirements, but using a different approach may increase the load on the system bus within the LSI chip.

- Register descriptors with 64-bit alignment (this does not apply to extended descriptors).
- While in operation mode, use LINKFIX instead of LINK whenever a descriptor need not be changed. Hardware modifies the descriptor type (DESCR.DT) fields of LINK descriptors.
- Frame data is accessed in blocks up to 128 bytes.
- The number of 128 byte borders (addresses H'xxx00 and H'xxx80) and frame data inside should be minimized.
- Design the descriptor chains in ways that minimize parallelism of processing. This helps in dividing the chains into segments allocated to different cache pages, and in arranging the different segments exclusively for access by software or hardware.
- Minimize the number of divided frames. This can reduce the overhead of descriptor handling.

### 37A.3.4 Control in Reception

The point of the AVB-DMAC is to transfer data between the E-MAC and URAM without intervention by the CPU.

AVB-DMAC needs descriptors that define the amounts of frame data to be stored and the locations. After the E-MAC receives a frame, it stores the received frame data and the conditions of reception as the E-MAC state. If the descriptor is extended, the time stamp is also stored. For a description of how to set up descriptors for use in reception, see section 37A.3.4.2, Setting Up Reception Descriptors.

The AVB-DMAC filters received frames to separate them into various classifications (separation filtering). More specifically, this is done to separate received frames into the various reception queues and to set the priorities of different classes of received frames. For more on separation filtering, see section 37A.3.4.1 (1), Separation Filtering.

Figure 37A.15 shows the reception data bus and the selection of queues for use in reception.

Each frame received from the E-MAC is stored in the reception FIFO; in parallel with this, the frame is analyzed to identify its type and the target queue number. After the E-MAC completes reception, the target queue number is generated and stored in the reception FIFO. Appending of a reception flag depends on the storage of one frame among the reception queues in the URAM, and the unread frame counter (UFC) is also associated with frame storage.

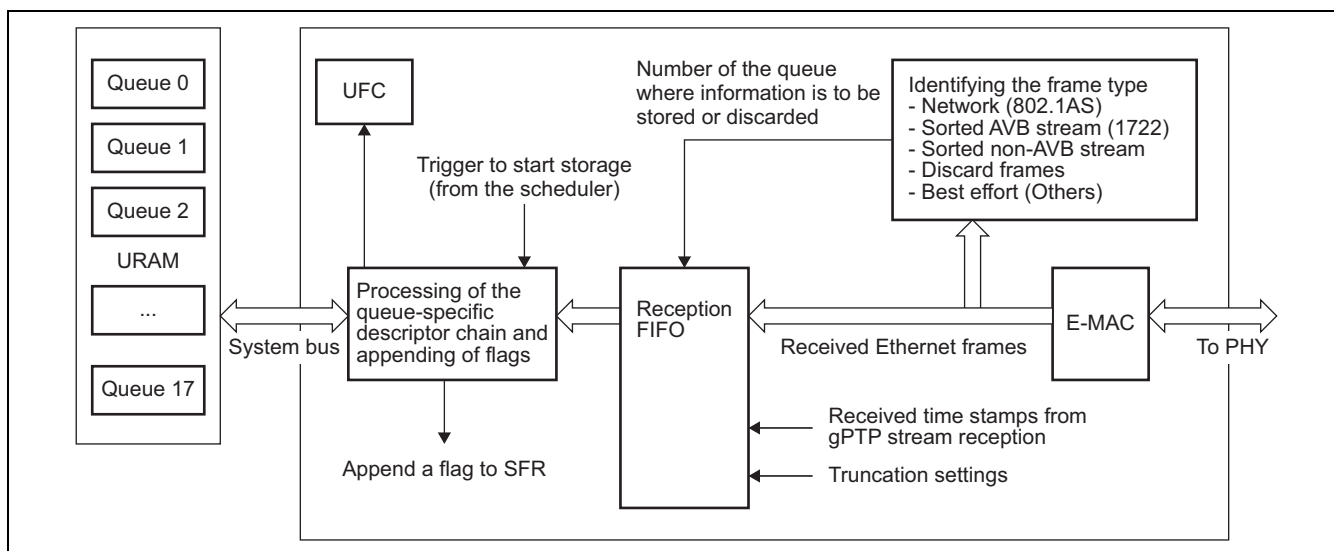

Figure 37A.15 Mechanism of General Reception Queue Selection

### 37A.3.4.1 Reception Queues

The AVB-DMAC applies its separation filtering mechanism to select the reception queue for storing a received frame. The AVB-DMAC stores all received frames in the URAM.

There are two conditions for the AVB-DMAC to discard a received frame.

- Detection of an error during reception by the E-MAC
  - Whether error frames are discarded or stored in reception queue 0 (best effort) depends on the setting of the error frame enable bit in the receive configuration register (RCR.EFFS). If error frames are to be stored (RCR.EFFS = 1), they are always stored in queue 0 (best effort). In this case, characteristics specific to the queue (e.g. truncation) will vary. If the storage of time stamps for reception queue 0 (best effort) is enabled (the time stamp enable bit in the receive configuration register RCR.ETS0 = 1), time stamps are stored even for error frames.
- Frame fails the separation filter
  - It depends on RCR.ESF if such frame is discarded or stored in receive queue 0 (best effort).

The flowchart in Figure 37A.16 shows how the AVB-DMAC selects the reception queue in accord with the frame type, including judgment by the separation filter. Selection of the queue starts when the E-MAC completes frame reception. The result is storage of the frame in the proper queue or the frame being discarded.

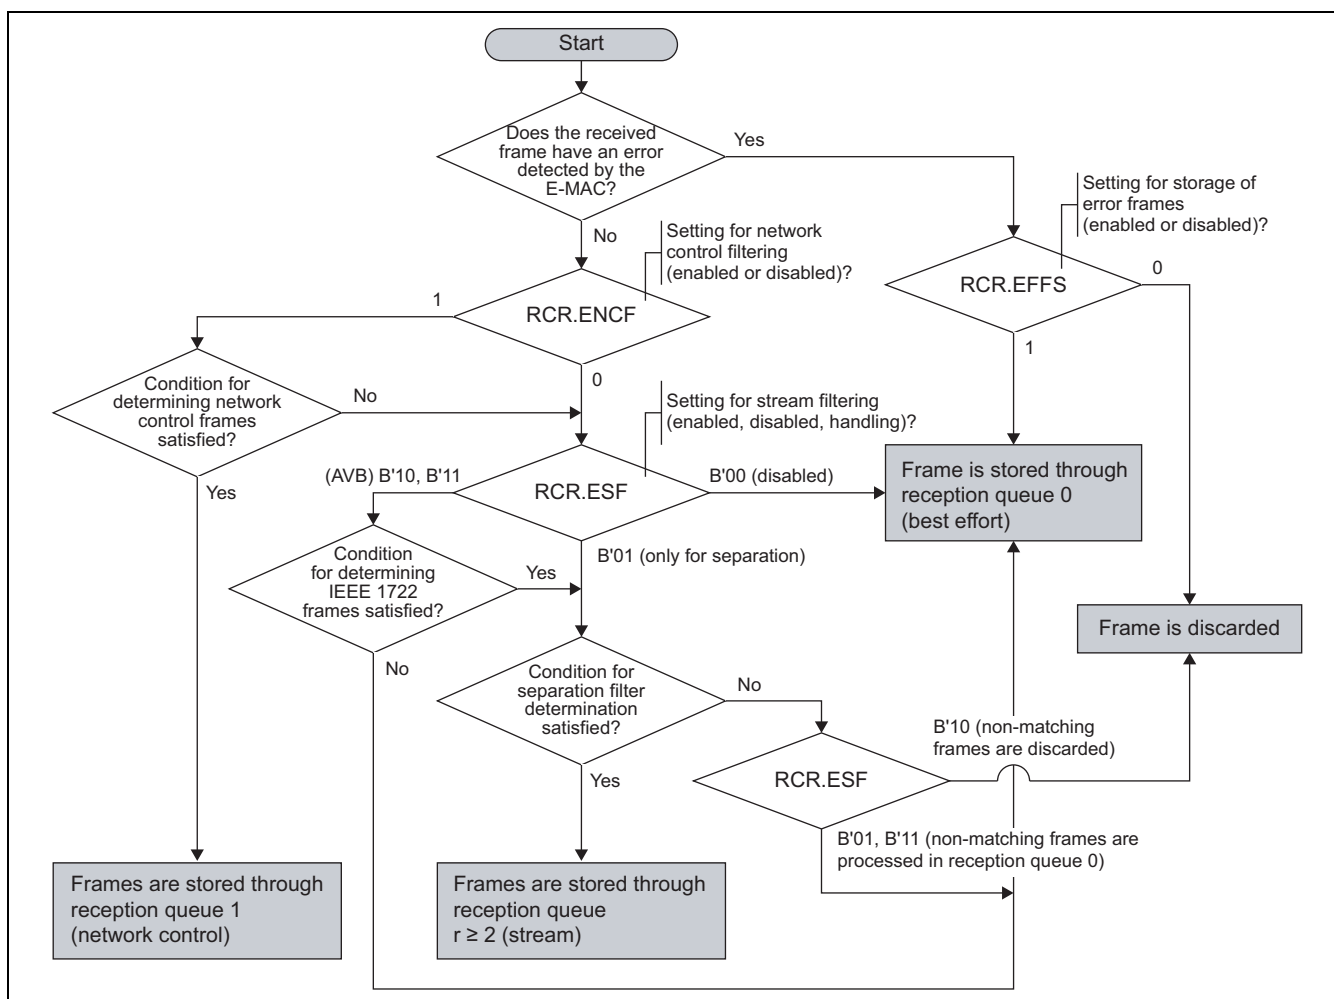

Figure 37A.16 Mechanism of Reception Queue Selection

Notes on the meanings of entries in the flowchart

- “Condition for determining network control frames”  
 The Ethernet destination address (DA) is 01:80:C2:00:00:0E.  
 The Ethernet type (ET) is 88:F7.
- “Condition for determining IEEE 1722 frames”  
 The Ethernet destination address (DA) is within the range from 91:E0:F0:00:00:00 to 91:E0:F0:00:FE:FF.  
 The VLAN tagged TPID (tag protocol identifier) field (VL) is 81:00.  
 The Ethernet type (ET) is 22:F0.
- “Condition for separation filter determination”  
 See section 37A.3.4.1 (1), Separation Filtering.

Figure 37A.17 shows the allocation of bits related to the network and stream types in Ethernet frames. The preambles of Ethernet frames are not taken into account.

Data bytes	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19
Network type	DA1	DA2	DA3	DA4	DA5	DA6	SA1	SA2	SA3	SA4	SA5	SA6	ET1	ET2	...	...	...	...	...	...
Stream type	DA1	DA2	DA3	DA4	DA5	DA6	SA1	SA2	SA3	SA4	SA5	SA6	VL1	VL2	-	-	ET1	ET2	...	...

**Figure 37A.17 Data Bytes of Ethernet Frames Used in Classification**

**(1) Separation Filtering**

Separation filtering involves the checking of up to 64 bits (eight successive bytes) in received Ethernet frames. The setting for the first byte (i.e. the setting of the separation filter offset configuration register (SFO.FBP)), selects the part of frames to be used in separation filtering. There is also a common filter mask (set in the separation filter mask configuration register (SFMi.CFM)) that can be freely set to reduce the number of bytes used in separation filtering or to mask particular bits.

**Examples**

To use one byte in separation, set separation filter mask configuration register 0 (SFM0.CFM) to H'0000 00FF and separation filter mask configuration register 1 (SFM1.CFM) to H'0000 0000.

To use seven bytes in separation, set separation filter mask configuration register 0 (SFM0.CFM) to H'FFFF FFFF and separation filter mask configuration register 1 (SFM1.CFM) to H'00FF FFFF.

Note: If bits at some positions are set to 0 in the separation mask, in order to match with the pattern, the bits at the corresponding positions of the pattern must also be set to 0. Only those bits in which the separation filter pattern configuration register (SFPi.FPs) setting is equal to the separation filter mask configuration register (SFMi.CFM) are sorted by matching with received data.

Figure 37A.18 shows separation filtering. The selected data from a received frame (Rx\_Frame[63:0]) are masked by the common filter mask. As a result, the selected frame data can be obtained. This value is compared with all filter patterns. The separation filter circuit in the AVB-DMAC selects the filter pattern that matches the queue having the lowest index s or selects a flag to indicate that there is no matching separation pattern.

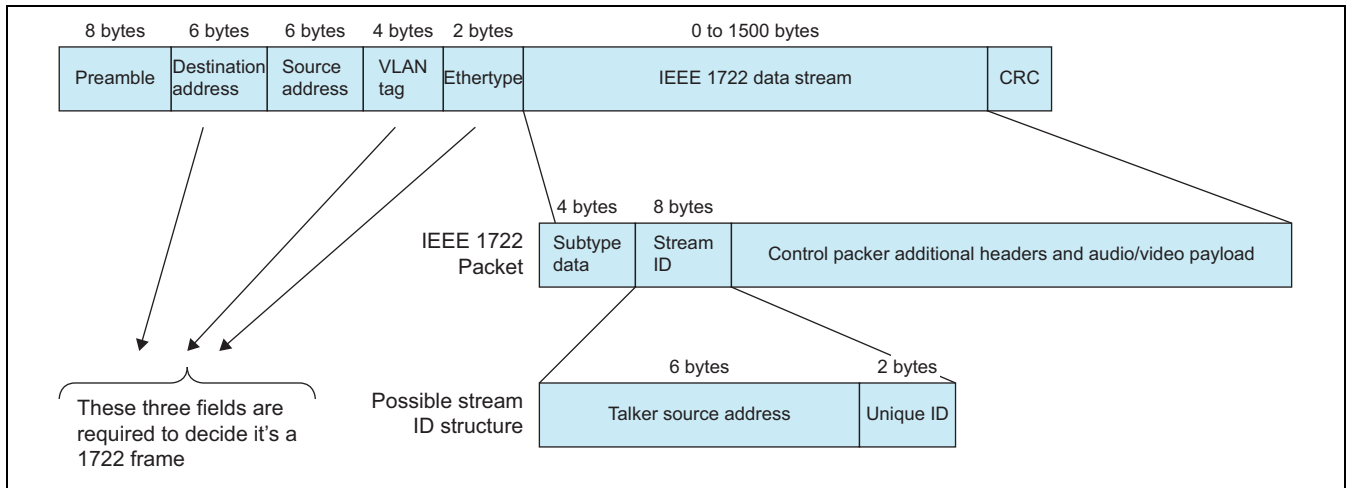

**Figure 37A.18 Separation Filtering**

**(2) Separating Streams**

The AVB-DMAC applies separation filtering to sort frames received in streams. An AVB network has a concept of “Talker” and “Listener”. A Talker is an end station that generates one or more streams. A Listener is an end station that has the role of being a sink for at least one stream. The various A/V streams are identified by 8-byte stream IDs.

The number of end stations within an AVB network and their roles differ with the application.

The stream ID is a general pattern of the AVB network for identifying one stream. Figure 37A.19 shows the bit allocation of bits in IEEE1722 Ethernet frames and stream ID fields.

**Figure 37A.19 IEEE 1722 Frame Layout and Stream ID**

The IEEE 1722 standard stipulates that the stream ID field starts from the 23rd byte (not counting the preamble). Accordingly, set the separation filter offset (SFO.FBP) to 22 in operations on IEEE 1722 streams. Set the separation filter mask (SFMi) and separation filter pattern (SFPi) in accord with the specification of the product in which the chip is being used.

Example: In the example of a stream ID shown in Figure 37A.19, the current application divides the field into the talker source address and the unique stream ID. The unique ID is used to differentiate between multiple streams from the same talker. Based on this, there are two settings for separation filter masking:

- To divide various streams into individual queues, set SFM0.CFM to H'FFFF FFFF and SFM1.CFM to H'FFFF FFFF.
- To divide streams from various talkers into individual queues, set SFM0.CFM to H'FFFF FFFF and SFM1.CFM to H'0000 FFFF. This excludes the unique ID from the filter condition.

### 37A.3.4.2 Setting Up Reception Descriptors

For reception, the descriptor mechanism is essentially as described in section 37A.3.3, Descriptors.

This section describes memory operations that are especially required in handling reception queues.

#### (1) Reception Descriptor Type

The type of a descriptor is defined by the descriptor type (DESCR.DT) field.

Table 37A.10 shows the descriptor types used in reception.

**Table 37A.10 Descriptor Types in Reception**

Descriptor Type (DESCR.DT)	Operation	Write-back
Frame Start (FSTART)	Condition for data not being stored in a reception queue: The RIS2.QFFr bit indicates that queue r is full and the received frame is not stored. Descriptor processing proceeds again in response to further reception.	Not changed
Frame Middle (FMID)	Same as FSTART	Not changed
Frame End (FEND)	Same as FSTART	Not changed
Frame Single (FSINGLE)	Same as FSTART	Not changed
Link (LINK)	Processing proceeds to the descriptor specified by DESCR.DPTR.	LEEMPTY
Fixed Link (LINKFIX)	Same as LINK	Not changed
End Of Set (EOS)	A stop point defined by software has been reached. A descriptor of this type within a divided frame (writing of FMID or FEND) stops the frame being stored and the frame is lost. RIS2.QFFr indicates that the frame has been lost. If this happens at the start of a frame (writing of FSTART or FSINGLE), storing of frames starts from the next descriptor. In either case, processing shifts to the next descriptor in the chain.	EEMPTY
Frame Empty (FEMPTY)	The descriptor can be used to store received data. Up to DESCR.DS bytes are stored in the descriptor data area. For details, see section 37A.3.4.3 (1), Storing Frame Data in the Descriptor Data Area.	FSTART, FMID, FEND, or FSINGLE
Frame Empty Incremental Start (FEMPTY_IS)	The descriptor can be used to store received data. All data for the frame are stored in the descriptor data area. DESCR.DPTR indicates the base address of the incremental data area. For details, see section 37A.3.4.3 (2), Incremental Data Areas.	FEND or FSINGLE
Frame Empty Incremental Continue (FEMPTY_IC)	The descriptor can be used to store received data. The remaining bytes of frame data are stored in the descriptor data area. DESCR.DPTR is undefined, but is written back at the start position within the incremental data area after processing. For details, see section 37A.3.4.3 (2), Incremental Data Areas.	FEND or FSINGLE
Frame Empty No Data storage (FEMPTY_ND)	The descriptor can be used to store received data. Up to DESCR.DS bytes are captured from the reception FIFO but not stored. After processing, DESCR.DS is written back as 0. For details, see section 37A.3.4.3 (2), Incremental Data Areas	FSTART, FMID, FEND or FSINGLE
Link Empty (LEEMPTY)	Same as FSTART	Not changed
EOS Empty (EEMPTY)	Same as FSTART	Not changed

## (2) Configuration of Reception Frame Data Descriptors

Figure 37A.20 shows the configuration of descriptors for use with reception queues. The reception-specific fields are the same whether the descriptor is normal or extended. The reception-specific fields (DESCR.MSC, DESCR.PS, DESCR.EI, and DESCR.TR) are described in Table 37A.11.

For the other fields and the descriptor types, see section 37A.3.3.6, Descriptor Type.

**Figure 37A.20 Configuration of Descriptor for a Received Frame**

**Table 37A.11 Configuration of a Received Descriptor**

Bit Name	Function
MSC	<p>E-MAC Status Code</p> <p>These bits indicate errors in reception detected by the E-MAC.</p> <p>In the case of a divided frame, these bits are set to the same value within all descriptors for the frame data. Details of the bits are as follows.</p> <p>MSC[7]: Received frame has a multicast address.</p> <p>MSC[6]: Carrier extend error</p> <p>MSC[5]: Carrier sense error</p> <p>MSC[4]: Received frame has alignment error.</p> <p>MSC[3]: Received frame is too long.</p> <p>MSC[2]: Received frame is too short</p> <p>MSC[1]: Error in frame reception (PHY detects an error)</p> <p>MSC[0]: Received frame has a CRC error.</p>
PS	<p>Padding Selection</p> <p>These bits specify whether frame data are to be padded when stored in the incremental data area.</p> <p>Insertion of padding data is in accord with the settings in the RPC register.</p> <p>B'00: Padding is not to be inserted.</p> <p>B'01: Padding data may be inserted. This depends on the RPC settings.</p> <p>Other settings are not effective.</p>
EI	<p>Error Indication</p> <p>This bit indicates the detection of an error in frame data while a frame was being stored.</p> <p>The bit is set to 1 for a descriptor in which an error has been detected. If the descriptor is for a divided frame, storage of the frame is aborted.</p> <p>0: No error</p> <p>1: Error is detected</p>
TR	<p>Truncation Indication</p> <p>This bit indicates whether frame data received from the E-MAC have been truncated before being stored.</p> <p>These bits are set to the same value within all frame data descriptors for a divided frame.</p> <p>0: Data have not been truncated.</p> <p>1: Data have been truncated.</p>

**Note:** The RCR.EFFS bit specifies whether or not frames with errors detected by the E-MAC are to be stored in the URAM. When the storing of error frames is disabled, error codes are not written to DESCR.MSC.

### 37A.3.4.3 Reception Processing

After initialization, the AVB-DMAC is able to select the proper reception queue and store received frames in the data area in the URAM as indicated by the descriptor. The AVB-DMAC continues to store received data in the URAM as long as space is available for descriptors and data areas.

Received frames are classified and stored in the reception FIFO in accord with the algorithm described in section 37A.3.4.1 (1), Separation Filtering.

If the reception FIFO contains even one frame, storing is executed to the reception queue.

If there is even one empty data descriptor in a queue for which reception has started, the storage of frame data starts. Received frames for a queue that is already full (there is no empty frame descriptor or the UFC stop level has been reached) are discarded from the reception FIFO. This ensures that one queue being full does not prevent the storage of data in the other queues.

#### (1) Storing Frame Data in the Descriptor Data Area

Frame data for storage are assumed to be in either of the two patterns described below.

- The data for an entire frame will fit in the descriptor data area.
  - In this case, the descriptor type (DESCR.DT) is FSINGLE.
- Frame data to be stored in the descriptor data area arrive in divided form.
  - In this case, FSTART is written to the descriptor type (DESCR.DT) bits of the first descriptor of the frame data to arrive and FMID and FEND are written to the type bits of descriptors for subsequent data.

The descriptor type is updated by the AVB-DMAC in the last step of descriptor processing, so software can always access the descriptor assigned to DESCR.DT.

When normal synchronization mode is used, the CPU can write FEMPTYxxx directly to the descriptor type field after processing the stored element. Do not change the descriptor or any part of the descriptor data area after FEMPTYxxx is written to DESCR.DT.

#### (a) Storing Frame Data for a Whole Single Frame

For a frame with an FSINGLE descriptor, all data for the frame are held at the position defined by DESCR.DPTR. DESCR.DS indicates the length of the received frame.

If DESCR.DS is bigger than the actual size of a received frame, the FSINGLE descriptor is stored in place of the FEMPTY or FEMPTY\_ND descriptor after processing.

Also, the FSINGLE descriptor is stored in place of the FEMPTY\_IS or FEMPTY\_IC descriptor, which always hold the descriptor data area greater than all frame data in Rx-FIFO after processing.

#### (b) Storing Frame Data as Divided Frames

Divided frames are handled in the same way as a single frame. A frame stored with divided descriptors must be recombined before use. DESCR.EI and DESCR.TS are only valid in the last descriptor of the sequence for a divided frame.

Note: If the data area size setting in DESCR.DS is not a multiple of four, the number of bytes set in DESCR.DS is fetched from the reception FIFO and the remaining bytes are used as the next storage area.

After a received frame is divided into different descriptors, each storage element is handled separately, and the descriptor type is assigned by software after processing. Accordingly, an error frame (FEMPTYxxx instead of FMID or FEND) may exist while a descriptor chain is being processed. In such a case, the CPU must postpone processing of the error frame to the next trigger point.

**(c) No Data are Stored**

The application specification may lead to some types of received frames being unimportant (for example, when the application only requires stream data from the Ethernet frames). Storing frames in divided form makes separating out the unnecessary parts of Ethernet frames possible.

If part of a divided frame is not required, use the FEMPTY\_ND descriptor for that part so that it is not stored in the URAM. Not storing the data negates the need for bandwidth on the data bus, improving the overall performance.

When an FEMPTY\_ND descriptor is processed, DESCR.DS is set to 0. This brings the frame data section of the descriptor into agreement with the FEMPTY type. DESCR.DS = 0 is for the unique identification of the descriptor after writing.

**(2) Incremental Data Areas**

Secure space in the URAM for storing received data. Even when data are placed in the URAM area such that all descriptor data areas of a chain are contiguous, a received frame being shorter than the descriptor data area will lead to an empty space. Figure 37A.21 shows an example of settings and the memory map.

Certain applications require that data areas be contiguous (e.g. when received data are to be processed other than by hardware as the A/V codec module). When the length of received frames differs (e.g. when payloads vary between having one or two A/V packages), the use of a static pointer in the descriptor produces empty spaces in the data area. This may necessitate direct additional processing to remove the empty spaces.

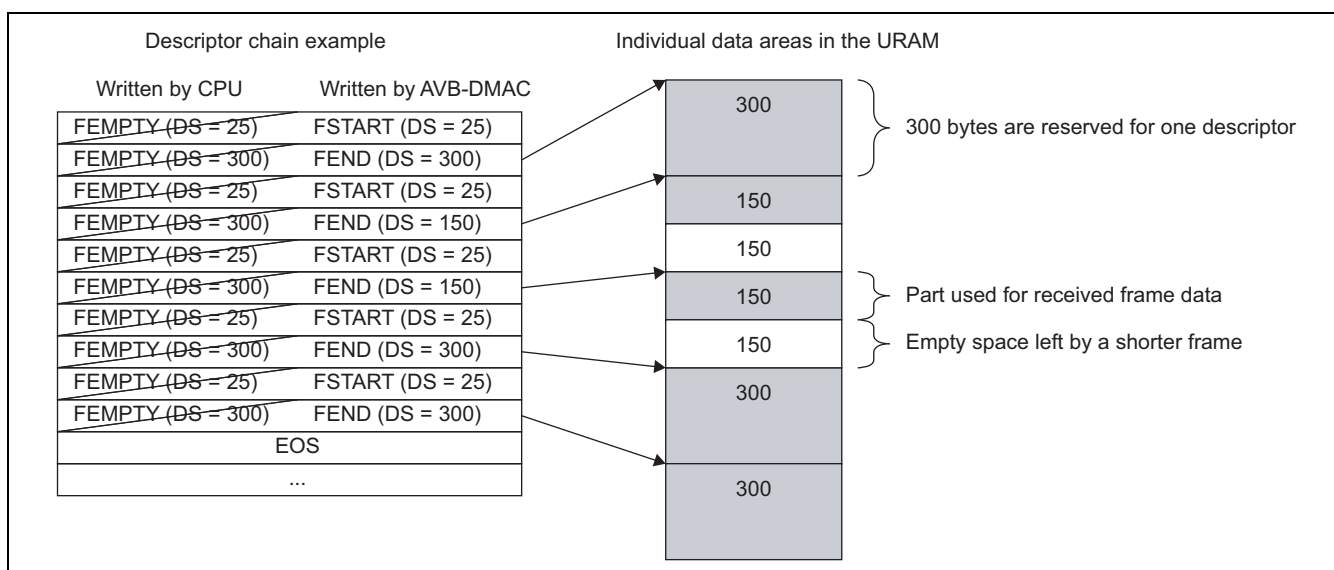

Accordingly, and to reduce the CPU load imposed by copying data, the AVB-DMAC supports an “incremental data area” function.

When incremental data areas are in use, all descriptors use a common data area for storage. One descriptor (FEMPTY\_IS) defines the base address of the incremental data area and the next descriptor (FEMPTY\_IC) within the descriptor chain holds received data. Figure 37A.22 shows an example of settings and the memory map.

Use of an incremental data area does not reduce the memory space in the individual descriptor data areas.

The hardware and software synchronization strategy and performance are also not changed.

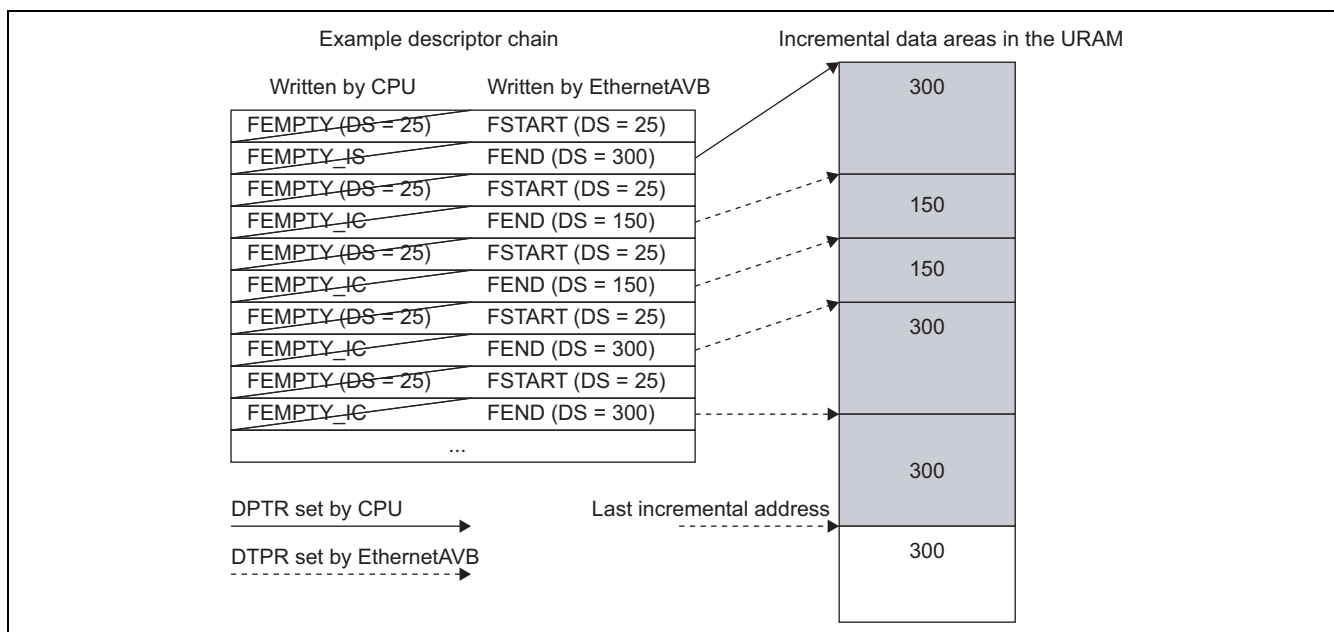

It is also possible to divide a frame up among various descriptors in a way that reflects its structure (e.g. one descriptor for the Ethernet header and one for the data payload).

**Figure 37A.21 A Reception Queue Using Individual Descriptor Data Areas**

Figures 37A.21 and 37A.22 show how control of the data storage areas by a descriptor chain varies according to whether individual or incremental data areas are in use. The chains are configured for storing received frames consisting of a 25-byte header (which is treated as one descriptor; and is outside the scope) and a 150- or 300-byte payload (whether one or two 150-byte payload packages are transmitted with one Ethernet frame depends on the data source).

In Figure 37A.21, the EOS descriptor is added as an example of a re-synchronization point. If the frame source transmits a frame containing more than 325 bytes, the frame will be divided among three descriptors, meaning that synchronization of the header and data sequences is lost. Despite this, however, the frame is not divided across the EOS descriptor, so recovery is automatic without software interaction. The EOS is not required with the incremental descriptors because all data being processed are always stored while an incremental data area is in use.

**Figure 37A.22 Reception Queue Using a Common Incremental Data Area**

As Figure 37A.22 shows, when data are stored in an incremental data area, the descriptor pointers in the FEMPTY\_IC descriptors (DESCR.DPTR) are updated. Accordingly, the resulting FEND or FSINGLE descriptor is in the same format as after writing to an FEMPTY descriptor.

Software captures received data from an incremental data area, which has no empty storage areas between frame data. The only empty space is that at the end of the incremental data area. The sizes of incremental data areas and of blocks of data for storage in incremental data areas must be multiples of four bytes. When the amount of data for storage in an incremental data area is not a multiple of four bytes, from one to three bytes of empty space will be produced. DESCR.DS can be read to check for such empty spaces.

CPU cannot restrict directly the amount of received data stored by an incremental descriptor (FEMPTY\_IS, FEMPTY\_IC) as this is possible for other descriptors (FEMPTY, FEMPTY\_ND) by DESCR.DS. Incremental descriptors store always all received data.

#### (a) Setting Up an Incremental Data Area

A descriptor chain in the incremental data area having N descriptors (one FEMPTY\_IS and N-1 FEMPTY\_IC) means that the incremental storage area of N times of maximum frame size is needed.

As Figure 37A.22 shows, DESCR.DPTR of an FEMPTY\_IS descriptor indicates the base address of the incremental data area. The next FEMPTY\_IS descriptor in the chain indicates the processing step where data must be stored in the incremental data area.

**(b) Processing an Incremental Data Area Based on Descriptors**

Since data processing by the CPU is the same regardless of how the AVB-DMAC stores the data, data stored in an incremental data area do not require any special handling.

**(c) Padding**

Use padding for received frame data that are not aligned correctly in the specified memory structure. Padding can be set individually for each descriptor. Accordingly, in the reception of divided frames, padding can be restricted to only those frames that require it (e.g. A/V payload data.)

Padding can also be used to optimize system performance in an incremental data area (e.g. to prevent inefficient access by aligning received data with 32-byte boundaries in the incremental data area), as well as to fulfill application-specific requirements for specified memory structures (e.g. formats required by other modules that will be processing the received data).

Padding can only be used in an incremental data area.

The value H'0000 0000 is always used in padding.

Padding is the addition of the number of words (from one to seven 32-bit words) set in the stored padding counter in the receive padding configuration register (RPC.PCNT). This padding is repeatedly inserted in accord with the value in the stored data counter (RPC.DCNT) (from one to 255 32-bit words). When the stored data counter (RPC.DCNT) reaches 0, however, padding is not repeated.

The first word of padding is always inserted at the position specified by DESCR.DPTR. When divided frames are in use, a padding word can be inserted at any byte position, and padding is handled on a 32-bit basis (e.g. an incremental data area where the first descriptor is for a 42-byte header data and the second descriptor holds padded payload data).

The next figure shows a general example of how padding is inserted and an example of setting up padding. A indicates frame data A received by the E-MAC, and B indicates the frame data stored in the descriptor data area (32-bit word units).

**Figure 37A.23 Example of a Padding Setting**

Both padding and received frame data are counted in the descriptor size (DESCR.DS).

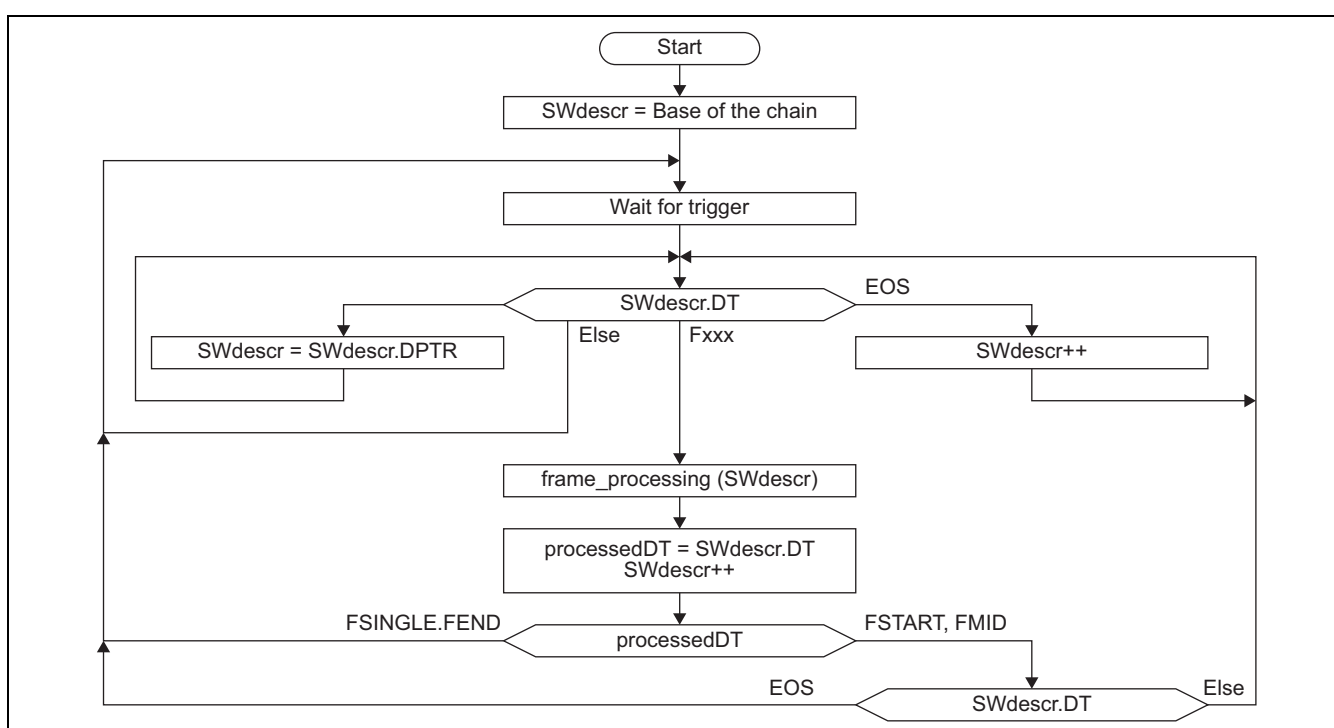

### (3) Mode with Write-Back

Constructing a descriptor chain requires software (see Figure 37A.24).

In the example in the figure, the variable SWdescr (software descriptor pointer) is a structure to identify a descriptor being processed. SWdescr must be initialized after operation mode is entered and a descriptor base address load request (DLR.LBAq) is executed (condition for starting the flow of software operations).

The frame\_processing() function processes the stored data. The function can use SWdescr.DT to check whether processing of a frame is completed. How frame data are processed differs with the application, so create functions that handle processing in accord with the specification.

The processing section is common to all modes of reception. The number of frames processed in response to each trigger can be restricted. When multiple frames have to be processed in a batch, waiting for individual trigger boxes must be skipped for these frames.

**Figure 37A.24 Flow of Reception Descriptor Processing (with Write-Back)**

### (4) Support for Reception Time Stamps

Capturing reception time stamps is essential for IEEE 802.1AS time synchronization. Other types of received frames may also require that a reception time stamp be appended; this depends on the application. The AVB-DMAC supports reception time stamps based on the gPTP timer by storing time stamps, which have been captured when Start Frame Delimiter (SFD) of a received frame is arrived, in the last frame data descriptor (FEND or FSINGLE). For the gPTP timer, see section 37A.3.7.1, gPTP Timer.

When time stamps are to be stored, use extended descriptors for the entire reception queue. Furthermore, time stamps are always stored for reception queue 1 (network control). Time stamps for reception queue 0 (best effort) and reception queue  $r$  ( $r \geq 2$ ; for stream data) can be selected by the time stamp enable bits in the receive configuration register (RCR.ETS0 or RCR.ETS2).

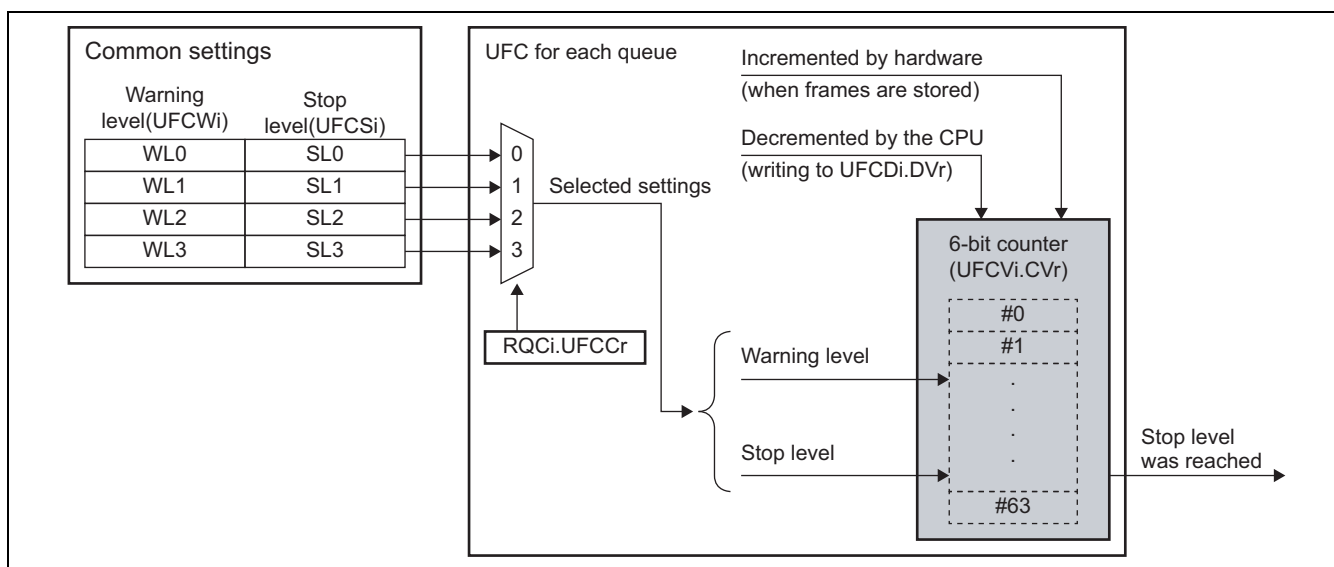

### 37A.3.4.4 Unread Frame Counters

Each reception queue has an unread frame counter (UFCVi). Use the unread frame counter configuration bits in the receive queue configuration register (RQCi.UFCCr) to select from among the four warning and stop levels for each unread frame counter. The 0 setting disables the stop and warning functions. For how to set this up, see Figure 37A.25.

Operations of the AVB-DMAC (hardware) and CPU (software) drive an unread frame counter (UFC) in the following ways.

- The hardware indicates that it has added a new frame to the descriptor chain for the queue (this increments the counter).
- Software indicates how many frames from the descriptor chain it has processed by writing to the corresponding bits of the unread frame counter decrement register for the queue (this decrements the register by the number written).

The unread frame counter is based on the number of frames stored in the URAM and is only incremented by one even when a received frame is divided into different descriptors. Failure in storing a descriptor chain requires care because this may unread frame counter may fail in synchronization as described in section 37A.3.4.4 (1), Unread Frame (UFC) Synchronization Failure.

**Figure 37A.25 Overview of an Unread Frame Counter**

Unless synchronization of hardware and software is lost, the current unread frame counter value (UFCVi.CVr) indicates the number of unread frames in the queue.

The indicator that the stop level has been reached prevents the storage of further received frames in the descriptor chain. Selecting 0 as the stop level disables this function. Otherwise, further received frames for the queue are discarded once its unread frame counter reaches the stop level. Activation of the unread frame counter stop function is indicating by setting of the receive queue full interrupt flag in the receive interrupt status register 2 (RIS2.QFFr).

Set the unread frame counter warning level configuration register (UFCW) and the unread frame counter stop level configuration register (UFCS) for each reception queue that will use the unread frame counter function while the current operating mode is configuration mode.

### (1) Unread Frame (UFC) Synchronization Failure

The unread frame counters do not recognize failure to store a frame in the URAM. In other words, the AVB-DMAC increments the counter for a queue each time it captures a frame for that queue from the reception FIFO whether or not it succeeds in storing the frame normally in the descriptor chain.

In general, synchronization of hardware and software fails under the following conditions.

- An unread frame counter reaching its maximum value  
When the value of a counter in an unread frame counter register  $i$  (UFCVi) ( $i = 0$  to  $4$ ) reaches 63, synchronization for the corresponding queue can fail.  
The CPU can only judge that a failure in synchronization has not occurred when the stop level is set to 63.
- A queue not having enough space for a descriptor  
In this case, the corresponding receive queue full interrupt flag (RIS2.QFFr) in receive interrupt status register 2 (RIS2) is set.  
If an unread frame counter reaches its stop level while synchronization remains normal, the receive queue full interrupt flag (RIS2.QFFr) in the receive interrupt status register 2 (RIS2) is set. Software must respond to this.
- A problem occurring during access to memory

The result of a failure in synchronization is the unread frame counter indicating that the corresponding descriptor chain may contain more available frames than it actually can. To retrieve the correct starting point for operations, use the descriptor base address load request (DLR.LBAq) for the given queue.

### 37A.3.5 Transmission Control

Areas in the URAM for storing transmission descriptors must also be secured (for descriptors, see section 37A.3.3, Descriptors).

The AVB-DMAC fetches data from the URAM in accord with the procedure the descriptor describes. The descriptor also retains tag information once the frame has been fetched for transmission. The tag information is used to maintain the relationships between status and time stamps for the software and the AVB-DMAC. The status and time stamp information for transmitted frames remains accessible after their transmission is completed.

#### 37A.3.5.1 Transmission Modes

The AVB-DMAC has two modes of transmission.

- AVB transmission mode  
This mode is selected by the priority level setting for the transmission queue in the transmit configuration register (setting of the TGC.TQP[1:0] bits) being B'01 or B'11.
- Non-AVB transmission mode  
This mode is selected by the priority level setting for the transmission queue in the transmit configuration register (setting of the TGC.TQP[1:0] bits) being B'00.

##### (1) AVB Transmission Mode

AVB transmission supports the control of traffic through the output port to implement various traffic classes.

##### (a) Support for Traffic Classes and Associated Priority

When transmission is in AVB transmission mode, streams of traffic are transmitted in accord with the part of the AVB specification called Forwarding and Queuing for Time Sensitive Streams (FQTSS; for details on this, see the IEEE 802.1Q standard).

In the AVB specification, at least one queue for a reserving stream under the Stream Reservation Protocol (SR stream) and at least one queue for a non-SR stream are present, and the queues for SR traffic is Highest priority queue.

The AVB-DMAC supports four traffic classes: SR class A, SR class B, network control (NC) traffic (gPTP frames), and best effort (BE) traffic. Allocating a specific queue to network control (NC) frames ensures the control of synchronization.

The AVB-DMAC realizes compliance with the AVB standards by handling queues with the following architecture (in terms of traffic classes).

- Four transmission queues (Q3, Q2, Q1, and Q0) are available.
- Q3 and Q2 are for SR streams (one each for class A and class B).
- Q1 is for low-bandwidth network control (NC) traffic (gPTP frames)
- Q0 is for other types of traffic (MSRPDU\*<sup>1</sup>, MVRPDU\*<sup>2</sup>, best effort (BE), etc.)

Notes: 1. MSRPDU: Multiple Stream Registration Protocol Data Unit  
2. MVRPDU: Multiple VLAN Registration Protocol Data Unit

Fetching from queues proceeds in order of priority of the above traffic types. Three systems of priority are available through the setting of the transmit queue priority bits in the transmit configuration register (TGC.TQP[1:0]). In the default priority scheme, which is called AVB mode 1 (selected by TGC.TQP[1:0] = B'01), operation of the AVB-DMAC is fully in accord with the AVB specification. AVB mode 2 (transmit queue priority bits (TGC.TQP[1:0] = B'11) is an alternative priority scheme and varies from the AVB specification. Using this scheme thus requires more care. The other setting is for non-AVB-mode transmission.

**Table 37A.12 Default and Alternative Priority Orders in AVB Transmission Mode**

Priority Schemes (AVB Mode)	Priority Order of Queues
Default	Q3 (SR class A) > Q2 (SR class B) > Q1 (NC) > Q0 (BE)
Alternative	Q1 (NC) > Q3 (SR class A) > Q2 (SR class B) > Q0 (BE)

**(b) Transmission Selecting Algorithm and CBS**

The algorithm the AVB-DMAC applies to select frames for transmission is in accord with the specifications under section 8.6.8, Transmission selection, of the IEEE 802.1Q standard. For AVB mode, the CBS (credit-based shaping) algorithm is applied to the class A and class B SR queues (Q3 and Q2). Use of the CBS enables correct handling of the priorities of transmission from the SR queues. For the CBS algorithm, see section 37A.3.6, CBS (Credit-Based Shaping).

When the following conditions both hold, transmission from an SR queue (Q3 or Q2) proceeds at the specified time.

- The queue contains at least one frame ready for transmission.
- The queue has available credit.
- Unless an SR queue satisfies the above conditions, a higher priority queue is not present (not ready for transmission).

A non-SR queue (Q1 or Q0) is selected if the conditions below both hold.

- The queue contains at least one frame ready for transmission.
- As well as the above condition, a higher priority queue is not present (not ready for transmission).

Figures 37A.26 and 37A.27 are flowcharts of selection for transmission in AVB mode 1 (default) and AVB mode 2 (alternative).

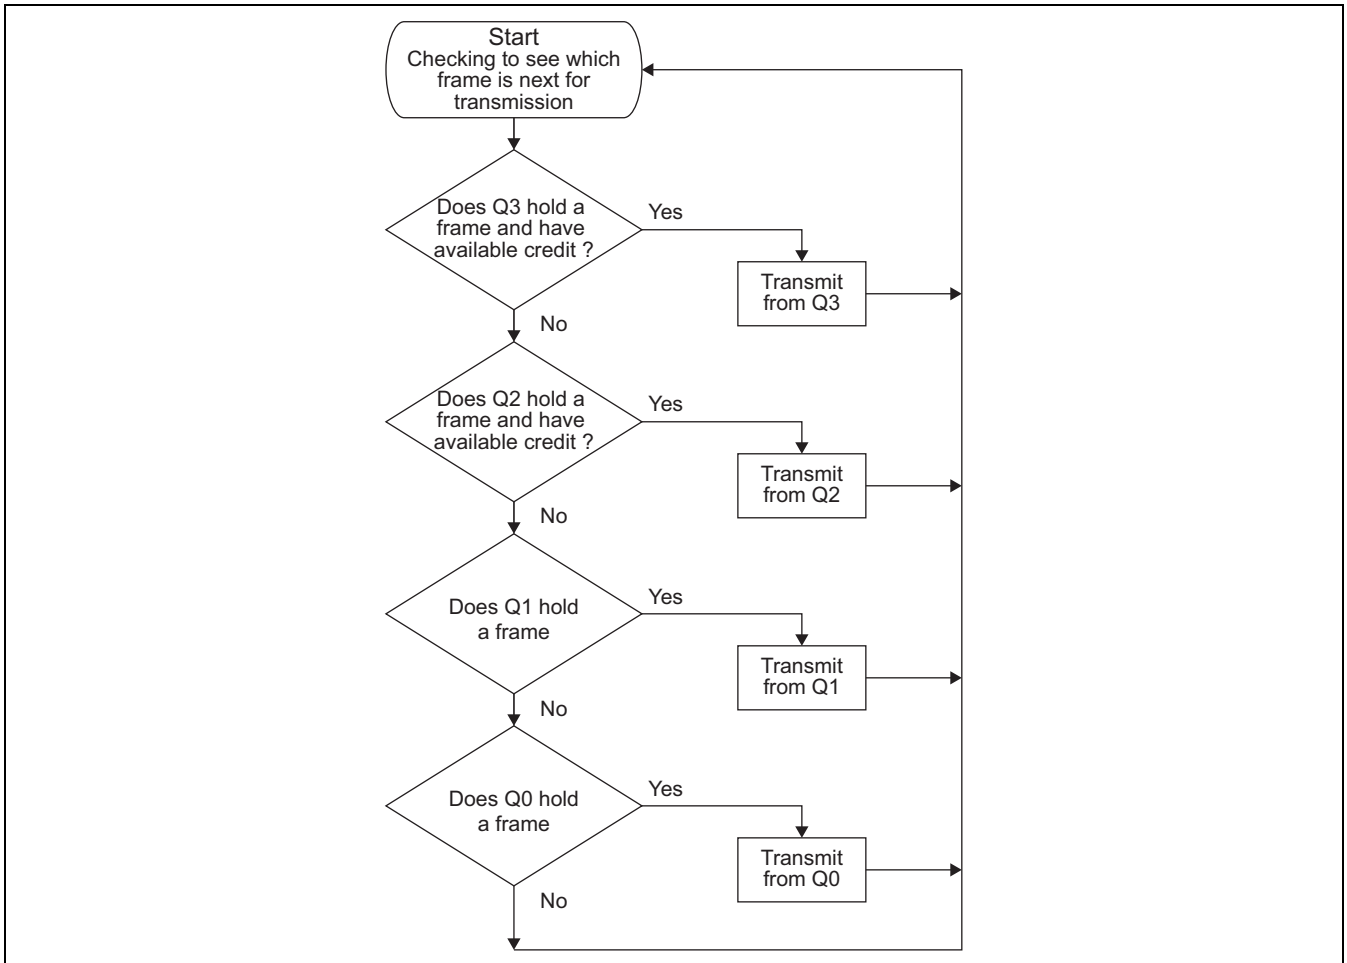

Figure 37A.26 Flow of Selection for Transmission in AVB Mode 1 (Default)

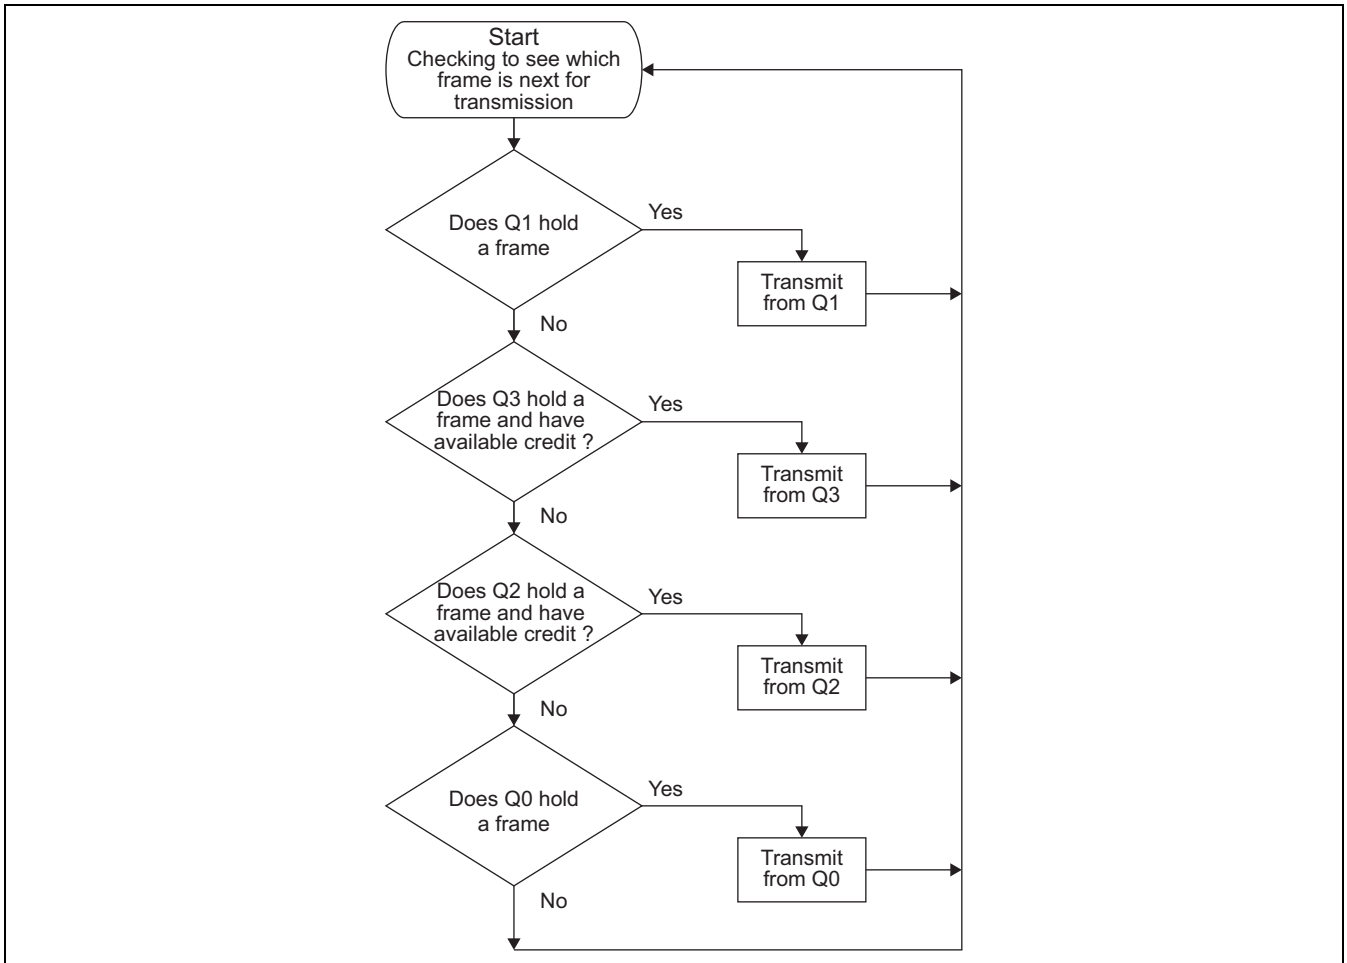

Figure 37A.27 Flow of Selection for Transmission in AVB Mode 2 (Alternative)

## (2) Non-AVB Transmission Mode

In non-AVB transmission mode, an absolute priority scheme is used. The SR class is not supported and the CBS algorithm is not used.

In non-AVB transmission mode (when the transmit queue priority bits in the transmit configuration register (TGC.TQP[1:0]) are B'00), data is fetched for transmission in a strict order of priority ( $Q3 > Q2 > Q1 > Q0$ ).

Figure 37A.28 shows the flow of selection in non-AVB transmission mode.

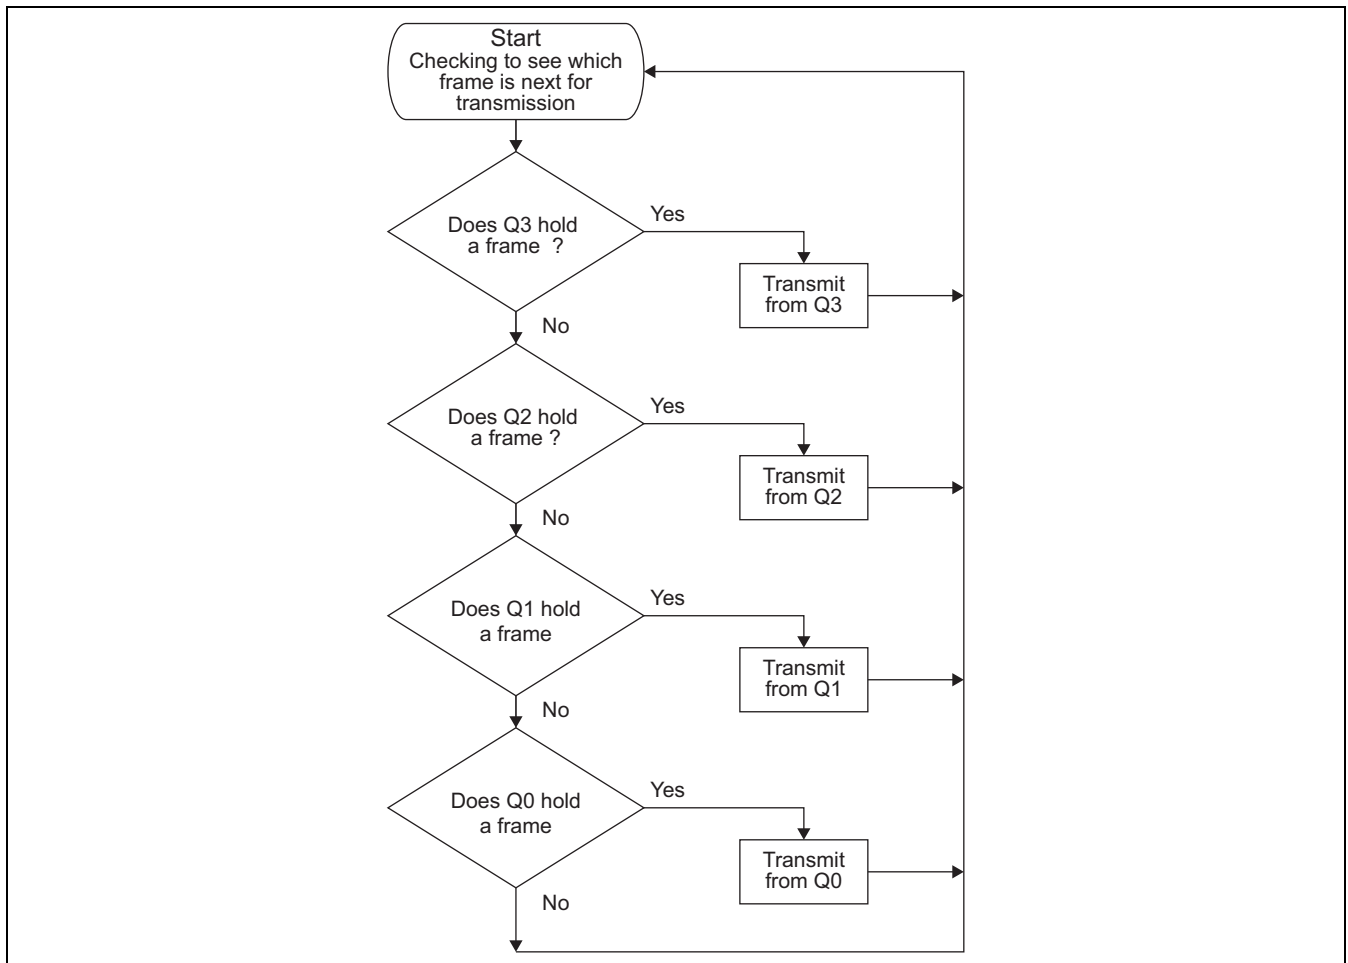

Figure 37A.28 Flow of Selection for Transmission in Non-AVB Mode

### (3) Setting the Size of the Transmission FIFO

The transmission FIFO is made up of 124 clusters. Each cluster can hold up to 128 bytes.

The size of the part of the transmission FIFO for use by each of the four transmission queues can be set by the corresponding transmit queue configuration q bits in the transmit control register (TGC.TBDq). The setting of TGC.TBDq is fixed to 2.

#### General Usage Examples:

Q0: Frames containing up to 1500 bytes  $\rightarrow 1500/128 = 11.7 \rightarrow 12$  clusters

Q1: Frames containing up to 1024 bytes  $\rightarrow 1024/128 = 8.0 \rightarrow 8$  clusters

Q3: Frames containing up to 1996 bytes  $\rightarrow 1996/128 = 15.6 \rightarrow 16$  clusters

Q4: Frames containing up to 1996 bytes  $\rightarrow 1996/128 = 15.6 \rightarrow 16$  clusters

When the depth of all transmission queues is 2, only the following number of clusters is required.

$$2 \times (12 + 8 + 16 + 16) + 16 = 2 \times 52 + 16 = 120$$

In the worst case (each of the transmission queues holds 1996 bytes),  $2 \times 64 + 16 = 144$  clusters are required, so the maximum length of transmission frames must be less than 1996 bytes for some queues.

### 37A.3.5.2 Setting Up Transmission Descriptors

#### (1) Transmission Descriptor Type

The type of a descriptor is defined by the descriptor type (DESCR.DT) field.

Table 37A.13 shows the descriptor types used in transmission.

**Table 37A.13 Descriptor Types in Transmission**

Descriptor Type (DESCR.DT)	Operation	Write-back
Frame Start (FSTART)	The AVB-DMAC fetches the first of the data for the divided frame and proceeds to processing of the next descriptor.	FEMPTY
Frame Middle (FMID)	The AVB-DMAC fetches the second or subsequent data for the divided frame and proceeds to processing of the next descriptor.	FEMPTY
Frame End (FEND)	The AVB-DMAC fetches the last of the data for the divided frame. The frame of data that has been fetched to the transmission FIFO is ready for transmission by the E-MAC, and then the AVB-DMAC proceeds to processing of the next descriptor.	FEMPTY
Frame Single (FSINGLE)	The AVB-DMAC fetches the frame of data. The frame of data that has been fetched to the transmission FIFO is ready for transmission by the E-MAC, and then the AVB-DMAC proceeds to processing of the next descriptor.	FEMPTY
Link (LINK)	Processing proceeds to the descriptor specified by DESCR.DPTR.	LEEMPTY
Fixed Link (LINKFIX)	Same as LINK	Not changed
End Of Set (EOS)	This is a transmission stop point defined by software This leads to clearing of the transmit start request bit (TCCR.TSRQt), which stops transmission. When the TCCR.TSRQt is again set to 1 (a new transmission start request is issued), processing proceeds to the next descriptor.	EEMPTY
Frame Empty (FEMPTY)	No frame data are ready for transmission This leads to clearing of the transmit start request bit (TCCR.TSRQt), which stops transmission. When the TCCR.TSRQt is again set to 1 (a new transmission start request is issued), processing starts at this descriptor.	Not changed
Link Empty (LEEMPTY)	Same as FEMPTY	Not changed
EOS Empty (EEMPTY)	Same as FEMPTY	Not changed

**(2) Configuration of Transmission Frame Data Descriptors**

Figure 37A.29 shows the configuration of descriptors for use with transmission queues. The transmission-specific fields (DESCR.MSR, DESCR.TSR, and DESCR.TAG) are described in Table 37A.14.

For the other fields and the descriptor types, see section 37A.3.3.6, Descriptor Type.

**Figure 37A.29 Configuration of Descriptor for a Transmitted Frame**

**Table 37A.14 Configuration of a Transmission Descriptor**

Bit Name	Function
TSR	Time Stamp Store Request This bit specifies whether the transmission time stamp is to be stored within the EthernetAVB module. 0: The time stamp status FIFO within the EthernetAVB module does not retain a transmission time stamp. 1: The time stamp status FIFO within the EthernetAVB module retains a transmission time stamp. This bit is available while the current DESCR.DT is FEND or FSINGLE.
TAG	Frame Tag This TAG field is used to associate each frame data with a time stamp. Frame TAG is not required but is recommended. This bit is available while the current DESCR.DT is FEND or FSINGLE.

For the time stamp FIFO function, see section 37A.3.5.4, Time Stamping in Transmission.

### 37A.3.5.3 Transmission

#### (1) Transmitting Frames

Setting the transmit start request bit in the transmit configuration control register (TCCR.TSRQt) starts the transfer of frames from the corresponding transmission queue.

The descriptor in the current descriptor address (CDARq.CDA) for the queue t (with q = t) is read first.

If this descriptor is a descriptor for frame transmission (FSINGLE, etc.), the AVB-DMAC fetches the frame data from the data area indicated by the descriptor, writes FEMPTY back to the descriptor type (DESCR.DT) bits to indicate completion of this processing, then proceeds to processing of the next descriptor.

If the descriptor is not for transmission, processing is as dictated by the given descriptor (for these descriptors, see the descriptions in section 37A.3.3, Descriptors).

If a base address load request is issued for a descriptor chain while it is being processed (by setting 1 in the LBAq bit for transmission queue q that is currently being processed in the descriptor base address load request register, DLR), processing proceeds to the new descriptor chain. Changing the chain does not interrupt frame fetching, but note that frames that have not been fetched from the old chain remain where they are.

Figure 37A.30 shows descriptor processing during transmission.

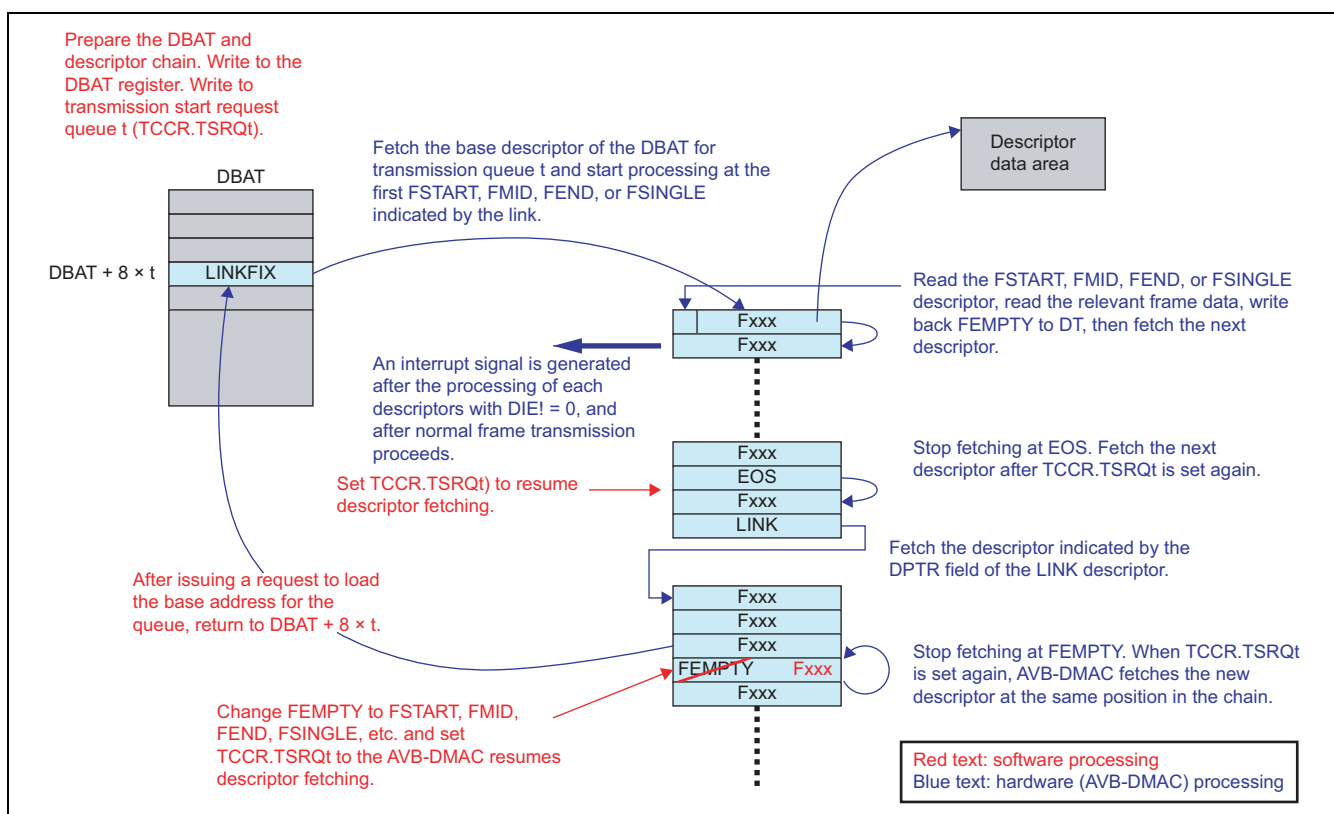

Figure 37A.30 Descriptor Processing During Transmission

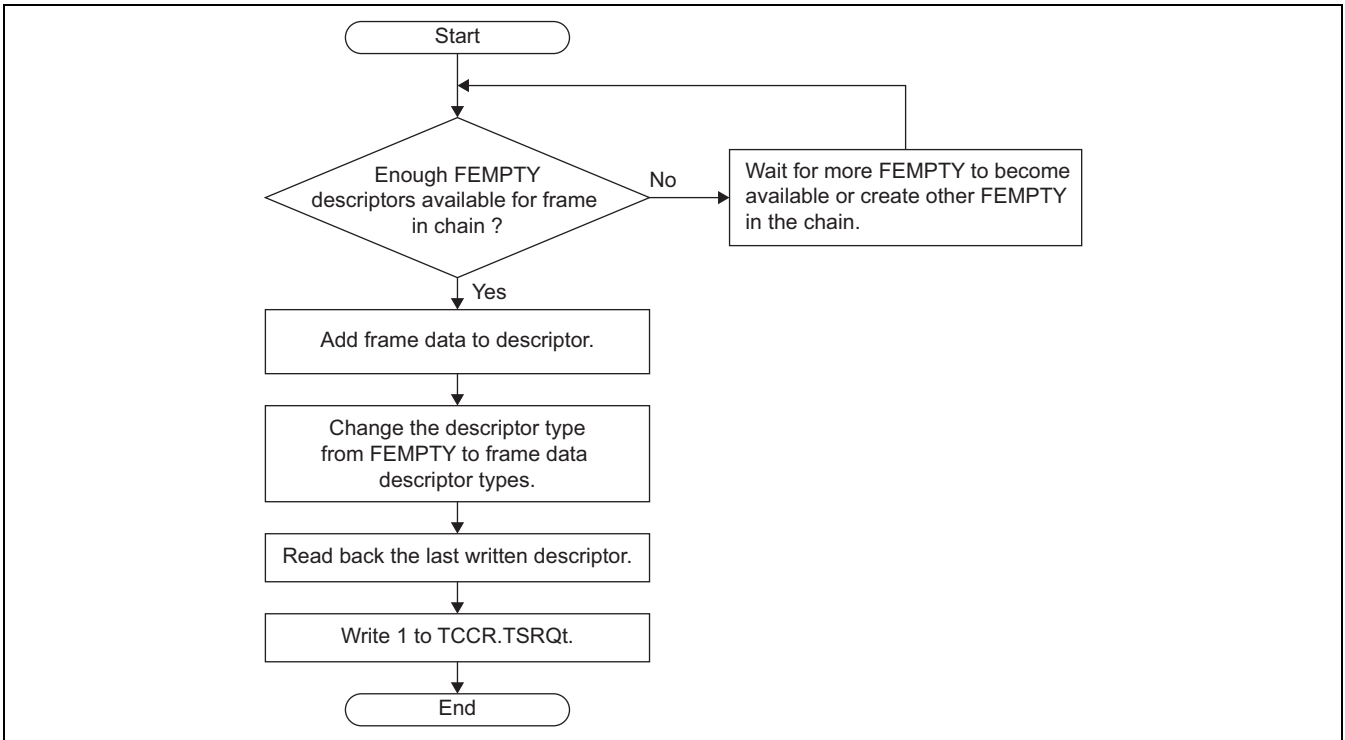

**(2) Examples of Descriptor Usage**

**(a) Immediate Frame Transmission**

Immediate frame transmission is a pattern in which fetching by the AVB-DMAC starts whenever software adds data to a queue. FEMPTY descriptors are used as stop points to keep the hardware and software in synchronization.

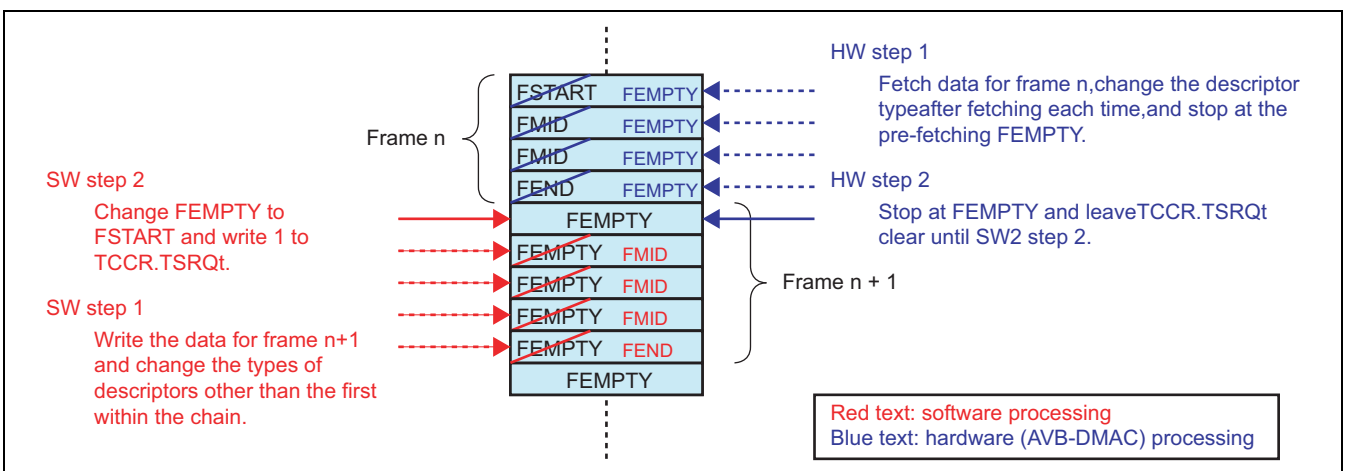

Create descriptor chains that have FEMPTY descriptors at the stop points.

Figure 37A.31 shows the flow for software implementing this pattern. SW should read back written descriptor between changing FEMPTY descriptor before writing to TCCR.TSRQt.

**Figure 37A.31 Software Flow for Immediate Frame Transmission**

Figure 37A.32 shows software and AVB-DMAC operations for immediate frame transmission.

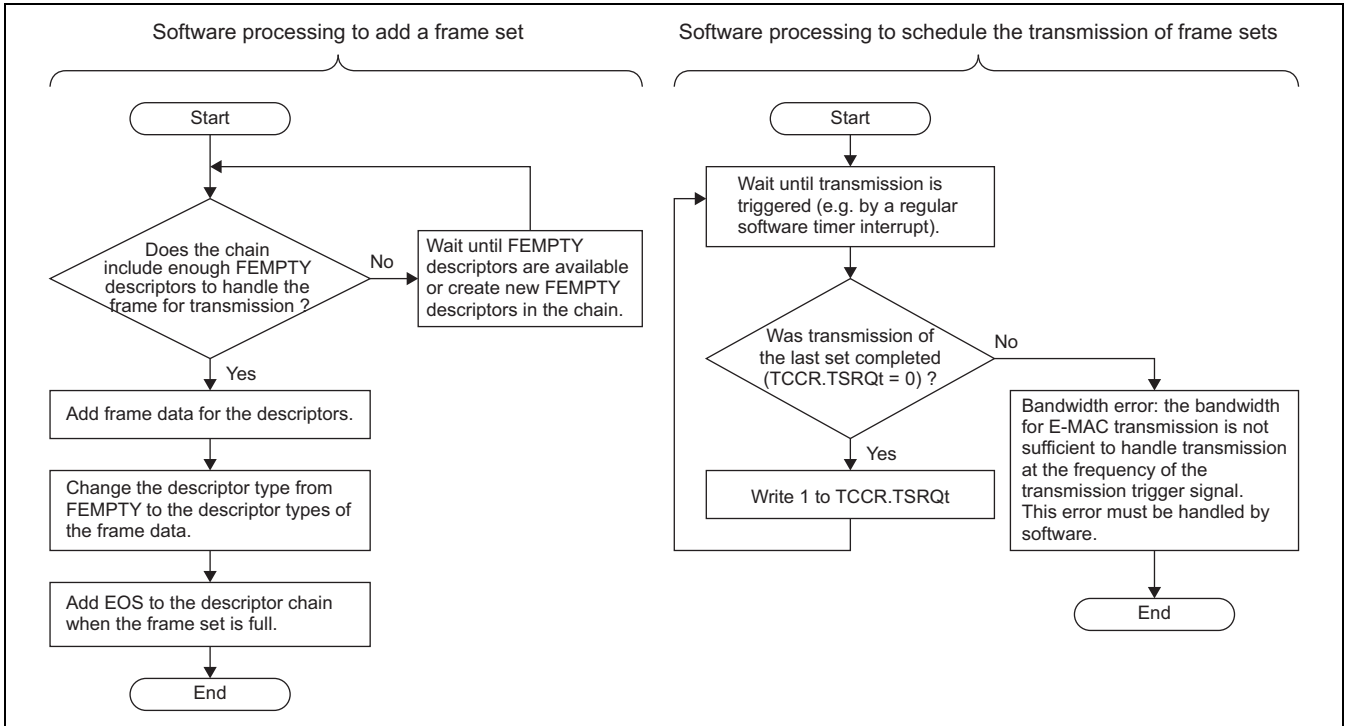

**Figure 37A.32 Software and AVB-DMAC Operations for Immediate Frame Transmission**

**(b) Frame Set Transmission with Changing of the Active Descriptor Chain**

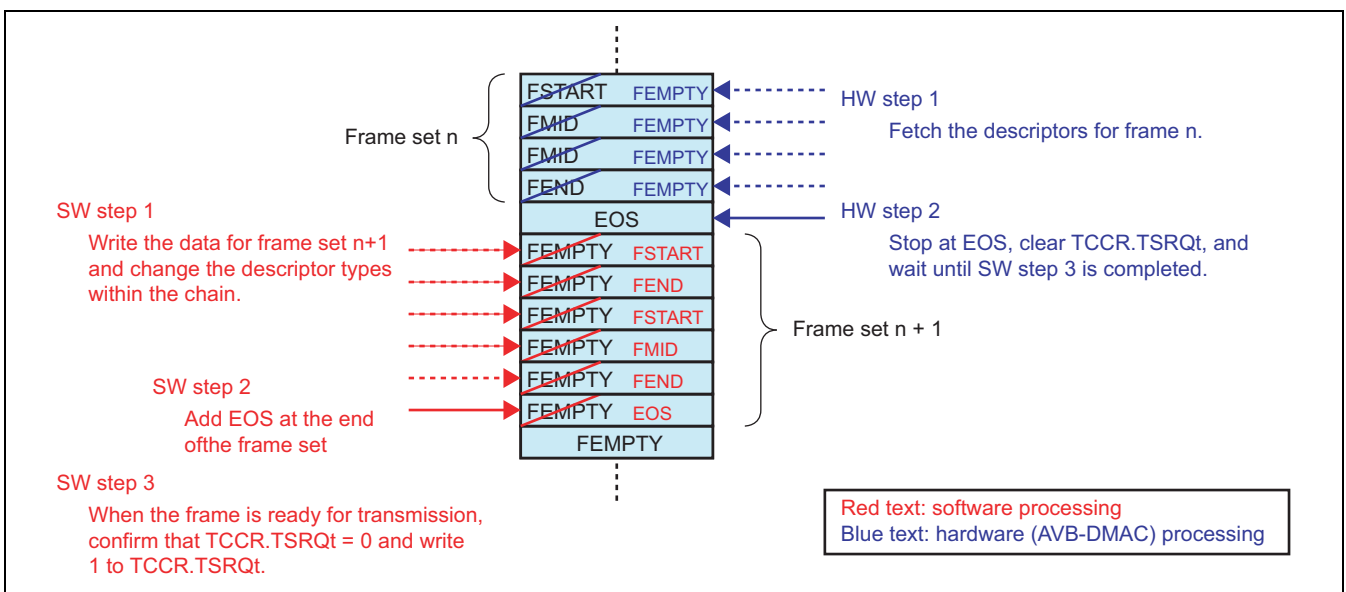

This pattern is used when data are transmitted with a delay for software control to secure bandwidth or for other reasons, rather than immediately transmitted. EOS descriptors are used for the stop points. Start by creating a descriptor chain that has a FEMPTY descriptor as its stop point.

Figure 37A.33 shows the software flow in this pattern.

**Figure 37A.33 Software Flow for Frame Set Transmission with Changing of the Active Descriptor Chain**

Figure 37A.34 shows software and AVB-DMAC operations for frame set transmission.

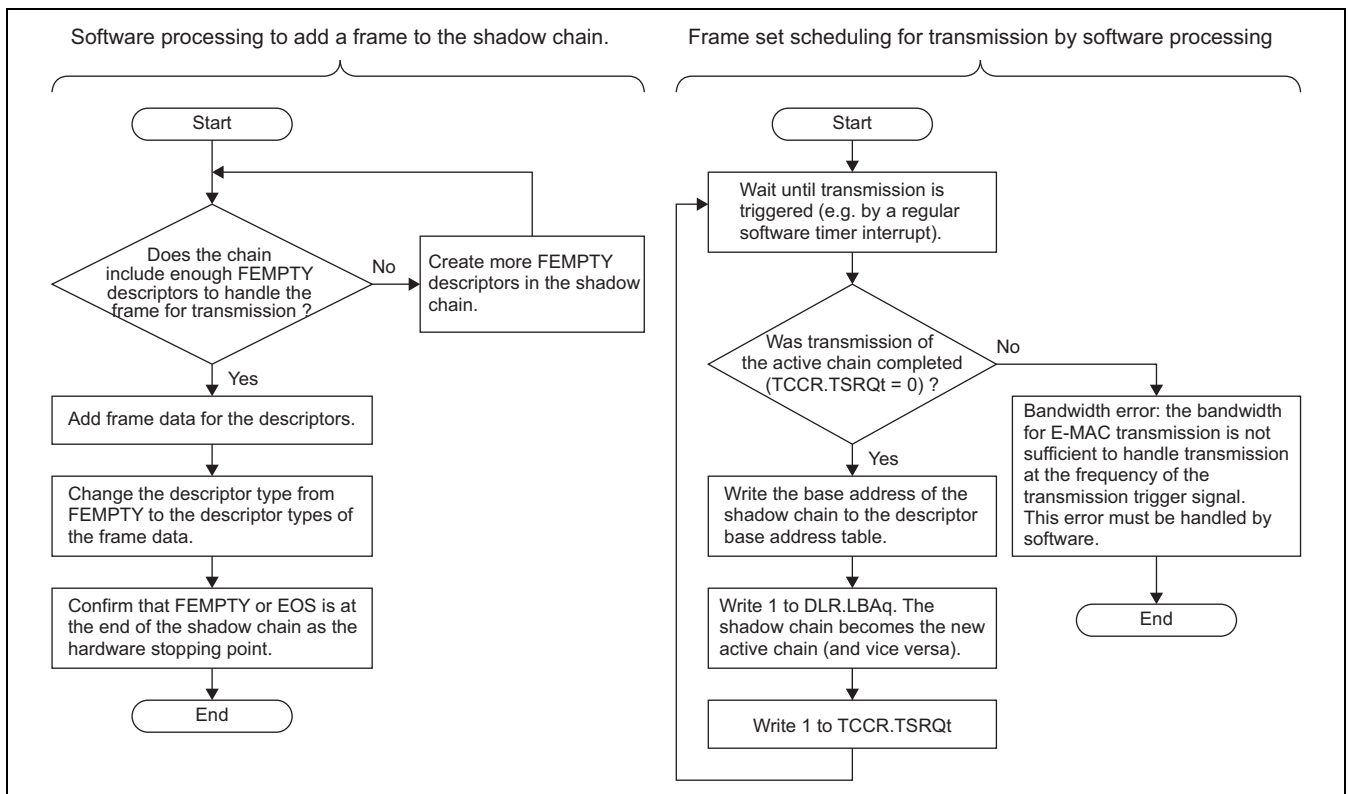

**Figure 37A.34 SW and AVB-DMAC Operations for Frame Set Transmission with Changing of the Active Descriptor Chain**

**(c) Frame Set Transmission Using a Shadow Descriptor Chain**

This pattern is used when data are transmitted with a delay for software control to secure bandwidth or for other reasons, rather than immediately transmitted. Two or more descriptor chains are used. The chains are classified as active or shadow chains. EOS descriptors are used for the stop points.

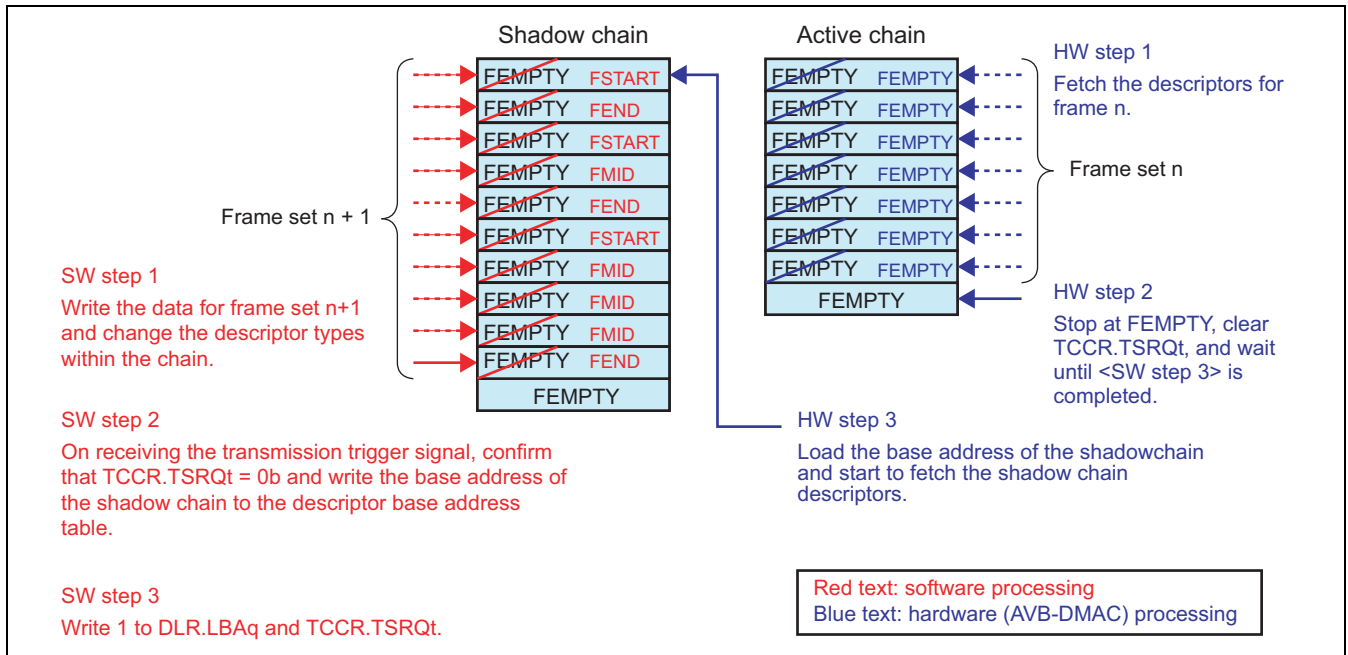

Create descriptor chains that have FEMPTY descriptors at the stop points.

Figure 37A.35 shows the flow for software implementing this pattern.

**Figure 37A.35 Software Flow for Frame Set Transmission Using the Shadow Descriptor Chain**

Figure 37A.36 shows software and AVB-DMAC operations for frame set transmission.

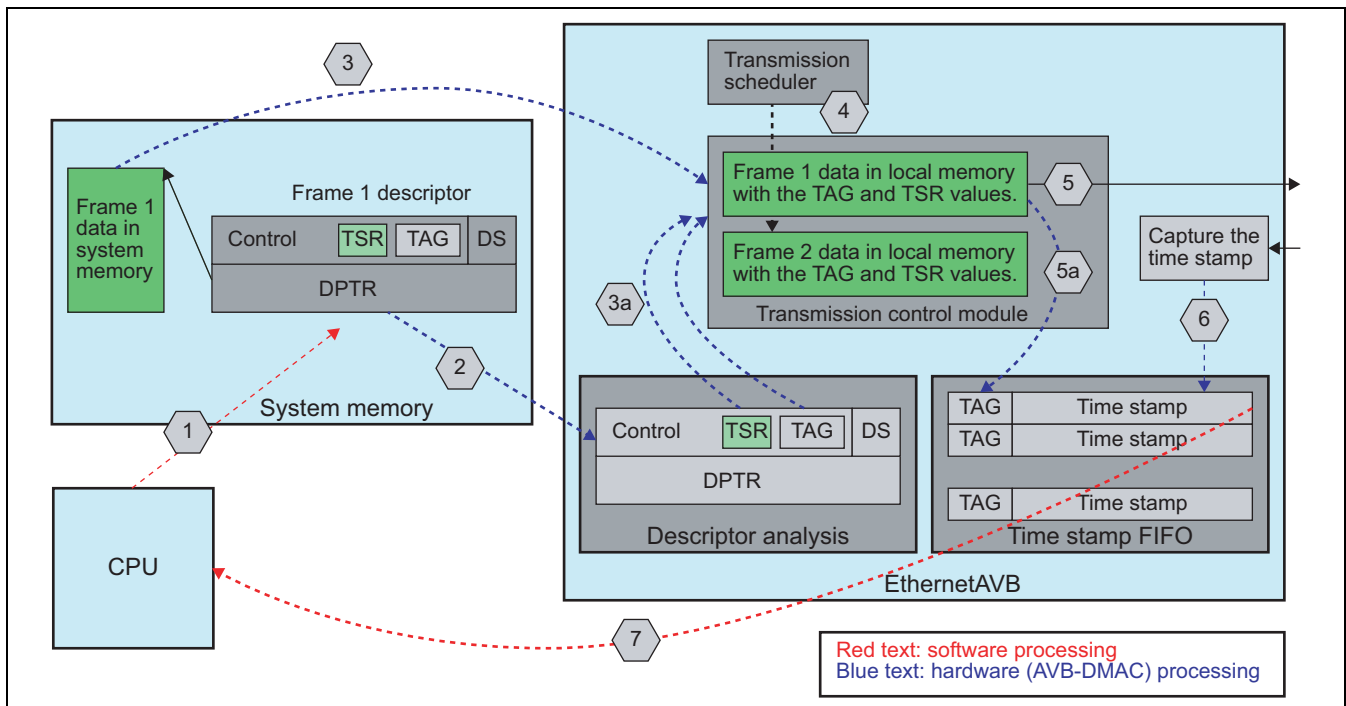

**Figure 37A.36 SW and AVB-DMAC Operations for Frame Set Transmission Using the Shadow Descriptor Chain**

### 37A.3.5.4 Time Stamping in Transmission

Transmission time stamps are important in satisfying the requirements for timing and synchronization of the IEEE 802.1AS standard. Reference to this information can also be useful to other applications and in testing. The AVB-DMAC supports the storage of time stamps for transmitted frames. The time-stamp values are based on the gPTP timer and are captured at the same time as sending of the Start of Frame Delimiter (SFD) for transmitted frames.

When the time stamp storage request field (DESCR.TSR) is set to 1, selecting storage of a time stamp, the tag number defined in the tag field (DESCR.TAG) of the last descriptor (FEND or FSINGLE) for the frame being transmitted is stored with the time stamp. This eases identification and association. The time-stamp FIFO is accessible at any time.

Figure 37A.37 shows the mechanism supporting transmission time stamping.

**Figure 37A.37 Mechanism to Support Transmission Time Stamps**

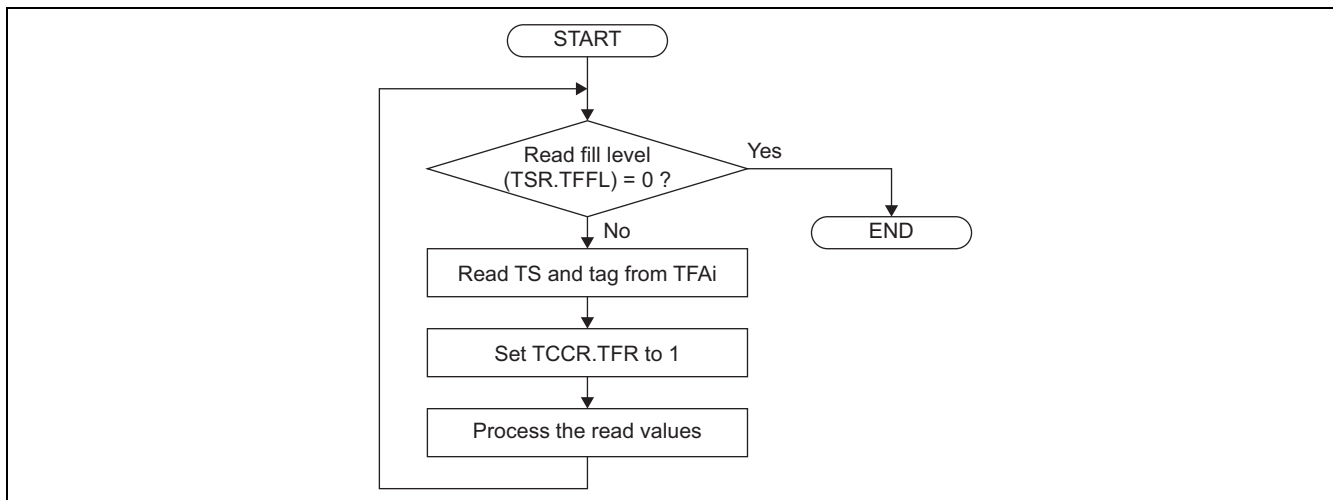

The method of using this function is described below:

- Secure space in the URAM for the frame requiring time stamping.  
Write the tag number of the frame to the frame tag field (DESCR.TAG) and set the time stamp storage request field (DESCR.TSR) to 1.
- The AVB-DMAC fetches and analyzes the descriptor. The time stamp storage request field (DESCR.TSR) is 1, so it recognizes that transmitting this frame also requires storage of the time stamp.
- The AVB-DMAC fetches the data for frame 1 and temporarily stores the frame in internal memory for scheduling.  
3a: The frame tag field (DESCR.TAG) and time stamp storage request field (DESCR.TSR) are stored with the fetched data.)
- Under the control of priority settings according to credit-based shaping (CBS) or another scheme, the transmission scheduler decides it is time to transmit frame 1.
- Transmission of frame 1 starts.  
5a: Frame 1's tag is stored in the time-stamp FIFO.
- The gPTP time stamp is captured at the start of frame delimiter (SFD) for transmission and stored with the tag in the time-stamp FIFO when the frame is completely transmitted. An interrupt is generated to indicate existence of new timestamp information. For this to happen, the descriptor interrupt control register (DIC) must be set beforehand.

7. The entry can now be read from the time-stamp FIFO.

Use the time-stamp FIFO for the timing and synchronization of frames with IEEE 802.1AS compliance.

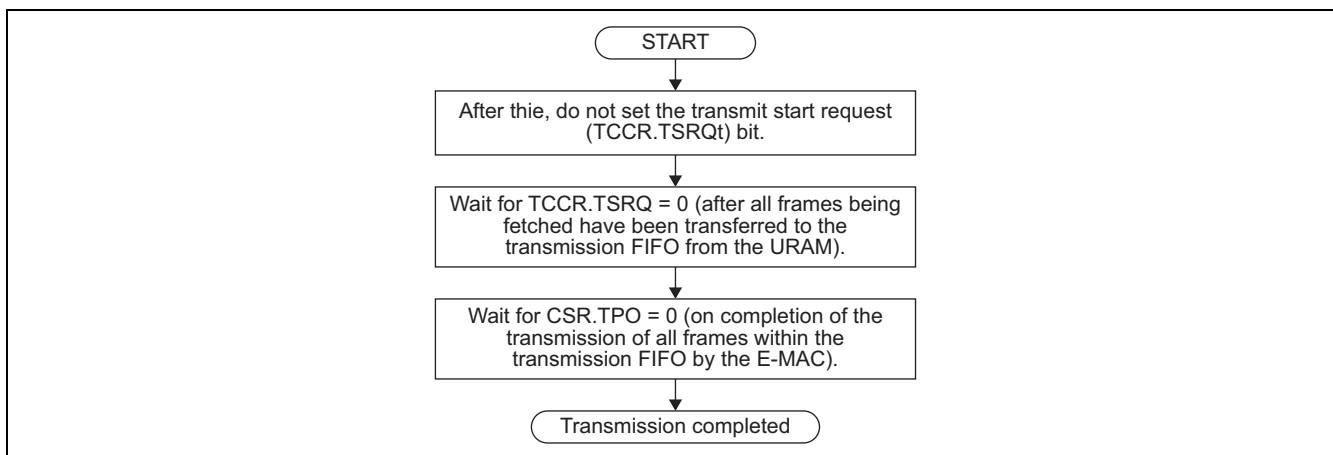

Time stamping can also be used with other frames, but take care not to allow the time-stamp FIFO to overflow. When the FIFO is full, further time stamps supplied to it are lost.

**Figure 37A.38 Flow of Transmission Time Stamping**

### 37A.3.5.5 Ending Transmission

Figure 37A.39 shows the procedure for ending transmission.

**Figure 37A.39 Procedures for Ending Transmission**

### 37A.3.6 CBS (Credit-Based Shaping)

In AVB transmission mode (i.e. when the transmit queue priority field in the transmit configuration register (TGC.TQP) is B'01 or B'11), transmission queues Q3 and Q2 are respectively assigned to class A and class B stream traffic and the CBS (Credit Based Shaping) algorithm is used to select the transmission queues in order to satisfy the Forwarding and Queuing for Time Sensitive Streams (FQTSS) specification (see section 8.6.8 or section 34 in IEEE 802.1Q).

The CBS algorithm is based on the concept of transmission credit for each queue. Credit can be thought of as the degree to which a queue has the “right” to transmit at a given time. Actually, in AVB transmission mode as specified in IEEE 802.1Q, queues that are subject to the CBS algorithm are able to transmit when the following conditions are met.

At least one frame is stored in the queue.

The credit for the queue is 0 or a positive value.

The credit for a transmission queue is incremented while one or more frames from the queue are present in the transmission FIFO but transmission of these frames is not proceeding. This state is indicated by the transmission process status bit for queue t in the AVB-DMAC status register (CSR.TPOt). The credit is decremented while transmission of a frame from the queue is in progress. This mechanism is used to control transmission so that the transmission of frames from the queues for each of the traffic classes does not exceed the specified maximum bandwidths.

IEEE 802.1Q defines the following parameters for queues under the control of the CBS algorithm.

**portTransmitRate:** Maximum transmission data rate of an external port. The E-MAC determines this parameter.

**bandwidthFraction:** Maximum fraction of portTransmitRate that can be used for a queue.

**idleSlope:** Rate of change of credit for a queue when transmission of frames from the queue is not proceeding so the credit value (in bits per second) is increasing. idleSlope is also equal to the maximum fraction of the total bandwidth (portTransmitRate) that is available to the given queue under a specified condition (frames from the queue can be placed in a continuous stream. See Annex L of IEEE 802.Q.  

$$\text{idleSlope} = \text{bandwidthFraction} \times \text{portTransmitRate}$$

**sendSlope:** Rate of change of credit for a queue while transmission of a frame from the queue is in progress so the credit value is decreasing.  
 The value of sendSlope is defined as follows:  

$$\text{sendSlope} = \text{idleSlope} - \text{portTransmitRate}$$

Furthermore, the values below are used to define individual traffic classes (or queues for the classes) under control of the algorithm. See Annex L of IEEE 802.Q.

**maxFrameSize:** Maximum size of frames (in bits) of the corresponding traffic class that can be transmitted from a port

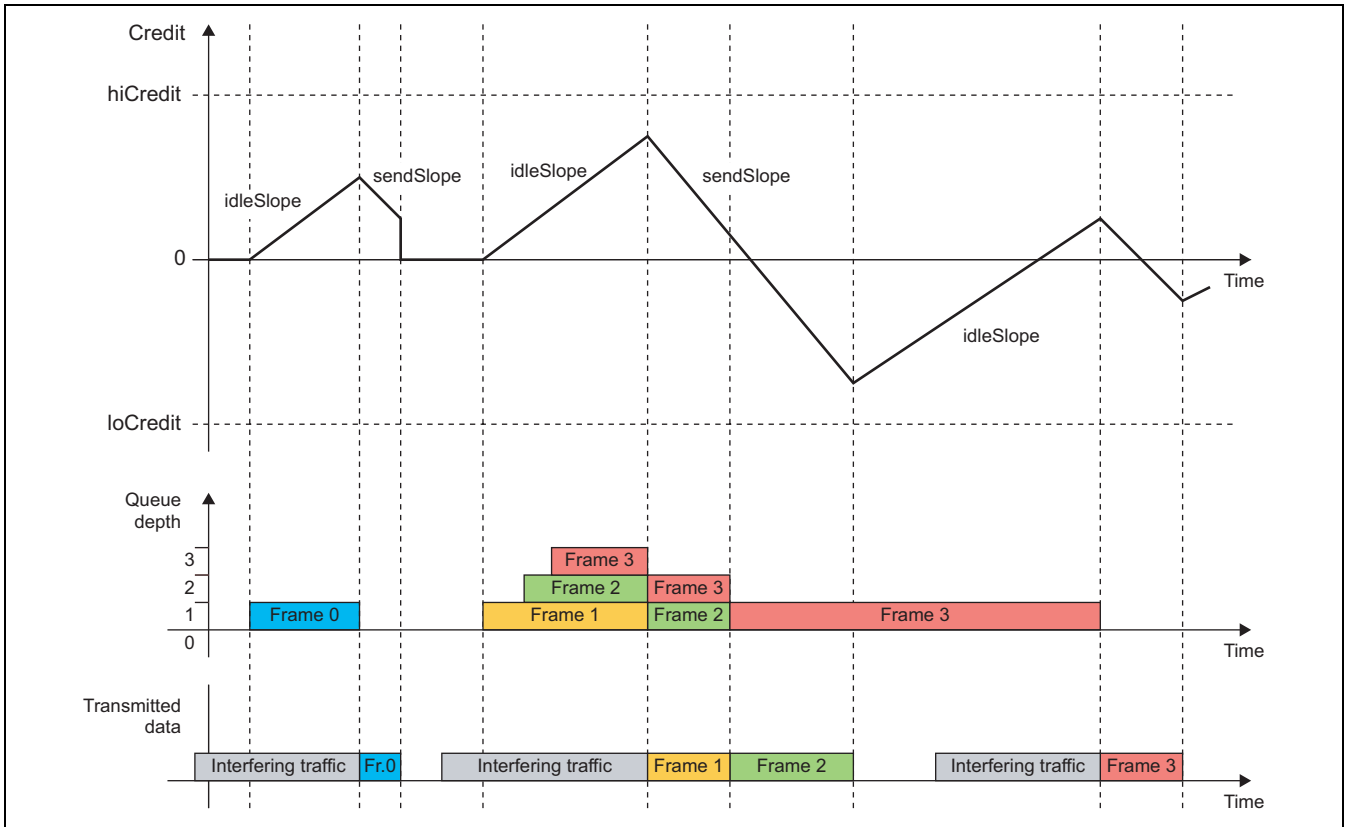

**maxInterferenceSize:** Maximum burst size (in bits) by which delays for the corresponding traffic class can be allowed

**hiCredit:** Maximum credit value (positive number). Can be calculated by using the following equation:  $\text{hiCredit} = \text{maxInterferenceSize} \times (\text{idleSlope} / \text{portTransmitRate})$

**loCredit:** Minimum credit value (negative number). Can be calculated by using the following equation:  

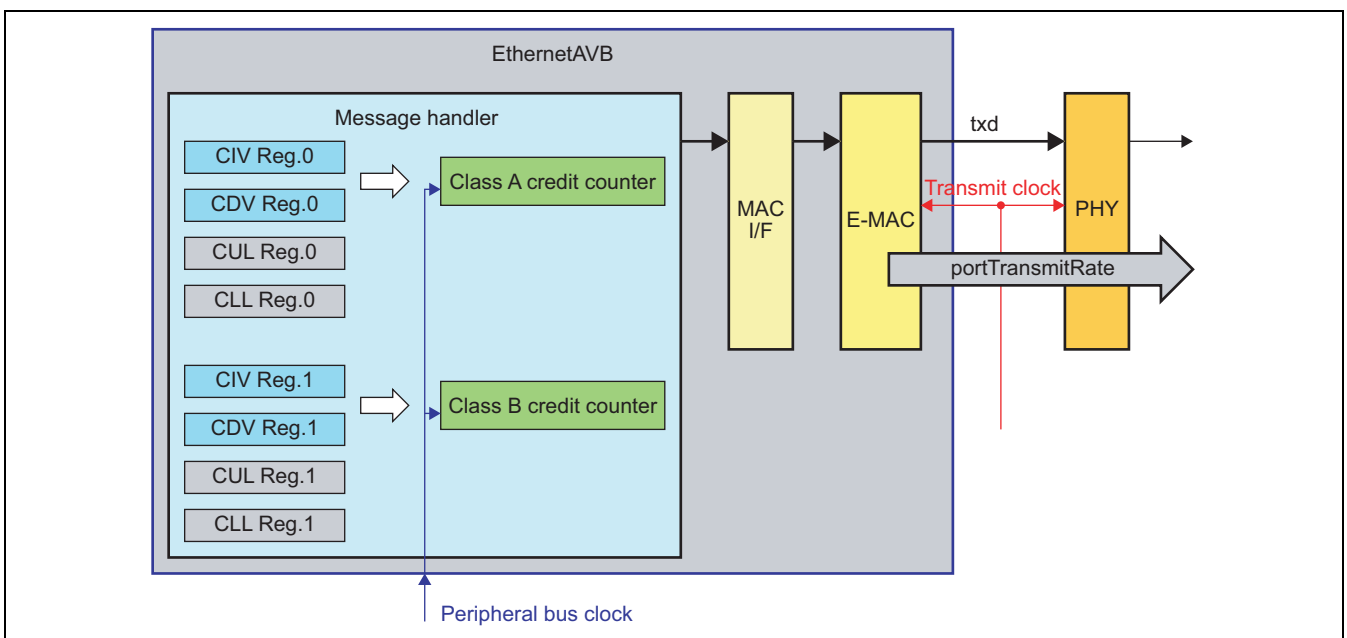

$$\text{loCredit} = \text{maxFrameSize} \times (\text{sendSlope} / \text{portTransmitRate})$$

Figure 37A.40 shows how the CBS algorithm works and the meaning of the above parameters.

**Figure 37A.40 CBS (Credit-Based Shaping) Operation**

Figure 37A.41 shows the implementation of CBS in the AVB-DMAC.

**Figure 37A.41 CBS (Credit-Based Shaping) Operation in the AVB-DMAC**

The above implementation is based on “credit counters” for the respective traffic classes (SR class A and class B). The following parameters apply for these classes.

CBS increment value (CIV): Signed positive number

The credit is incremented by this amount every high-speed peripheral bus clock cycle while a frame from the queue is pending but transmission has not started (idleSlope).

CBS decrement value (CDV): Signed negative number

The credit is decremented by this amount every high-speed peripheral bus clock cycle while transmission of a frame from the queue is proceeding (sendSlope).

The CBS increment value (CIV) and CBS decrement value (CDV) are defined as follows.

$$\text{CIV} = \text{idleSlope} \times \text{Mfactor}$$

$$\text{CDV} = \text{sendSlope} \times \text{Mfactor}$$

Mfactor is a multiplier factor to ensure accuracy for CIV and CDV. CIV and CDV are calculated by using the following equations.

$$\text{CIV} = (\text{portTransmitRate}/\text{HP}\phi) \times \text{bwFraction} \times \text{Mfactor}$$

$$\text{CDV} = (\text{portTransmitRate}/\text{HP}\phi) \times (\text{bwFraction} - 1) \times \text{Mfactor}$$

HP $\phi$  is the frequency of the high-speed peripheral bus clock. The credit counters are driven by the high-speed peripheral bus clock, so calculating the slope parameters for CBS requires (1/HP $\phi$ ).

Use software to prepare Mfactor for the CBS parameters. All queues for the same class must have the same Mfactor for all CBS parameters. Mfactor for a specified class c can be changed during operation, unless transmission is pending for that class (i.e. the transmit process status bit in the AVB-DMAC status register (CSR.TPOt) = 0). At that time, the credit counter values for class A and class B are 0. Note that the credit value will not match a new incrementation or decrementation parameter if Mfactor is changed while the credit counter value is non-zero. Mfactor is not present in the AVB-DMAC registers.

Set the CIV and CDV parameters in the CBS increment value registers (CIVRc) and the CBS decrement value registers (CDVRc). These are treated as dynamic settings since they should be updated when streams are registered and erased in accord with IEEE 802.1Qat.

The AVB-DMAC also has CBS upper limit registers (CULc) (the upper limit registers for classes A and B) and CBS lower limit registers (CLLc) (the lower limit registers for classes A and B). Set Mfactor to match the credit value and set the upper limit (hiCredit) and the lower limit (loCredit) for each class as defined above.

$$\text{CUL} = \text{hiCredit} \times \text{Mfactor} = \text{maxInterferenceSize} \times \text{bwFraction} \times \text{Mfactor}$$

$$\text{CLL} = \text{loCredit} \times \text{Mfactor} = \text{maxFrameSize} \times (\text{bwFraction} - 1) \times \text{Mfactor}$$

### Example:

Assume that portTransmitRate = 100 Mbps, HP $\phi$  = 130 MHz and bwFraction = 3%. Then idleSlope and sendSlope represented as one bit vs. cycles of the high-speed peripheral bus clock are as follows.

$$\text{idleSlope} = (\text{portTransmitRate}/\text{HP}\phi) \times \text{bwFraction} = 100/130 \text{ (Mbps/MHz)} \times 3\% = 0.023 \text{ bit per high-speed peripheral bus clock cycle}$$

$$\text{sendSlope} = \text{idleSlope} - (\text{portTransmitRate} / \text{HP}\phi) = -0.746 \text{ bits per high-speed peripheral bus clock cycle}$$

Let Mfactor be 100, then CIV and CDV parameters are determined as follows.

$$\text{CIV} = \text{idleSlope} \times \text{Mfactor} = 2.3$$

$$\text{CDV} = \text{sendSlope} \times \text{Mfactor} = -74.6$$

### 37A.3.6.1 Restrictions on CIV, CDV and Mfactor

The maximum value (the minimum value for negative numbers) up to which the credit counter will not overflow determines the maximum values of CIV and CDV that can be set in the CBS registers. This maximum credit value is equivalent to the worst case of the hiCredit value, and the maximum values for class A and class B are calculated as follows.

#### <Conditions>

- Class A maximum value (hiCredit\_max\_classA)

classA bwFraction  $\cong$  100%

Maintaining the proper relations in the transmission priority order requires waiting for a period equivalent to the maximum frame size.

hiCredit\_max\_classA  $\cong$  maxInterferenceSize for class A = Interference due to one max. sized frame = header + max. size payload + CRC (2000 bytes) + preamble (8 bytes) + IFG (12 bytes) + processing\_delay ( $\cong$  80 bytes)  $\cong$  2100 bytes

- Class B maximum value (hiCredit\_max\_classB)

classB bwFraction  $\cong$  100%

Maintaining the proper relations in the transmission priority order requires waiting for a period equivalent to the maximum size of frames in the class A transmission queue and other transmission queues.

hiCredit\_max\_classB  $\cong$  maxInterferenceSize for class B = Interference due to two max-size frames =  $2 \times$  hiCredit\_max\_classA  $\cong$  4200 bytes

hiCredit\_max\_classA = 16800

hiCredit\_max\_classB = 33600

The maximum values that can be selected with Mfactor for the 32-bit signed counter without overflow are:

Mfactor\_max\_classA =  $2^{31}-1$  / hiCredit\_max\_classA  $\cong$  127826 and

Mfactor\_max\_classB =  $2^{31}-1$  / hiCredit\_max\_classB  $\cong$  63913.

A high degree of accuracy can be achieved even with a low bandwidth. In class B, bandwidthFraction = 0.05% and the bandwidth error < 0.1%.

The maximum value of CIV is calculated from the following equation.

CIV = idleSlope x Mfactor = (portTransmitRate / HP $\phi$ )  $\times$  bandwidthFraction  $\times$  Mfactor

When Mfactor is the maximum value and bandwidthFraction is the maximum value (up to 100%):

CIV\_max\_classA = (portTransmitRate / HP $\phi$ )  $\times$  Mfactor\_max\_classA and

CIV\_max\_classB = (portTransmitRate / HP $\phi$ )  $\times$  Mfactor\_max\_classB.

The maximum values when portTransmitRate = 1000 Mbps and HP $\phi$  = 130 MHz are as follows:

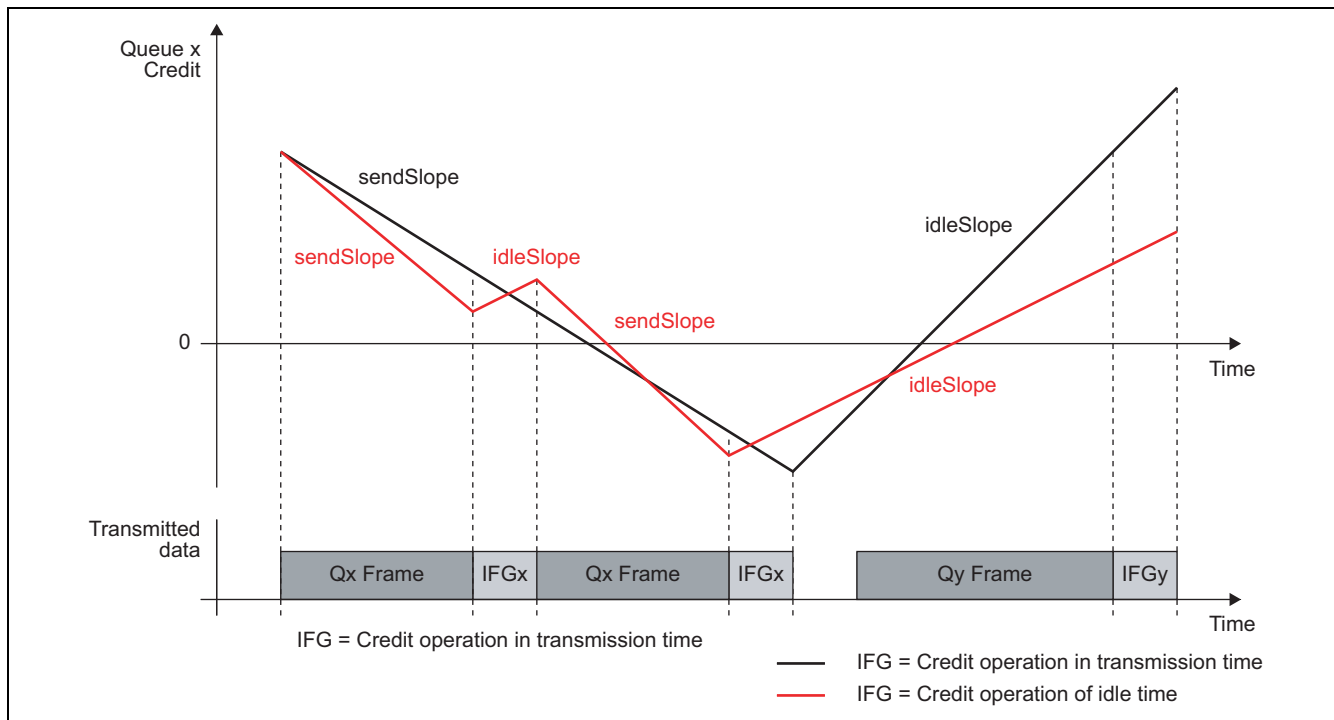

CIV\_max\_classA  $\cong$  983277

CIV\_max\_classB  $\cong$  491638

These values in the table are the limits of CIV up to which the 32-bit credit counter will not overflow. The CIV parameters are implemented as 16 bits + a sign bit, so a further limit of CIV  $\leq$  65535 applies to both class A and class B.

### 37A.3.6.2 Credit Incrementation during Inter-Frame Gaps (IFGs)

The inter-frame gap (IFG) after a frame is transmitted is not treated as part of frame transmission by the CBS credit counter. During an IFG, the credit is incremented for all SR queues that have pending frames or negative credit. Figure 37A.42 illustrates credit operations during IFGs.

**Figure 37A.42 Credit Operations during IFGs**

Accordingly, the IFG need not be included in calculation of the bandwidth requirements for the specified SR class when deciding the idleSlope, sendSlope, and CIV and CDV parameters. However, IFG must also be included in the calculation in order to confirm that the total bandwidth allocated to all SR classes does not exceed 100% of portTransmitRate. This is described in Section 35.2.2.8.4 of IEEE 802.1Q.

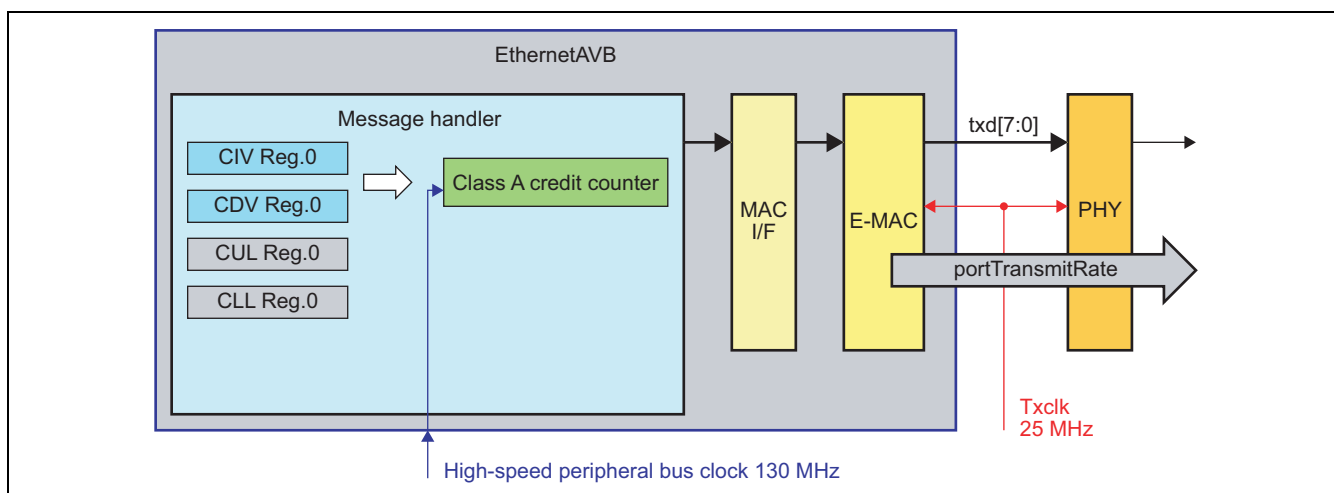

### 37A.3.6.3 Example

The case of a class A 48-kHz stereo audio stream among Ethernet frames is described as an example.

After every class A measurement interval (125  $\mu$ s), 80 octets consisting of two sets of six 32-bit samples plus a 32-octet header are stored as audio data within a frame. The IEEE 802.3 also imposes a 42-octet media-specific framing overhead (an 8-octet preamble, 14-octet IEEE 802.3 header, 4-octet IEEE 802.1Q priority/VID Tag, 4-octet CRC, and 12-octet IFG) are also added. Accordingly, the total frame size is  $80 + 42 = 122$ , and one such frame is transmitted after every class measurement interval.

This represents a total bandwidth of about 7.8 Mbits per second (122 octets  $\times$  8 bits per octet  $\times$  8000 frames per second) for this class. If the E-MAC is assumed to run at 1 Gbps (portTransmitRate), this is equivalent to the allocation of about 0.78% of the total bandwidth to each class A queue. If other traffic classes are to share the total transmission bandwidth, checking that this 0.78% allocation does not lead to the total allocation of bandwidth being greater than 100% of portTransmitRate is required.

To obtain the CIV and CDV parameters for a given class, the IFG must not be taken into account in calculation of the frame size must not include the IFG. For this case, therefore, we obtain an 80-bit payload + 30-bit overhead = 110-octet measurement interval for the class  $\rightarrow$  the total bandwidth for the class = 7.04 Mbps = 0.704% of portTransmitRate.

**Figure 37A.43 Example of CBS Settings**

Given that:

- the E-MAC runs at 100 Mbps, so portTransmitRate = 100 Mbps and
- high-speed peripheral bus clock (operating clock for the credit counter) frequency = 130 MHz, securing a bandwidth of 7.04 Mbits/sec for class A requires configuring the CBS parameters as follows.

$$\text{bandwidthFraction} = 0.704\%$$

$$\text{idleSlope} = (\text{portTransmitRate} / \text{HP}\phi) \times \text{bandwidthFraction} \cong 0.0176 \text{ bits per high-speed peripheral bus clock cycle}$$

$$\text{sendSlope} = \text{idleSlope} - (\text{portTransmitRate} / \text{HP}\phi) \cong -2.4824 \text{ bits per high-speed peripheral bus clock cycle}$$

When Mfactor = 100000, the parameters are as follows.

- CIV = idleSlope  $\times$  Mfactor = 1760 bits per high-speed peripheral bus clock cycle
- CDV = sendSlope  $\times$  Mfactor = 248240 bits per high-speed peripheral bus clock cycle

These are the final values for setting in the CIVR1 and CDVR1 registers.

### 37A.3.7 Time Synchronization

#### 37A.3.7.1 gPTP Timer

An 84-bit timer is provided to support the gPTP function. Figure 37A.44 shows the definitions of bits for the timer and in related registers.

**Figure 37A.44 Definitions of gPTP Timer Bits and Related Bits**

The higher-order 32 bits indicate seconds. For the next 32 bits, counting by one corresponds to the passage of 1 ns. The lower-order 20 bits are a fractional value (less than 1 ns). Software can only read the 32 higher-order bits, indicating seconds, and the subsequent 32-bits, indicating nanoseconds. The 20 lower-order 20 bits, representing less than 1 ns, are not readable. They are only used within the AVB-DMAC to maintain accuracy in time measurement.

The timer can be reset by setting the timer control request bits in the gPTP configuration control register (GCCR.TCR[1:0]) to B'01. These bits are set to B'00 on completion of normal resetting of the timer.

After the timer starts, the value in the gPTP timer increment register (GTI.TIV) is added to the value of the gPTP timer every clock cycle.

Before setting a value in the gPTP timer increment register (GTI.TIV), set the timer increment value setting request bit in the gPTP configuration control register (GCCR.LTI). If this bit is not set to 1, new values that are written will not be reflected in the register. This bit returns to 0 after the setting is completed.

An offset to the gPTP timer is also available. If this is required, set the value in the gPTP timer offset register (GTO.TOV). Before setting a value in this register, set the timer offset value setting request bit in the gPTP configuration control register (GCCR.LTO). If this bit is not set to 1, new values that are written will not be reflected in the register. This bit returns to 0 after the setting is completed. When adding an offset, take care that it does not exceed 80 bits.

The value of the gPTP timer can be read from the gPTP timer capture register (GCTi.CTV). Set the timer capture source select bits in the gPTP configuration control register (TCCR.TCSS) to select the timer value for capture as the value of the gPTP timer, the corrected value of the gPTP timer (value with the offset added), or the AVTP presentation time. Setting the timer control request bits in the gPTP configuration control register (GCCR.TCR[1:0]) to B'11 initiates the capture. Once normal capture of the timer is complete, the value of the timer control request bits in the gPTP configuration control register (GCCR.TCR[1:0]) returns to B'00.

The timer for gPTP operates as a free-running timer but can be synchronized with the Grandmaster clock.

### 37A.3.7.2 Free-Running Operation

The IEEE 802.1 AS standard for timing and synchronization does not prescribe the physical adjustment of local clocks to the Grandmaster clock. To avoid negative effects from the correction procedure, we recommend the use of a free-running timer.

As a free-running timer, the timer counts the local time in seconds or nanoseconds. The gPTP timer increment register (GTI.TIV) is set to 1 ns (the setting value = H'0010 0000) and the gPTP timer offset register (GTOi.TOV) is set to 0. The ratio information captured at the time of the gPTP delay measurement and synchronization procedures is used to correct the frequency ratio to that of the Grandmaster clock. The Grandmaster clock can be calculated from the local clock by using the information collected during the gPTP measurement and synchronization procedures.

### 37A.3.7.3 Synchronization with the Grandmaster Clock

In situations requiring physical synchronization of the local clock with the Grandmaster clock, the fractional nanoseconds value (the 20 lower-order bits of the gPTP timer) is used to make the adjustment. Specifically, the increment value is finely adjusted to correct for deviations of the clock frequency from that of the Grandmaster clock.

Use the timer offset value (in the gPTP timer offset registers, GTOi.TOV) to correct for offsets from the theoretical value (at start-up, etc.). The sum of the timer value and the offset register is the “corrected timer” value.

Note that for the nanoseconds part of the Offset register GTOi.TOV[31:0] should be below  $10^9$ .

The following equation gives a method of calculating the increment (GTI.TIV) from the frequency of the gPTP clock and its deviation from that of the Grandmaster clock. Variable  $d$  is the deviation ( $d = 10^{-6}$  for 1 ppm).

$$GTI.TIV = round\left(\frac{2^{20} \text{ GHz}}{f_{GPTP}} \times (1 + d)\right)$$

After adjusting for the current deviation of clock frequency, reset the gPTP timer increment register (GTI.TIV).

After calculating the new offset value, reset the gPTP timer offset register (GTOi.TOV).

### 37A.3.7.4 Support Provided by the gPTP Timer in Transmission and Reception

The timer value described above is used in the time-stamp values captured when start frame delimiters are detected in reception and generated in transmission at PHY interface.

Captured time stamp values for received frames are stored in the corresponding descriptors. Those for transmitted frames are stored with tag information in the time-stamp FIFO. The time stamp values are thus correlated with both transmitted and received frames.

Note that the use of corrected timer values can introduce an error due to the offset correction in the gPTP synchronization procedure.

Due to asynchronous interface between the SFD notification and the timer modules, errors must also be taken into account.

### 37A.3.8 Support for IEEE 1722

For IEEE 1722, the following two functions are supported.

- Output and capture of values in the IEEE 1722 AVTP (Audio/Video Transport Protocol) presentation time format
- Comparison of IEEE 1722 AVTP presentation time stamps

The 32-bit AVTP time stamp field of IEEE 1722 frames holds the AVTP presentation time when the AVTP time-stamp enable bit in the frame is 1. The AVTP time stamp field is generated from the gPTP timer and is given as seconds (gPTP\_seconds) and nanoseconds (gPTP\_nanoseconds) according to the following equation.

$$\text{AVTP time stamp} = (\text{gPTP\_seconds} \times 10^9 + \text{gPTP\_nanoseconds}) \text{ modulo } 2^{32}$$

The AVTP presentation time can be read from the gPTP timer capture register (GCTi.CTV). Set the timer capture source select bits in the gPTP configuration control register (GCCR.TCSS) to select the timer value for capture as the AVTP presentation time. Setting the timer control request bits in the gPTP configuration control register (GCCR.TCR[1:0]) to B'11 initiates the capture. The value is obtained by adding the maximum transit time defined in the gPTP maximum transit time register (GMTT.MTTV) to the corrected timer value. The AVTP presentation time wraps around approximately every four seconds.

Note: The AVTP presentation time captured in GCTi.CTV is only valid when the corrected timer value is in synchronization with the Grandmaster clock. That is, the timer increment and timer offset values for the corrected timer value must be adjusted during the synchronization procedure so that the corrected gPTP clock is physically adjusted to match the time kept by the Grandmaster clock.

### 37A.3.9 Flow Control

The EthernetAVB does not support flow control in the specification. Flow control is only effective when transmitting and receiving only normal (non-AVB) packets.

The E-MAC supports flow control for full-duplex operation in compliance with the IEEE 802.3 standards. This flow control is applicable to both reception and transmission. In regard to the transmission of PAUSE frames, flow control operates in the following ways.

#### (1) PAUSE Frame Transmission

PAUSE frames can also be transmitted in response to software operations. Writing a timer value to the manual PAUSE frame register (MPR) starts the transmission of a PAUSE frame. This only causes the transmission of one PAUSE frame.

#### (2) PAUSE Frame Reception

After reception of a PAUSE frame, transmission of the next frame does not proceed until the time indicated by the Timer value elapses. However, transmission of a frame currently being transmitted continues. PAUSE frames are only received while the RXF bit in the E-MAC mode register (ECMR) is set to 1. The number of received PAUSE frames is counted.

#### (3) PAUSE Frames with the Timer Value 0

The setting of the 0-time PAUSE frame enable bit (ECMR.ZPF) enables or disables the reception of PAUSE frames with the TIME parameter value 0.

- When control of PAUSE frames with the TIME parameter value 0 is disabled PAUSE frames with the TIME parameter value 0 are not transmitted. Received PAUSE frames with the TIME parameter value 0 are discarded.

### 37A.3.10 Magic Packet Detection

The E-MAC has a Magic Packet detection function. This function provides a facility for host devices and other sources to start other peripheral devices connected to a LAN. A peripheral device that handles Magic Packets starts itself in response to receiving a Magic Packet.

When a Magic Packet is detected, data from broadcast packets that were previously being received are stored in the FIFO and the E-MAC is notified of the receiving status. To return to normal operation from the associated interrupt processing, the E-MAC and AVB-DMAC must be initialized by using the operating mode configuration bit in the AVB-DMAC mode register (CCC.OPC) to set the operating mode to reset mode.

Magic Packets are received regardless of the destination address. As a result, the AVB\_MAGIC pin is only enabled in the case of a match with the destination address specified in the Magic Packet.

The procedure for using the Magic Packet detection function with this LSI chip is as follows.

1. Use the various interrupt enabling and masking registers to disable the output of interrupts from interrupt sources.
2. Set the Magic Packet detection enable bit in the E-MAC mode register (ECMR.MPDE).
3. Set the Magic Packet detection interrupt enable bit in the E-MAC interrupt enable register (ECSIPR.MPDIP) to enable the interrupt.
4. Place the CPU in sleep mode as required.
5. An interrupt is conveyed to the CPU on detection of a Magic Packet.
6. The AVB\_MAGIC pin notifies connected devices of Magic Packet detection.

Note: The Magic Packet detection interrupt status can be read in the E-MAC status register (ECSR.MPD). The bit can be cleared by setting the E-MAC status register Magic Packet TM detection bit (ECSR.MPD) to 1.

But EthernetAVB can't detect 2nd or later Magic Packet<sup>TM</sup> and the AVB\_MAGIC pin can be negated though the bit is cleared.

The AVB\_MAGIC pin can be negated and EthernetAVB can detect MAGIC Packet<sup>TM</sup> again according to below way.

- |                                   |   |
|-----------------------------------|---|
| 1) Hardware reset                 | set reset pin in the RZ/G series to reset signal.                                     |
| 2) Software reset                 | set mstp/srst register for EthernetAVB to software reset mode.                        |
| 3) Software reset register in AVB | set AVB DMAC mode register Operating Mode Configuration bits (CCC.OPC) to reset mode. |

### 37A.3.11 Interrupts

The EthernetAVB is capable of generating one interrupt.

For details, refer to the “Interrupt Controller” section in the manual.

The AVB-DMAC related interrupts include descriptor interrupts (15 sources), error interrupts (5 sources), reception interrupts (37 sources), transmission interrupts (2 sources), and gPTP interrupts (3 sources). From the CPU’s perspective, each appears as one of the above four interrupt sources.

The states of an AVB-DMAC-related interrupt sources can be checked in the following registers.

- Descriptor interrupt status register (DIS)
- Error interrupt status register (EIS)
- Receive interrupt status register (RISi)
- Transmit interrupt status register (TIS)
- gPTP interrupt status register (GIS)

The interrupts are controlled by the corresponding interrupt enable bits. However, the status flags operate independently of the settings of the enable bits.

The states of grouped interrupts can only be checked by reading the interrupt summary status register (ISS) and the queue full error interrupt status bit in the error interrupt status register (EIS.QFS). This reduces the load on the CPU.

#### 37A.3.11.1 Transmit/Receive Data Management Interrupt

The management interrupt for transmission and reception is conveyed when the interrupt conditions corresponding to the following sources are satisfied.

- Receive frame interrupt in the receive interrupt status register 0 (RIS0.FRFr)
- Descriptor interrupt in the descriptor interrupt status register (DIS.DPFi)

The general error interrupt state can be checked by reading the descriptor interrupt status bits in the interrupt summary status register (ISS.DPSi) or the receive FIFO warning interrupt summary bit (ISS.RFWS).

#### 37A.3.11.2 Error Management Interrupt

The error management interrupt is conveyed when interrupt conditions corresponding to the following sources are satisfied.

- Time stamp FIFO full interrupt in the error interrupt status register (EIS.TFFF)
- CBS limitation interrupts in the error interrupt status register (EIS.CULF1, EIS.CULF0, EIS.CLLF1, EIS.CLLF0)
- Receive FIFO full interrupt in the receive interrupt status register 2 (RIS2.RFFF)
- Receive queue full interrupt in the receive interrupt status register 2 (RIS2.QFFr)

The general error interrupt state can be checked by reading the error interrupt summary bit in the interrupt summary status register (ISS.ES).

### 37A.3.11.3 Other Management (FIFO Warning, etc.) Interrupts

The other management (FIFO warning, etc.) interrupt is conveyed when interrupt conditions corresponding to the following sources are satisfied.

(1) Reception related interrupt

Receive FIFO warning interrupt in the receive interrupt status register 1 (RIS1.RFWF)

(2) Transmission related interrupts

Time stamp FIFO warning interrupt in the transmit interrupt status register (TIS.TSWF)

Time stamp FIFO update interrupt in the transmit interrupt status register (TIS.TSUF)

(3) gPTP related interrupts

AVTP presentation target match interrupt in the gPTP interrupt status register (GIS.PTMF)

The general error interrupt state can be checked by reading the receive FIFO warning error interrupt status bit in the interrupt summary status register (ISS.RFWS), the time stamp FIFO warning interrupt status bit (ISS.TFWS), and the time stamp FIFO update interrupt status bit (ISS.TFUS).

### 37A.3.11.4 E-MAC Interrupt

The E-MAC interrupt is conveyed when the E-MAC interrupt source is generated.

The general error interrupt state can be checked by reading the E-MAC interrupt summary bit in the interrupt summary status register (ISS.MS).

### 37A.3.12 Flows of Operations

#### 37A.3.12.1 Flow of E-MAC Initialization

Figure 37A.45 shows the flow of E-MAC initialization (for AVB mode and full-duplex operation).

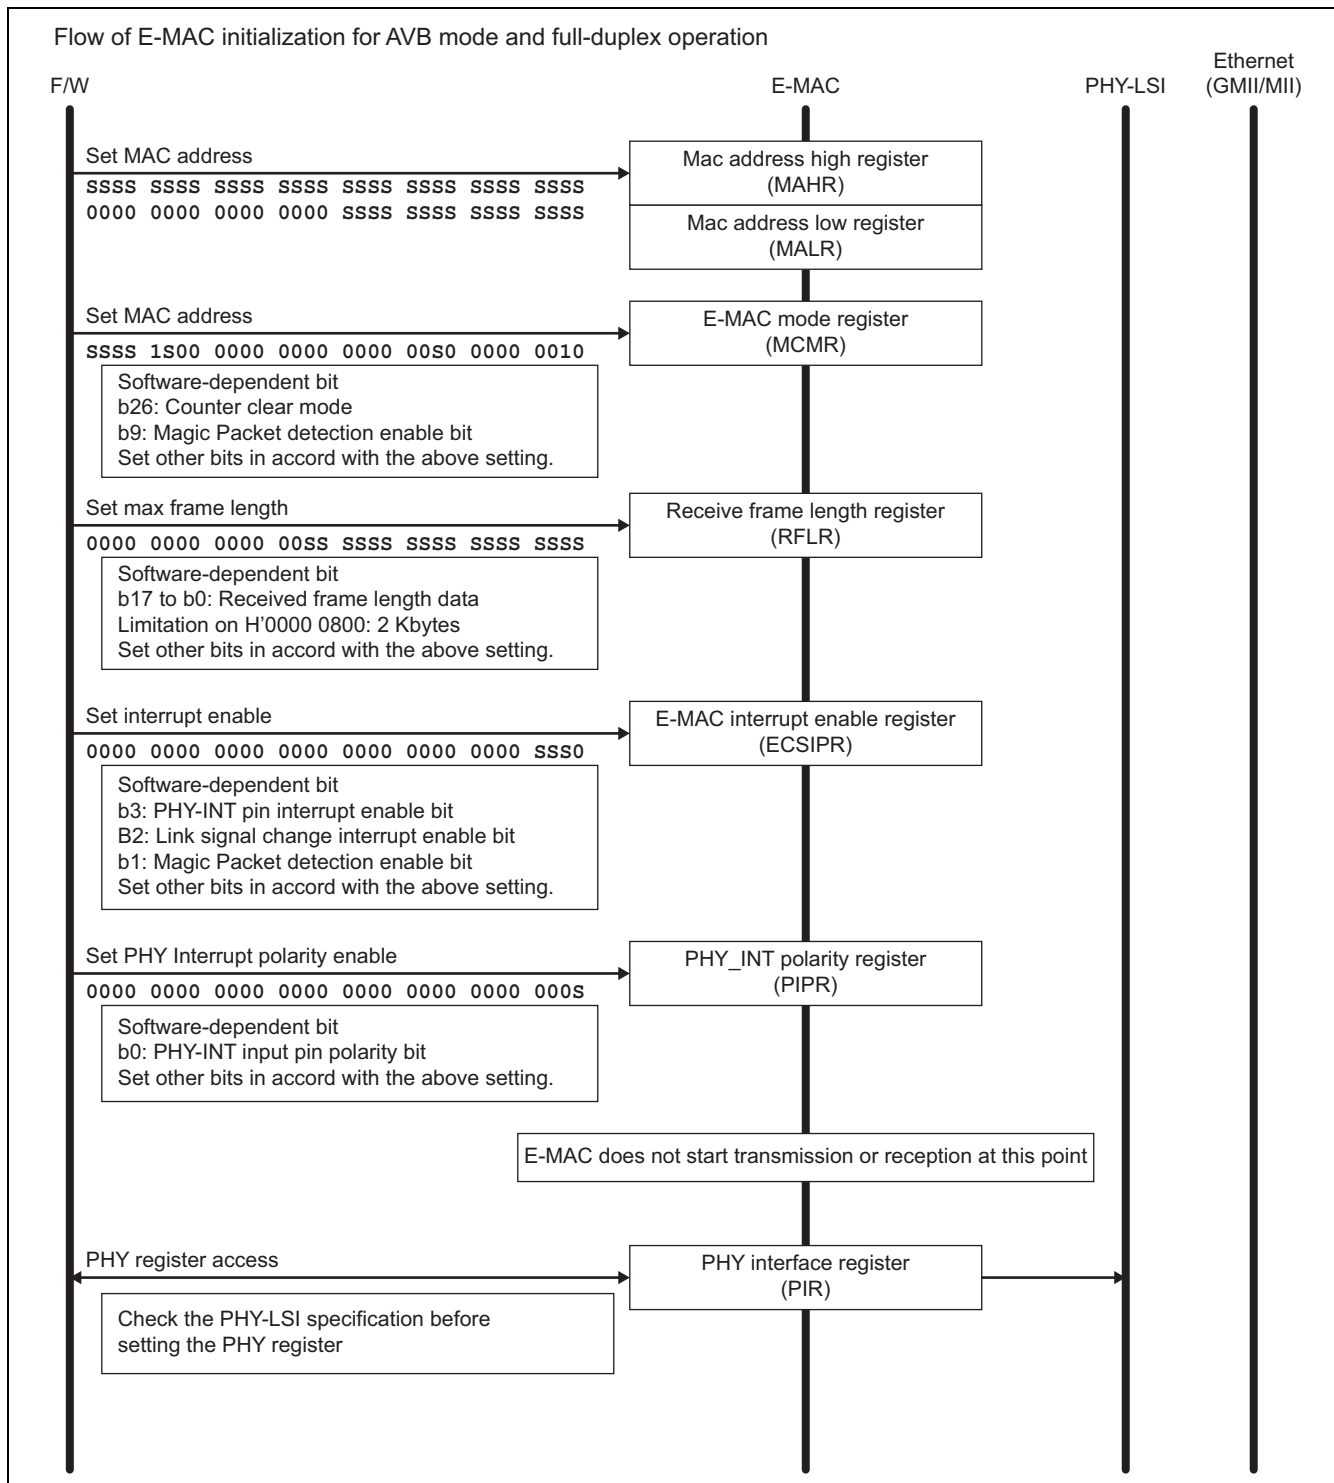

Figure 37A.45 Flow of E-MAC Initialization (for AVB Mode and Full-Duplex Operation)

### 37A.3.12.2 Flow of AVB-DMAC Initialization

Figure 37A.46 shows the flow of AVB-DMAC initialization (for AVB mode and full-duplex operation).

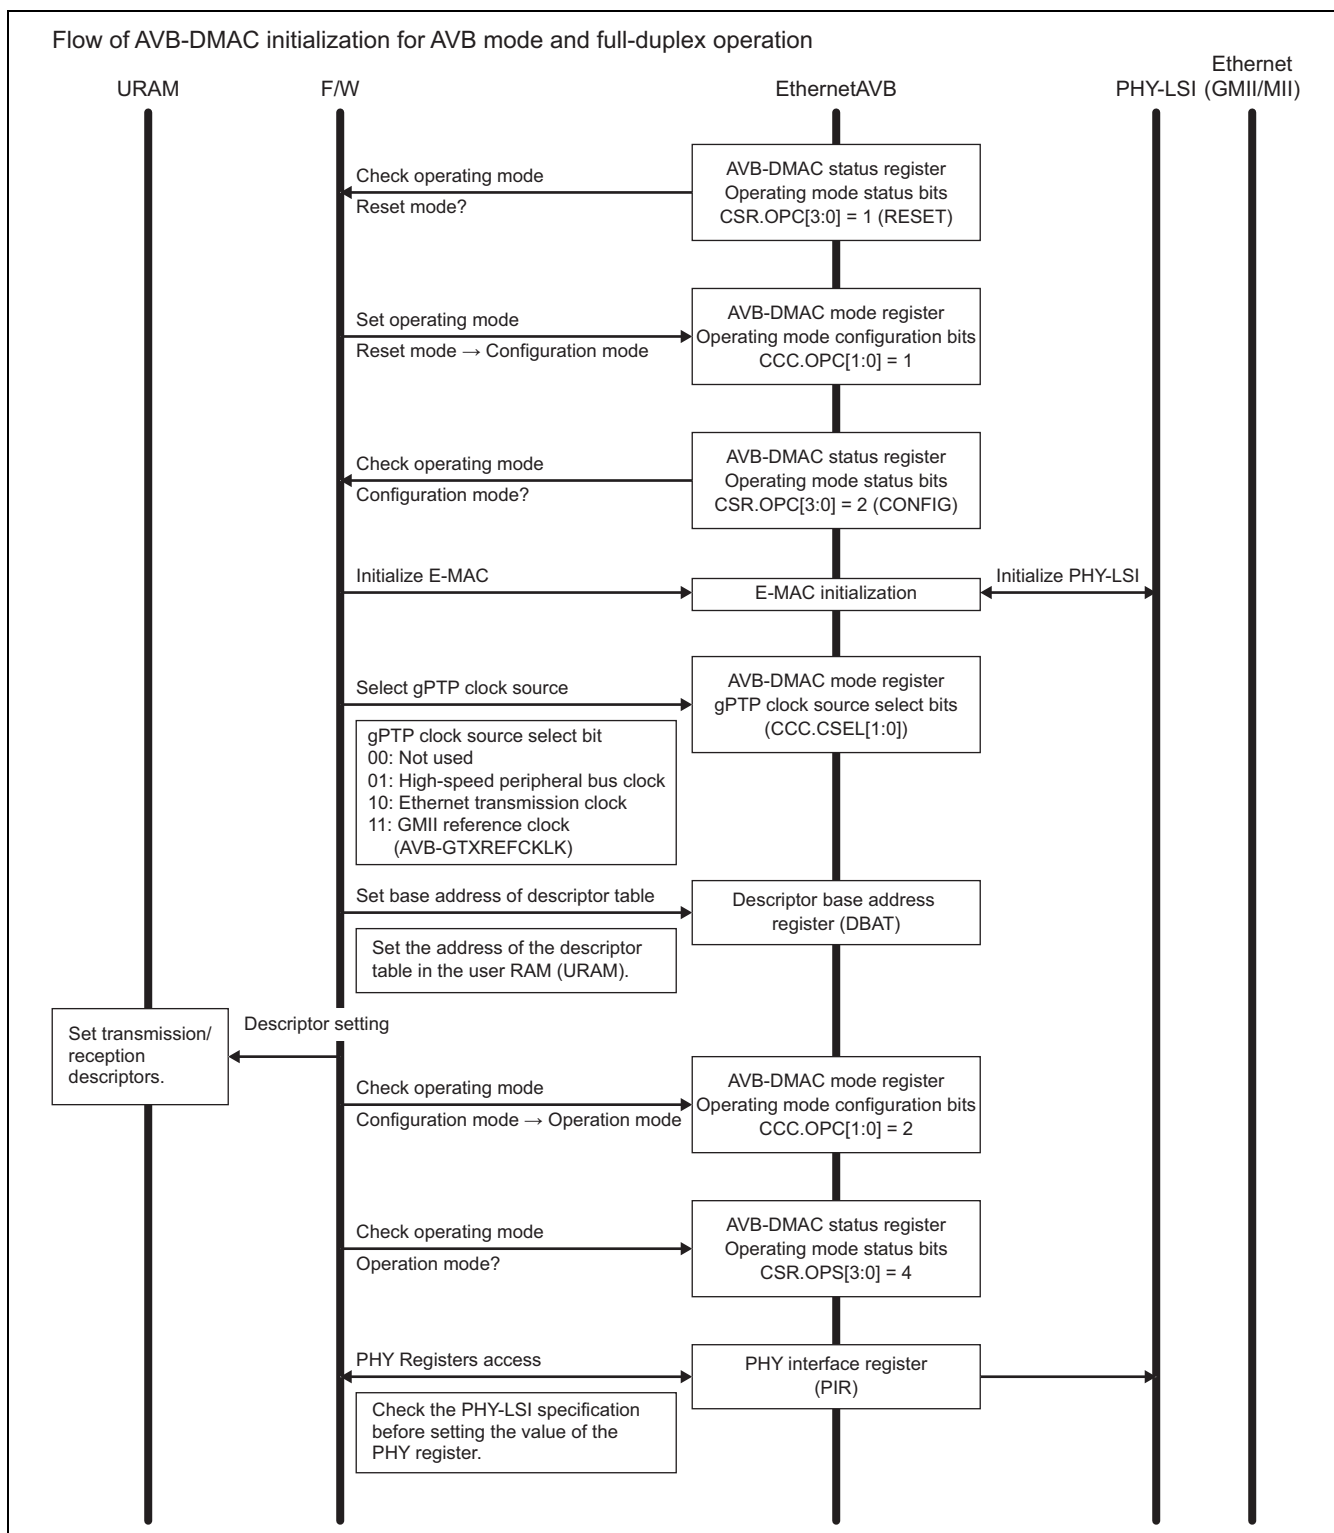

Figure 37A.46 Flow of AVB-DMAC Initialization (for AVB Mode and Full-Duplex Operation)

37A.3.12.3 Flow for the AVB-DMAC in Reception

Figure 37A.47 shows the flow for the AVB-DMAC in reception (in AVB mode and full-duplex operation).

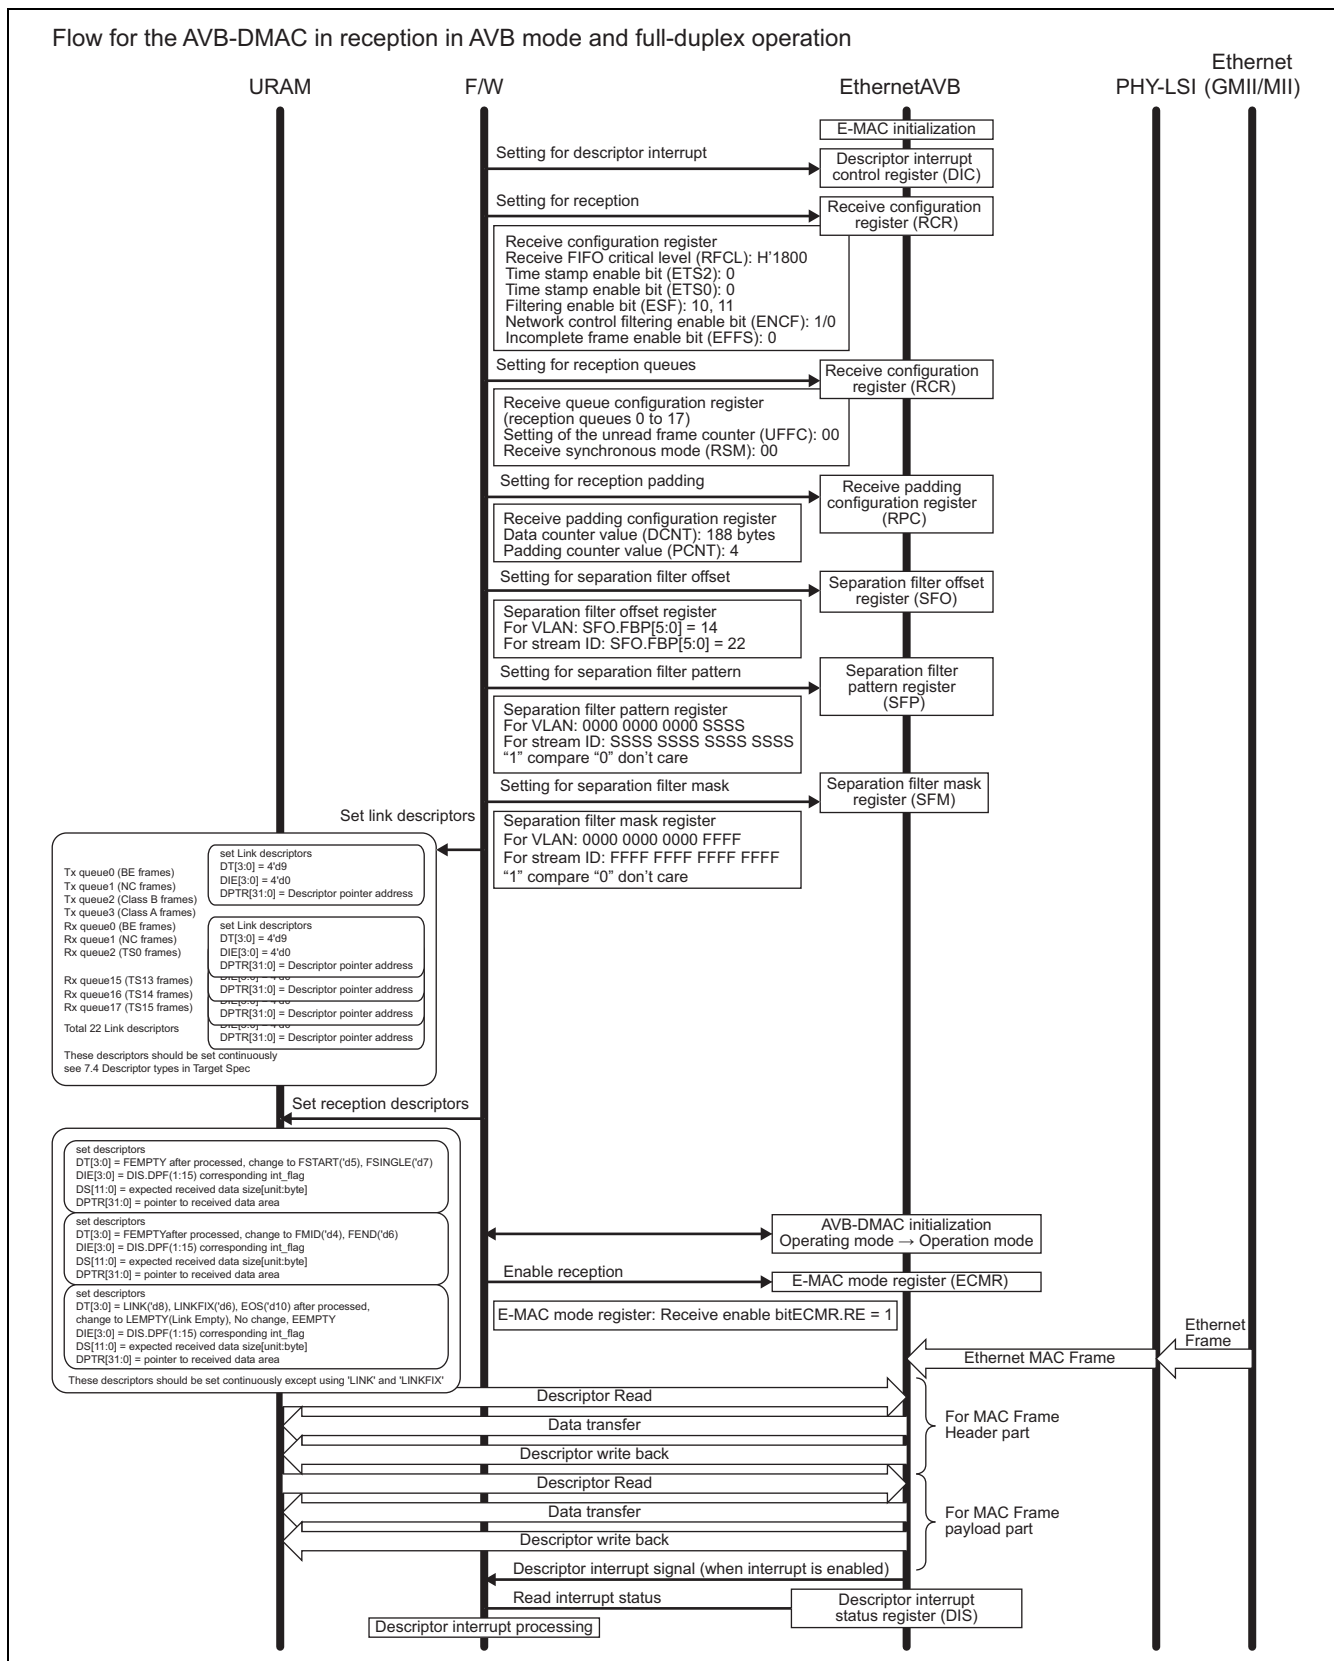

Figure 37A.47 Flow for the AVB-DMAC in Reception (in AVB Mode and Full-Duplex Operation)

37A.3.12.4 Flow for the AVB-DMAC in Transmission

Figure 37A.48 shows the flow for the AVB-DMAC in transmission (in AVB mode and full-duplex operation).

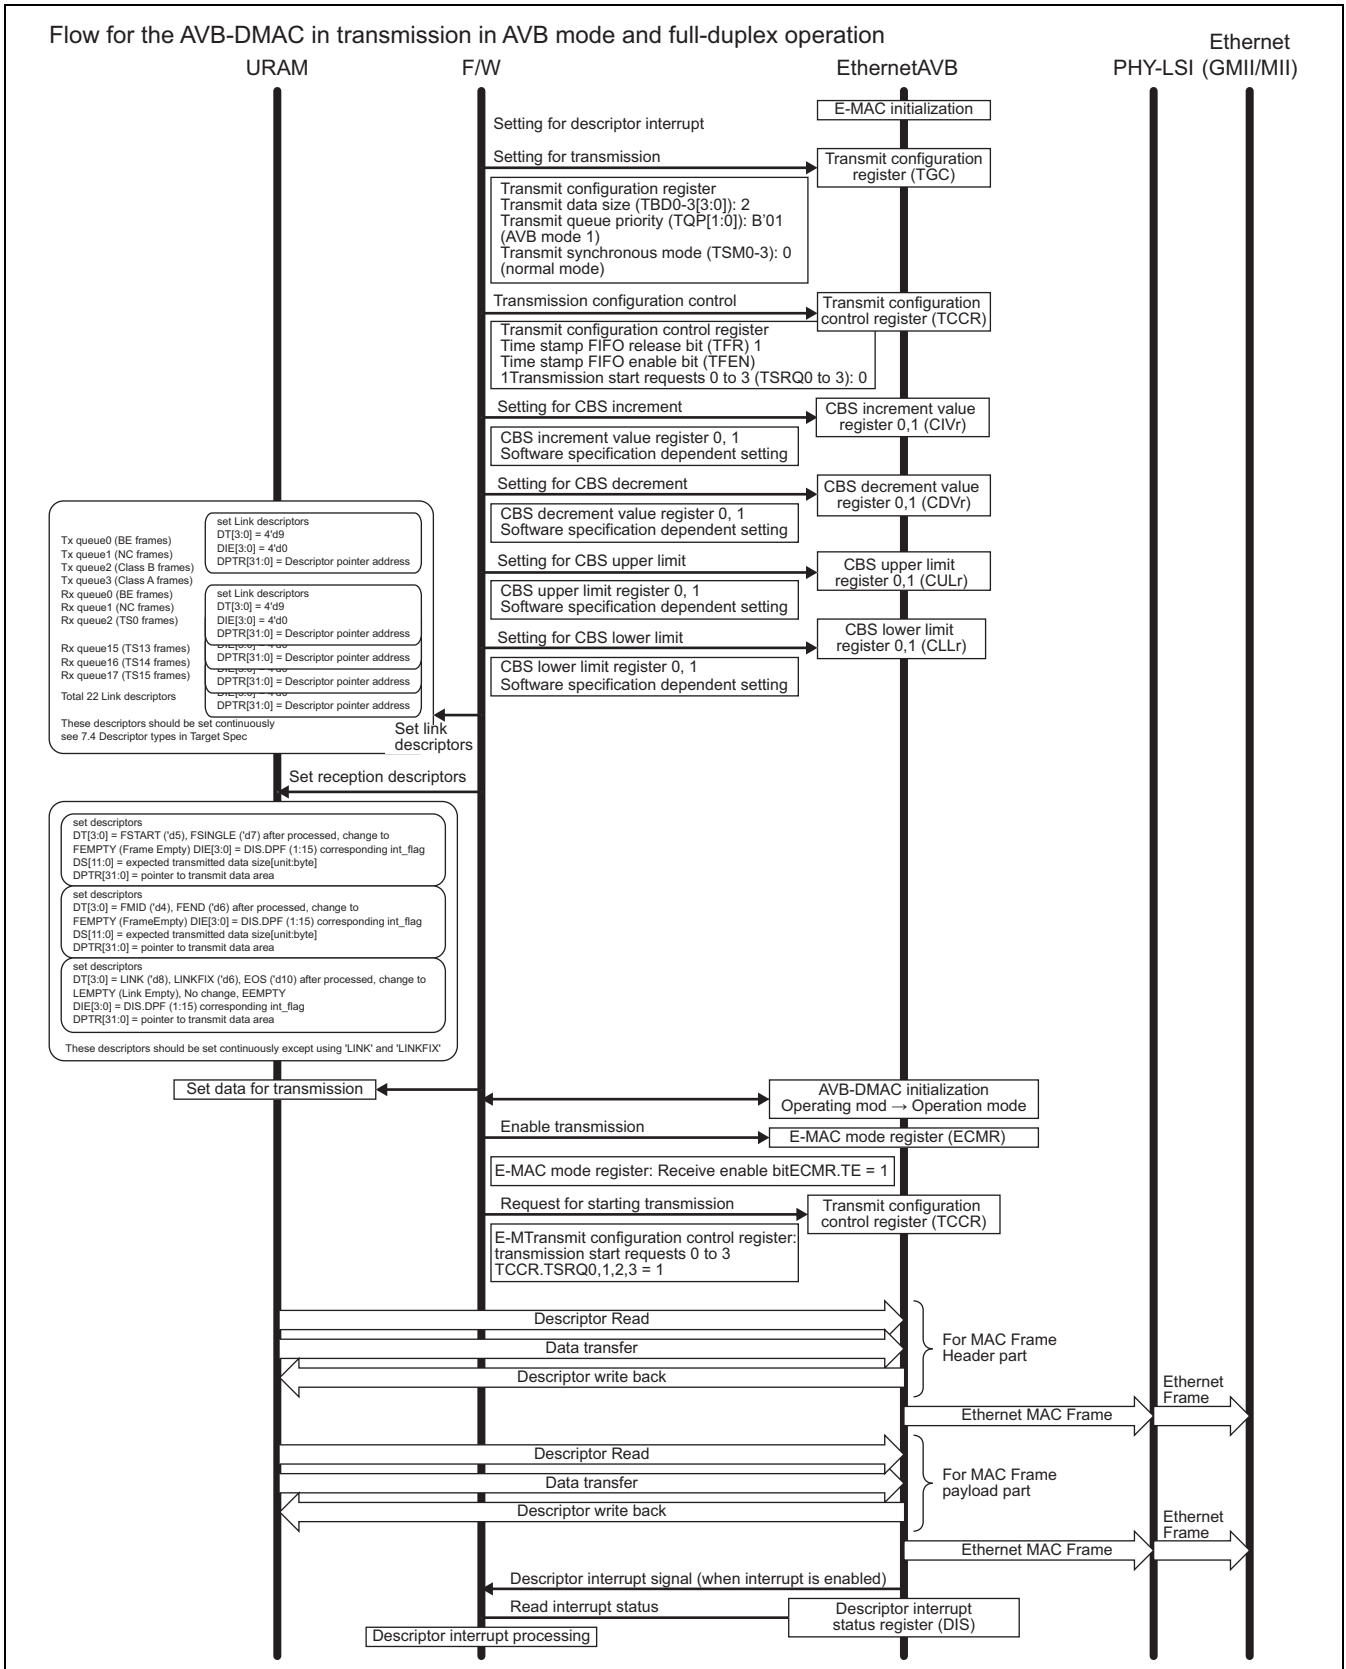

Figure 37A.48 Flow for the AVB-DMAC in Transmission (in AVB Mode and Full-Duplex Operation)

### 37A.3.12.5 Flow for Stopping AVB-DMAC Operation in Reception

Figure 37A.49 shows the flow for stopping AVB-DMAC operation in reception (normal, common to all modes).

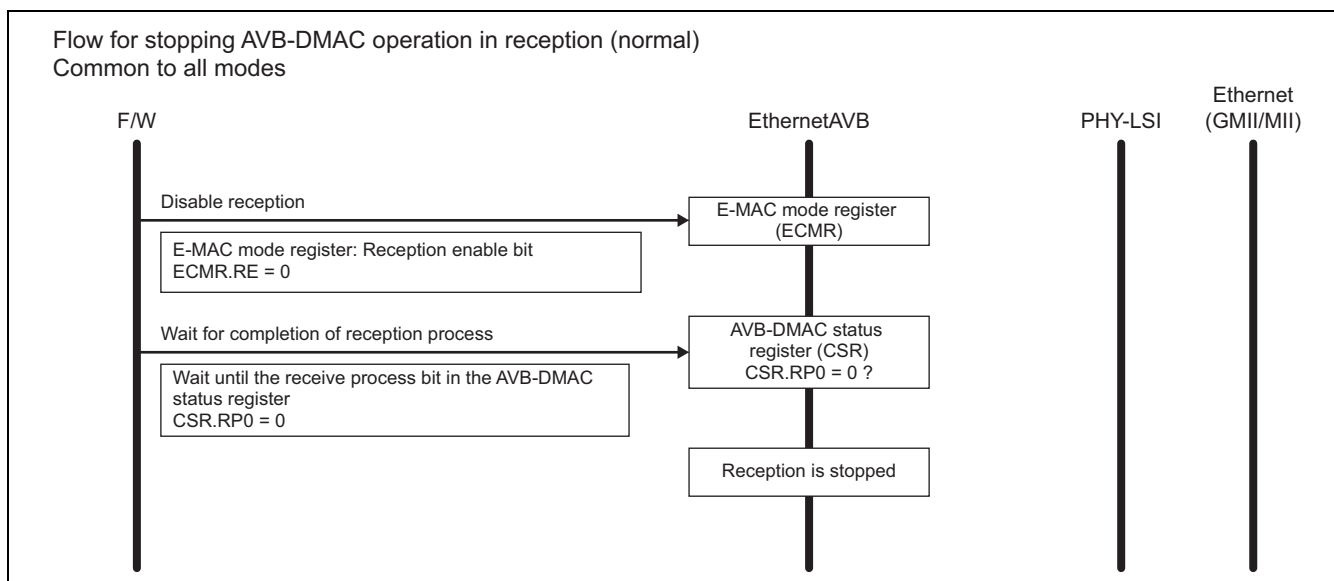

Figure 37A.49 Flow for Stopping AVB-DMAC Operation in Reception (Normal, Common to All Modes)

### 37A.3.12.6 Flow for Stopping AVB-DMAC Operation in Transmission

Figure 37A.50 shows the flow for stopping AVB-DMAC operation in transmission (normal, common to all modes).

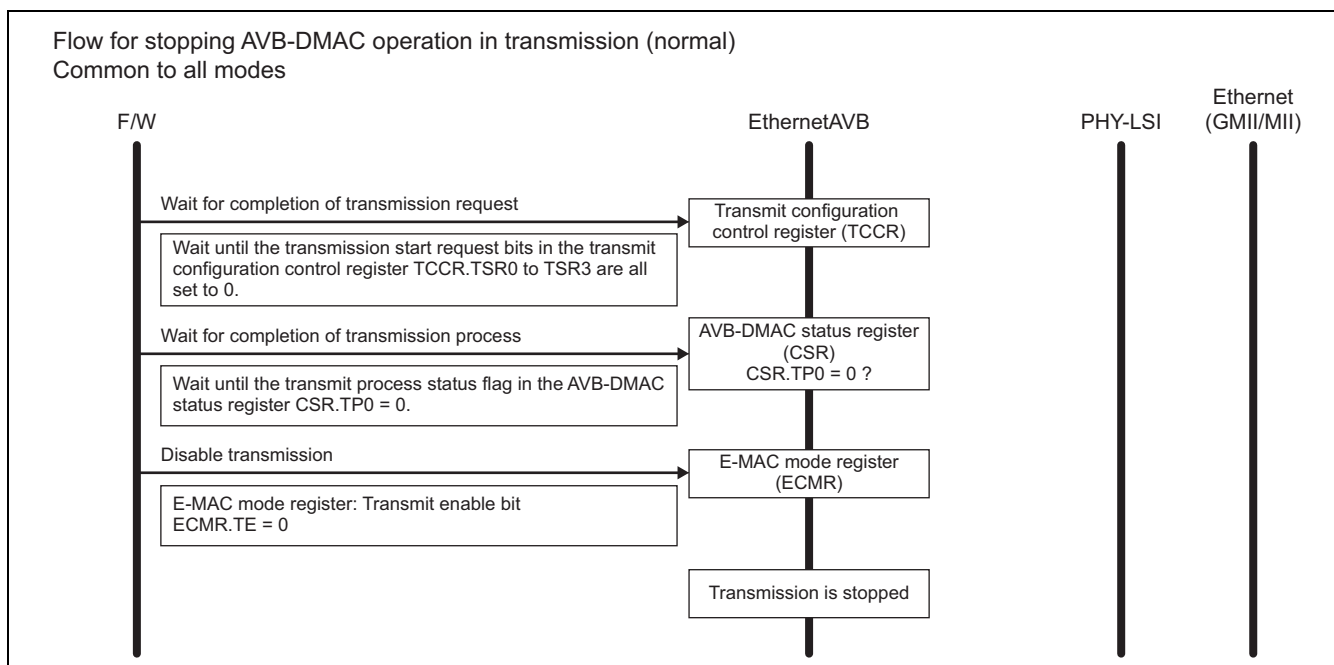

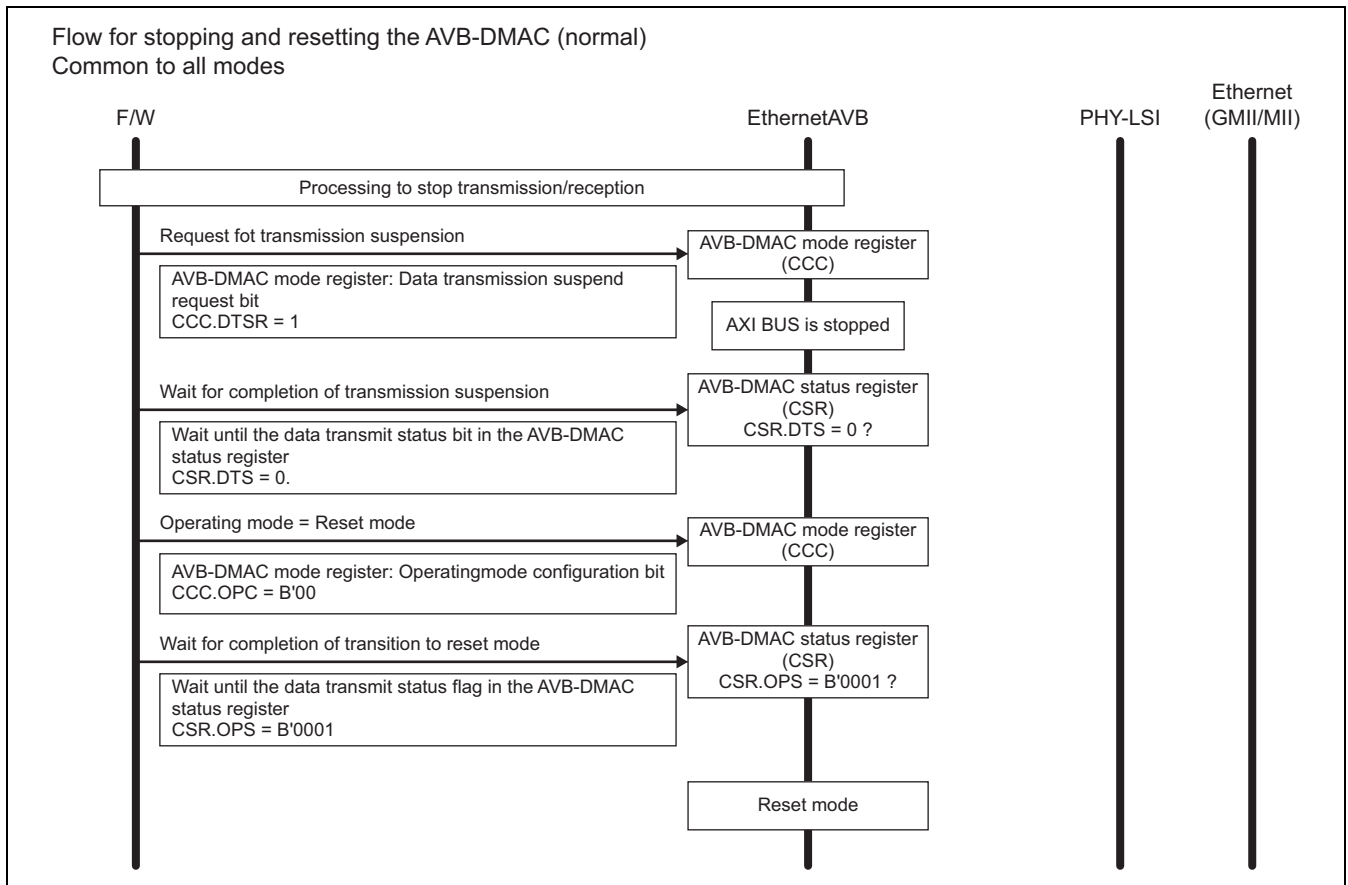

Figure 37A.50 Flow for Stopping AVB-DMAC Operation in Transmission (Normal, Common to All Modes)

**37A.3.12.7 Flow for Stopping and Resetting the AVB-DMAC**

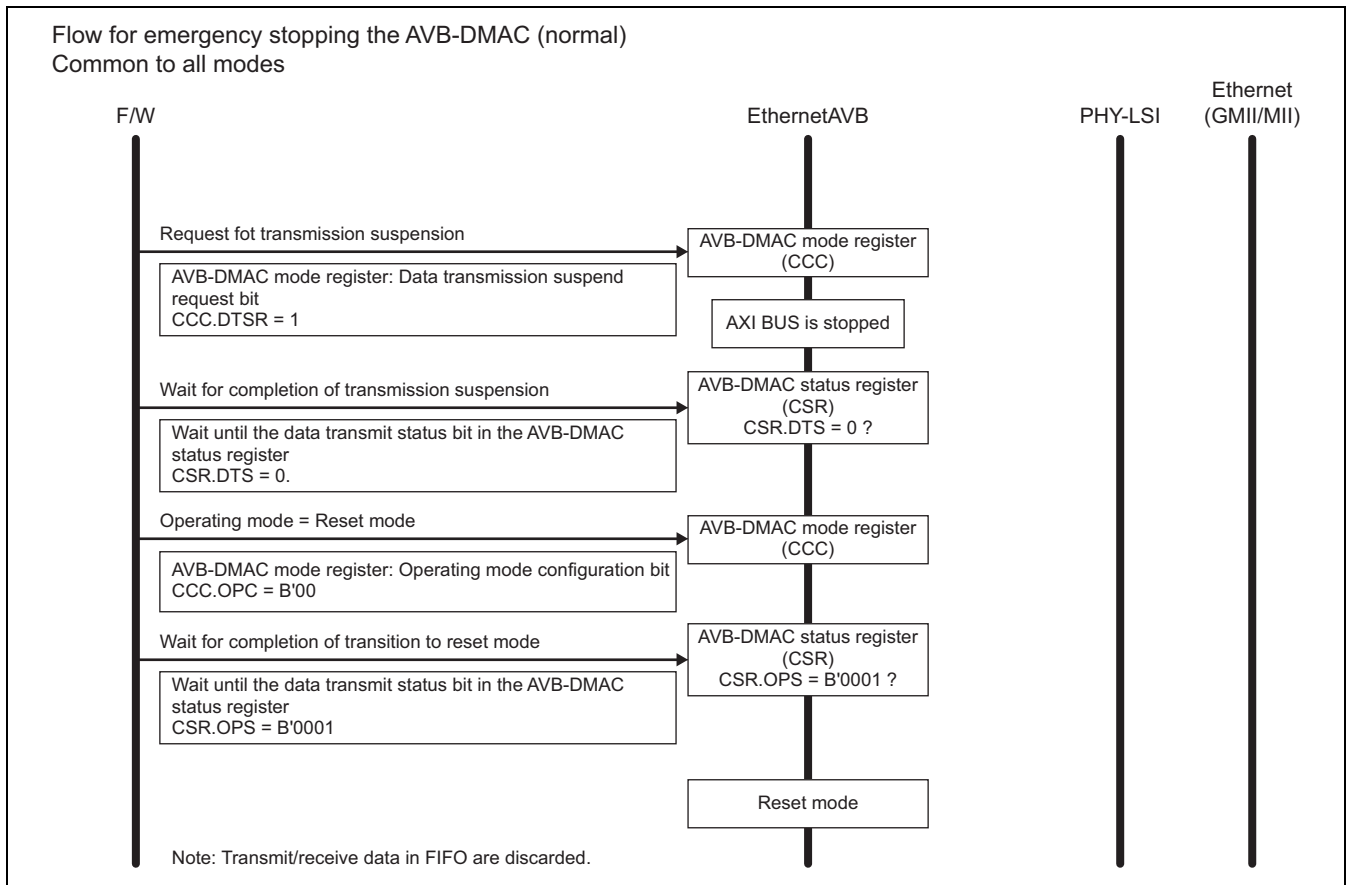

Figure 37A.51 shows the flow for stopping and resetting the AVB-DMAC (normal, common to all modes).

**Figure 37A.51 Flow for Stopping and Resetting the AVB-DMAC (Normal, Common to All Modes)**

### 37A.3.12.8 Flow for Emergency Stopping the AVB-DMAC

Figure 37A.52 shows the flow for emergency stopping the AVB-DMAC (normal, common to all modes).

**Figure 37A.52 Flow for Emergency Stopping the AVB-DMAC (Normal, Common to All Modes)**

### 37A.3.12.9 Flow of gPTP Initialization

Figure 37A.53 shows the flow of gPTP initialization (normal, common to all modes).

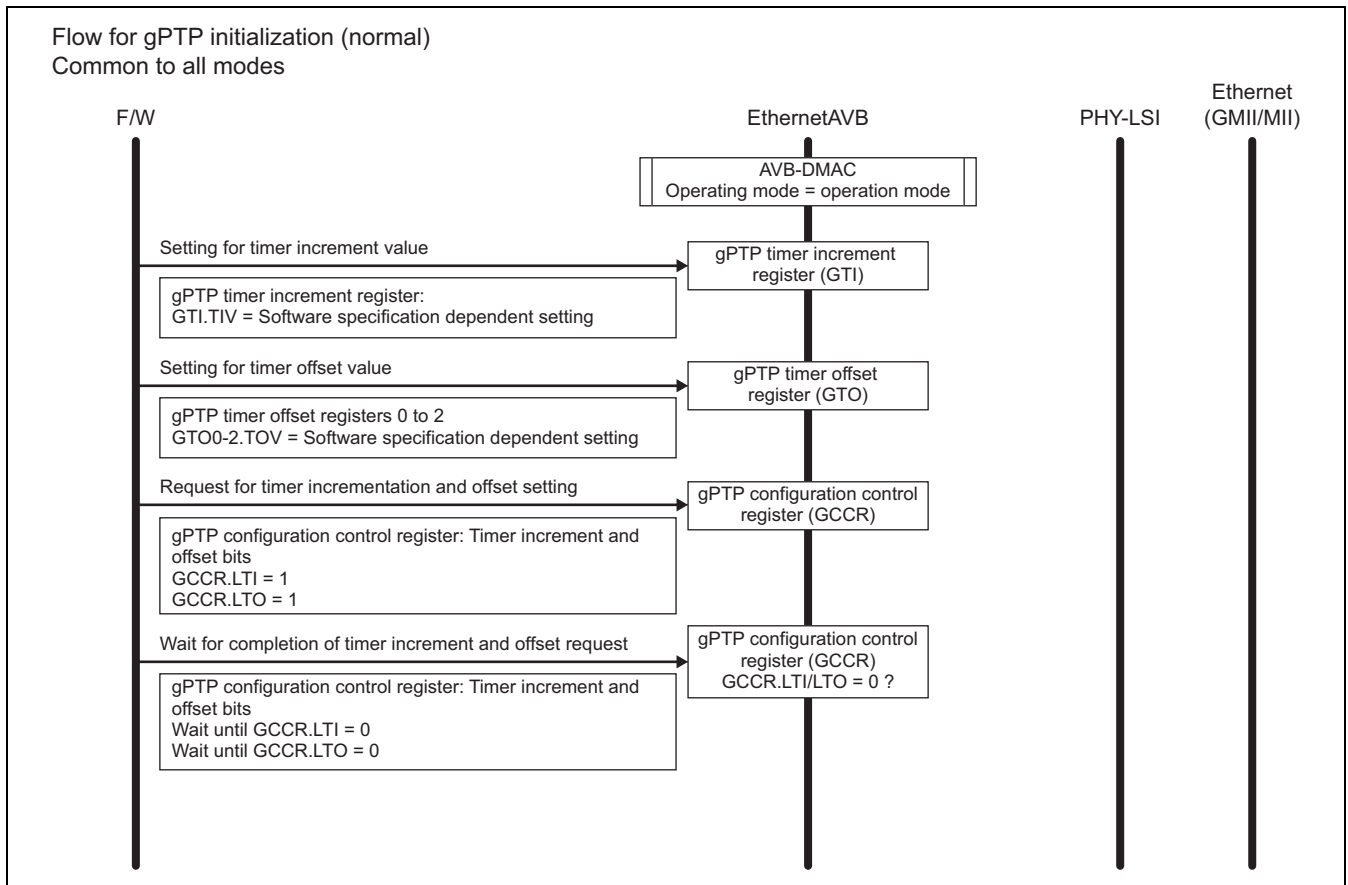

Figure 37A.53 Flow of gPTP Initialization (Normal, Common to All Modes)

### 37A.3.12.10 Flow of gPTP Time Stamping in Transmission

Figure 37A.54 shows the flow of gPTP time stamping in transmission (normal, common to all modes).

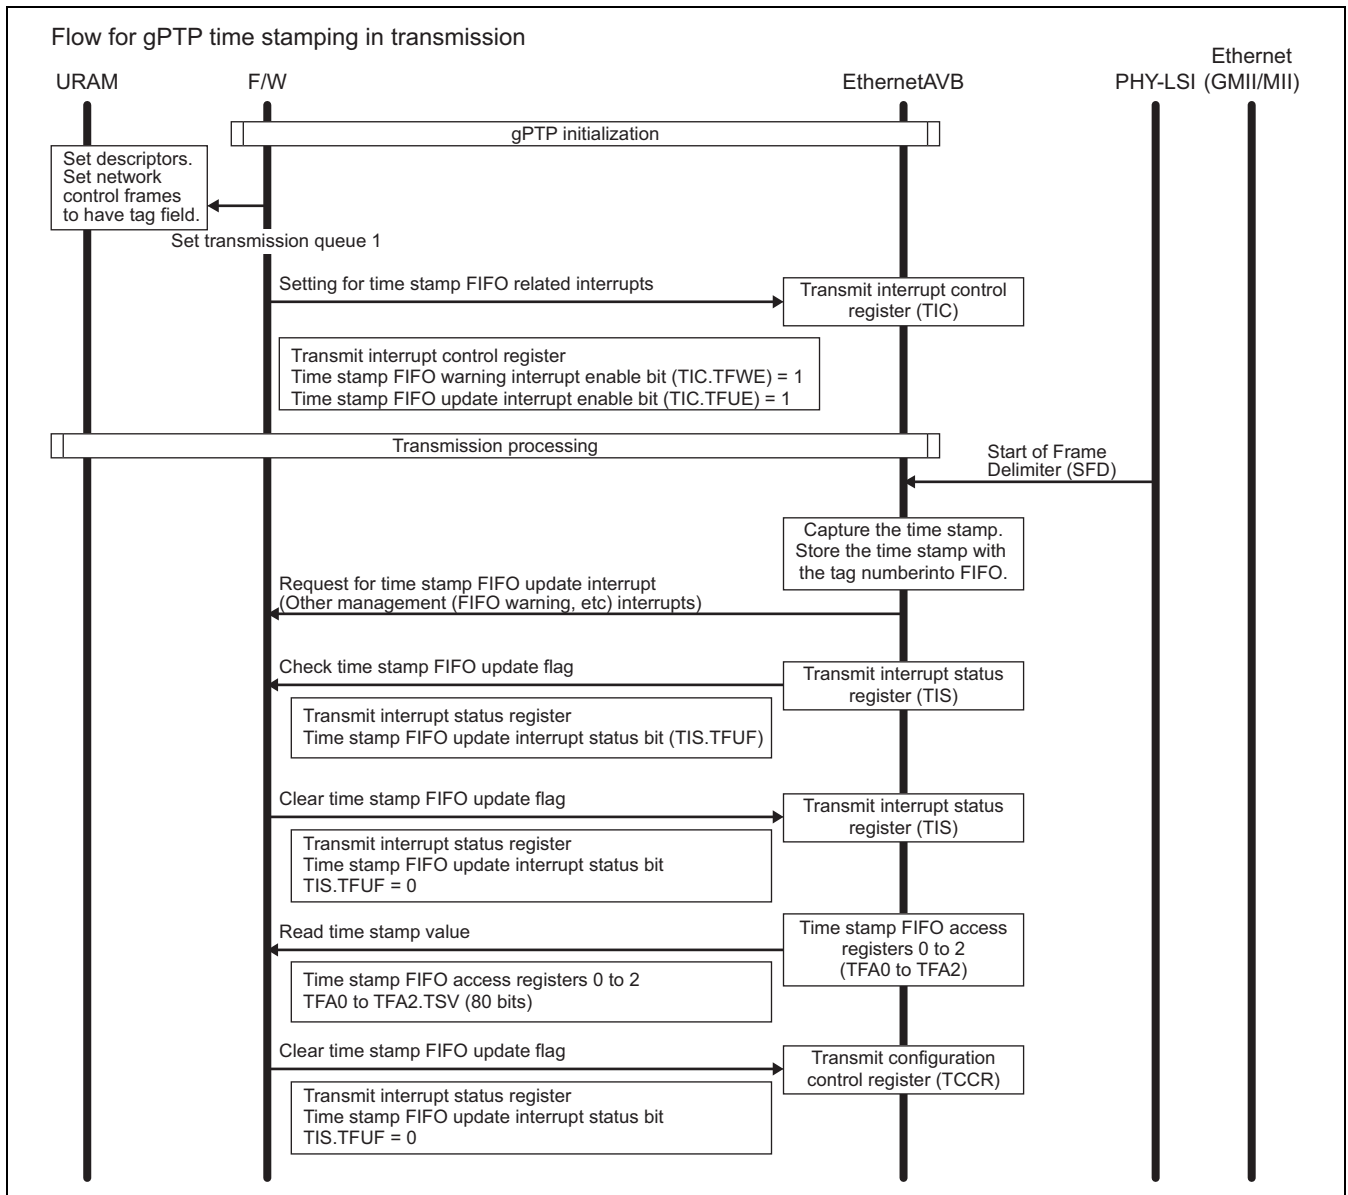

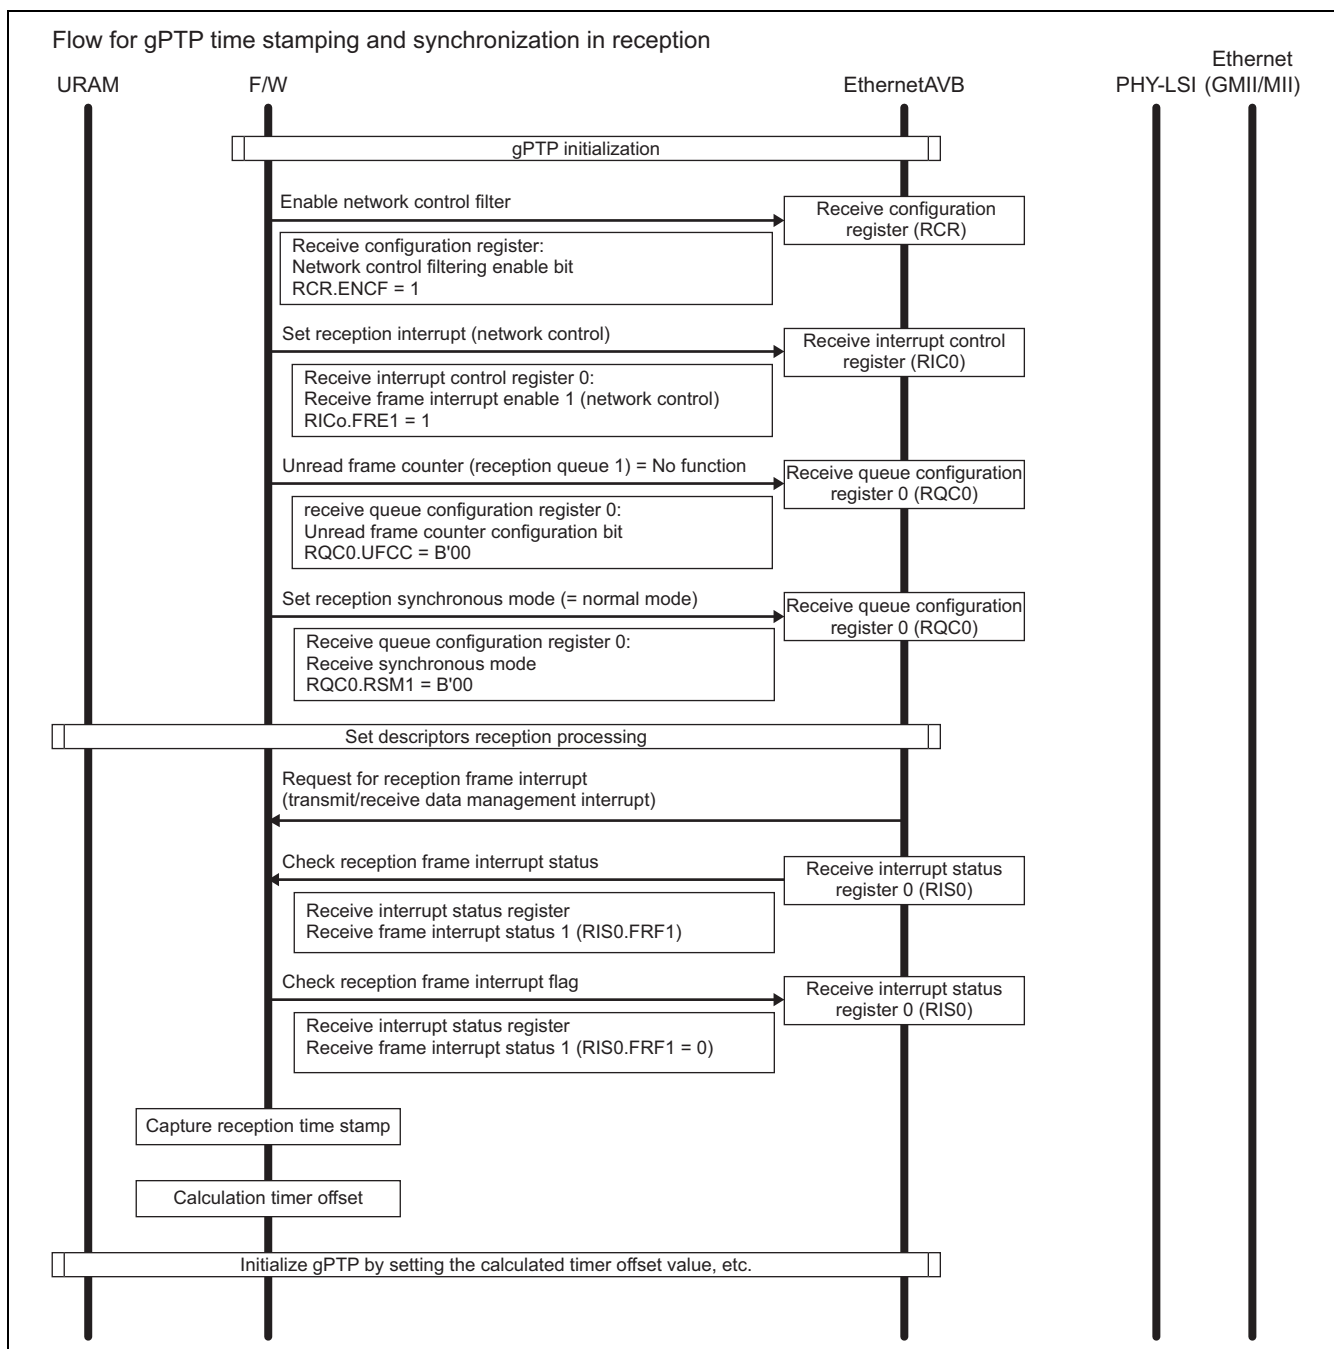

Figure 37A.54 Flow of gPTP Time Stamping in Transmission (Normal, Common to All Modes)

**37A.3.12.11 Flow of gPTP Time Stamping and Synchronization in Reception**

Figure 37A.55 shows the flow of gPTP time stamping and synchronization in reception (normal, common to all modes).

**Figure 37A.55 Flow of gPTP Time Stamping and Synchronization in Reception (Normal, Common to All Modes)**

### 37A.3.12.12 Flow of Capturing gPTP Presentation Times

Figure 37A.56 shows the flow of capturing gPTP presentation times (common to all modes).

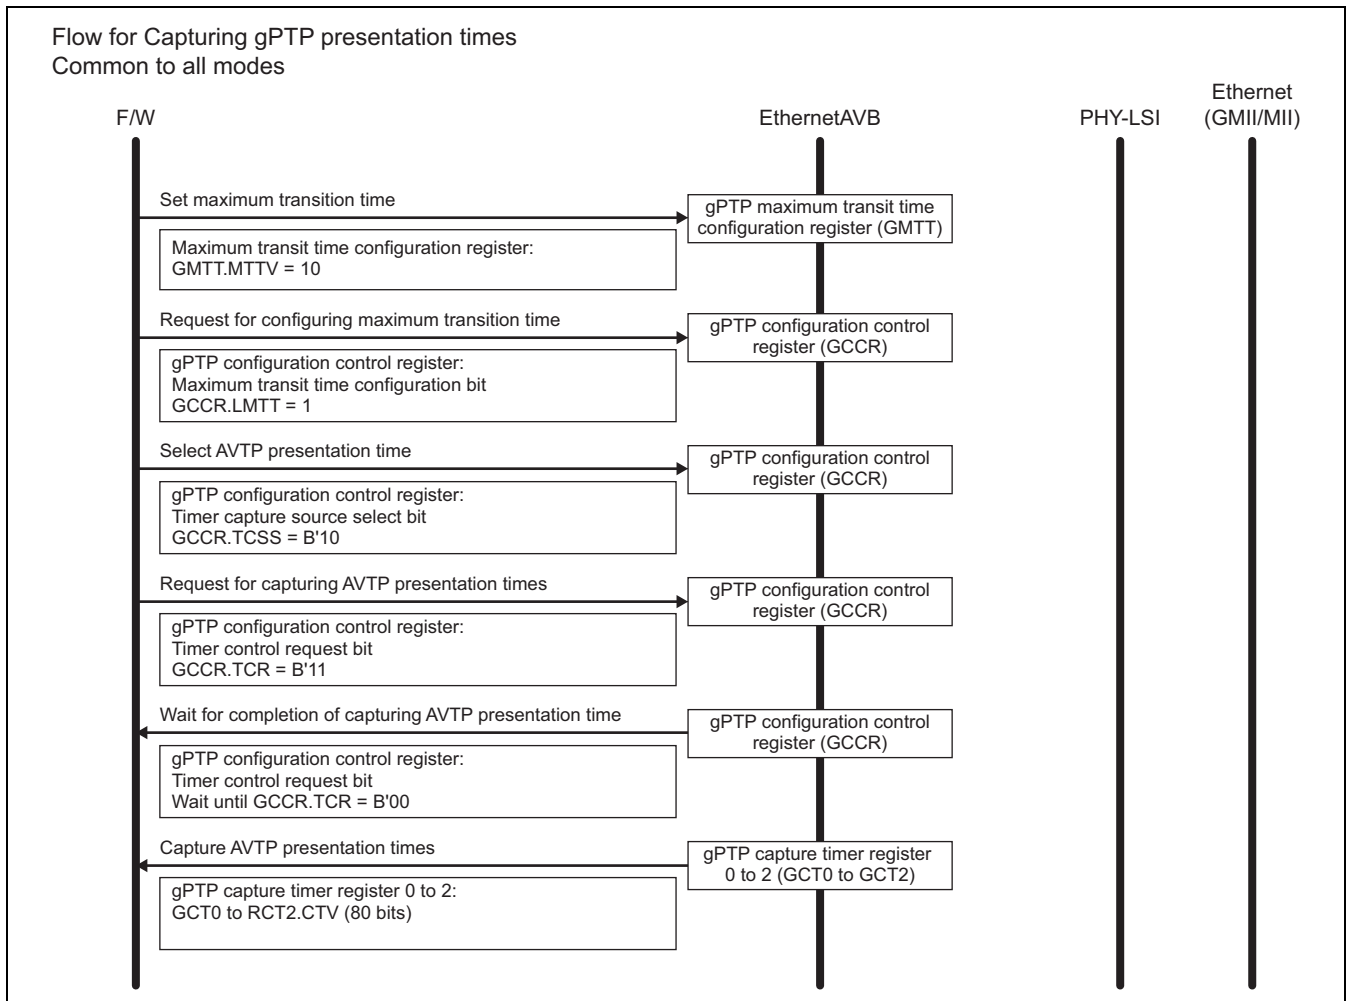

Figure 37A.56 Flow of Capturing gPTP Presentation Times (Common to All Modes)

### 37A.3.12.13 Flow of AVTP Presentation Time Comparison

Figure 37A.57 shows the flow of AVTP presentation time comparison (common to all modes).

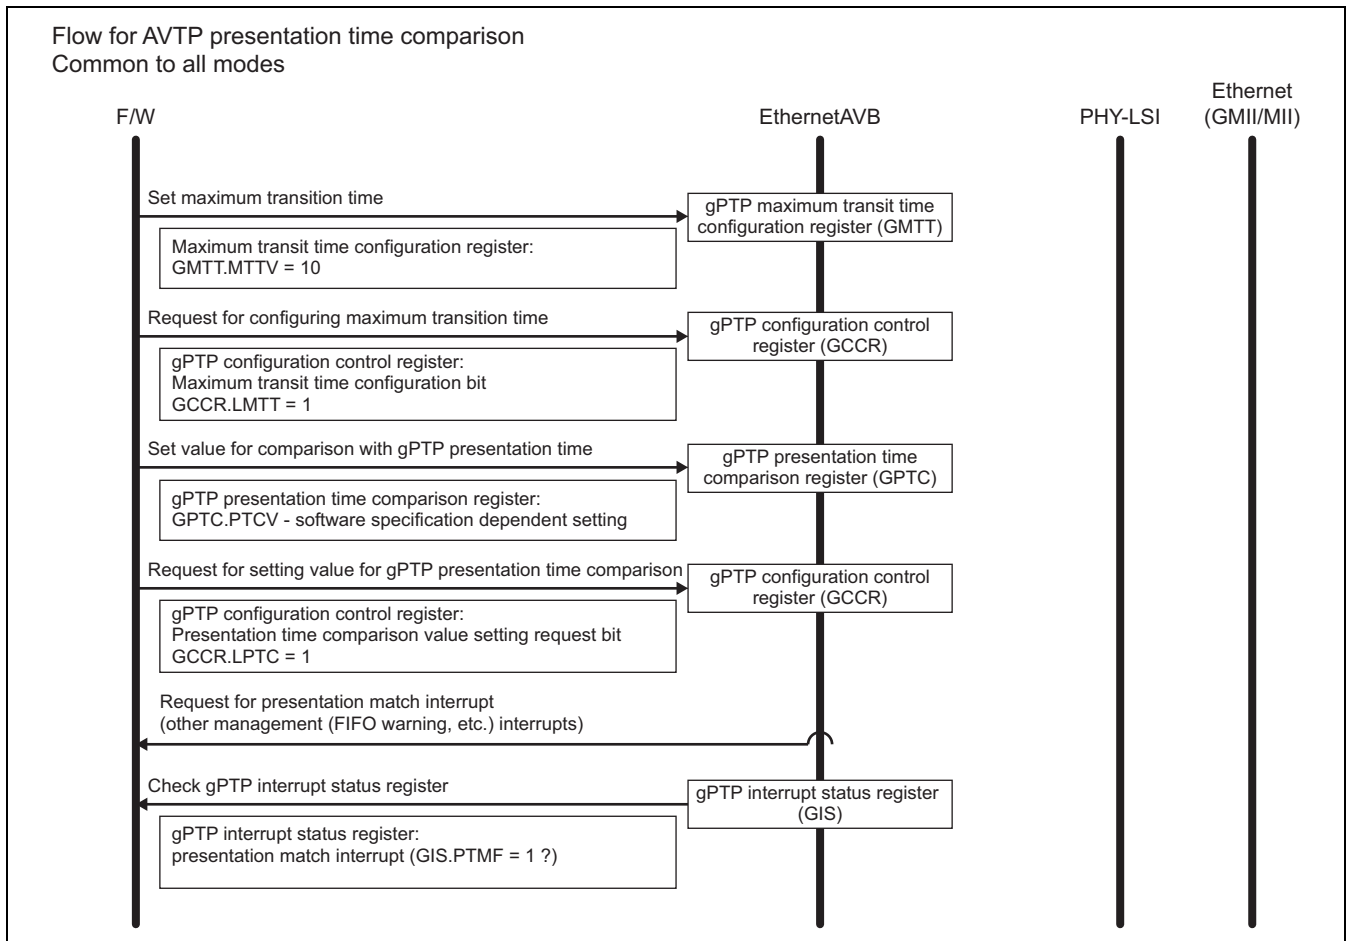

Figure 37A.57 Flow of AVTP Presentation Time Comparison (Common to All Modes)

### 37A.3.12.14 Flow of Loopback Mode Operation

Figure 37A.58 shows the flow of loopback mode operation.

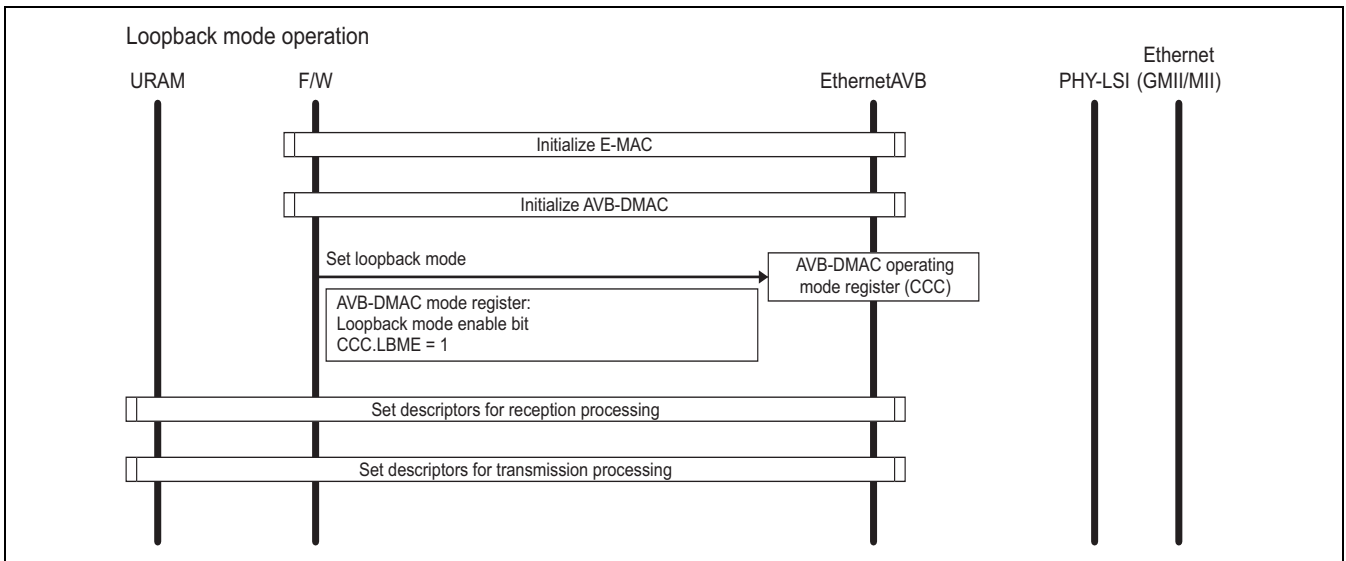

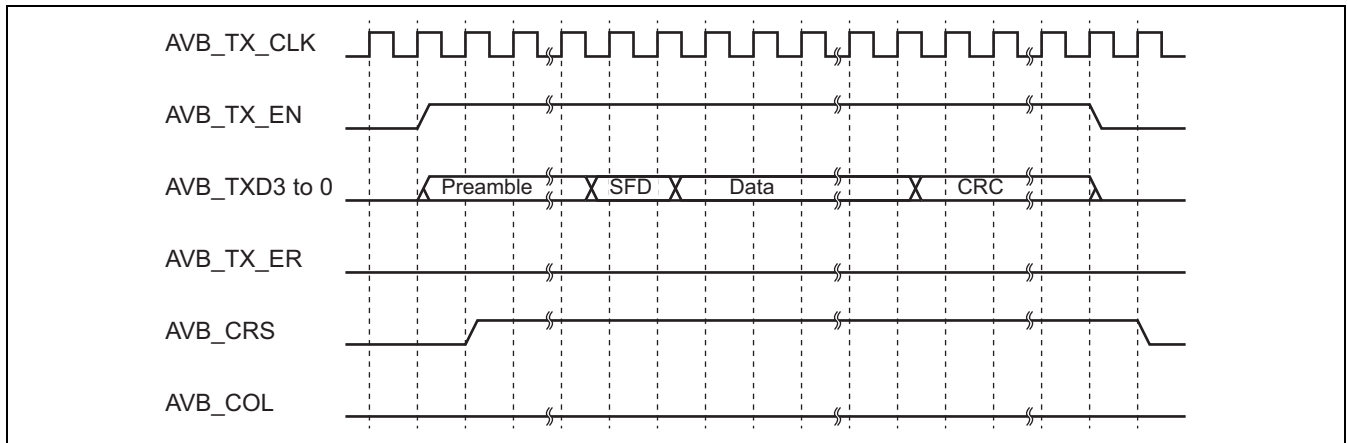

Figure 37A.58 Flow of Loopback Mode Operation

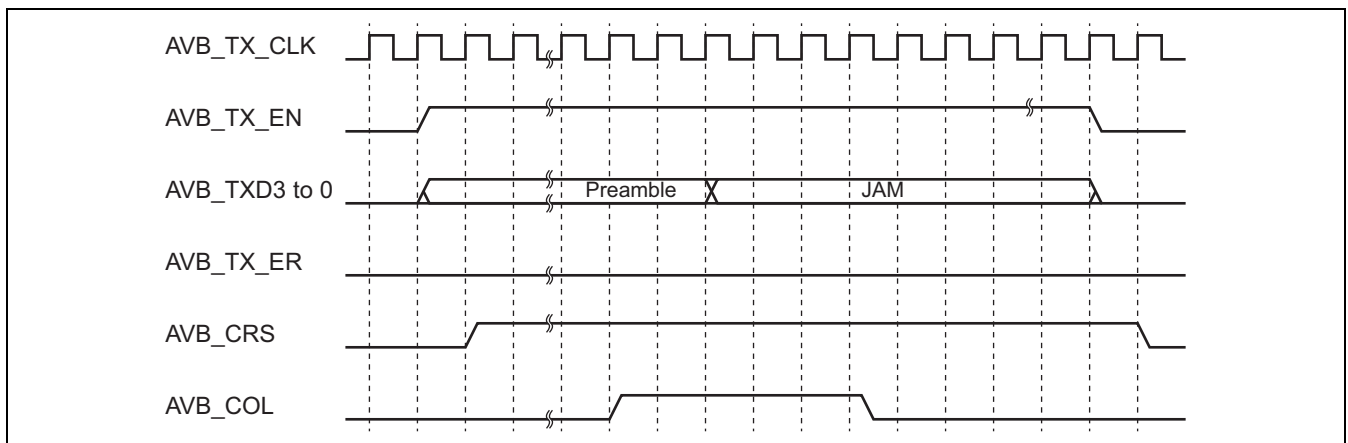

**37A.3.13 Connection to PHY-LSI**

**37A.3.13.1 MII Frame Transmission/Reception Timing**

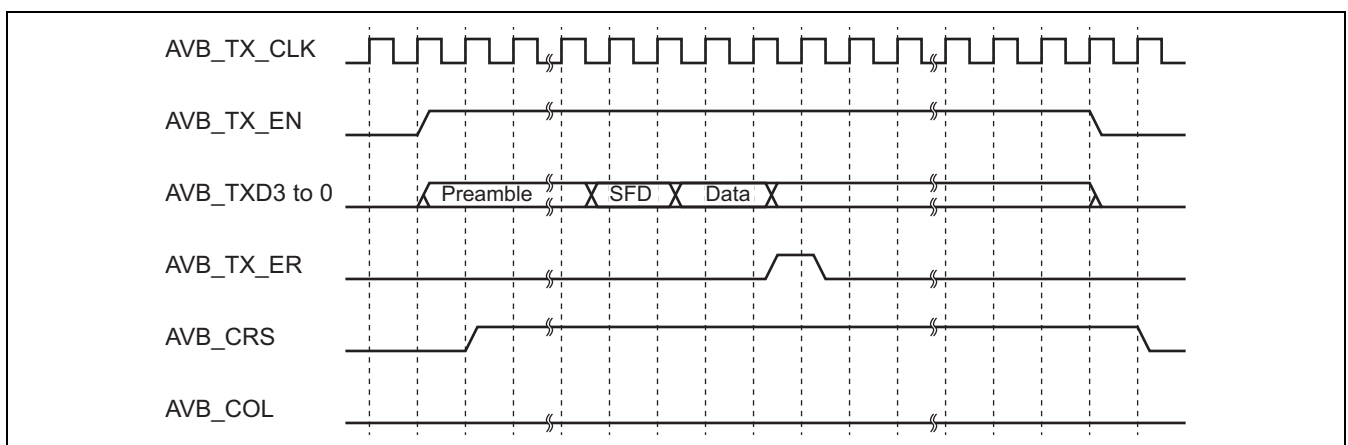

Each MII frame transmission/reception timing is shown in Figures 37A.59 to 37A.64.

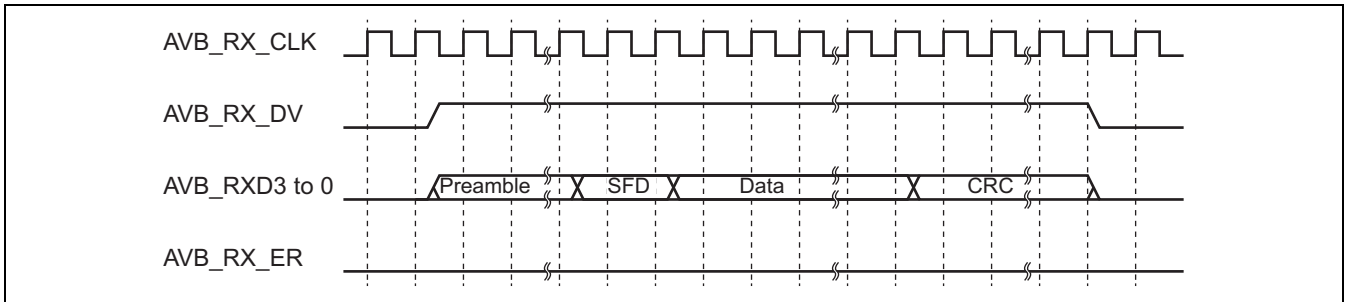

**Figure 37A.59 MII Frame Transmit Timing (Normal Transmission)**

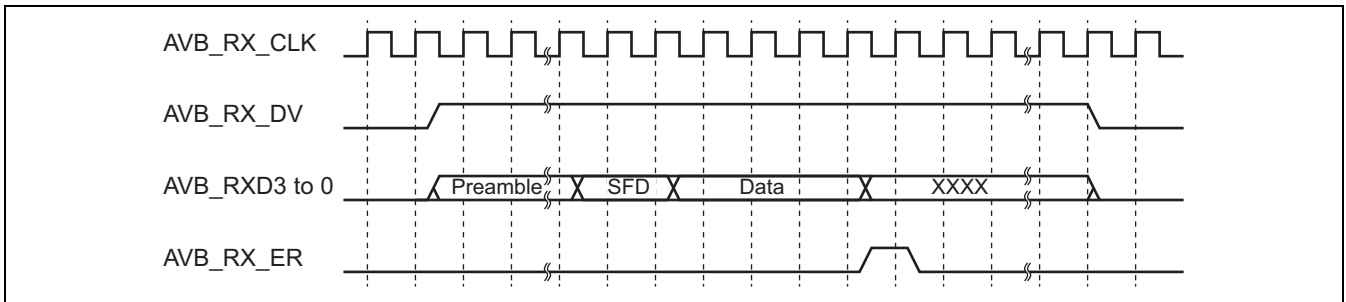

**Figure 37A.60 MII Frame Transmit Timing (Collision)**

**Figure 37A.69 GMII Fame Receive Timing (Error with Carrier Extension)**

**Figure 37A.70 GMII Fame Receive Timing (False Carrier Indication)**

### 37A.3.13.3 Accessing MII Management Registers

MII management registers in the PHY-LSI are accessed via PIR in this LSI. PIR is used as a serial interface conforming to the MII frame format specified in IEEE802.3u.

#### (1) MII Management Frame Format

Figure 37A.71 shows the format of an MII management frame. To access an MII management register, a management frame is implemented by the program in accordance with the procedures shown in MII Management Register Access Procedure.

Access Type	MII Management Frame							
Item	PRE	ST	OP	PHYAD	REGAD	TA	DATA	IDLE
Number of bits	32	2	2	5	5	2	16	
Read	1..1	01	10	00001	RRRRR	Z0	D...D	
Write	1..1	01	01	00001	RRRRR	10	D...D	X

[Legend]

PRE: 32 consecutive 1 s

ST: Write of B'01 indicating start of frame

OP: Write of code indicating access type

PHYAD: Write of B'00001 if the PHY-LSI address is 1 (sequential write starting with the MSB).  
This bit changes depending on the PHY-LSI address.

REGAD: Write of 000q if the register address is 1 (sequential write starting with the MSB).  
This bit changes depending on the PHY-LSI register address.

TA: Time for switching data transmission source on MII interface  
(a) Write: 10 written  
(b) Read: Bus release (notation: Z0) performed

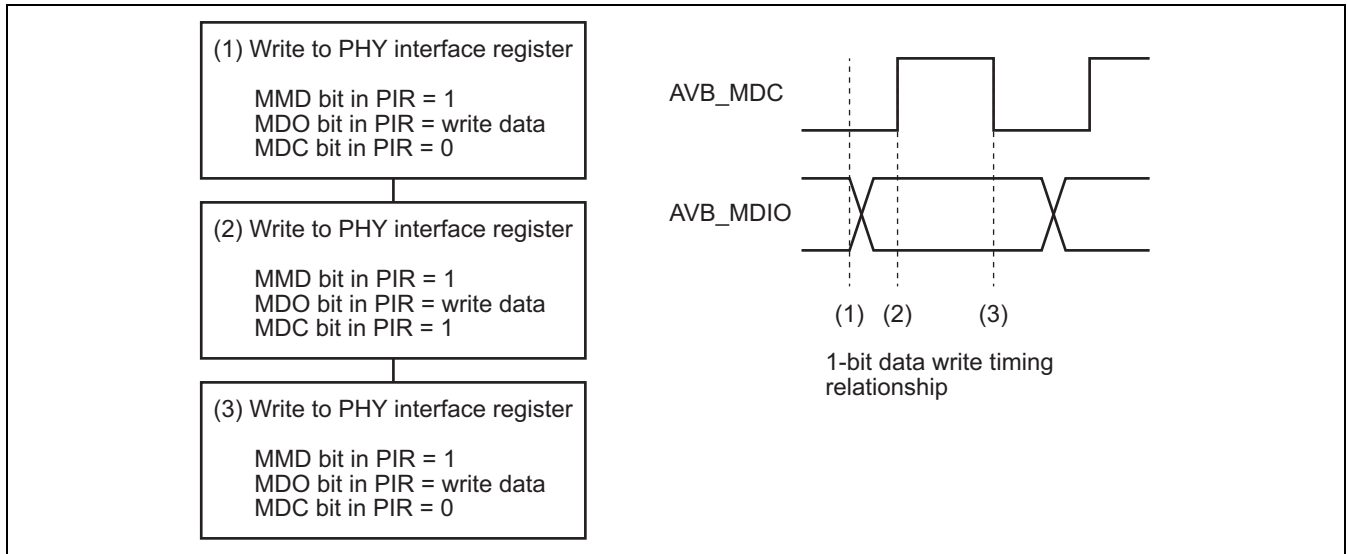

DATA: 16-bit data. Sequential write or read from MSB  
(a) Write: 16-bit data write  
(b) Read: 16-bit data read

IDLE: Wait time until next MII management format input  
(a) Write: Independent bus release (notation: X) performed  
(b) Read: Bus already released in TA: control unnecessary

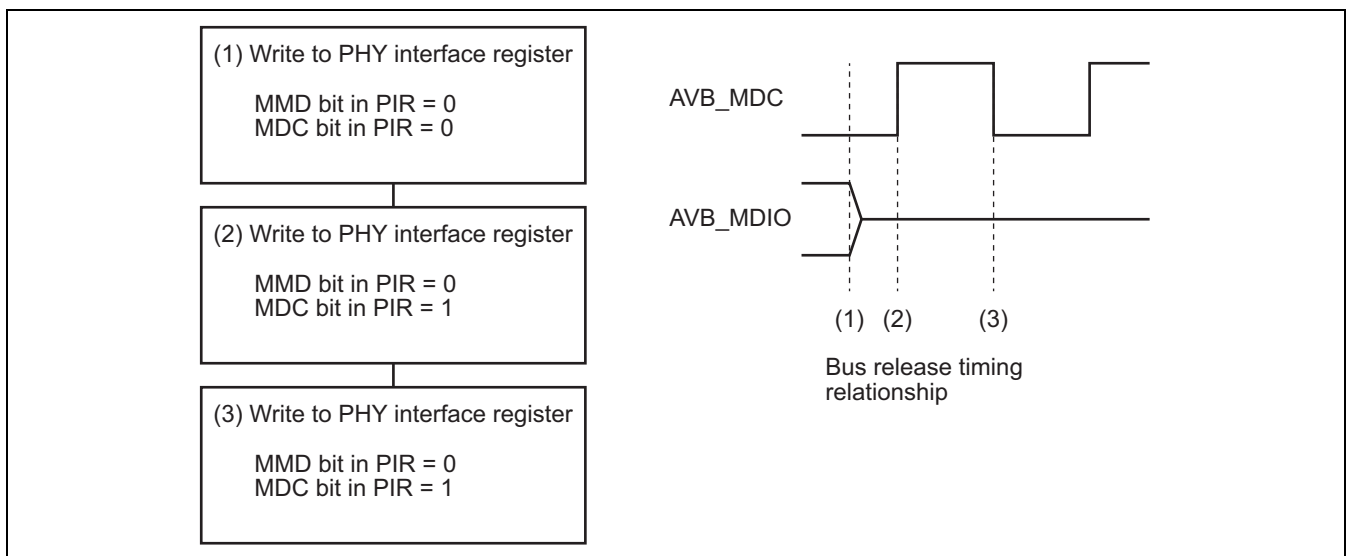

**Figure 37A.71 MII Management Frame Format**

#### (2) MII Management Register Access Procedure

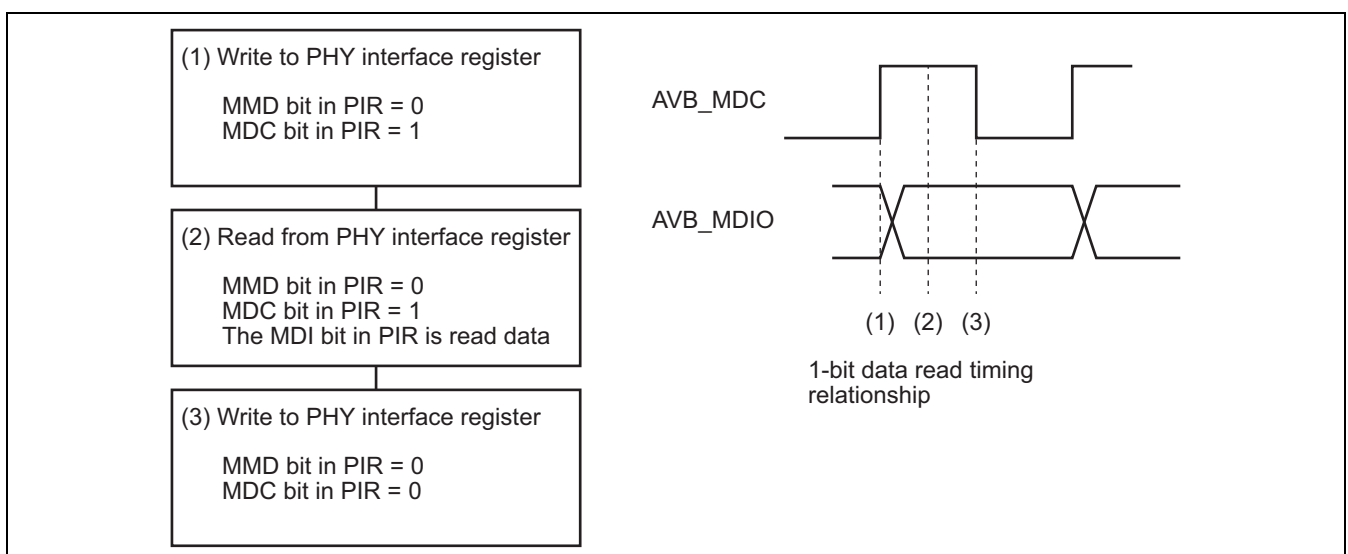

The program accesses MII management registers via PIR. Access is implemented by a combination of 1-bit-unit data write, 1-bit-unit data read, bus release, and independent bus release. Figures 37A.72 to 37A.75 show the MII management register timing. The timing will differ depending on the PHY-LSI type.

**Figure 37A.72 1-Bit Data Write Flowchart**

**Figure 37A.73 Bus Release Flowchart (TA in Read in Figure 37A.71)**

**Figure 37A.74 1-Bit Data Read Flowchart**

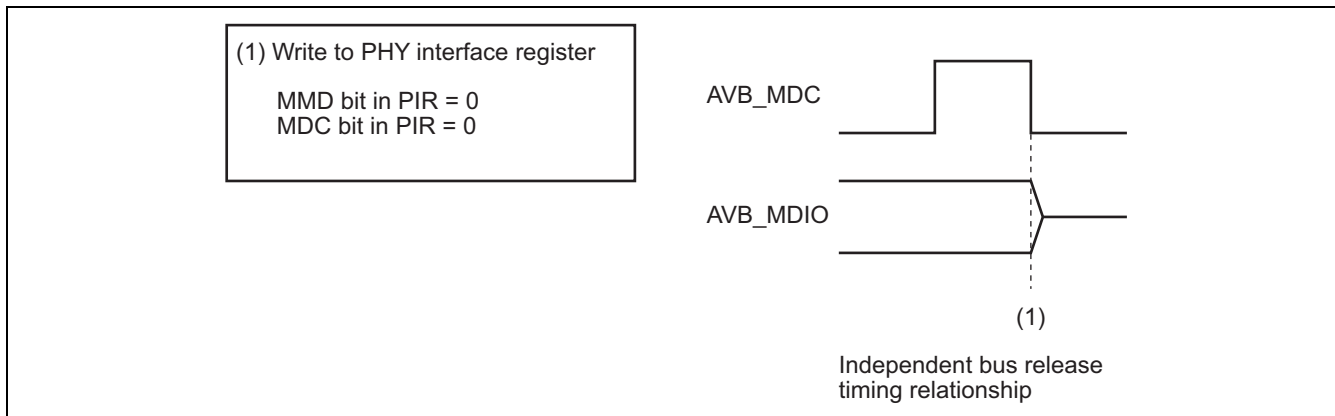

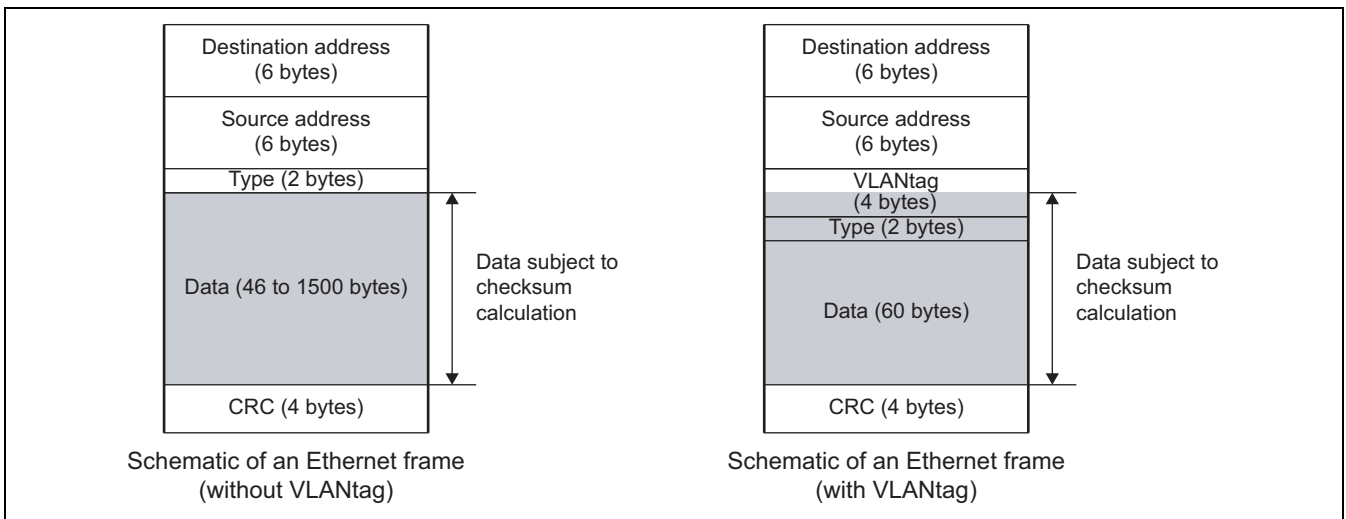

Figure 37A.75 Independent Bus Release Flowchart (IDLE in Write in Figure 37A.71)

**37A.3.14 Usage Notes**

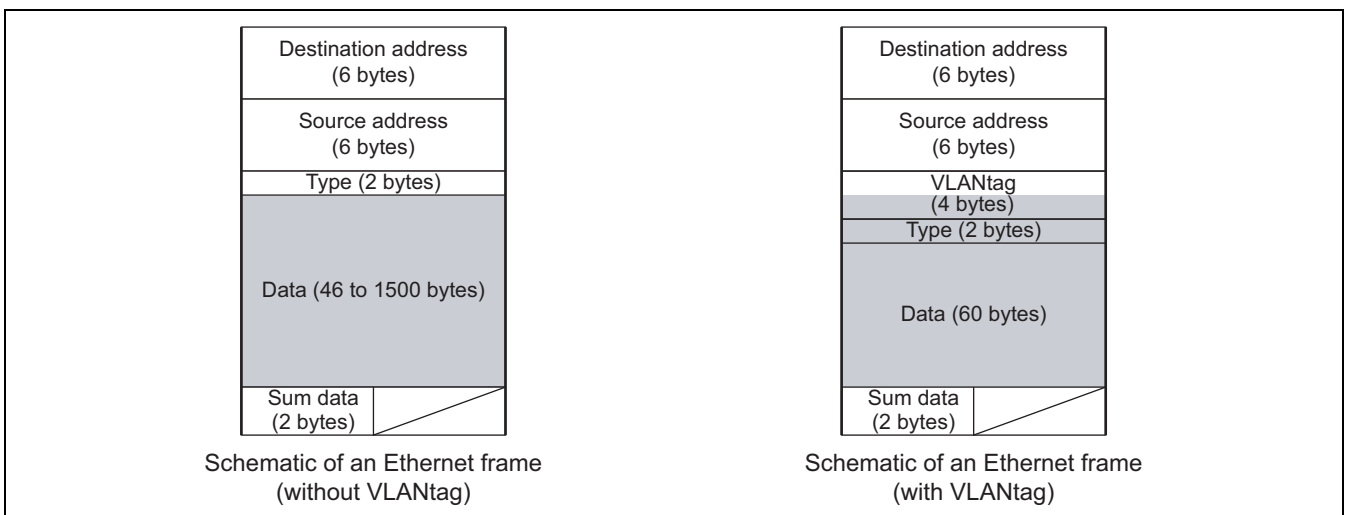

**37A.3.14.1 Checksum Calculation of Ethernet Frames**

This LSI is capable of calculating the checksum data of the received frames. Only the data fields of the Ethernet frames are subject to checksum calculation. Specifically, a data field follows the length/type field and is followed by the CRC field. Figure 37A.76 shows schematics indicating which parts of the Ethernet frames are calculated. Calculation involves 16-bit addition only; it does not involve bit inversion. Note that when the checksum data is valid, the CRC data (4 bytes) is not transferred as a receive frame, and the checksum data (sum data) is added automatically. Figure 37A.77 shows schematics of Ethernet frames to which the checksum data has been added.

Note: Also for the frames with VLANtag inserted, the 15th byte from the top and the following bytes before the CRC field are subject to calculation.

**Figure 37A.76 Data Subject to Checksum Calculation**

**Figure 37A.77 Data after Checksum Data Addition**

### 37A.3.14.2 Data Transfer Function Stops after Read Access Error

If EthernetAVB gets an access error when reading from work RAM, it may happen that no further work RAM accesses are issued. So transfer of receive/transmit frames is halted. By using the data transfer suspend function SW can observe if data transfer function is available or not.

Perform one of given SW flows which are triggered by this start condition: when AXI read access error has been flagged by EIS.QEF is 1, and ESR.ET is B'0000 or B'0100; additionally when ESR.EIL is 1 (this is an indication that an work RAM read error may be lost).

There are two possible SW flows given. Figure 37A.78 applies always the SW reset, independently if this is required or not. Figure 37A.79 checks in addition if SW reset is required; checking CSR.DTS after wait gives an indication that issue has been occurred.

Note that the wait after write of CCC.DTSR is mandatory to prevent cases where issue has not been occurred.

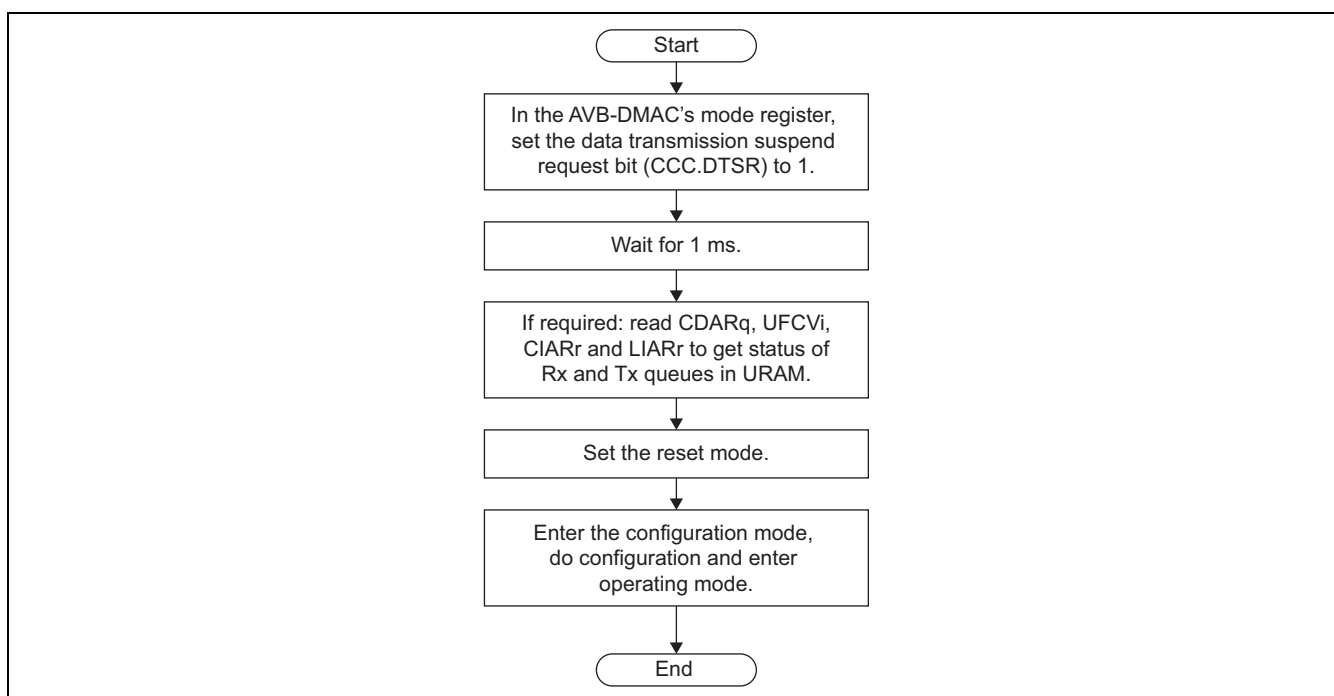

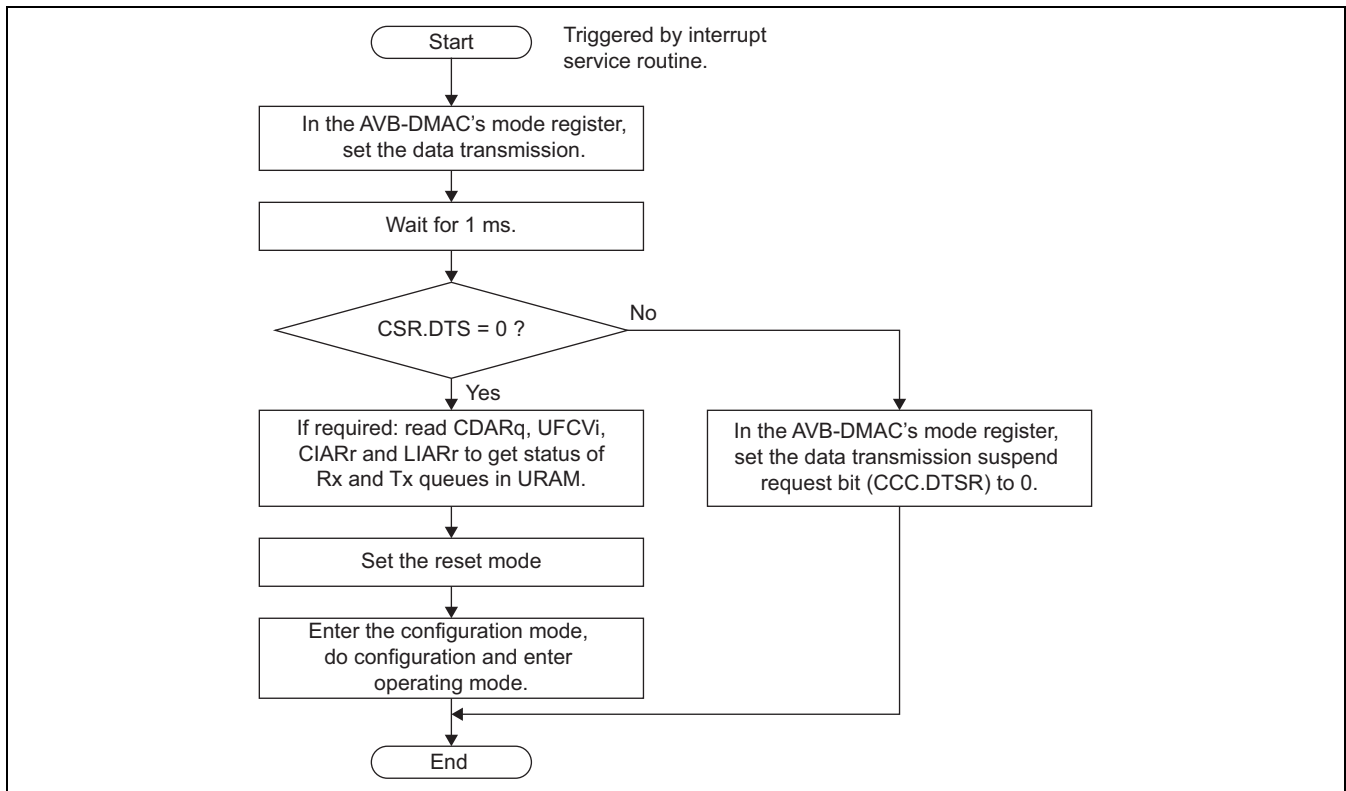

Figure 37A.78 Data Transfer Function Stop Flow1 after Read Access Error

**Figure 37A.79 Data Transfer Function Stop Flow2 after Read Access Error**

### 37A.3.14.3 Power Down Request

If EthernetAVB gets a power down request while writing to work RAM, it may happen that the request is not accepted even if the transfer is completed. Due to this the external power down module cannot complete the power down sequence.

A power down request is acceptable only when EthernetAVB is in RESET state.

### 37A.3.15 Notes

#### (1) Reception is Ignored when AVB\_RX\_ER from PHY is Flagged at 1st Data Byte

The issue is limited to reception of frames with physical faults. Flagging of occurrence in SFR is missing. When EthernetAVB is configured to store faulty frames in reception queue 0 (BE) by RCR.EFFS there is no storage.

#### (2) Unexpected Data are Exported when AVB\_RX\_ER is Flagged at 8th Data Byte

The issue is limited to reception of frames with physical faults.

Flagging of occurrence in SFR is invalid. When EthernetAVB is configured to store faulty frames in reception queue 0 (BE) by RCR.EFFS corrupted data is stored and MAC status code is wrong.

#### (3) Receive Frame Interrupt and Descriptor Interrupt may be Issued before Completion of Writing Data

When receive frame interrupt and descriptor interrupt are issued, whether writing data is completed by DESCR.DT in a descriptor can be confirmed.

And CDARq register has the descriptor address which EtherAVB is processing currently or is going to process at the next time.

The descriptors before one indicated by CDARq register are scope for receive frame interrupt and descriptor interrupt scope.

If there is a descriptor which wait for HW processing (ex. FEMPTY), it's delayed. Confirm the descriptor again after waiting for 1ms.

## 37B. Stream Buffer for EthernetAVB (STBE)

RZ/G1H	RZ/G1N
RZ/G1M	RZ/G1E

### 37B.1 Overview

The stream buffer for the EthernetAVB module (hereinafter referred to as STBE) incorporates a 16-Kbyte RAM for the EthernetAVB descriptors.

Using the STBE reduces the number of accesses to the DRAM and provides efficient access.

#### 37B.1.1 Features

- 1-, 2-, 4-, 8-, or 16-byte access is available for transfer.
- Transfer to/from the EthernetAVB is performed via the AXI bus using the following addresses:  
H'EE0E\_8000 to H'EE0E\_BFFF (16 Kbytes)

Note: For use of the EthernetAVB descriptors, refer to section 37A, EthernetAVB.

#### 37B.1.2 Block Diagram

Figure 37B.1 shows a block diagram of the STBE.

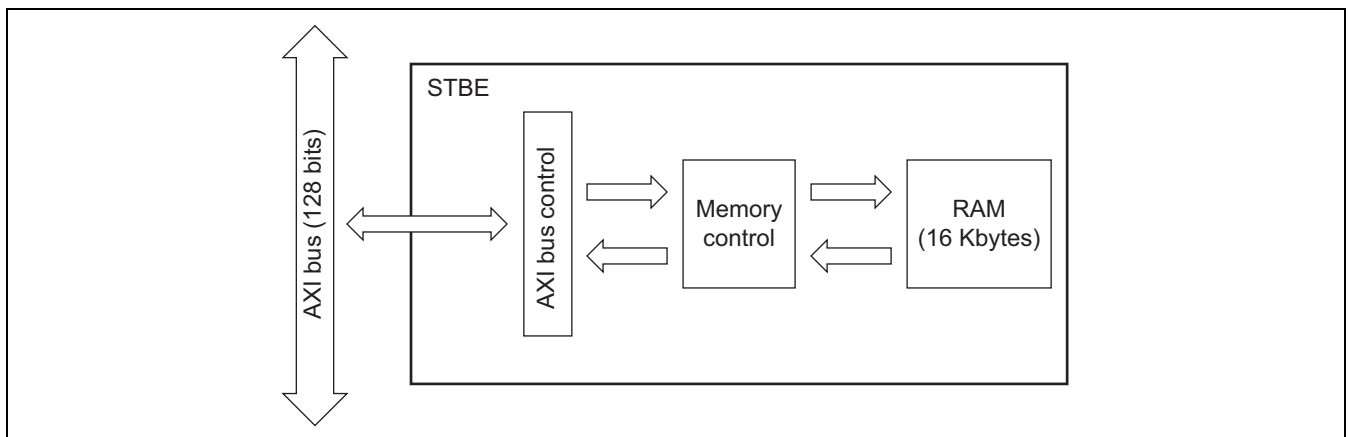

Figure 37B.1 Block Diagram

## 37B.2 Usage Notes

RZ/G1H

RZ/G1N

RZ/G1M

RZ/G1E

### 37B.2.1 Module Standby Mode

This module can be placed on module standby mode.

Ensure that this module is released from the module standby mode before using it.

### 37B.2.2 Transition to Module Standby Mode

1. Before stopping supply of the clock signal to this module, confirm that this module is not being accessed.
2. Set the relevant module stop control register in the clock pulse generator to stop supply of a clock signal to this module.

Note: Refer to section 7A, Module Standby and Software Reset, for the module stop control register.

### 37B.2.3 Release of Module Standby Mode and Restarting the STBE

Set the relevant module stop control register in the clock pulse generator to start supply of the clock signal to this module.

Note: Refer to section 7A, Module Standby and Software Reset, for the module stop control register.

## 38. Controller Area Network Interface (CAN interface)

RZ/G1H

RZ/G1N

RZ/G1M

RZ/G1E

### 38.1 Features

This MCU implements two channels (referred to as CAN0 and CAN1) of CAN (Controller Area Network) module that complies with the ISO11898-1 Specifications. The CAN module transmits and receives both formats of messages, namely the standard identifier (11 bits) (identifier hereafter referred to as ID) and extended ID (29 bits). Table 38.1 lists the CAN module overview and Figure 38.1 shows the CAN module block diagram. Connect the CAN bus transceiver externally.

**Table 38.1 CAN Module Overview**

Item	Overview
Protocol	<ul style="list-style-type: none"> <li>ISO11898-1 compliant</li> </ul>
Bit-rate	<ul style="list-style-type: none"> <li>Up to 1 Mbps</li> </ul>
Message box	<ul style="list-style-type: none"> <li>64 mailboxes: Two selectable mailbox mode Normal mailbox mode: Of the 64 mailboxes, 32 can be configured for either transmission or reception (and the other 32 are reception-only). FIFO mailbox mode: 24 mailboxes configurable as transmission or reception (and the other 32 are reception-only). 4 stages FIFO for transmission and 4 stages FIFO for reception</li> </ul>
Reception	<ul style="list-style-type: none"> <li>Data frame and remote frame can be received.</li> <li>Selectable receiving ID format (only standard ID, only extended ID or both ID)</li> <li>Programmable one-shot reception function</li> <li>Selectable overwrite mode (message overwritten) or overrun mode (message discarded)</li> <li>The reception complete interrupt can be enabled or disabled for each mailbox.</li> </ul>
Acceptance filter	<ul style="list-style-type: none"> <li>8 acceptance masks (one mask every 4 mailboxes)</li> <li>2 acceptance masks (one mask every 16 mailboxes)</li> <li>The mask can be enabled or disabled for each mailbox.</li> </ul>
Transmission	<ul style="list-style-type: none"> <li>Data frame and remote frame can be transmitted.</li> <li>Selectable transmitting ID format (only standard ID, only extended ID or both ID)</li> <li>Programmable one-shot transmission function (enable or disable)</li> <li>Selectable ID priority mode or mailbox number priority mode</li> <li>Transmission request can be aborted (The completion of abort can be confirmed with a flag.)</li> <li>The transmission complete interrupt can be enabled or disabled for each mailbox.</li> </ul>
Mode transition for bus-off recovery	<ul style="list-style-type: none"> <li>Mode transition for the recovery from the bus-off state can be selected: Automatic entry to CAN halt mode at bus-off entry Automatic entry to CAN halt mode at bus-off end Entry to CAN halt mode by a program Transition into error-active state by a program</li> </ul>
Error status monitoring	<ul style="list-style-type: none"> <li>CAN bus errors (stuff error, form error, ACK error, CRC error, bit error, and ACK delimiter error) can be monitored.</li> <li>Transition to error states can be detected (error-warning, error-passive, bus-off entry, and bus-off recovery).</li> <li>The error counters can be read.</li> </ul>

Item	Overview
Time stamp function	<ul style="list-style-type: none"> <li>• Time stamp function using a 16-bit counter</li> <li>• The reference clock can be selected from either 1-, 2-, 4- or 8-bit time periods.</li> </ul>
Interrupt sources	<ul style="list-style-type: none"> <li>• 5 types: <ul style="list-style-type: none"> <li>Reception complete</li> <li>Transmission complete</li> <li>Receive FIFO</li> <li>Transmit FIFO</li> <li>Error</li> </ul> </li> </ul>
CAN sleep mode	<ul style="list-style-type: none"> <li>• Current consumption can be reduced by stopping the CAN clock.</li> </ul>
Software support unit	<ul style="list-style-type: none"> <li>• 3 software support units: <ul style="list-style-type: none"> <li>Acceptance filter support</li> <li>Mailbox search support (receive mailbox search, transmit mailbox search and message lost search)</li> <li>Channel search support</li> </ul> </li> </ul>
CAN clock source (fCAN)	<ul style="list-style-type: none"> <li>• Peripheral clocks (clkp1 or clkp2) or externally input clock is selectable. clkp1 = P<math>\phi</math>, clkp2 =RCAN<math>\phi</math></li> </ul>

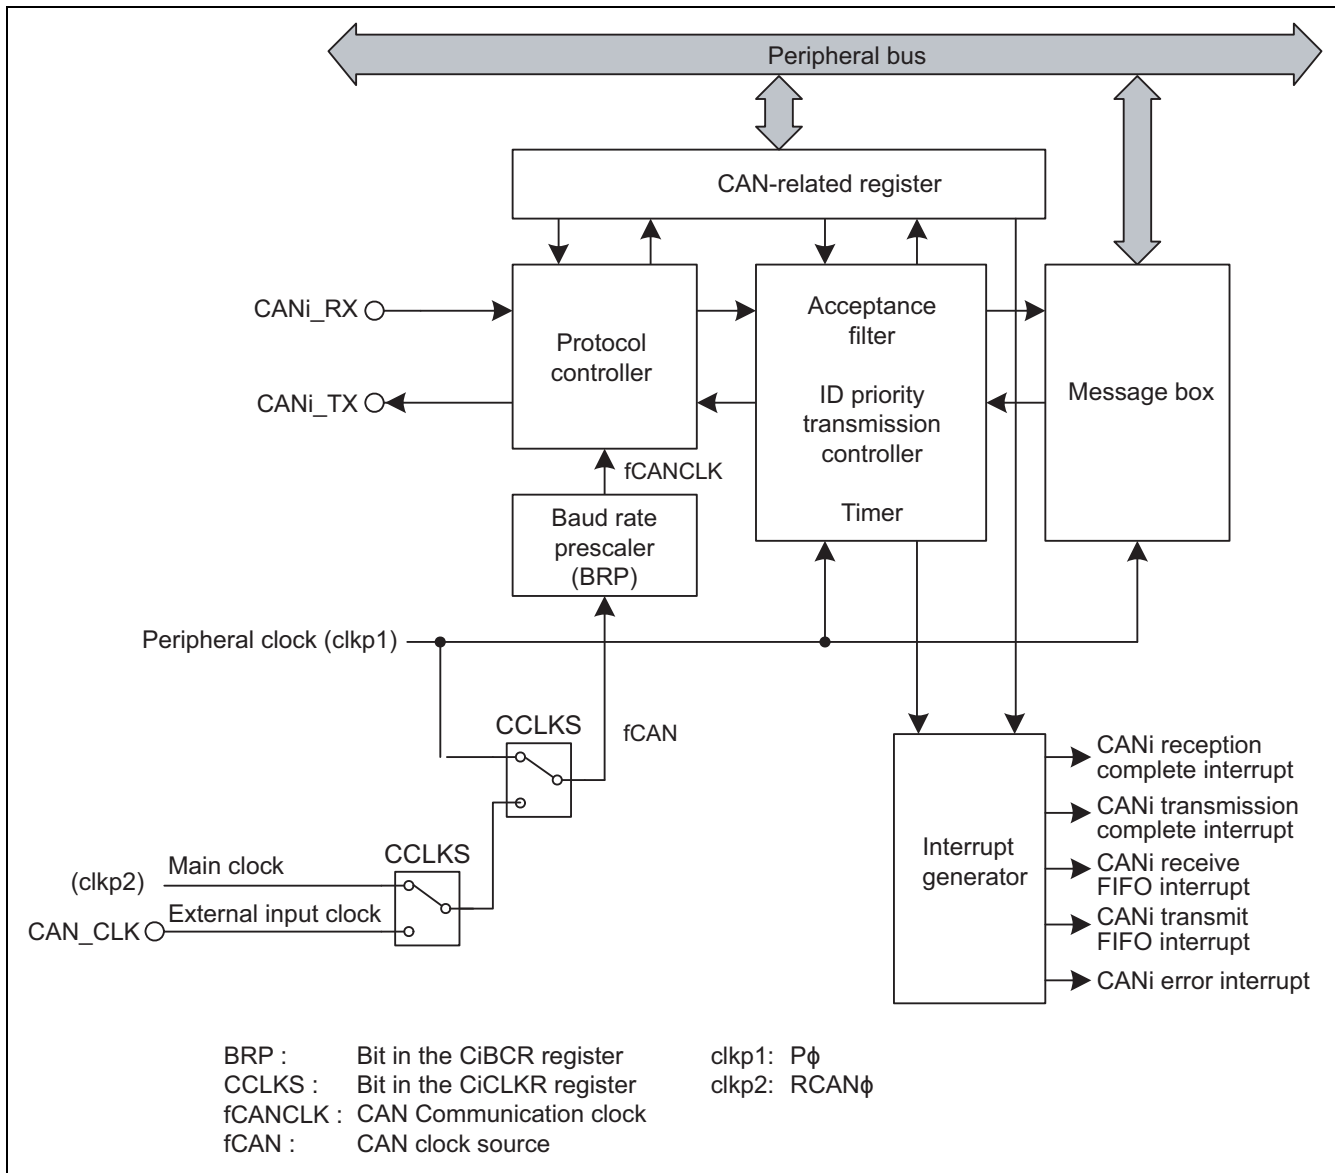

Figure 38.1 Block Diagram of CAN Module (i = 0, 1)

- CAN<sub>i</sub>\_RX/CAN<sub>i</sub>\_TX (i = 0 and 1):  
CAN input/output pins
- Protocol controller:  
Handles CAN protocol processing such as bus arbitration, bit timing at transmission and reception, stuffing, and error handling, etc.
- Message box:  
Consists of 64 mailboxes which can be configured as either transmit or receive mailboxes. Each mailbox has an individual ID, data length code, a data field (8 bytes), and a time stamp.
- Acceptance filter:  
Performs filtering of received messages. Registers CiMKR0 to CiMKR9 are used for the filtering process.
- Timer:  
Used for the time stamp function. The timer value when storing a message into the mailbox is written as the time stamp value.
- Interrupt generator:  
Generates the following five types of interrupts:  
CAN<sub>i</sub> reception complete interrupt  
CAN<sub>i</sub> transmission complete interrupt  
CAN<sub>i</sub> receive FIFO interrupt  
CAN<sub>i</sub> transmit FIFO interrupt  
CAN<sub>i</sub> error interrupt

## 38.2 Input/Output Pins

Table 38.2 shows the CAN module pin.

Pin switching is required for pins which are multiplexed with other functions. For details, see section 5, Pin Function Controller (PFC).

**Table 38.2 Pin Configuration**

Pin Name	I/O	Function	RZ/G Series Products			
			RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E

**Legend:**

Initial value: Register value after a reset

—: Undefined value

R/W: Readable/writable. The written value can be read.

R/WC0: Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.

R: Read-only. When writing to the register, read out the value of these bits and write it back without alteration.

W: Write-only. The read value is undefined.

<After Reset: H'0500>

Bit	Symbol	Initial Value	R/W	Description
15, 14	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
13	RBOC	0	R/W	Forcible Return From Bus-OFF Bit*1 When the RBOC bit is set to "1" (forcible return from bus-off) in bus-off state, the CAN module forcibly returns from the bus-off state. This bit is automatically set to 0. The error state changes from bus-off to error-active. When the RBOC bit is set to "1", registers CiRECR and CiTECR are set to "H'00" and the BOST bit in the CiSTR register is set to "0" (the CAN module is not in bus-off state). The other registers remain unchanged. No bus-off recovery interrupt request is generated by this recovery from the bus-off state. Use the RBOC bit only when the BOM bit = "00" (normal mode). 0: Nothing occurred 1: Forcible return from bus-off*2

Bit	Symbol	Initial Value	R/W	Description
12, 11	BOM	All 0	R/W	<p>Bus-Off Recovery Mode Bit*<sup>3</sup></p> <p>The BOM bit is used to select bus-off recovery mode.</p> <p>When the BOM bit is "00", the recovery from bus-off is compliant with ISO11898-1, i.e. the CAN module re-enters CAN communication (error-active state) after detecting 11 consecutive recessive bits 128 times. A bus-off recovery interrupt request is generated when recovering from bus-off.</p> <p>When the BOM bit is "01", as soon as the CAN reaches the bus-off state, the CANM bit in the CiCTRL register is set to "10" (CAN halt mode) and the CAN enters CAN halt mode. No bus-off recovery interrupt request is generated when recovering from bus-off and registers CiTECR and CiRECR are set to "H'00".</p> <p>When the BOM bit is "10", the CANM bit is set to 10b as soon as the CAN module reaches the bus-off state. The CAN module enters CAN halt mode after the recovery from the bus-off state, i.e. after detecting 11 consecutive recessive bits 128 times. A bus-off recovery interrupt request is generated when recovering from bus-off and registers CiTECR and CiRECR are set to "H'00".</p> <p>When the BOM bit is "11", the CAN module enters CAN halt mode by setting the CANM bit to "10" while the CAN module is still in bus-off state. No bus-off recovery interrupt request is generated when recovering from bus-off and registers CiTECR and CiRECR are set to "H'00". However, if the CAN module recovers from bus-off after detecting 11 consecutive recessive bits 128 times before the CANM bit is set to "10", a bus-off recovery interrupt request is generated.</p> <p>If the CPU requests an entry to CAN reset mode at the same time as the CAN module attempts to enter CAN halt mode (at bus-off entry when the BOM bit is "01", or at bus-off end when the BOM bit is "10"), then the CPU request to enter CAN reset mode has higher priority.</p> <p>00: Normal mode (ISO11898-1 compliant)  01: Entry to CAN halt mode automatically at bus-off entry  10: Entry to CAN halt mode automatically at bus-off end  11: Entry to CAN halt mode (during bus-off recovery period) by a program request</p>
10	SLPM	1	R/W	<p>CAN Sleep Mode Bit*<sup>4,5</sup></p> <p>When the SLPM bit is set to "1", the CAN module enters CAN sleep mode.</p> <p>When the SLPM bit is set to "0", the CAN module exits CAN sleep mode. Refer to section 38.4, Operating Mode for detail.</p> <p>0: Other than CAN sleep mode  1: CAN sleep mode</p>
9, 8	CANM	01	R/W	<p>CAN Operating Mode Select Bit*<sup>4</sup></p> <p>The CANM bit selects one of the following modes for the CAN module: CAN operation mode, CAN reset mode or CAN halt mode. Refer to section 38.4, Operating Mode for detail. CAN sleep mode is set by the SLPM bit.</p> <p>When the CAN module enters CAN halt mode according to the setting of the BOM bit, the CANM bit is automatically set to "10".</p> <p>00: CAN operation mode  01: CAN reset mode  10: CAN halt mode  11: CAN reset mode (forcible transition)</p>

Bit	Symbol	Initial Value	R/W	Description
7, 6	TSPS	All 0	R/W	<p>Time Stamp Prescaler Select Bit*<sup>3</sup></p> <p>The TSPS bit selects the prescaler for the time stamp. The reference clock for the time stamp can be selected to be either 1-, 2-, 4- or 8-bit time periods.</p> <p>00: Every bit time 01: Every 2-bit time 10: Every 4-bit time 11: Every 8-bit time</p>
5	TSRC	0	R/W	<p>Time Stamp Counter Reset Command Bit*<sup>6</sup></p> <p>The TSRC bit is used to reset the time stamp counter. When the TSRC bit is set to "1", the CiTSR register is set to H'0000. It is automatically set to 0.</p> <p>0: Nothing occurred 1: Reset*<sup>2</sup></p>
4	TPM	0	R/W	<p>Transmission Priority Mode Select Bit*<sup>3</sup></p> <p>The TPM bit specifies the priority of modes when transmitting messages. ID priority transmit mode or mailbox number transmit mode can be selected.</p> <p>All mailboxes are set for either ID priority transmission or mailbox number priority transmission.</p> <p>When the TPM bit is 0, ID priority transmit mode is selected and transmission priority complies with the CAN bus arbitration rule, as defined in the ISO 11898-1 Specifications. In ID priority transmit mode, mailboxes [0] to [63] (in normal mailbox mode), and mailboxes [0] to [55] (in FIFO mailbox mode), and the transmit FIFO are compared for the IDs of mailboxes configured for transmission. If two or more mailbox IDs are the same, the mailbox with the smaller number has higher priority.</p> <p>Only the next message to be transmitted from the transmit FIFO is included in the transmission arbitration. If a transmit FIFO message is being transmitted, the next pending message within the transmit FIFO is included in the transmission arbitration.</p> <p>When the TPM bit is 1, mailbox number transmit mode is selected and the transmit mailbox with the smallest mailbox number has the highest priority. In FIFO mailbox mode, the transmit FIFO has lower priority than normal mailboxes (mailboxes [0] to [55]).</p> <p>0: ID priority transmit mode 1: Mailbox number priority transmit mode</p>
3	MLM	0	R/W	<p>Message Lost Mode Select Bit*<sup>3</sup></p> <p>The MLM bit specifies the operation when a new message is captured in the unread mailbox.</p> <p>Overwrite mode or overrun mode can be selected. All mailboxes (including the receive FIFO) are set to either overwrite mode or overrun mode.</p> <p>When the MLM bit is "0", all mailboxes are set to overwrite mode and the new message is overwriting the old message.</p> <p>When this bit is "1", all mailboxes are set to overrun mode and the new message is discarded.</p> <p>0: Overwrite mode 1: Overrun mode</p>

Bit	Symbol	Initial Value	R/W	Description
2, 1	IDFM	All 0	R/W	<p>ID Format Mode Select Bit*<sup>3</sup></p> <p>The IDFM bit specifies the ID format.</p> <p>00: Standard ID mode All mailboxes (including FIFO mailboxes) handle only standard IDs.</p> <p>01: Extended ID mode All mailboxes (including FIFO mailboxes) handle only extended IDs.</p> <p>10: Mixed ID mode All mailboxes (including FIFO mailboxes) handle both standard IDs and extended IDs. Standard IDs or extended IDs are specified by using the IDE bit in the corresponding mailbox in normal mail box mode. In FIFO mailbox mode, the IDE bit in the corresponding mailbox is used for mailboxes [0] to [55], the IDE bit in registers CiFIDCR0 and CiFIDCR1 is used for the receive FIFO, and the IDE bit in mailbox [56] is used for the transmit FIFO.</p> <p>11: Do not use this combination</p>
0	MBM	0	R/W	<p>CAN Mailbox Mode Select Bit*<sup>3</sup></p> <p>When the MBM bit is "0" (normal mailbox mode), mailboxes [0] to [63] are configured as transmit or receive mailboxes. When the MBM bit is "1" (FIFO mailbox mode), mailboxes [0] to [55] are configured as transmit or receive mailboxes. Mailboxes [56] to [59] are configured as a transmit FIFO and mailboxes [60] to [63] as a receive FIFO.</p> <p>Transmit data is written into mailbox [56] (mailbox [56] is a window mailbox for the transmit FIFO).</p> <p>Receive data is read from mailbox [60] (mailbox [60] is a window mailbox for the receive FIFO).</p> <p>Table 38.4 lists the Mailbox Configuration.</p> <p>0: Normal mailbox mode 1: FIFO mailbox mode</p>

- Notes:
1. Set the RBOC bit to "1" in bus-off state.
  2. Bits RBOC and TSRC are automatically set back to "0" after being set to "1". It should be read as "0".
  3. Write to bits BOM, MBM, IDFM, MLM, TPM, and TSPS in CAN reset mode.
  4. When bits CANM and SLPM are changed, check the CiSTR register to ensure that the mode has been switched.
  5. Write to the SLPM bit in CAN reset mode or CAN halt mode. When rewriting the SLPM bit, set only this bit to "0" or "1".
  6. Set the TSRC bit to "1" in CAN operation mode.

**Table 38.4 Mailbox Configuration**

Mailbox	MBM Bit = "0" (Normal mailbox mode)	MBM Bit = "1" (FIFO mailbox mode)
Mailboxes [0] to [55]	Normal mailbox	Normal mailbox
Mailboxes [56] to [59]		Transmit FIFO
Mailboxes [60] to [63]		Receive FIFO

Notes: Points 1 to 5 below should be considered when the MBM bit is set to "1".

1. Transmit FIFO is controlled by the CiTFCR register.  
The CiMCTLj register of mailboxes [56] to [59] are disabled.  
Registers CiMCTL56 to CiMCTL59 cannot be used.
2. Receive FIFO is controlled by the CiRFCR register.  
The CiMCTLj register of mailboxes [60] to [63] are disabled.  
Registers CiMCTL60 to CiMCTL63 cannot be used.
3. Refer to the CiMIER1 register about the FIFO interrupts.
4. The corresponding bits in the CiMKIVLR register for mailboxes [56] to [63] are disabled. Set 0 to these bits.
5. Transmit/receive FIFOs can be used for both data frames and remote frames.

### 38.3.2 CANi Clock Select Register (CiCLKR) (i = 0, 1)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

CAN0 Clock Select Register (C0CLKR)

CAN1 Clock Select Register (C1CLKR)

Bit:	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	CCLKS	
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W

<After Reset: H'00>

Bit	Symbol	Initial Value	R/W	Description
7 to 2	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
1, 0	CCLKS	0	R/W	CAN Clock Source Select Bits* The CCLKS bits select clock source from among the peripheral clock (clkp1 or clkp2) generated by the PLL frequency synthesizer, and an externally input clock. 00: Peripheral clock (clkp1) 01: Peripheral clock (clkp2) 10: Illegal value 11: Externally input clock

Note: \* Write to the CCLKS bit in CAN reset mode.

**38.3.3 CANi Bit Configuration Register (CiBCR) (i = 0, 1)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

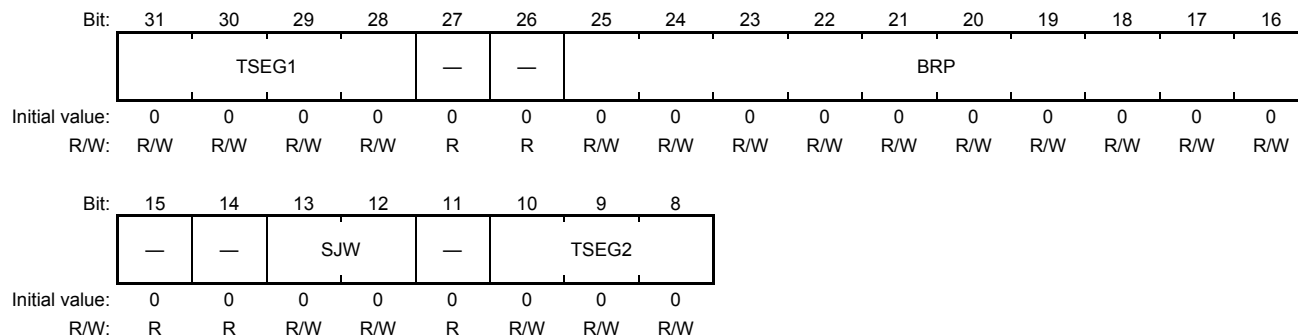

For the bit timing configuration rule, refer to section 38.5, CAN Communication Speed Configuration.

Set the CiBCR register before entering CAN halt mode from CAN reset mode or CAN operation mode from CAN reset mode. After the setting is made once, this register can be written to in CAN reset mode or CAN halt mode.

The CiBCR register consists of 24 bits. A 32-bit read/write access should be performed carefully not to rewrite the CiCLKR register.

CAN0 Bit Configuration Register (C0BCR)

CAN1 Bit Configuration Register (C1BCR)

<After Reset: H'000000>

Bit	Symbol	Initial Value	R/W	Description
31 to 28	TSEG1	All 0	R/W	<p>Time Segment 1 Control Bits</p> <p>The TSEG1 bit is used to specify the total length of the propagation time segment (PROP_SEG) and phase buffer segment 1 (PHASE_SEG1) with the value of Tq.</p> <p>A value from 4 to 16 time quanta can be set.</p> <p>0000: Do not use this combination</p> <p>0001: Do not use this combination</p> <p>0010: Do not use this combination</p> <p>0011: 4 Tq</p> <p>0100: 5 Tq</p> <p>0101: 6 Tq</p> <p>0110: 7 Tq</p> <p>0111: 8 Tq</p> <p>1000: 9 Tq</p> <p>1001: 10 Tq</p> <p>1010: 11 Tq</p> <p>1011: 12 Tq</p> <p>1100: 13 Tq</p> <p>1101: 14 Tq</p> <p>1110: 15 Tq</p> <p>1111: 16 Tq</p>

Bit	Symbol	Initial Value	R/W	Description
27, 26	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
25 to 16	BRP	All 0	R/W	Prescaler Division Ratio Set Bits The BRP bit is used to set the peripheral bus clock periods contained in a Time Quantum. If the setting value is P (0 to 1023), the baud rate prescaler divides fCAN by P + 1.
15, 14	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
13, 12	SJW	All 0	R/W	Resynchronization Jump Width Control Bits The SJW bit is used to specify the resynchronization jump width with the value of Tq. A value from 1 to 4 time quanta can be set. Set the value smaller than or equal to that of the TSEG2 bit. 00: 1 Tq 01: 2 Tq 10: 3 Tq 11: 4 Tq
11	—	0	R	Reserved bit This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit.
10 to 8	TSEG2	All 0	R/W	Time Segment 2 Control Bits The TSEG2 bit is used to specify the length of phase buffer segment 2 (PHASE_SEG2) with the value of Tq. A value from 2 to 8 time quanta can be set. Set the value smaller than that of the TSEG1 bit. 000: Do not use this combination 001: 2 Tq 010: 3 Tq 011: 4 Tq 100: 5 Tq 101: 6 Tq 110: 7 Tq 111: 8 Tq

### 38.3.4 CANi Mask Register k (CiMKRk) (i = 0, 1; k = 0 to 9)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

For masking the function in FIFO mailbox mode, refer to section 38.7, Acceptance Filtering and Masking Function.

Write to registers CiMKR0 to CiMKR9 in CAN reset mode or CAN halt mode.

CAN0 Mask Register 0 (C0MKR0)

CAN0 Mask Register 1 (C0MKR1)

CAN0 Mask Register 2 (C0MKR2)

:

CAN0 Mask Register 9 (C0MKR9)

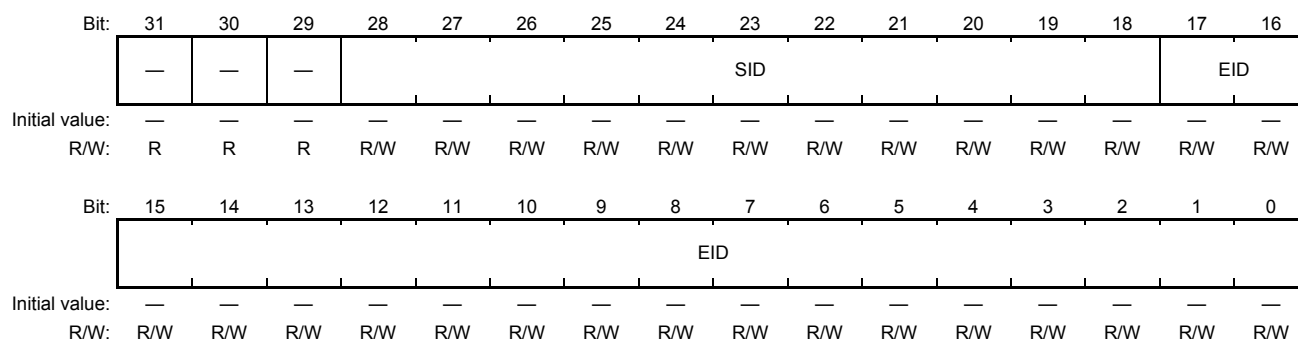

CAN1 Mask Register 0 (C1MKR0)

CAN1 Mask Register 1 (C1MKR1)

CAN1 Mask Register 2 (C1MKR2)

:

CAN1 Mask Register 9 (C1MKR9)

<After Reset: Undefined>

Bit	Symbol	Initial Value	R/W	Description
31 to 29	—	Undefined	R	Reserved bits The reset value is undefined. The write value should be "0". These bits are read as "0" after "0" is written to.
28 to 18	SID	Undefined	R/W	Standard ID Bits The SID bit is the filter mask bit corresponding to the CAN standard ID bit. The SID bit is used to receive both standard ID and extended ID messages. When the SID bit is set to "0", the corresponding SID bit is not compared for the received ID and the mailbox ID. When the SID bit is set to "1", corresponding SID bit compares received ID with mailbox ID. 0: Corresponding SID bit is not compared 1: Corresponding SID bit is compared

---

Bit	Symbol	Initial Value	R/W	Description
17 to 0	EID	Undefined	R/W	<p>Extended ID Bits</p> <p>The EID bit is the filter mask bit for CAN extended ID bit.</p> <p>This bit is used to receive extended ID messages.</p> <p>When the EID bit is set to "0", corresponding EID bit does not compare received ID with mailbox ID.</p> <p>When the EID bit is set to "1", corresponding EID bit compares received ID with mailbox ID.</p> <p>0: Corresponding EID bit is not compared</p> <p>1: Corresponding EID bit is compared</p>

---

### 38.3.5 CANi FIFO Received ID Compare Registers (CiFIDCR0 and CiFIDCR1) (i = 0, 1)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Registers CiFIDCR0 and CiFIDCR1 are enabled when the MBM bit in the CiCTLR register is set to "1" (FIFO mailbox mode). Bits EID, SID, RTR, and IDE in registers CiMB60 to CiMB63 are disabled.

For the usage of these registers, refer to section 38.7, Acceptance Filtering and Masking Function.

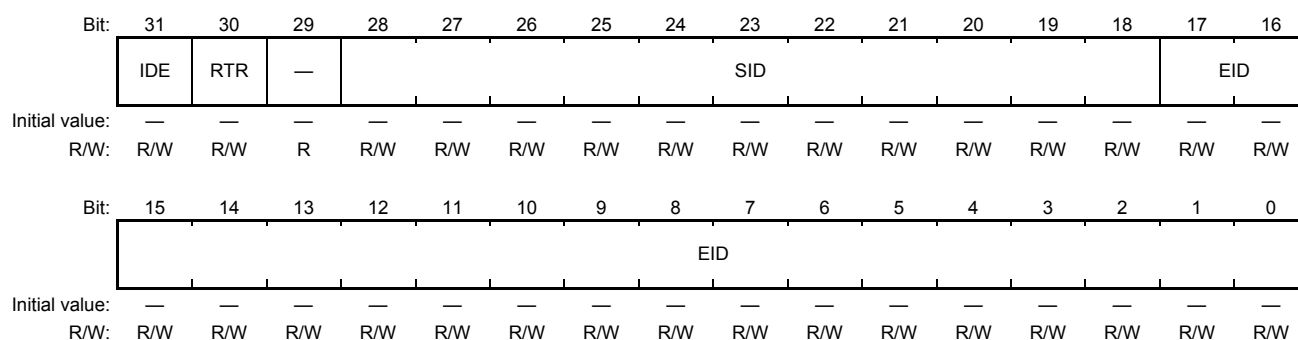

Write to registers CiFIDCR0 and CiFIDCR1 in CAN reset mode or CAN halt mode.

CAN0 FIFO Received ID Compare Register 0 (C0FIDCR0)

CAN0 FIFO Received ID Compare Register 1 (C0FIDCR1)

CAN1 FIFO Received ID Compare Register 0 (C1FIDCR0)

CAN1 FIFO Received ID Compare Register 1 (C1FIDCR1)

<After Reset: Undefined>

Bit	Symbol	Initial Value	R/W	Description
31	IDE	Undefined	R/W	<p>ID Extension Bit*</p> <p>The IDE bit sets the ID format to standard ID or extended ID. The IDE bit is enabled when the IDFM bit in the CiCTLR register is "10" (mixed ID mode). When the IDFM bit is "10", the IDE bit specifies the following operation.</p> <p>When both IDE bits in registers CiFIDCR0 and CiFIDCR1 are set to "0", only standard ID frames can be received.</p> <p>When both IDE bits in registers CiFIDCR0 and CiFIDCR1 are set to "1", only extended ID frames can be received.</p> <p>When the IDE bits in registers CiFIDCR0 and CiFIDCR1 are set to "0" or "1" individually, both standard ID and extended ID frames can be received.</p> <p>0: Standard ID 1: Extended ID</p>

Bit	Symbol	Initial Value	R/W	Description
30	RTR	Undefined	R/W	<p>Remote Transmission Request Bit</p> <p>The RTR bit sets the specified frames format of data frame or remote frames. The RTR bit specifies the following operation.</p> <p>When both RTR bits in registers CiFIDCR0 and CiFIDCR1 are set to "0", only data frames can be received.</p> <p>When both RTR bits in registers CiFIDCR0 and CiFIDCR1 are set to "1", only remote frames can be received.</p> <p>When the RTR bits in registers CiFIDCR0 and CiFIDCR1 are set to "0" or "1" individually, both data frames and remote frames can be received.</p> <p>0: Data frame 1: Remote frame</p>
29	—	Undefined	R	<p>Reserved bit</p> <p>The reset value is undefined. The write value should be "0". This bit is read as "0" after "0" is written to.</p>
28 to 18	SID	Undefined	R/W	<p>Standard ID Bits</p> <p>The SID bit sets the standard ID of data frames and remote frames. The SID bit is used to receive both standard ID and extended ID messages.</p> <p>0: Corresponding SID bit is "0" 1: Corresponding SID bit is "1"</p>
17 to 0	EID	Undefined	R/W	<p>Extended ID Bits</p> <p>The EID bit sets the extended ID of data frames and remote frames. The EID bit is used to receive extended ID messages.</p> <p>0: Corresponding EID bit is "0" 1: Corresponding EID bit is "1"</p>

Note: \* When the IDFM bit is not "10", the IDE bit should be written with "0".

### 38.3.6 CANi Mask Invalid Registers (CiMKIVLR0 and CiMKIVLR1) (i = 0, 1)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Each bit in registers CiMKIVLR0 and CiMKIVLR1 corresponds to a mailbox. The correspondence between the bits and mailboxes is as follows:

- Bit 0 in the CiMKIVLR0 register corresponds to mailbox 0 (MB0).
- Bit 31 in the CiMKIVLR0 register corresponds to mailbox 31 (MB31).
- Bit 0 in the CiMKIVLR1 register corresponds to mailbox 32 (MB32).
- Bit 31 in the CiMKIVLR1 register corresponds to mailbox 63 (MB63).

When each bit is "1", the acceptance mask for the mailbox corresponding to the bit number is disabled. In this case, a receiving message is stored into mailbox only its ID matches bits SID and EID in the CiMBj register.

Write to registers CiMKIVLR0 and CiMKIVLR1 either in CAN reset mode or CAN halt mode.

CAN0 Mask Invalid Register 0 (C0MKIVLR0)

CAN1 Mask Invalid Register 0 (C1MKIVLR0)

### 38.3.7 CANi Mailbox Register j (CiMBj) (i = 0, 1; j = 0 to 63)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Table 38.5 lists the CANi mailbox memory mapping and Table 38.6 lists the CAN data frame construction.

The value after reset of CANi Mailbox is undefined.

Write to the CiMBj register only when the associated CiMCTLj register is "H00" and the corresponding mailbox is not processing an abort request.

Refer to Table 38.5 for detailed addresses.

**Table 38.5 CANi Mailbox Memory Mapping (i = 0, 1)**

Address		Message Content
CAN0	CAN1	Memory Mapping
H'E6E80000 + 16 × j + 0	H'E6E88000 + 16 × j + 0	IDE, RTR, SID10 to SID6

---------------	--------------	----------------	---------------	--------------	--------------	-------	-------	-----	-------

The previous value of each mailbox is retained unless a new message is received.

CAN0 Mailbox Register 0 to 63 (C0MB0 to 63)

CAN1 Mailbox Register 0 to 63 (C1MB0 to 63)

&lt;After Reset: Undefined&gt;

Bit	Symbol	Initial Value	R/W	Description
31	IDE	Undefined	R/W	<p>ID Extension Bit*1</p> <p>The IDE bit sets the ID format of standard IDs or extended IDs.</p> <p>The IDE bit is enabled when the IDFM bit in the CiCTLR register is "10" (mixed ID mode).</p> <p>When the IDFM bit is "10", the IDE bit specifies the following operation.</p> <p>Receive mailbox receives only ID format specified by the IDE bit.</p> <p>Transmit mailbox transmits with ID format specified by the IDE bit.</p> <p>Receive FIFO mailbox receives messages with the standard ID, extended ID, or both IDs specified by the IDE bit in registers CiFIDCR0 and CiFIDCR1.</p> <p>Transmit FIFO mailbox transmits messages with the standard ID or extended ID specified by the IDE bit in the relevant transmitting message.</p> <p>0: Standard ID 1: Extended ID</p>
30	RTR	Undefined	R/W	<p>Remote Frame Request Bit</p> <p>The RTR bit sets the frame format of data frames or remote frames.</p> <p>This bit specifies the following operation:</p> <p>Receive mailbox receives only frames with the format specified by the RTR bit.</p> <p>Transmit mailbox transmits according to the frame format specified by the RTR bit.</p> <p>Receive FIFO mailbox receives the data frame, remote frame, or both frames specified by the RTR bit in registers CiFIDCR0 and CiFIDCR1.</p> <p>Transmit FIFO mailbox transmits the data frame or remote frame specified by the RTR bit in the relevant transmitting message.</p> <p>0: Data frame 1: Remote frame</p>
29	—	Undefined	R	<p>Reserved bit</p> <p>The reset value is undefined. The write value should be "0". This bit is read as "0" after "0" is written to.</p>

Bit	Symbol	Initial Value	R/W	Description
28 to 18	SID	Undefined	R/W	<b>Standard ID Bits</b> The SID bit sets the standard ID of data frames and remote frames. The SID bit is used to transmit or receive both standard ID and extended ID messages. 0: Corresponding SID bit is "0" 1: Corresponding SID bit is "1"
17 to 0	EID	Undefined	R/W	<b>Extended ID Bits*2</b> The EID bit sets the extended ID of data frames and remote frames. The EID bit is used to transmit or receive extended ID messages. 0: Corresponding EID bit is "0" 1: Corresponding EID bit is "1"

Notes: 1. When the IDFM bit is not "10", it should be written with "0".  
 2. If the mailbox has received a standard ID message, the EID bit in the mailbox is undefined.

CAN0 Mailbox Register 0 to 63 (C0MB0 to 63)

CAN1 Mailbox Register 0 to 63 (C1MB0 to 63)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	DLC

<After Reset: Undefined>

Bit	Symbol	Initial Value	R/W	Description
15 to 4	—	Undefined	R	<b>Reserved bits</b> The reset value is undefined. The write value should be "0". These bits are read as "0" after "0" is written to.
3 to 0	DLC	Undefined	R/W	<b>Data Length Code Bits*</b> The DLC is used to set the number of data bytes to be transmitted in a data frame. When data is requested using a remote frame, the number of data bytes to be requested is set. When a data frame is received, the number of received data bytes is stored. When a remote frame is received, the number of requested data bytes is stored. 0000: Data length = 0 byte 0001: Data length = 1 byte 0010: Data length = 2 bytes 0011: Data length = 3 bytes 0100: Data length = 4 bytes 0101: Data length = 5 bytes 0110: Data length = 6 bytes 0111: Data length = 7 bytes 1xxx: Data length = 8 bytes Legend: x represents any value.

Note: \* If the mailbox has received a message with n bytes less than 8 bytes, the values of DATA<sub>n</sub> to DATA<sub>7</sub> in the mailbox are undefined.

CAN0 Mailbox Register 0 to 63 (C0MB0 to 63)

CAN1 Mailbox Register 0 to 63 (C1MB0 to 63)

<After Reset: Undefined>

Bit	Symbol	Initial Value	R/W	Description
7 to 0	DATA0 to 7	Undefined	R/W	Data Bytes 0 to 7*1*2 DATA0 to DATA7 store the transmitted or received CAN message data. Transmission or reception starts from DATA0. The bit order on the CAN bus is MSB first, and transmission or reception starts from bit 7.

- Notes:
1. If the mailbox has received a message with n bytes less than 8 bytes, the values of DATAn to DATA7 in the mailbox are undefined.
  2. If the mailbox has received a remote frame, the previous values of DATA0 to DATA7 in the mailbox are retained.

CAN0 Mailbox Register 0 to 63 (C0MB0 to 63)

CAN1 Mailbox Register 0 to 63 (C1MB0 to 63)

<After Reset: Undefined>

Bit	Symbol	Initial Value	R/W	Description
15 to 8	TSH	Undefined	R/W	Time Stamp Higher Byte TSL and TSH store the counter value of the time stamp when received messages are stored in the mailbox.
7 to 0	TSL	Undefined	R/W	Time Stamp Lower Byte TSL and TSH store the counter value of the time stamp when received messages are stored in the mailbox.

### 38.3.8 CANi Mailbox Interrupt Enable Registers (CiMIER0 and CiMIER1) (i = 0, 1)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Interrupts can be enabled individually for each mailbox.

In normal mailbox mode (all bits) and in FIFO mailbox mode (bits 23 to 0 in the CiMIER1 register and all bits in the CiMIER0 register), each bit corresponds to the mailbox with the related number. These bits enable or disable transmission/reception complete interrupts for the corresponding mailboxes.

- Bit 0 in the CiMIER0 register corresponds to mailbox 0 (MB0).
- Bit 31 in the CiMIER0 register corresponds to mailbox 31 (MB31).
- Bit 0 in the CiMIER1 register corresponds to mailbox 32 (MB32).
- Bit 31 in the CiMIER1 register corresponds to mailbox 63 (MB63).

In FIFO mailbox mode, bits 29, 28, 25, and 24 of the CiMIER1 register specify whether transmit/receive FIFO interrupts are enabled/disabled and timing when interrupt requests are generated.

Write to registers CiMIER0 and CiMIER1 only when the associated CiMCTLj register (i = 0, 1) (j = 0 to 63) is "H'00" and the corresponding mailbox is not processing a transmission or reception abort request. In FIFO mailbox mode, change the bits in the CiMIER1 register for the associated FIFO only when:

- The TFE bit in the CiTFCR register is 0 and the TFEST bit is 1, and
- The RFE bit in the CiRFCR register is 0 and the RFEST bit is 1.

CAN0 Mailbox Interrupt Enable Register 1 (C0MIER1)

CAN1 Mailbox Interrupt Enable Register 1 (C1MIER1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

### 38.3.9 CANi Message Control Register j (CiMCTLj) (i = 0, 1; j = 0 to 63)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Write to the CiMCTLj register in CAN operation mode or CAN halt mode.

Do not use registers CiMCTL56 to CiMCTL63 in FIFO mailbox mode.

CAN0 Message Control Register 0 to 63 (C0MCTL0 to C0MCTL63)

CAN1 Message Control Register 0 to 63 (C1MCTL0 to C1MCTL63)

#### Registers CiMCTL32 to CiMCTL63

- Transmit mailbox setting enabled (When the TRMREQ bit is "1" and the RECREQ bit is "0")

Bit:	7	6	5	4	3	2	1	0
	TRM REQ	REC REQ	—	ONE SHOT	—	TRM ABT	TRMAC TIVE	SENTD ATA
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R	R/W	R	R/W	R	R/W

- Receive mailbox setting enabled (When the TRMREQ bit is "0" and the RECREQ bit is "1")

Bit:	7	6	5	4	3	2	1	0
	TRM REQ	REC REQ	—	ONE SHOT	—	MSG LOST	INVAL DATA	NEWD ATA
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R	R/W	R	R/W	R	R/W

#### Registers CiMCTL0 to CiMCTL31

Bit:	7	6	5	4	3	2	1	0
	—	REC REQ	—	—	—	MSG LOST	INVAL DATA	NEWD ATA
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R/W	R	R	R	R/W	R	R/W

&lt;After Reset: H'00&gt;

Bit	Symbol	Initial Value	R/W	Description
7	TRMREQ	0	R/W	<p>Transmit Mailbox Request Bit*2*4</p> <p>The TRMREQ bit selects transmit modes shown in Table 38.11.</p> <p>When TRMREQ bit is set to "1", the corresponding mailbox is configured for transmission of a data frame or a remote frame.</p> <p>When TRMREQ bit is set to "0", the corresponding mailbox is not configured for transmission of a data frame or a remote frame.</p> <p>If the TRMREQ bit is changed from "1" to "0" to cancel the corresponding transmission request, either the TRMABT or SENTDATA bit is set to "1".</p> <p>When setting the TRMREQ bit to "1", do not set the RECREQ bit to "1". To change the configuration of a mailbox from reception to transmission, first abort the reception and then set bits NEWDATA and MSGLOST to "0" before changing to transmission.</p> <p>0: Not configured for transmission 1: Configured for transmission</p>
—	—	0	R	<p>Reserved bit (Registers CiMCTL0 to CiMCTL31)</p> <p>This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit.</p>
6	RECREQ	0	R/W	<p>Receive Mailbox Request Bit*2*4*5</p> <p>The RECREQ bit selects receive modes shown in Table 38.11.</p> <p>When the RECREQ bit is set to "1", the corresponding mailbox is configured for reception of a data frame or a remote frame.</p> <p>When the RECREQ bit is set to "0", the corresponding mailbox is not configured for reception of a data frame or a remote frame.</p> <p>Due to hardware protection the RECREQ bit cannot be set to "0" by writing "0" by a program during the following period.</p> <p>Hardware protection is started From the acceptance filter procedure. (the beginning of CRC field) Hardware protection is released For the mailbox that is specified to receive the incoming message, after the received data is stored into the mailbox or a CAN bus error occurs. (i.e. a maximum period of hardware protection is from the beginning of CRC field to the end of the 7th bit of EOF.) For the other mailboxes, after the acceptance filter procedure.</p> <p>If no mailbox is specified to receive the message, after the acceptance filter procedure.</p> <p>When setting the RECREQ bit to "1", do not set "1" to the TRMREQ bit.</p> <p>To change the configuration of a mailbox from transmission to reception, first abort the transmission and then set bits SENTDATA and TRMABT to "0" before changing to reception.</p> <p>0: Not configured for reception 1: Configured for reception</p>
5	—	0	R	<p>Reserved bit</p> <p>This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit.</p>

Bit	Symbol	Initial Value	R/W	Description
4	ONESHOT	0	R/W	<p>One-shot Enable Bit*<sup>3</sup></p> <p>The ONESHOT bit can be used in the following two ways, receive mode and transmit mode:</p> <p>One-Shot Receive Mode</p> <p>When the ONESHOT bit is set to "1" in receive mode (RECREQ bit = "1" and TRMREQ bit = "0"), the mailbox receives a message only one time. The mailbox does not behave as a receive mailbox after having received a message one time. The behavior of bits NEWDATA and INVALIDDATA is the same as in normal reception mode. In one-shot receive mode, the MSGLOST bit is not set to "1".</p> <p>To set the ONESHOT bit to "0", first write "0" to the RECREQ bit and ensure that it has been set to "0".</p> <p>One-Shot Transmit Mode</p> <p>When the ONESHOT bit is set to "1" in transmit mode (RECREQ bit = "0" and TRMREQ bit = "1"), the CAN module transmits a message only one time.</p> <p>The CAN module does not transmit the message again if a CAN bus error or CAN bus arbitration lost occurs. When transmission is completed, the SENTDATA bit is set to "1". If transmission is not completed due to a CAN bus error or CAN bus arbitration lost, the TRMABT bit is set to "1".</p> <p>Set the ONESHOT bit to "0" after the SENTDATA or TRMABT bit is set to "1".</p> <p>0: One-shot reception or one-shot transmission disabled 1: One-shot reception or one-shot transmission enabled</p>
—	—	0	R	<p>Reserved bit (Registers CiMCTL0 to CiMCTL31)</p> <p>This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit.</p>
3	—	0	R	<p>Reserved bit</p> <p>This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit.</p>
2	TRMABT	0	R/W	<p>Transmission Abort Complete Flag (Transmit mailbox setting enabled)*<sup>1</sup>*<sup>2</sup></p> <p>The TRMABT bit is set to "1" in the following cases:</p> <p>Following a transmission abort request, when the transmission abort is completed before starting transmission.</p> <p>Following a transmission abort request, when the CAN module detects CAN bus arbitration lost or a CAN bus error.</p> <p>In one-shot transmission mode (RECREQ bit = "0", TRMREQ bit = "1", and ONESHOT bit = "1"), when the CAN module detects CAN bus arbitration lost or a CAN bus error.</p> <p>The TRMABT bit is not set to "1" when data transmission is completed. In this case, the SENTDATA bit is set to "1".</p> <p>The TRMABT bit is set to "0" by writing "0" by a program.</p> <p>0: Transmission has started, transmission abort failed because transmission is completed, or transmission abort is not requested 1: Transmission abort is completed</p>

Bit	Symbol	Initial Value	R/W	Description
	MSGLOST	0	R/W	<p>Message Lost Flag (Receive mailbox setting enabled)*1*2</p> <p>The MSGLOST bit is set to "1" when the mailbox is overwritten or overrun by a new received message while the NEWDATA bit is "1". The MSGLOST bit is set to "1" at the end of the 6th bit of EOF. The MSGLOST bit is set to "0" by writing "0" by a program.</p> <p>In both overwrite and overrun modes, the MSGLOST bit is not set to "0" by writing "0" by a program during the 5 peripheral clock (clkp1) cycles following the 6th bit of EOF.</p> <p>0: Message is not overwritten or overrun 1: Message is overwritten or overrun</p>
1	TRMACTIVE	0	R	<p>Transmission-in-Progress Status Flag (Transmit mailbox setting enabled)</p> <p>The TRMACTIVE bit is set to "1" when the corresponding mailbox of the CAN module begins transmitting a message.</p> <p>The TRMACTIVE is set to "0" when the CAN module has lost CAN bus arbitration, a CAN bus error occurs, or data transmission is completed.</p> <p>0: Transmission is pending or transmission is not requested 1: From acceptance of transmission request to completion of transmission, or error/arbitration lost</p>
	INVALIDDATA	0	R	<p>Reception-in-Progress Status Flag (Receive mailbox setting enabled)</p> <p>After the completion of a message reception, the INVALIDDATA bit is set to "1" while the received message is being updated into the corresponding mailbox.</p> <p>The INVALIDDATA bit is set to "0" immediately after the message has been stored. If the mailbox is read while the INVALIDDATA bit is "1", the data is undefined.</p> <p>0: Message valid 1: Message being updated</p>
0	SENTDATA	0	R/W	<p>Transmission Complete Flag (Transmit mailbox setting enabled)*1*2</p> <p>The SENTDATA bit is set to "1" when data transmission from the corresponding mailbox is completed.</p> <p>The SENTDATA bit is set to "0" by writing "0" by a program.</p> <p>To set the SENTDATA bit to "0", first set the TRMREQ bit to "0". Bits SENTDATA and TRMREQ cannot be set to "0" simultaneously.</p> <p>To transmit a new message from the corresponding mailbox, set the SENTDATA bit to "0".</p> <p>0: Transmission is not completed (pending) 1: Transmission is completed (success)</p>
	NEWDATA	0	R/W	<p>Reception Complete Flag (Receive mailbox setting enabled)*1*2</p> <p>The NEWDATA bit is set to "1" when a new message is being stored or has been stored to the mailbox. The timing for setting this bit to "1" is simultaneous with the INVALIDDATA bit.</p> <p>The NEWDATA bit is set to "0" by writing "0" by a program.</p> <p>The NEWDATA bit is not set to "0" by writing "0" by a program while the related INVALIDDATA bit is "1".</p> <p>0: No data has been received or "0" is written to the NEWDATA bit 1: A new message is being stored or has been stored to the mailbox</p>

- Notes:
1. Write "0" only. Writing "1" has no effect.
  2. When writing "0" to bits NEWDATA, SENTDATA, MSGLOST, TRMABT, RECREQ, and TRMREQ by a program, only the specified bit is set to "0" and the other bits are set to "1".
  3. To enter one-shot receive mode, write "1" to the ONESHOT bit at the same time as setting the RECREQ bit to "1".  
To exit one-shot receive mode, write "0" to the ONESHOT bit after writing "0" to the RECREQ bit and confirming it has been set to "0".  
To enter one-shot transmit mode, write "1" to the ONESHOT bit at the same time as setting the TRMREQ bit to "1".  
To exit one-shot transmit mode, write "0" to the ONESHOT bit after the message has been transmitted or aborted.
  4. Do not set both the RECREQ and TRMREQ bits to "1".
  5. When setting the RECREQ bit to "0", set bits MSGLOST, NEWDATA, RECREQ to "0" simultaneously.

**38.3.10 CANi Receive FIFO Control Register (CiRFCR) (i = 0, 1)**

<After Reset: H'80>

Bit	Symbol	Initial Value	R/W	Description
7	SEST	1	R	<p>Search Result Status Bit</p> <p>The SEST bit is set to "1" when no corresponding mailbox is found after searching all mailboxes. For example, in transmit mailbox search mode, the SEST bit is set to "1" when no SENTDATA bit for mailboxes is "1". The SEST bit is set to "0" when at least one SENTDATA bit is "1". When the SEST bit is "1", the value of the MBNST bits is undefined.</p> <p>0: Search result found 1: No search result</p>
6	—	0	R	<p>Reserved bit</p> <p>This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit.</p>
5 to 0	MBNST	All 0	R	<p>Search Result Mailbox Number Status Bits</p> <p>The MBNST bit outputs the smallest mailbox number that is searched in each mode of the CiMSMR register. In receive mailbox, transmit mailbox, and message lost search modes, the value of the mailbox i.e., the search result to be output, is updated as described below:</p> <p>When the NEWDATA, SENTDATA or MSGLOST bit for the output mailbox is set to "0".</p> <p>When the NEWDATA, SENTDATA or MSGLOST bit for a higher-priority mailbox is set to "1".</p> <p>In receive mailbox search and message lost search modes, the receive FIFO (mailbox [60]) is output when the receive FIFO is not empty and there are no unread received messages or no lost messages in any of the normal mailboxes (mailboxes [0] to [55]). In transmit mailbox search mode, the transmit FIFO (mailbox [56]) is not output. Table 38.7 lists the behavior of MBNST bit in FIFO mailbox mode.</p> <p>In channel search mode, the MBNST bit outputs the corresponding channel number. After the CiMSSR register is read by a program, the next target channel number is output.</p>

**Table 38.7 Operation of MBNST Bit in FIFO Mailbox Mode**

MBSM Bit	Mailbox [56] (Transmit FIFO)	Mailbox [60] (Receive FIFO)
"00"	Mailbox [56] is not output.	Mailbox [60] is output when no NEWDATA bit for the normal mailbox is set to "1" and the receive FIFO is not empty.
"01"		Mailbox [60] is not output.
"10"		Mailbox [60] is output when no MSGLOST bit for the normal mailbox is set to "1" and the RFMLF bit is set to "1" (receive FIFO message lost has occurred) in the receive FIFO.
"11"		Mailbox [60] is not output.

**38.3.17 CANi Channel Search Support Register (CiCSSR) (i = 0, 1)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

The bits in the CiCSSR register, which are set to "1", are encoded by an 8/3 encoder (the lower bit position, the higher priority) and output to the MBNST bits in the CiMSSR register.

The CiMSSR register outputs the updated value whenever the CiMSSR register is read by a program.

Write to the CiCSSR register only when the MBSM bit in the CiMSMR register is "11" (channel search mode). Write to this register in CAN operation mode or CAN halt mode.

CAN0 Channel Search Support Register (C0CSSR)

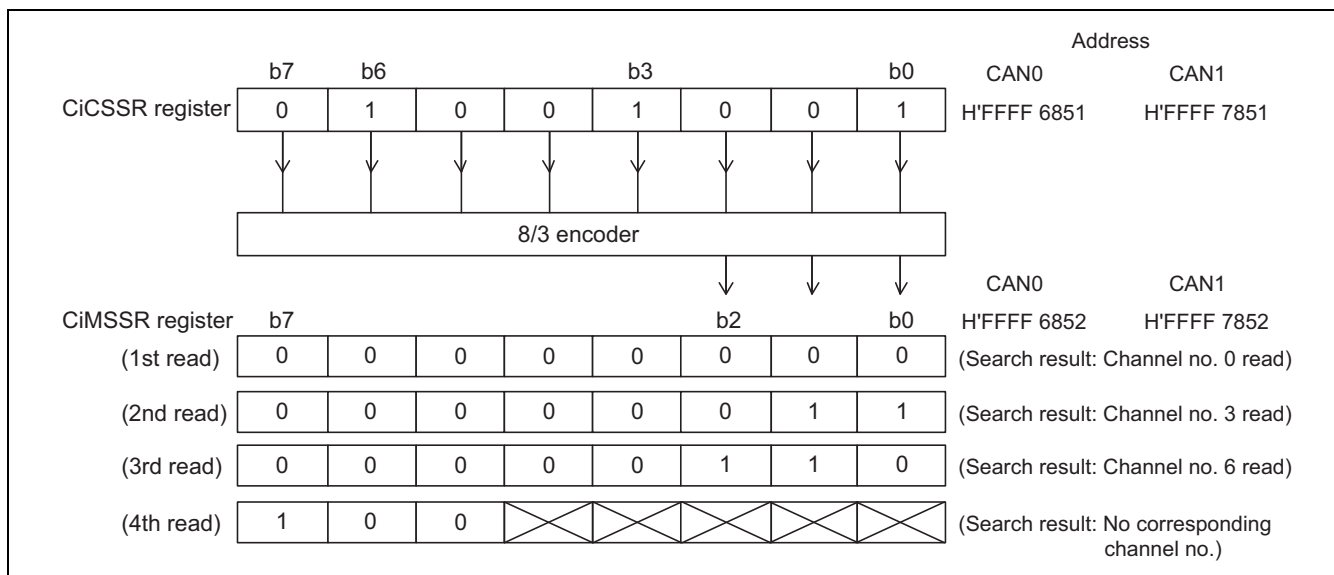

CAN1 Channel Search Support Register (C1CSSR)

<After Reset: Undefined>

Bit	Symbol	Initial Value	R/W	Description
7 to 0	CiCSSR	Undefined	R/W	When the value for the channel search is input, the channel number is output to the CiMSSR register.

Figure 38.4 shows the write and read of registers CiCSSR and CiMSSR.

**Figure 38.4 Write and Read of Registers CiCSSR and CiMSSR (i = 0, 1)**

The value of the CiCSSR register is also updated whenever the CiMSSR register is read. When the CiCSSR register is read, the value before the 8/3 encoder conversion is read.

**38.3.18 CANi Acceptance Filter Support Register (CiAFSR) (i = 0, 1)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

The acceptance filter support unit (ASU) can be used for data table (8 bits × 256) search. In the data table, all standard IDs created by the user are set to be valid/invalid in bit units. When the CAFSR register is written with the 16-bit unit data including the SID bit in the CiMBj register (j = 0 to 63), in which a received ID is stored, a decoded row (byte offset) position and column (bit) position for data table search can be read. The ASU can be used for standard (11-bit) IDs only.

The ASU is enabled in the following cases:

- When the ID to receive cannot be masked by the acceptance filter.  
(Example) IDs to receive: H'078, H'087, H'111
- When there are too many IDs to receive and software filtering time is expected to be shortened.

Write to the CiAFSR register in CAN operation mode or CAN halt mode.

CAN0 Acceptance Filter Support Register (C0AFSR)

CAN1 Acceptance Filter Support Register (C1AFSR)

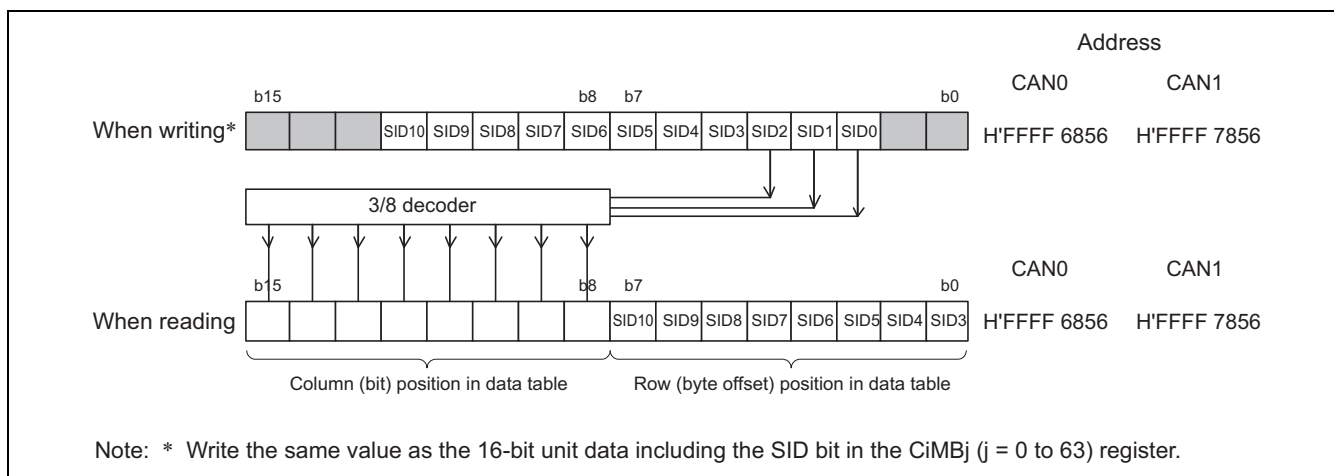

<After Reset: Undefined>

Bit	Symbol	Initial Value	R/W	Description
15 to 0	CiAFSR	Undefined	R/W	After the standard ID of a received message is written, the value converted for data table search can be read.

Figure 38.5 shows the write and read of CiAFSR register.

---

Bit	Symbol	Initial Value	R/W	Description
0	BEIE	0	R/W	Bus Error Interrupt Enable Bit When the BEIE bit is "0", no error interrupt request is generated even if the BEIF bit in the CiEIFR register is set to "1". When the BEIE bit is "1", an error interrupt request is generated if the BEIF bit is set to "1". 0: Bus error interrupt disabled 1: Bus error interrupt enabled

---

**38.3.20 CANi Error Interrupt Factor Judge Register (CiEIFR) (i = 0, 1)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

If an event corresponding to each bit occurs, the corresponding bit in the CiEIFR register is set to "1" regardless of the setting of the CiEIER register.

To set each bit to "0", write "0" by a program. If the set timing occurs simultaneously with the clear timing by the program, the bit becomes "1".

When writing "0" to a single bit by a program, only the specified bit is set to "0" and the other bits are set to "1". Writing "1" has no effect to these bit values.

CAN0 Error Interrupt Factor Judge Register (C0EIFR)

CAN1 Error Interrupt Factor Judge Register (C1EIFR)

Bit:	7	6	5	4	3	2	1	0
	BLIF	OLIF	ORIF	BORIF	BOEIF	EPIF	EWIF	BEIF
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

<After Reset: H'00>

Bit	Symbol	Initial Value	R/W	Description
7	BLIF	0	R/W	<b>Bus Lock Detect Flag*</b> The BLIF bit becomes 1 if 32 consecutive dominant bits are detected on the CAN bus while the CAN module is in CAN operation mode. After the BLIF bit becomes 1, bus lock can be detected again after either of the following conditions is satisfied: <ul style="list-style-type: none"> <li>• After this bit is set to 0 from 1, recessive bits are detected (bus lock is resolved).</li> <li>• After this bit is set to 0 from 1, the CAN module enters CAN reset mode and then enters CAN operation mode again (internal reset).0: No bus lock detected 1: Bus lock detected</li> </ul>
6	OLIF	0	R/W	<b>Overload Frame Transmission Detect Flag*</b> The OLIF bit is set to "1" if the transmitting condition of an overload frame is detected when the CAN module performs transmission or reception. 0: No overload frame transmission detected 1: Overload frame transmission detected
5	ORIF	0	R/W	<b>Receive Overrun Detect Flag*</b> The ORIF bit is set to "1" when a receive overrun occurs. This bit is not to set to "1" in overwrite mode. In overwrite mode, a reception complete interrupt request is generated if an overwrite condition occurs and the ORIF bit is not set to "1". In normal mailbox mode, if an overrun occurs in any of mailboxes [0] to [63] in overrun mode, this bit is set to "1". In FIFO mailbox mode, if an overrun occurs in any of mailboxes [0] to [55] or the receive FIFO in overrun mode, this bit is set to "1". 0: No receive overrun detected 1: Receive overrun detected

Bit	Symbol	Initial Value	R/W	Description
4	BORIF	0	R/W	<p>Bus-Off Recovery Detect Flag*</p> <p>The BORIF bit is set to "1" when the CAN module recovers from the bus-off state normally by detecting 11 consecutive bits 128 times in the following conditions:</p> <p>When the BOM bit in the CiCTLR register is "00".</p> <p>When the BOM bit is "10".</p> <p>When the BOM bit is "11".</p> <p>The BORIF bit is not set to "1" if the CAN module recovers from the bus-off state in the following conditions:</p> <p>When the CANM bit in the CiCTLR register is set to "01" or "11" (CAN reset mode).</p> <p>When the RBOC bit in the CiCTLR register is set to "1" (forcible return from bus-off).</p> <p>When the BOM bit is "01".</p> <p>When the BOM bit is "11" and the CANM bit is set to "10" (CAN halt mode) before normal recovery occurs.</p> <p>0: No bus-off recovery detected 1: Bus-off recovery detected</p>
3	BOEIF	0	R/W	<p>Bus-Off Entry Detect Flag*</p> <p>The BOEIF bit is set to "1" when the CAN error state becomes bus-off (the TEC value exceeds 255).</p> <p>The BOEIF bit is also set to "1" when the BOM bit in the CiCTLR register is "01" (entry to CAN halt mode automatically at bus-off entry) and the CAN module becomes the bus-off state.</p> <p>0: No bus-off entry detected 1: Bus-off entry detected</p>
2	EPIF	0	R/W	<p>Error Passive Detect Flag*</p> <p>The EPIF bit is set to "1" when the CAN error state becomes error-passive (the REC or TEC value exceeds 127).</p> <p>The EPIF bit is set to "1" only when the REC or TEC initially exceeds 127. Thus, if "0" is written to the EPIF bit by a program while the REC or TEC remains greater than 127, the EPIF bit is not set to "1" until the REC and TEC goes below 127 and then exceeds 127 again.</p> <p>0: No error passive detected 1: Error passive detected</p>
1	EWIF	0	R/W	<p>Error Warning Detect Flag*</p> <p>The EWIF bit is set to "1" when the value of the receive error counter (REC) or transmit error counter (TEC) exceeds 95.</p> <p>The EWIF bit is set to "1" only when the REC or TEC initially exceeds 95. Thus, if "0" is written to the EWIF bit by a program while the REC or TEC remains greater than 95, the EWIF bit is not set to "1" until the REC and TEC goes below 95 and then exceeds 95 again.</p> <p>0: No error warning detected 1: Error warning detected</p>
0	BEIF	0	R/W	<p>Bus Error Detect Flag*</p> <p>The BEIF bit is set to "1" when a bus error is detected.</p> <p>0: No bus error detected 1: Bus error detected</p>

Note: \* Only "0" may be written to this bit. (Writing "1" has no effect.) When writing "0" to specific bits in software, write "0" to each bit to be cleared to "0" and "1" to all other bits.

Table 38.8 lists the behavior of bits BOEIF and BORIF according to BOM bit setting value.

**Table 38.8 Behavior of Bits BOEIF and BORIF according to BOM Bit Setting Value**

<b>BOM Bit</b>	<b>BOEIF Bit</b>	<b>BORIF Bit</b>
00	Set to "1" on entry to the bus-off state.	Set to "1" on exit from the bus-off state.
01		Do not set to "1".
10		Set to "1" on exit from the bus-off state.
11		Set to "1" if normal bus-off recovery occurs before the CANM bit is set to "10" (CAN halt mode).

**38.3.21 CANi Receive Error Count Register (CiRECR) (i = 0, 1)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

The CiRECR register indicates the value of the receive error counter.

For the increment/decrement conditions of the receive error counter, refer to the CAN Specifications (ISO11898-1).

The value in bus-off state is undefined.

CAN0 Receive Error Count Register (C0RECR)

CAN1 Receive Error Count Register (C1RECR)

<After Reset: H'00>

Bit	Symbol	Initial Value	R/W	Description
7 to 0	CiRECR	All 0	R	Receive Error Count Function The CiRECR register increments or decrements the counter value according to error status of the CAN module during reception.

**38.3.22 CANi Transmit Error Count Register (CiTECR) (i = 0, 1)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

The CiTECR register indicates the value of the transmit error counter.

For the increment/decrement conditions of the transmit error counter, refer to the CAN Specifications (ISO11898-1).

The value in bus-off state is undefined.

CAN0 Transmit Error Count Register (C0TECR)

CAN1 Transmit Error Count Register (C1TECR)

<After Reset: H'00>

Bit	Symbol	Initial Value	R/W	Description
7 to 0	CiTECR	All 0	R	Transmit Error Count Function The CiTECR register increments or decrements the counter value according to error status of the CAN module during transmission.

**38.3.23 CANi Error Code Store Register (CiECSR) (i = 0, 1)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

The CiECSR register can be used to monitor whether an error has occurred on the CAN bus. Refer to the CAN Specifications (ISO11898-1) to check the generation conditions of each error.

To set each bit except the EDPM bit to "0", write "0" by a program. If the timing at which each bit is set to "1" and the timing at which "0" is written by a program are the same, the relevant bit is set to "1".

CAN0 Error Code Store Register (C0ECSR)

CAN1 Error Code Store Register (C1ECSR)

Bit:	7	6	5	4	3	2	1	0
	EDPM	ADEF	BE0F	BE1F	CEF	AEF	FEF	SEF
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

<After Reset: H'00>

Bit	Symbol	Initial Value	R/W	Description
7	EDPM	0	R/W	<p>Error Display Mode Select Bit*1*2</p> <p>The EDPM bit selects the output mode of the CiECSR register.</p> <p>When the EDPM bit is set to "0", the CiECSR register outputs the first error code.</p> <p>When the EDPM bit is set to "1", the CiECSR register outputs the accumulated error code.</p> <p>0: Output of first detected error code 1: Output of accumulated error code</p>
6	ADEF	0	R/W	<p>ACK Delimiter Error Flag*3*4</p> <p>The ADEF bit is set to "1" when a form error is detected with the ACK delimiter during transmission.</p> <p>0: No ACK delimiter error detected 1: ACK delimiter error detected</p>
5	BE0F	0	R/W	<p>Bit Error (dominant) Flag*3*4</p> <p>The BE0F bit is set to "1" when a dominant bit error is detected.</p> <p>0: No bit error (dominant) detected 1: Bit error (dominant) detected</p>
4	BE1F	0	R/W	<p>Bit Error (recessive) Flag*3*4</p> <p>The BE1F bit is set to "1" when a recessive bit error is detected.</p> <p>0: No bit error (recessive) detected 1: Bit error (recessive) detected</p>
3	CEF	0	R/W	<p>CRC Error Flag*3*4</p> <p>The CEF bit is set to "1" when a CRC error is detected.</p> <p>0: No CRC error detected 1: CRC error detected</p>

Bit	Symbol	Initial Value	R/W	Description
2	AEF	0	R/W	ACK Error Flag*3*4 The AEF bit is set to "1" when an ACK error is detected. 0: No ACK error detected 1: ACK error detected
1	FEF	0	R/W	Form Error Flag*3*4 The FEF bit is set to "1" when a form error is detected. 0: No form error detected 1: Form error detected
0	SEF	0	R/W	Stuff Error Flag*3*4 The SEF bit is set to "1" when a stuff error is detected. 0: No stuff error detected 1: Stuff error detected

- Notes:
1. Write to the EDPM bit in CAN reset mode or CAN halt mode.
  2. If more than one error condition is detected simultaneously, all related bits are set to "1".
  3. Writing "1" has no effect to these bit values.
  4. When writing "0" to bits SEF, FEF, AEF, CEF, BE1F, BE0F, and ADEF by a program, only the specified bit is set to "0" and the other bits are set to "1".

**38.3.24 CANi Time Stamp Register (CiTSR) (i = 0, 1)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

When the CiTSR register is read, the value of the time stamp counter (16-bit free-running counter) at that moment is read.

The value of the time stamp counter reference clock is a multiple of 1 bit time, as configured by the TSPS bit in the CiCTRL register.

The time stamp counter stops in CAN sleep mode and CAN halt mode, and is initialized in CAN reset mode.

The time stamp counter value is stored to TSL and TSH in the CiMBj register when a received message is stored in a receive mailbox.

CAN0 Time Stamp Register (C0TSR)

CAN1 Time Stamp Register (C1TSR)

<After Reset: H'0000>

Bit	Symbol	Initial Value	R/W	Description
15 to 0	CiTSR	All 0	R	Free-running counter value for the time stamp function

Note: Read the CiTSR register in 16-bit units.

**38.3.25 CANi Test Control Register (CiTCR) (i = 0, 1)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

Write to the CiTCR register in CAN halt mode only.

CAN0 Test Control Register (C0TCR)

CAN1 Test Control Register (C1TCR)

<After Reset: H'00>

Bit	Symbol	Initial Value	R/W	Description
7 to 3	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
2, 1	TSTM	All 0	R/W	CAN Test Mode Select Bits The TSTM bit selects the CAN test mode. For details on the CAN test modes, see section 38.3.25 (1), Listen-Only Mode, section 38.3.25 (2), Self-Test Mode 0 (External Loop Back), and section 38.3.25 (3), Self-Test Mode 1 (Internal Loop Back). 00: Other than CAN test mode 01: Listen-only mode 10: Self-test mode 0 (external loop back) 11: Self-test mode 1 (internal loop back)
0	TSTE	0	R/W	CAN Test Mode Enable Bit When the TSTE bit is set to "0", CAN test mode is disabled. When the TSTE bit is set to "1", CAN test mode is enabled. 0: CAN test mode disabled 1: CAN test mode enabled

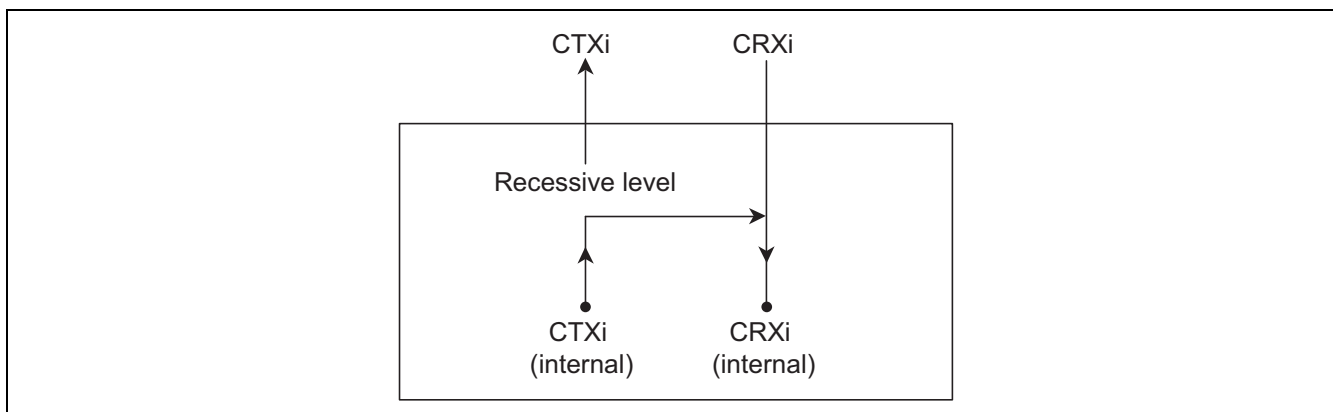

**(1) Listen-Only Mode**

The ISO 11898-1 recommends an optional bus monitoring mode. In listen-only mode, the CAN node is able to receive valid data frames and valid remote frames. It sends only recessive bits on the CAN bus, and the protocol controller is not required to send the ACK bit, overload flag, or active error flag.

Listen-only mode can be used for baud rate detection.

Do not request transmission from any mailboxes in this mode.

Figure 38.6 shows the connection when listen-only mode is selected.

**Figure 38.6 Connection when Listen-Only Mode is Selected**

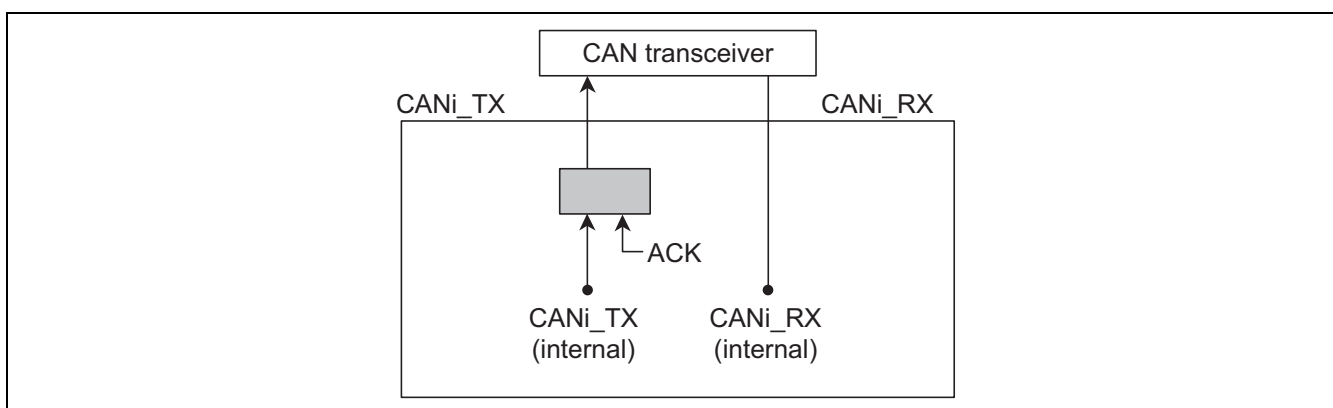

**(2) Self-Test Mode 0 (External Loop Back)**

Self-test mode 0 is provided for CAN transceiver tests.

In this mode, the protocol controller treats its own transmitted messages as messages received via the CAN transceiver and stores them into the receive mailbox. To be independent from external stimulation, the protocol controller generates the ACK bit.

Connect the CANi\_TX/CANi\_RX pins to the transceiver.

Figure 38.7 shows the connection when self-test mode 0 is selected.

**Figure 38.7 Connection when Self-Test Mode 0 is Selected**

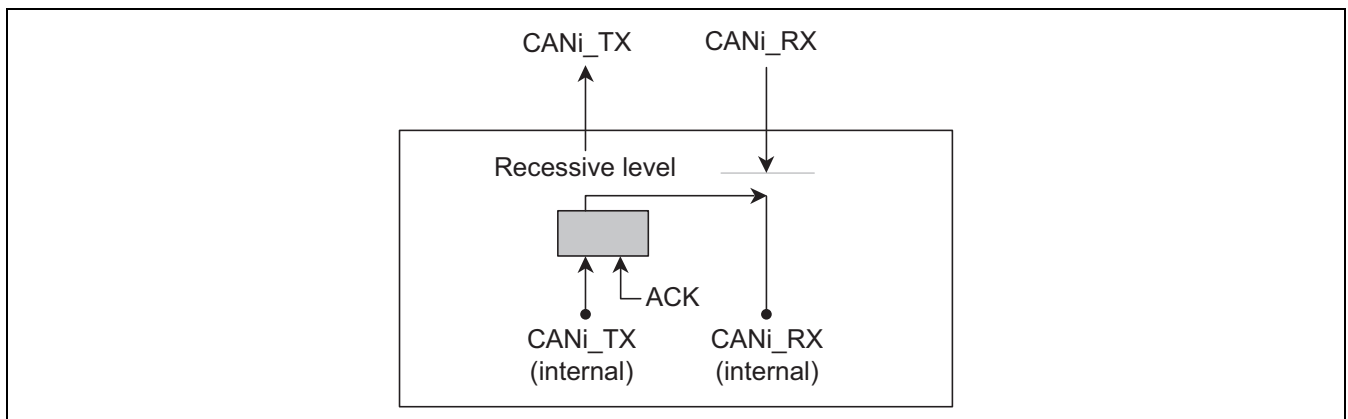

### (3) Self-Test Mode 1 (Internal Loop Back)

Self-test mode 1 is provided for self-test functions.

In this mode, the protocol controller treats its transmitted messages as received messages and stores them into the receive mailbox. To be independent from external stimulation, the protocol controller generates the ACK bit.

In self-test mode 1, the protocol controller performs an internal feedback from the internal CANi\_TX pin to the internal CANi\_RX pin. The input value of the external CANi\_RX pin is ignored. The external CANi\_TX pin outputs only recessive bits. The CANi\_TX/CANi\_RX pins do not need to be connected to the CAN bus or any external device.

Figure 38.8 shows the connection when self-test mode 1 is selected.

**Figure 38.8 Connection when Self-Test Mode 1 is Selected**

**38.3.26 CANi Interrupt Status Register (CiISR) (i = 0, 1)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

The CiISR register shows interrupt sources before masking by the CiIER register.

CAN0 Interrupt Status Register (C0ISR)

CAN1 Interrupt Status Register (C1ISR)

Bit:	7	6	5	4	3	2	1	0
	—	—	ERSF	RXFF	TXFF	RX MOF	RXM1F	TXMF
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R	R

<After Reset: H'00>

Bit	Symbol	Initial Value	R/W	Description
7, 6	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
5	ERSF	0	R	Error (ERS) Interrupt Status Bit* <sup>1</sup> The ERSF bit shows the error interrupt source status. 0: ERS interrupt source not detected 1: ERS interrupt source detected
4	RXFF	0	R/W	Reception FIFO (RXF) Interrupt Status Bit* <sup>2</sup> The RXFF bit shows the FIFO receive interrupt source status. 0: RXF interrupt source not detected 1: RXF interrupt source detected The RXFF is cleared to "0" by writing "0" to it by software. (writing "1" has no effect)
3	TXFF	0	R/W	Transmission FIFO (TXF) Interrupt Status Bit* <sup>3</sup> The TXFF bit shows the FIFO transmit interrupt source status. 0: TXF interrupt source not detected 1: TXF interrupt source detected The TXFF is cleared to "0" by writing "0" to it by software. (writing "1" has no effect)
2	RXM0F	0	R	Mailbox 0 Successful Reception (RXM0) Interrupt Status Bit* <sup>4</sup> The RXM0F bit shows the successful reception interrupt source status for mailbox 0. 0: RXM0 interrupt source not detected 1: RXM0 interrupt source detected
1	RXM1F	0	R	Mailbox 1 to 63 Successful Reception (RXM1) Interrupt Status Bit* <sup>5</sup> The RXM1F bit shows the successful reception interrupt source status for mailboxes 1 to 63. 0: RXM1 interrupt source not detected 1: RXM1 interrupt source detected

Bit	Symbol	Initial Value	R/W	Description
0	TXMF	0	R	Mailbox 32 to 63 Successful Transmission (TXM) Interrupt Status Bit* <sup>6</sup> The TXMF bit shows the successful transmission interrupt source status for mailboxes 32 to 63. 0: TXM interrupt source not detected 1: TXM interrupt source detected

- Notes:
1. The ERSF bit is set to "1" when a bit in one of the CiEIFR[j] registers is set to "1" due to a communication error while the corresponding bit in the CiEIER[j] register is set to "1" (j = 0 to 7).
  2. The RXFF bit is set to "1" when bit 6 or 5 in the CiRFCR register is set to "1" because of a reception FIFO full or warning condition due to the setting of CiMIER[61].
  3. The TXFF bit is set to "1" when the transmission FIFO message count reaches the specified value due to the setting of CiMIER[57].
  4. After the NEWDATA bit in CiMCTL0 is set to "1" at the end of a receive operation, the RXM0F bit is set to "1" if storing of the receive data is complete (corresponding INVALIDDATA bit value changed from "1" to "0") and the CiMIER0[0] bit has been set to "1".
  5. After the NEWDATA bit in CiMCTLj is set to "1" at the end of a receive operation, the RXM1F bit is set to "1" if storing of the receive data is complete (corresponding INVALIDDATA bit value changed from "1" to "0") and the bit in CiMIER0 or CiMIER1 corresponding to mailbox j has the been set to "1" (j = 1 to 63).
  6. The TXMF bit is set to "1" when the bit in the CiMIER1 register corresponding to mailbox j is set to "1" while the value of the SENTDATA bit in the CiMCTLj register is "1" following a successful reception (j = 32 to 63).

**38.3.27 CANi Interrupt Enable Register (CiIER) (i = 0, 1)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	√

The CiIER register can be used by an application to cause some interrupts to be ignored while processing by an interrupt service routine is taking place. Each bit affects the individual interrupt source corresponding to it.

CAN0 Interrupt Enable Register (C0IER)

<After Reset: H'00>

Bit	Symbol	Initial Value	R/W	Description
7 to 1	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
0	MB0SM	0	R/W	Mailbox 0 Search Mask Bit* When the MB0SM bit is set to "1", message box 0 is excluded from the search target for the CANi mailbox search status register.

Note: \* The MB0SM bit is enabled in the search modes except channel search mode. In the RXM1 interrupt handling, this bit is usable to exclude message box 0 from the search target for the CiMSSR register in receive mailbox search mode.

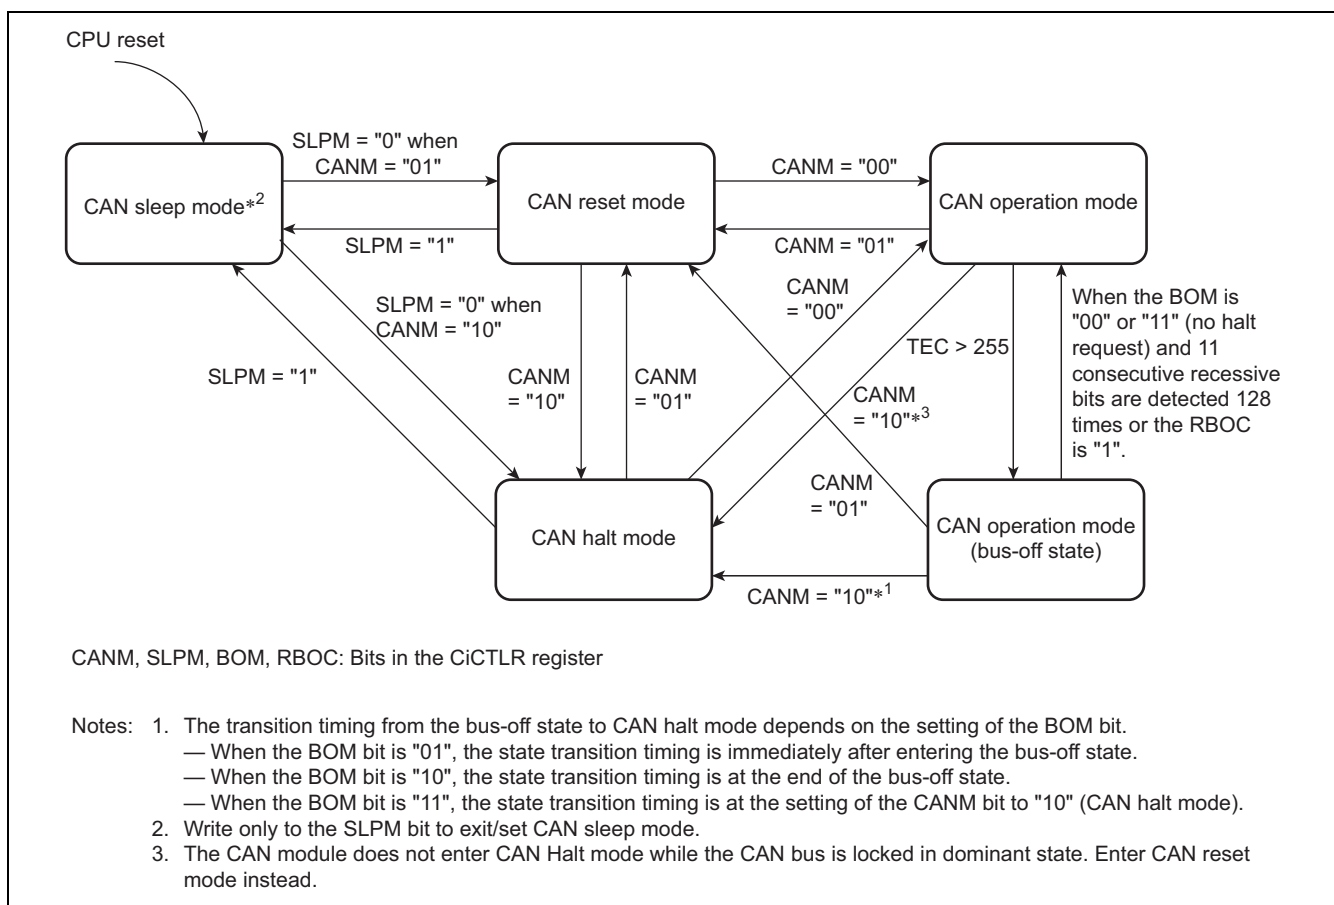

RZ/G1H	RZ/G1N
RZ/G1M	RZ/G1E

### 38.4 Operating Mode

The CAN module has the following four operating modes.

- CAN reset mode
- CAN halt mode
- CAN operation mode
- CAN sleep mode

Figure 38.9 shows the transition between CAN operating modes.

**Figure 38.9 Transition between CAN Operating Modes (i = 0, 1)**

### 38.4.1 CAN Reset Mode

CAN reset mode is provided for CAN communication configuration.

When the CANM bit in the CiCTLR register is set to "01" or "11", the CAN module enters CAN reset mode. Then the RSTST bit in the CiSTR register is set to "1". Do not change the CANM bit until the RSTST bit is set to "1". Configure the CiBCR register before exiting CAN reset mode to any other modes.

The following registers are initialized to their reset values after entering CAN reset mode and their initialized values are retained during CAN reset mode:

- CiMCTLj register
- CiSTR register (except bits SLPST and TFST)
- CiEIFR register
- CiRECR register
- CiTECR register
- CiTSR register
- CiMSSR register
- CiMSMR register
- CiRFCR register
- CiTFPCR register
- CiTCR register
- CiECSR register (except EDPM bit)
- CiISR register
- CiMBSMR register

The following registers retain their values after entering CAN reset mode.

- CiCLKR register
- CiCTLR register
- CiSTR register (bits SLPST and TFST)
- Registers CiMIER0 and CiMIER1
- CiEIER register
- CiBCR register
- CiCSSR register
- CiECSR register (EDPM bit only)
- CiMBj register
- Registers CiMKR0 to CiMKR9
- Registers CiFIDCR0 and CiFIDCR1
- Registers CiMKIVLR0 and CiMKIVLR1
- CiAFSR register
- CiRFPCR register
- CiTFPCR register
- CiIER register

### 38.4.2 CAN Halt Mode

CAN halt mode is used for mailbox configuration and test mode setting.

When the CANM bit in the CiCTLR register is set to "10", CAN halt mode is selected. Then the HLTST bit in the CiSTR register is set to "1". Do not change the CANM bit until the HLTST bit is set to "1".

Refer to Table 38.9, Operation in CAN Reset Mode and CAN Halt Mode regarding the state transition conditions when transmitting or receiving.

All registers except bits RSTST, HLTST, and SLPST in the CiSTR register remain unchanged when the CAN module enters CAN halt mode.

Do not change registers CiCLKR, CiCTLR (except bits CANM and SLPM), and CiEIER in CAN halt mode. The CiBCR register can be changed in CAN halt mode only when listen-only mode is selected to use for automatic bit rate detection.

**Table 38.9 Operation in CAN Reset Mode and CAN Halt Mode**

Mode	Receiver	Transmitter	Bus-Off
CAN reset mode	CAN module enters CAN reset mode without waiting for the end of message reception	CAN module enters CAN reset mode after waiting for the end of message transmission (1, 4)	CAN module enters CAN reset mode without waiting for the end of bus-off recovery
CAN halt mode	CAN module enters CAN halt mode after waiting for the end of message reception (2, 3)	CAN module enters CAN halt mode after waiting for the end of message transmission (1, 2, 4)	<ul style="list-style-type: none"> <li>When the BOM bit is "B'00" A halt request from a program will be acknowledged only after bus-off recovery</li> <li>When the BOM bit is "B'01" CAN module automatically enters CAN halt mode without waiting for the end of bus-off recovery (regardless of a halt request from a program)</li> <li>When the BOM bit is "B'10" CAN module automatically enters CAN halt mode after waiting for the end of bus-off recovery (regardless of a halt request from a program)</li> <li>When the BOM bit is "B'11" CAN module enters CAN halt mode (without waiting for the end of bus-off recovery) if a halt is requested by a program during bus-off</li> </ul>

BOM bit: Bit in the CiCTLR register (i = 0, 1)

- Notes:
- If several messages are requested to be transmitted, mode transition occurs after the completion of the first message transmission. When CAN reset mode is being requested during suspend transmission, mode transition occurs when the bus is idle, the next transmission ends, or the CAN module becomes a receiver.
  - If the CAN bus is locked in dominant state, the program can detect this state by monitoring the BLIF bit in the CiEIFR register. The CAN module does not enter CAN Halt mode while the CAN bus is locked in dominant state. Enter CAN reset mode instead.
  - If a CAN bus error occurs during reception after CAN halt mode is requested, the CAN module enters CAN halt mode. However, the CAN module does not enter CAN Halt mode when the CAN bus is locked in dominant state.
  - If a CAN bus error or arbitration lost occurs during transmission after CAN reset mode or CAN halt mode is requested, the CAN module enters the requested operating mode. However, the CAN module does not enter CAN Halt mode when the CAN bus is locked in dominant state.

### 38.4.3 CAN Sleep Mode

CAN sleep mode is used for reducing current consumption by stopping the clock supply to the CAN module. After MCU hardware reset or software reset, the CAN module starts from CAN sleep mode.

When the SLPM bit in the CiCTLR register is set to "1", the CAN module enters CAN sleep mode. Then the SLPST bit in the CiSTR register is set to "1". Do not change the value of the SLPM bit until the SLPST bit is set to "1". The other registers remain unchanged when the MCU enters CAN sleep mode.

Write to the SLPM bit in CAN reset mode and CAN halt mode. Do not change any registers (except the SLPM bit) during CAN sleep mode. Read operation is still allowed. When the SLPM bit is set to "0", the CAN module is released from CAN sleep mode. When the CAN module exits CAN sleep mode, the other registers remain unchanged.

### 38.4.4 CAN Operation Mode (Excluding Bus-Off State)

CAN operation mode is used for CAN communication.

When the CANM bit in the CiCTLR register is set to "B'00", the CAN module enters CAN operation mode.

Then bits RSTST and HLTST in the CiSTR register are set to "0". Do not change the value of the CANM bit until these bits are set to "0".

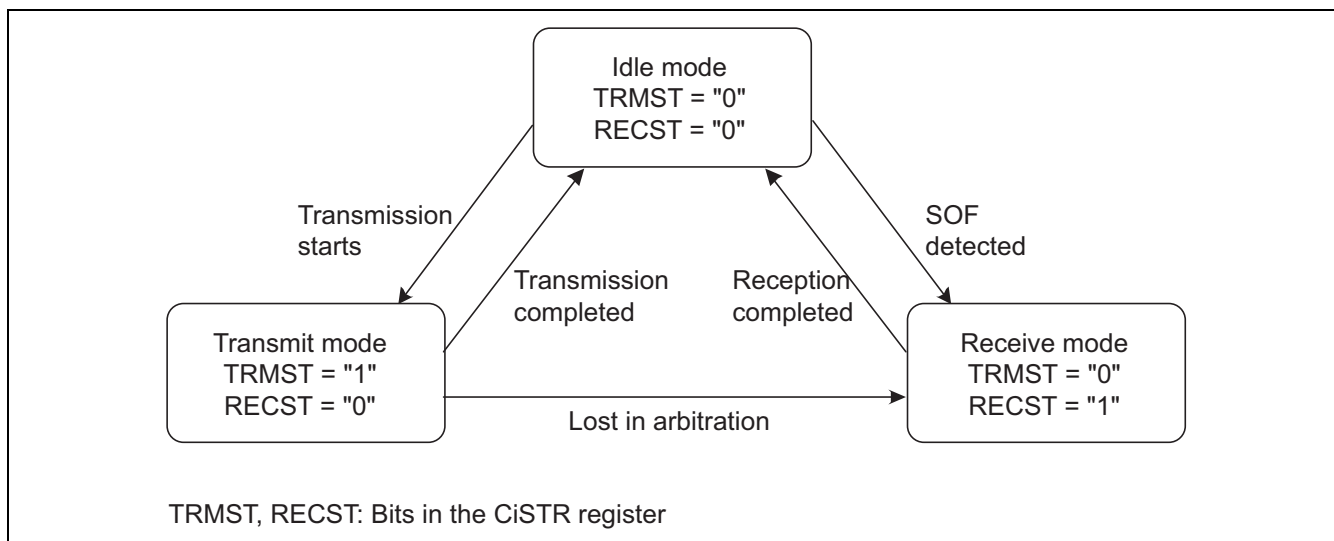

If 11 consecutive recessive bits are detected after entering CAN operation mode, the CAN module is in the following states:

- The CAN module becomes an active node on the network that enables transmission and reception of CAN messages.
- Error monitoring of the CAN bus, such as receive and transmit error counters, is performed.

During CAN operation mode, the CAN module may be in one of the following three sub-modes, depending on the status of the CAN bus:

- Idle mode: Transmission or reception is not being performed.
- Receive mode: A CAN message sent by another node is being received.
- Transmit mode: A CAN message is being transmitted. The CAN module may receive its own message simultaneously when self-test mode 0 (TSTM bit in the CiTCR register = "B'10") or self-test mode 1 (TSTM bit = "B'11") is selected.

Figure 38.10 shows the sub mode in CAN operation mode.

**Figure 38.10 Sub Mode in CAN Operation Mode (i = 0, 1)**

### 38.4.5 CAN Operation Mode (Bus-Off State)

The CAN module enters the bus-off state according to the increment/decrement rules for the transmit/error counters in the CAN Specifications.

The following cases apply when recovering from the bus-off state. When the CAN module is in bus-off state, the values of the associated registers, except registers CiSTR, CiEIFR, CiRECR, CiTECR and CiTSR, remain unchanged.

- When the BOM bit in the CiCTLR register is "B'00" (normal mode)
 

The CAN module enters the error-active state after it has completed the recovery from the bus-off state and CAN communication is enabled instantly. The BORIF bit in the CiEIFR register is set to "1" (bus-off recovery detected) at this time.
- When the RBOC bit in the CiCTLR register is set to "1" (forcible return from bus-off)
 

The CAN module enters the error-active state when it is in bus-off state and the RBOC bit is set to "1". CAN communication is enabled again after 11 consecutive recessive bits are detected. The BORIF bit is not set to "1" at this time.
- When the BOM bit is "B'01" (entry to CAN halt mode automatically at bus-off entry)
 

The CAN module enters CAN halt mode when it reaches the bus-off state. The BORIF bit is not set to "1" at this time.
- When the BOM bit is "B'10" (entry to CAN halt mode automatically at bus-off end)
 

The CAN module enters CAN halt mode when it has completed the recovery from bus-off. The BORIF bit is set to "1" at this time.
- When the BOM bit is "B'11" (entry to CAN halt mode by a program) and the CANM bit in the CiCTLR register is set to "B'10" (CAN halt mode) during the bus-off state
 

The CAN module enters CAN halt mode when it is in bus-off state and the CANM bit is set to "B'10" (CAN halt mode). The BORIF bit is not set to "1" at this time.

If the CANM bit is not set to "B'10" during bus-off, the same behavior as (1) applies.

### 38.5 CAN Communication Speed Configuration

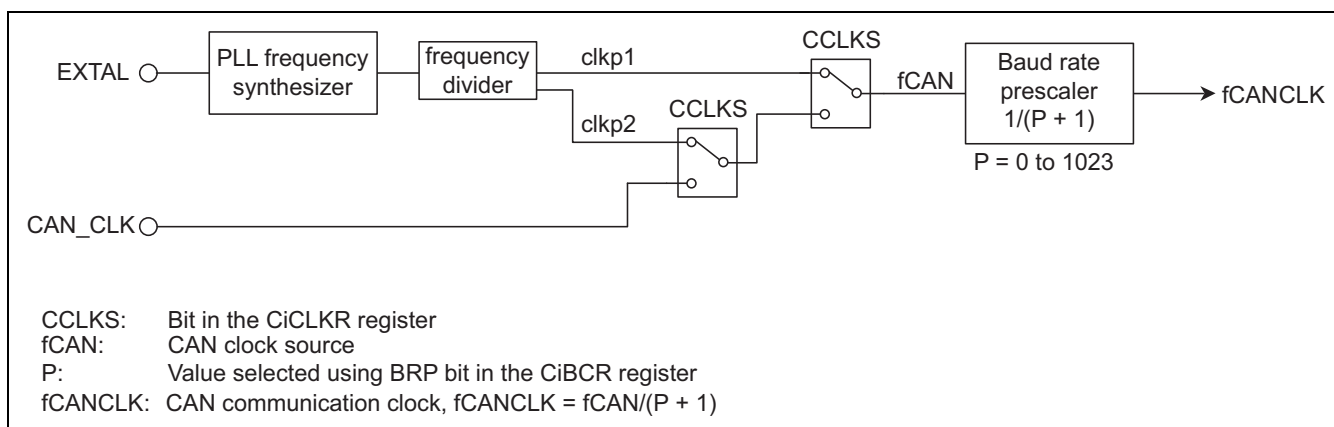

RZ/G1H	RZ/G1N
RZ/G1M	RZ/G1E

The following description explains about the CAN communication speed configuration.

#### 38.5.1 CAN Clock Configuration

This MCU has a CAN clock selector. The CAN clock can be configured by setting the CCLKS bit in the CiCLKR register and the BRP bit in the CiBCR register.

Figure 38.11 shows the block diagram of CAN clock generator.

**Figure 38.11 Block Diagram of CAN Clock Generator (i = 0, 1)**

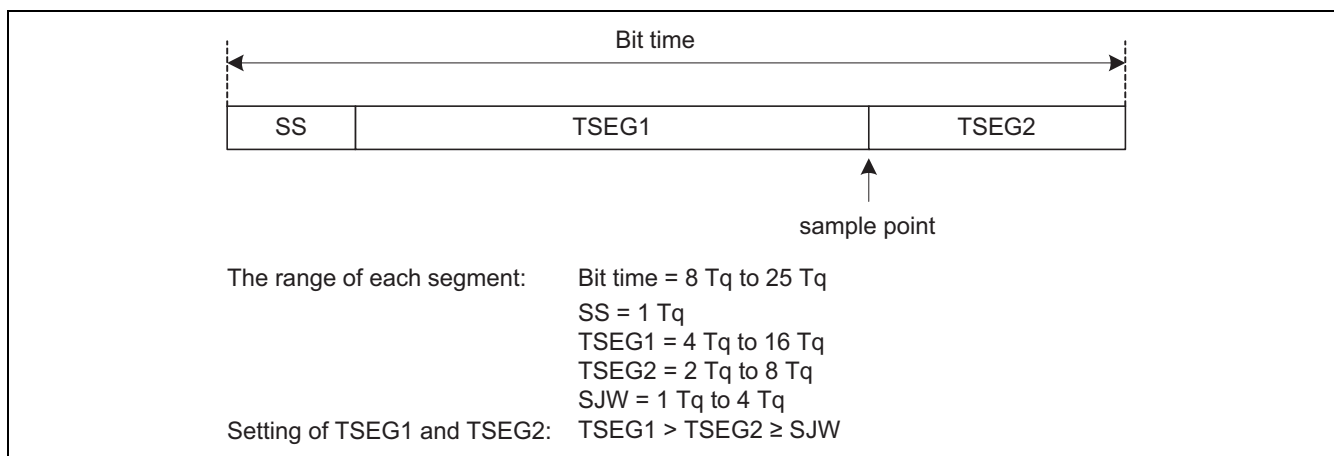

The CAN operating clock can be selected from the internal clock (clkp1, clkp2) from the CPG (PLL), and the external clock input to external pin (CAN\_CLK).

In the initial state, clkp1 is selected. If an external clock input is to be selected, set the CiCLKR register (section 38.3.2) before accessing the CAN module. The range of frequencies that may be input as an external clock is 8 to 50 MHz.

#### 38.5.2 Bit Timing Configuration

The bit time is a single bit time for transmitting/receiving a message and consists of the following three segments.

Figure 38.12 shows the bit timing.

**Figure 38.12 Bit Timing**

### 38.5.3 Bit-rate

The bit rate depends on the division value of the  $f_{CAN}$  (CAN clock source), the division value of the baud rate prescaler, and the number of  $T_q$  of one bit time.

$$\text{Bit rate [bps]} = \frac{f_{CAN}}{\text{Baud rate prescaler division value}^* \times \text{number of } T_q \text{ of one bit time}} = \frac{f_{CANCLK}}{\text{Number of } T_q \text{ of one bit time}}$$

Note: \* Division value of the baud rate prescaler =  $P + 1$  (P: 0 to 1023)  
P: Setting value of the BRP bit in the CiBCR register (i = 0, 1)

Table 38.10 lists bit rate examples.

**Table 38.10 Example of Bit-rate**

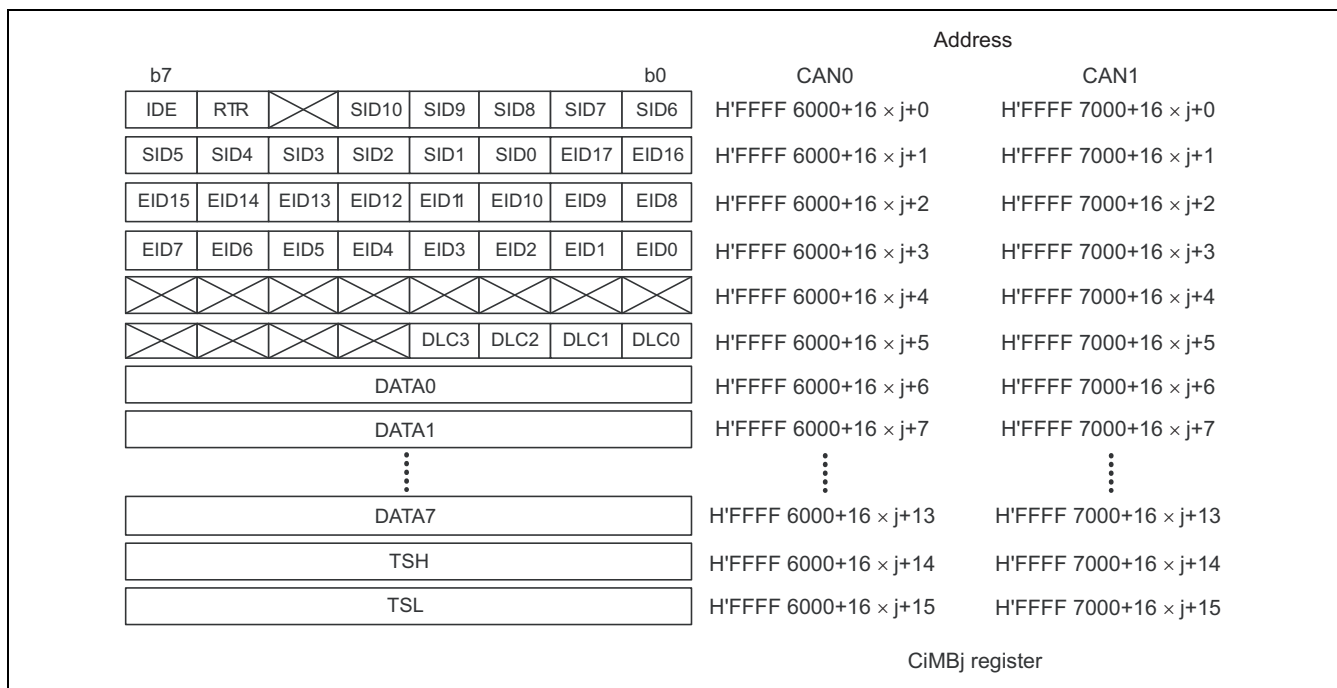

fCAN	40 MHz		32 MHz		20 MHz		16 MHz	
	No. of $T_q$	P + 1	No. of $T_q$	P + 1	No. of $T_q$	P + 1	No. of $T_q$	P + 1
1 Mbps	10 $T_q$	4	8 $T_q$	4	10 $T_q$	2	8 $T_q$	2
	20 $T_q$	2	16 $T_q$	2	20 $T_q$	1	16 $T_q$	1
500 kbps	10 $T_q$	8	8 $T_q$	8	10 $T_q$	4	8 $T_q$	4
	20 $T_q$	4	16 $T_q$	4	20 $T_q$	2	16 $T_q$	2
250 kbps	10 $T_q$	16	8 $T_q$	16	10 $T_q$	8	8 $T_q$	8
	20 $T_q$	8	16 $T_q$	8	20 $T_q$	4	16 $T_q$	4
83.3 kbps	8 $T_q$	60	8 $T_q$	48	8 $T_q$	30	8 $T_q$	24
	10 $T_q$	48	16 $T_q$	24	10 $T_q$	24	16 $T_q$	12
	16 $T_q$	30			16 $T_q$	15		
	20 $T_q$	24			20 $T_q$	12		
33.3 kbps	8 $T_q$	150	8 $T_q$	120	8 $T_q$	75	8 $T_q$	60
	10 $T_q$	120	10 $T_q$	96	10 $T_q$	60	10 $T_q$	48
	20 $T_q$	60	16 $T_q$	60	20 $T_q$	30	16 $T_q$	30
			20 $T_q$	48			20 $T_q$	24

### 38.6 Mailbox and Mask Register Structure

RZ/G1H	RZ/G1N
RZ/G1M	RZ/G1E

Figure 38.13 shows the structure of the CiMBj register.

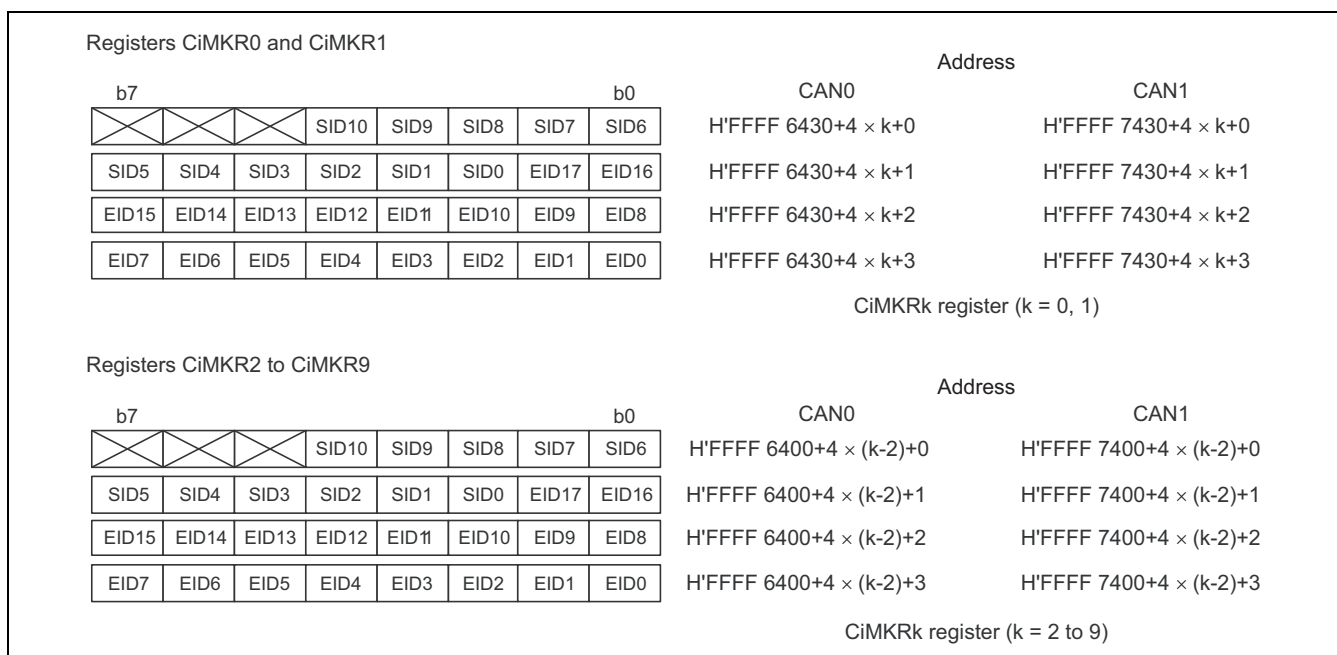

There are 64 mailboxes with the same structure.

**Figure 38.13 Structure of CiMBj Register (i = 0, 1; j = 0 to 63)**

Figure 38.14 shows the structure of registers CiMKR0, CiMKR1, and CiMKR2 to CiMKR9.

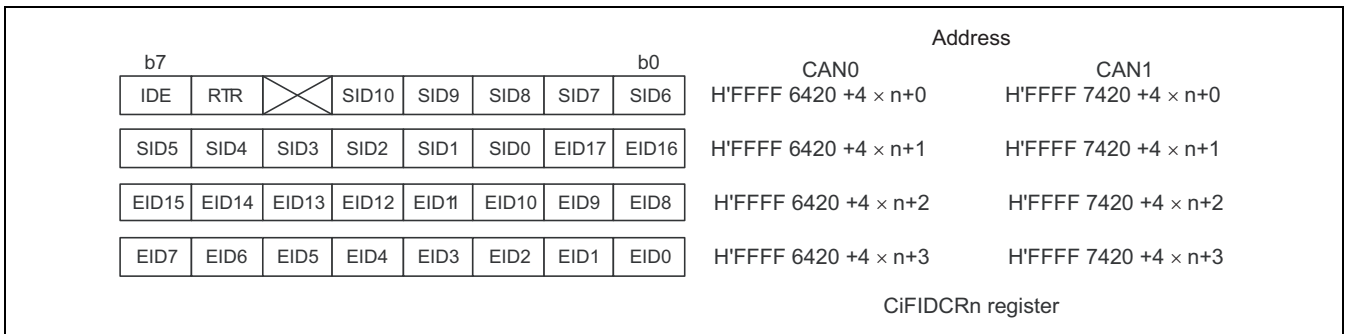

There are 10 mask registers with the same structure.

**Figure 38.14 Structure of CiMKRk Register (i = 0, 1; k = 0 to 9)**

Figure 38.15 shows the structure of the CiFIDCRn register.

There are 2 FIFO received ID compare registers with the same structure.

**Figure 38.15 Structure of CiFIDCRn register (i = 0, 1; n = 0, 1)**

## 38.7 Acceptance Filtering and Masking Function

RZ/G1H

RZ/G1N

RZ/G1M

RZ/G1E

Acceptance filtering allows the user to receive messages with a specified range of multiple IDs for mailboxes. Registers CiMKR0 to CiMKR9 can perform masking of the standard ID and the extended ID of 29 bits.

- The CiMKR0 register corresponds to mailboxes [0] to [15].
- The CiMKR1 register corresponds to mailboxes [16] to [31].
- The CiMKR2 register corresponds to mailboxes [32] to [35].
- The CiMKR3 register corresponds to mailboxes [36] to [39].
- The CiMKR4 register corresponds to mailboxes [40] to [43].
- The CiMKR5 register corresponds to mailboxes [44] to [47].
- The CiMKR6 register corresponds to mailboxes [48] to [51].
- The CiMKR7 register corresponds to mailboxes [52] to [55].
- The CiMKR8 register corresponds to mailboxes [56] to [59] in normal mailbox mode and the receive FIFO mailboxes [60] to [63] in FIFO mailbox mode.
- The CiMKR9 register corresponds to mailboxes [60] to [63] in normal mailbox mode and the receive FIFO mailboxes [60] to [63] in FIFO mailbox mode.

Registers CiMKIVLR0 and CiMKIVLR1 disable acceptance filtering individually for each mailbox.

The IDE bit in the CiMBj register is enabled when the IDFM bit in the CiCTRL register is "B'10" (mixed ID mode).

The RTR bit in the CiMBj register selects a data frame or a remote frame.

In FIFO mailbox mode, normal mailboxes (mailboxes [0] to [55]) use the single corresponding register among registers CiMKR0 to CiMKR7 for acceptance filtering. Receive FIFO mailboxes (mailboxes [60] to [63]) use two registers CiMKR8 and CiMKR9 for the acceptance filtering.

Also, the receive FIFO uses two registers CiFIDCR0 and CiFIDCR1 for ID comparison. Bits EID, SID, RTR, and IDE in registers CiMB60 to CiMB63 for the receive FIFO are disabled. As acceptance filtering depends on the result of two ID-mask sets, two ranges of IDs can be received into the receive FIFO.

Registers CiMKIVLR0 and CiMKIVLR1 are disabled for the receive FIFO.

If both setting of standard ID and extended ID are set in the IDE bits in registers CiFIDCR0 and CiFIDCR1 individually, both ID formats are received.

If both setting of data frame and remote frame are set in the RTR bits in registers CiFIDCR0 and CiFIDCR1 individually, both data and remote frames are received.

When combination with two ranges of IDs is not necessary, set the same mask value and the same ID into both of the FIFO ID/mask register sets.

Figure 38.16 shows the correspondence of mask registers to mailboxes. Figure 38.17 shows the acceptance filtering.

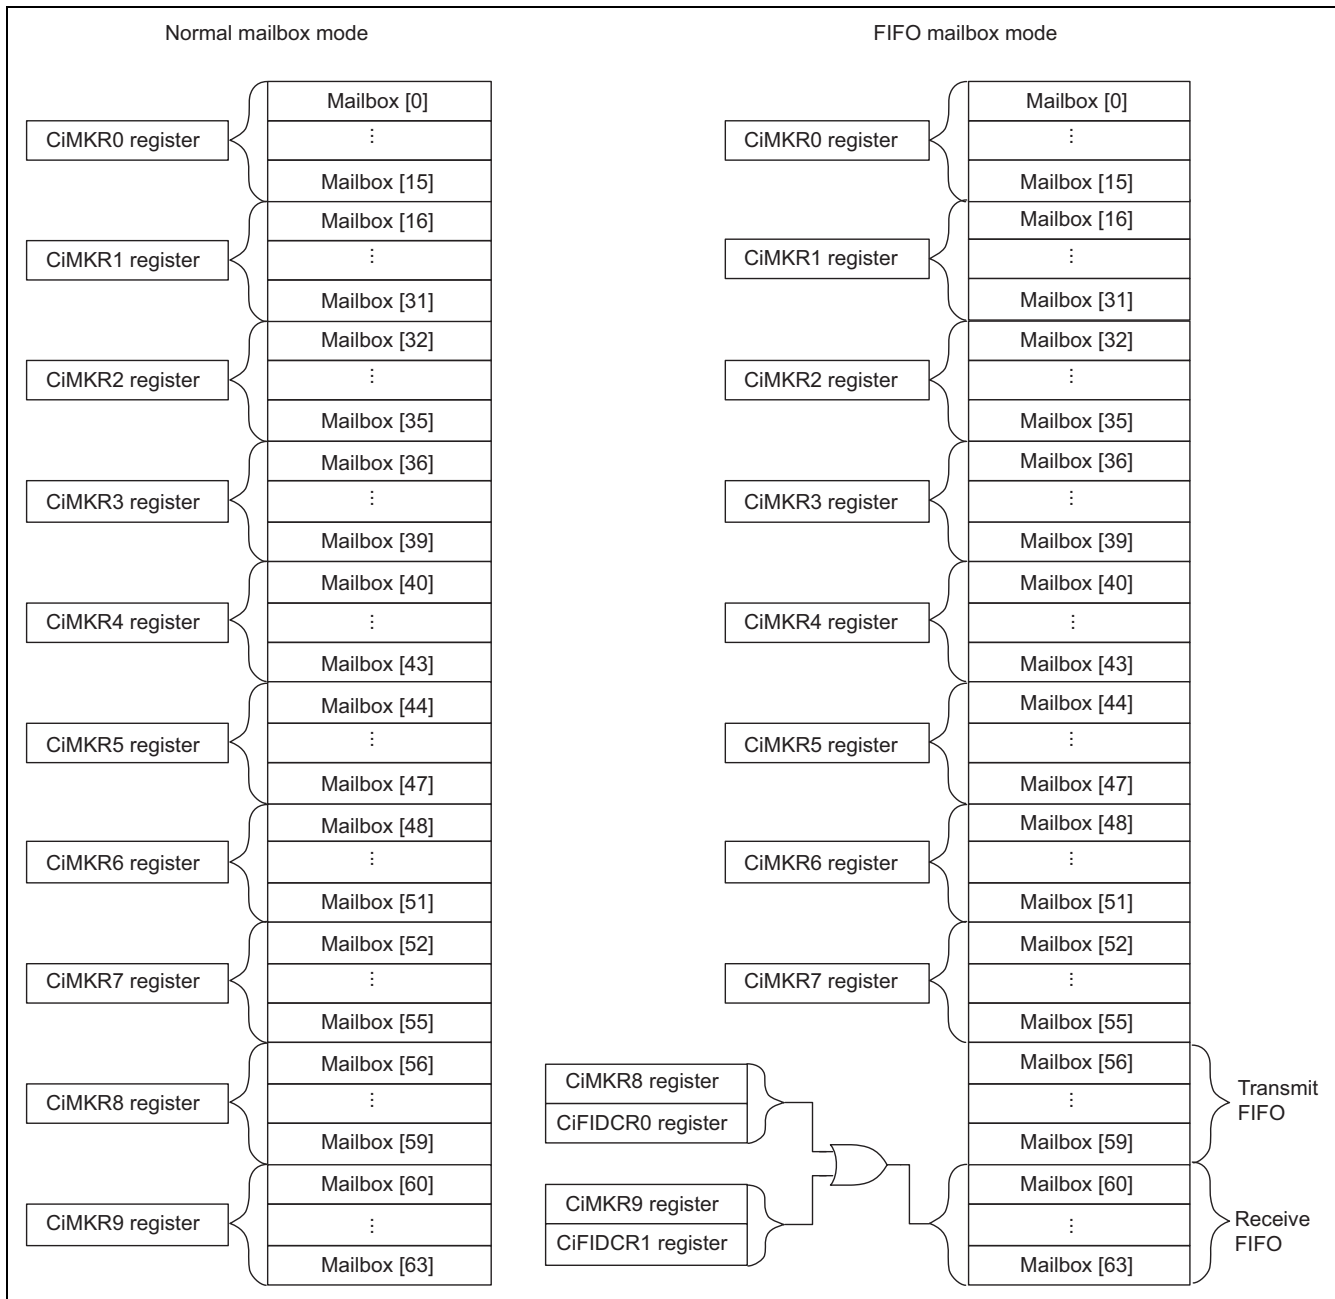

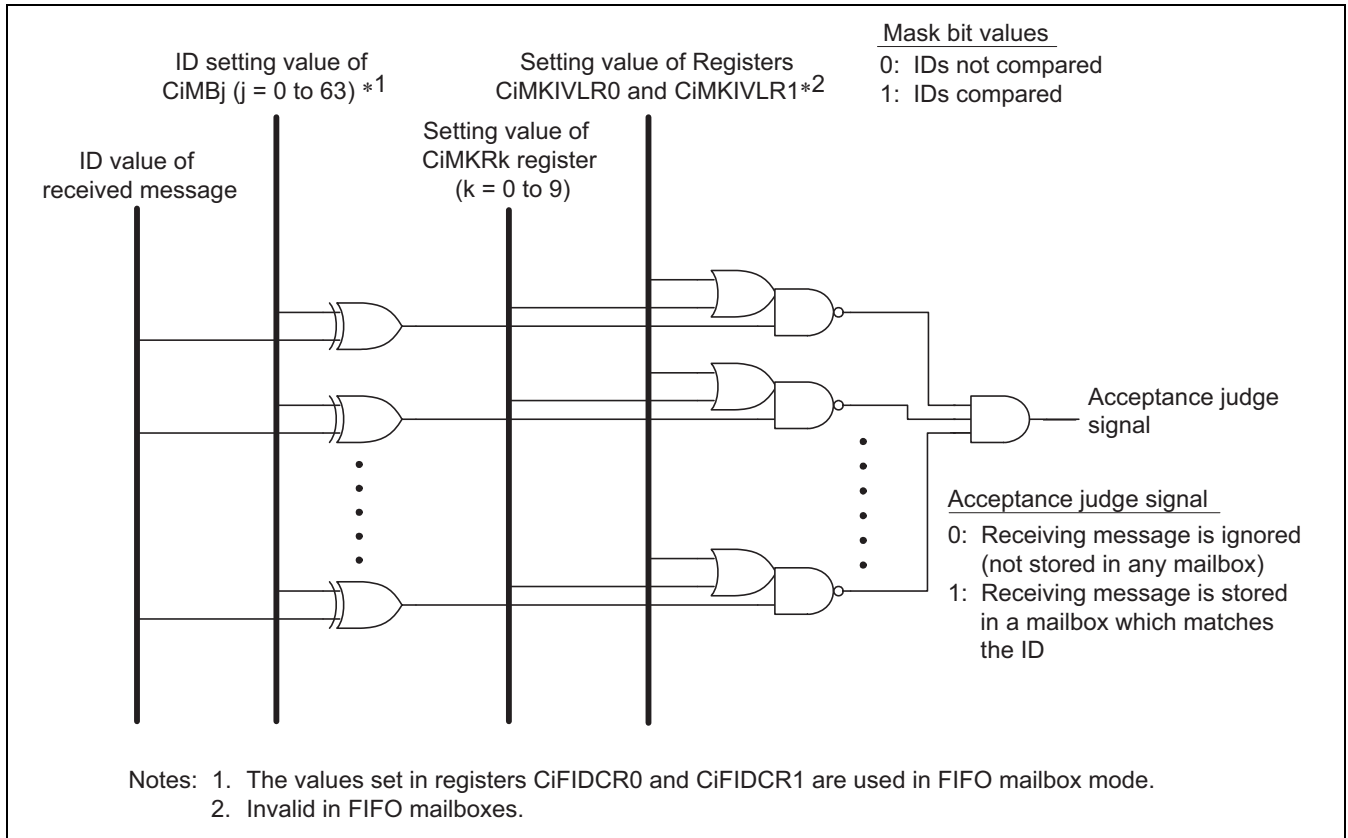

Figure 38.16 Correspondence of Mask Registers to Mailboxes (i = 0, 1)

**Figure 38.17 Acceptance Filtering (i = 0, 1)**

## 38.8 Reception and Transmission

RZ/G1H

RZ/G1N

RZ/G1M

RZ/G1E

Table 38.11 lists the CAN communication mode configuration.

**Table 38.11 Configuration for CAN Reception Mode and Transmission Mode**

TRMREQ	RECREQ	ONESHOT	Communication Mode of Mailbox
0	0	0	Mailbox disabled or transmission being aborted
0	0	1	Configurable only when transmission or reception from a mailbox (programmed in one-shot mode) is aborted.
0	1	0	Configured as a receive mailbox for a data frame or a remote frame.
0	1	1	Configured as a one-shot receive mailbox for a data frame or a remote frame.
1	0	0	Configured as a transmit mailbox for a data frame or a remote frame.
1	0	1	Configured as a one-shot transmit mailbox for a data frame or a remote frame.
1	1	0	Do not set.
1	1	1	Do not set.

Note: TRMREQ, RECREQ, ONESHOT: Bits in CiMCTLj register (i = 0, 1; j = 32 to 63)

When a mailbox is configured as a receive mailbox or a one-shot receive mailbox, note the following:

1. Before a mailbox is configured as a receive mailbox or a one-shot receive mailbox, set the CiMCTLj register to "H'00".
2. A received message is stored into the first mailbox that matches the condition according to the result of receive mode configuration and acceptance filtering. Upon deciding a mailbox which stores the received message, the mailbox with the smaller number has higher priority.
3. In CAN operation mode, when a CAN module transmits a message whose ID matches with the ID/mask set of a mailbox configured to receive messages, the CAN module never receives the transmitted data. In self-test mode, however, the CAN module may receive its transmitted data. In this case, the CAN module sends an ACK.

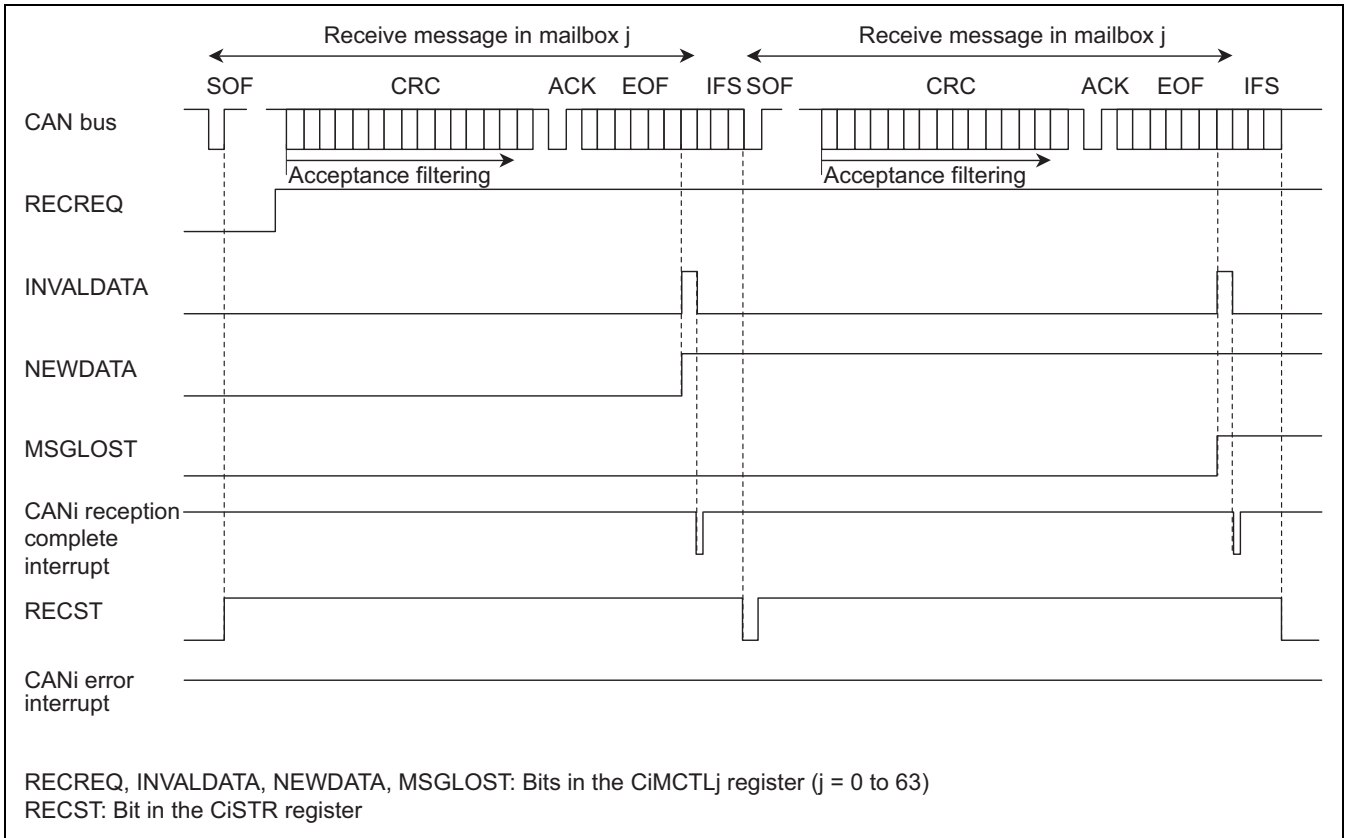

When configuring a mailbox as a transmit mailbox or a one-shot transmit mailbox, note the following:

1. Before a mailbox is configured as a transmit mailbox or one-shot transmit mailbox, ensure that the CiMCTLj register is "H'00" and that there is no pending abort process.

**38.8.1 Reception**

Figure 38.18 shows an operation example of data frame reception in overwrite mode.

This example shows the operation of overwriting the first message when the CAN module receives two consecutive CAN messages that matches the receiving conditions of the CiMCTLj register.

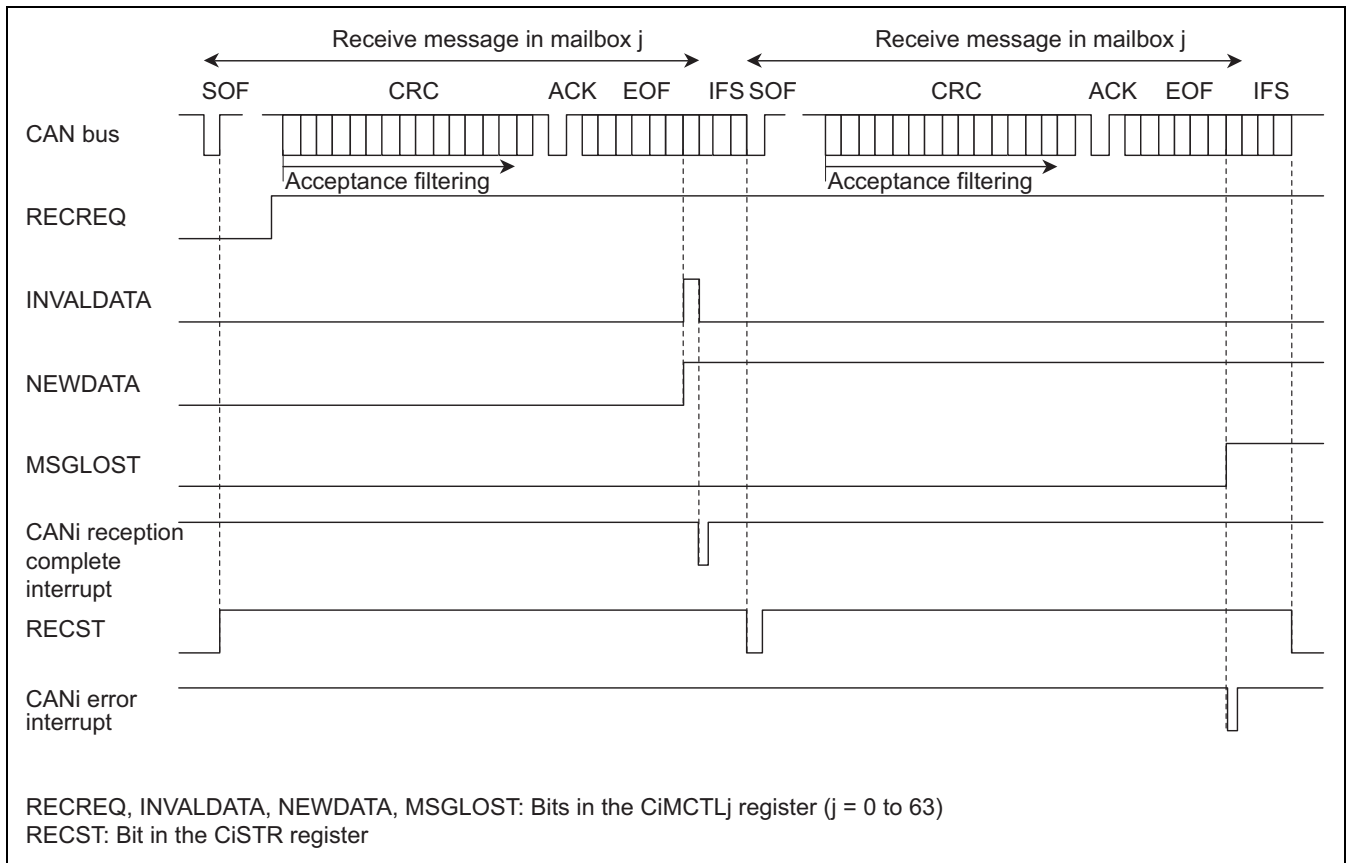

**Figure 38.18 Operation Example of Data Frame Reception in Overwrite Mode (i = 0, 1)**

1. When a SOF is detected on the CAN bus, the RECST bit in the CiSTR register is set to "1" (reception in progress) if the CAN module has no message ready to start transmission.
2. The acceptance filter procedure starts at the beginning of the CRC field to select the receive mailbox.
3. After a message has been received, the NEWDATA bit in the CiMCTLj register for the receive mailbox is set to "1" (new data being updated/stored in the mailbox). The INVALIDDATA bit in the CiMCTLj register is set to "1" (message is being updated) at the same time, and then the INVALIDDATA bit is set to "0" (message valid) again after the complete message is transferred to the mailbox.
4. When the interrupt enable bit in the CiMIER register for the receive mailbox is "1" (interrupt enabled), the CANi reception complete interrupt request is generated. This interrupt is generated when the INVALIDDATA bit is set to "0".
5. After reading the message from the mailbox, the NEWDATA bit needs to be set to "0" by a program.
6. In overwrite mode, if the next CAN message has been received into a mailbox whose NEWDATA bit is still set to "1", the MSGLOST bit in the CiMCTLj register is set to "1" (message has been overwritten). The new received message is transferred to the mailbox. The CANi reception complete interrupt request is generated the same as in 4.

Figure 38.19 shows the operation example of data frame reception in overrun mode. This example shows the operation of overrunning the second message when the CAN module receives two consecutive CAN messages that matches the receiving conditions of the CiMCTLj register.

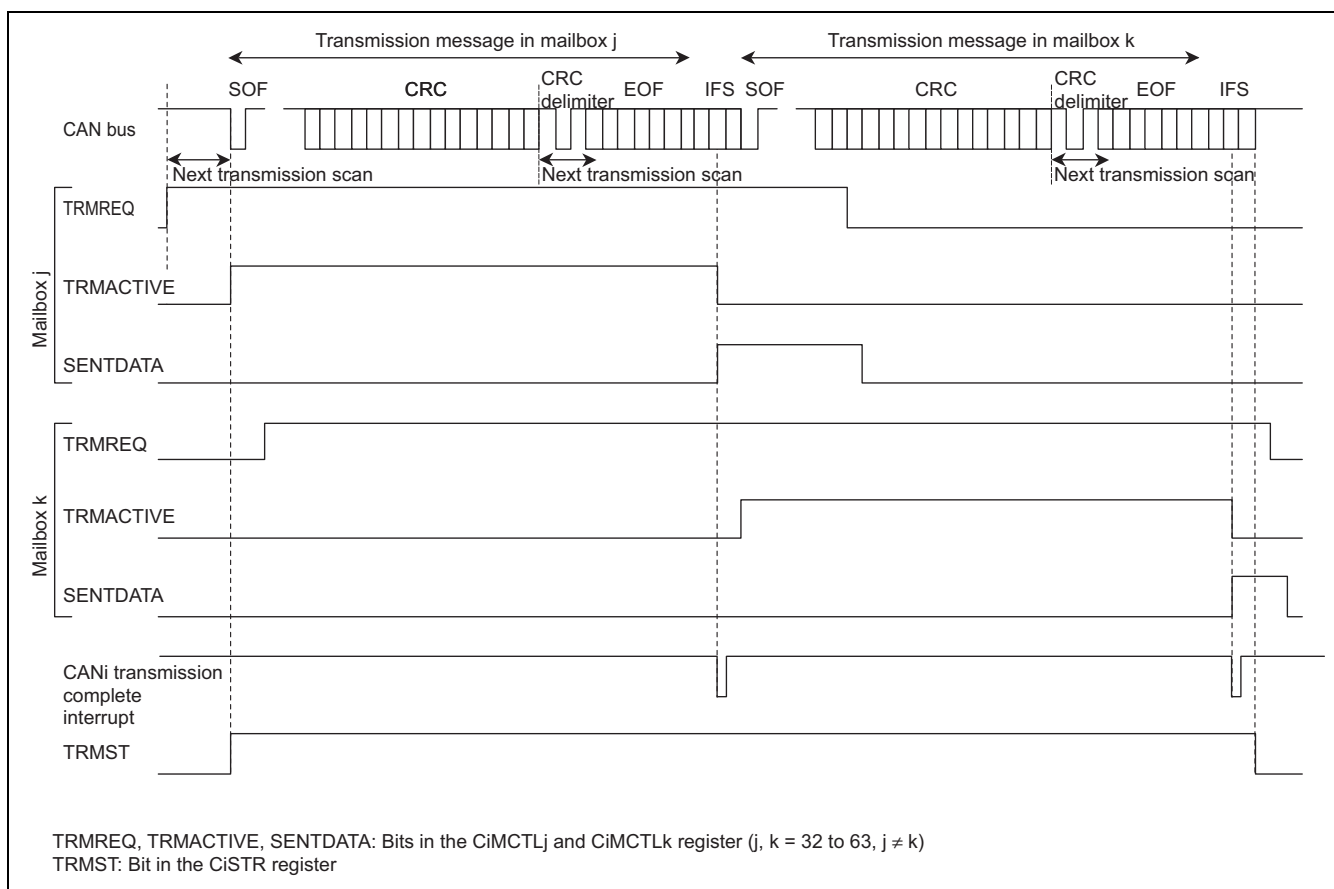

**Figure 38.19 Operation Example of Data Frame Reception in Overrun Mode (i = 0, 1)**

1. to 5. are the same as overwrite mode.
6. In overrun mode, if the next message has been received before the NEWDATA bit is set to "0", the MSGLOST bit in the CiMCTLj register is set to "1" (message has been overrun). The new received message is discarded and a CANi error interrupt request is generated if the corresponding interrupt enable bit in the CiEIER register is set to "1" (interrupt enabled).

### 38.8.2 Transmission

Figure 38.20 shows an operation example of data frame transmission.

**Figure 38.20 Operation Example of Data Frame Transmission (i = 0, 1)**

1. When a TRMREQ bit in the CiMCTLj register is set to 1 (transmit mailbox) in bus-idle state, the mailbox scan procedure starts to decide the highest-priority mailbox for transmission. Once the transmit mailbox is decided, the TRMACTIVE bit in the CiMCTLj register is set to "1" (from when a transmission request is received until transmission is completed, or an error/arbitration lost has occurred), the TRMST bit in the CiSTR register is set to "1" (transmission in progress), and the CAN module starts transmission.\*
2. If other TRMREQ bits are set, the transmission scan procedure starts with the CRC delimiter for the next transmission.
3. If transmission is completed without losing arbitration, the SENTDATA bit in the CiMCTLj register is set to "1" (transmission completed) and the TRMACTIVE bit is set to "0" (transmission is pending, or no transmission request). If the interrupt enable bit in the CiMIER register is "1" (interrupt enabled), the CANi transmission complete interrupt request is generated.
4. When requesting the next transmission from the same mailbox, set bits SENTDATA and TRMREQ to "0", then set the TRMREQ bit to "1" after checking that bits SENTDATA and TRMREQ have been set to "0".

Note: \* If arbitration is lost after the CAN module starts transmission, the TRMACTIVE bit is set to "0". The transmission scan procedure is performed again to search for the highest-priority transmit mailbox from the beginning of the CRC delimiter. If an error occurs either during transmission or following the arbitration lost the transmission scan procedure is performed again from the start of the error delimiter to search for the highest-priority transmit mailbox.

## 38.9 CAN Interrupt

RZ/G1H

RZ/G1N

RZ/G1M

RZ/G1E

The CAN module provides the following CAN interrupts for each channel. Table 38.12 lists CAN interrupts.

- CANi reception complete interrupt (mailbox 0) [RXM0i]
- CANi reception complete interrupt (mailbox 1 to 63) [RXM1i]
- CANi transmission complete interrupt (mailbox 32 to 63) [TXMi]
- CANi reception FIFO interrupt [RXFi]
- CANi transmission FIFO interrupt [TXFi]
- CANi error interrupt [ERSi]

There are eight types of interrupt sources for the CANi error interrupts. These sources can be determined by checking the CiEIFR register.

- Bus error
- Error-warning
- Error-passive
- Bus-off entry
- Bus-off recovery
- Receive overrun
- Overload frame transmission
- Bus lock

**Table 38.12 CAN Interrupts**

Module	Interrupt Symbol	Interrupt Source	Source Flag
CANi	ERSi	Bus lock detected	CiEIFR.BLIF
		Overload frame transmission detected	CiEIFR.OLIF
		Overrun detected	CiEIFR.ORIF
		Bus-off recovery detected	CiEIFR.BORIF
		Bus-off entry detected	CiEIFR.BOEIF
		Error-passive detected	CiEIFR.EPIF
		Error-warning detected	CiEIFR.EWIF
		Bus error detected	CiEIFR.BEIF
RXFi	RXFi	Receive FIFO message received (CiMIER1[29] = 0)	CiISR.RXFF
		Receive FIFO warning (CiMIER1[29] = 1)	
TXFi	TXFi	Transmit FIFO message transmission completed (CiMIER1[25] = 0)	CiISR.TXFF
		FIFO last message transmission completed (CiMIER1[25] = 1)	
RXM0i	RXM0i	Mailbox 0 message received	CiMCTL0.NEWDATA
RXM1i	RXM1i	Mailbox 1 to 63 message received	CiMCTL1.NEWDATA to CiMCTL63.NEWDATA
TXMi	TXMi	Mailbox 32 to 63 message transmission completed	CiMCTL32.SENTDATA to CiMCTL63.SENTDATA

Legend: i = 0, 1

**(1) CANi reception complete interrupt (mailbox 0) [RXM0i]**

After the CiMCTL0.NEWDATA bit is set by the completion of reception, if received data has been stored (the corresponding INVALIDDATA bit changes from "1" to "0"), the CiISR.RXM0F bit is set to "1" when CiMIER0[0] has been set to "1". When the mailbox 0 reception complete (RXM0) interrupt has been enabled, the RXM0 interrupt is requested to the interrupt controller.

To clear the RXM0 interrupt, clear the CiMCTL0.NEWDATA bit in the RXM0 interrupt handling routine. To change the CiIER.RXM0IE bit to disabled after having set the bit, make the change while no RXM0 interrupt is generated or during the RXM0 interrupt handling routine. This also applies to CiMIER0[0].

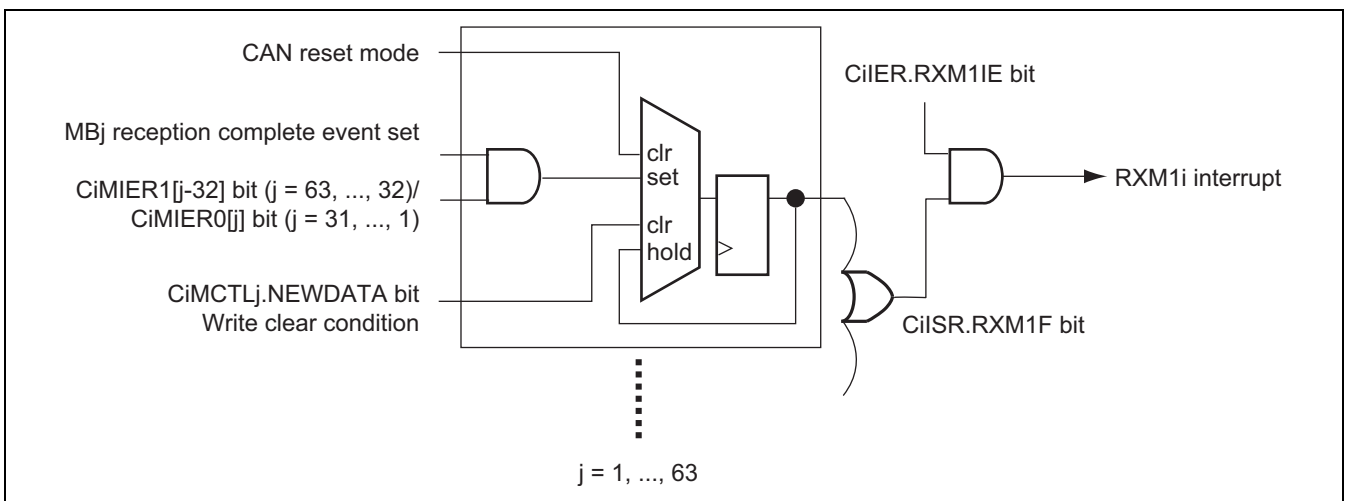

**Figure 38.21 Block Diagram of CANi Reception Complete Interrupt (Mailbox 0) [RXM0i]**

**(2) CANi reception complete interrupt (mailbox 1 to 63) [RXM1i]**

After the CiMCTLj.NEWDATA bit is set by the completion of reception, if received data has been stored (the corresponding INVALIDDATA bit changes from "1" to "0"), the CiISR.RXM1F bit is set to "1" when the CiMIER0 or CiMIER1 register bit corresponding to mailbox j has been set to "1". When the mailbox 1 to 63 reception complete (RXM1) interrupt has been enabled, the RXM1 interrupt is requested to the interrupt controller.

To clear the RXM1 interrupt, clear the CiMCTLj.NEWDATA bit in the RXM1 interrupt handling routine. To change the CiIER.RXM1IE bit to disabled after having set the bit, make the change while no RXM1 interrupt is generated or during the RXM1 interrupt handling routine. This also applies to CiMIER0[j] (j = 1 to 31) or CiMIER1[j-32] (j = 32 to 63).

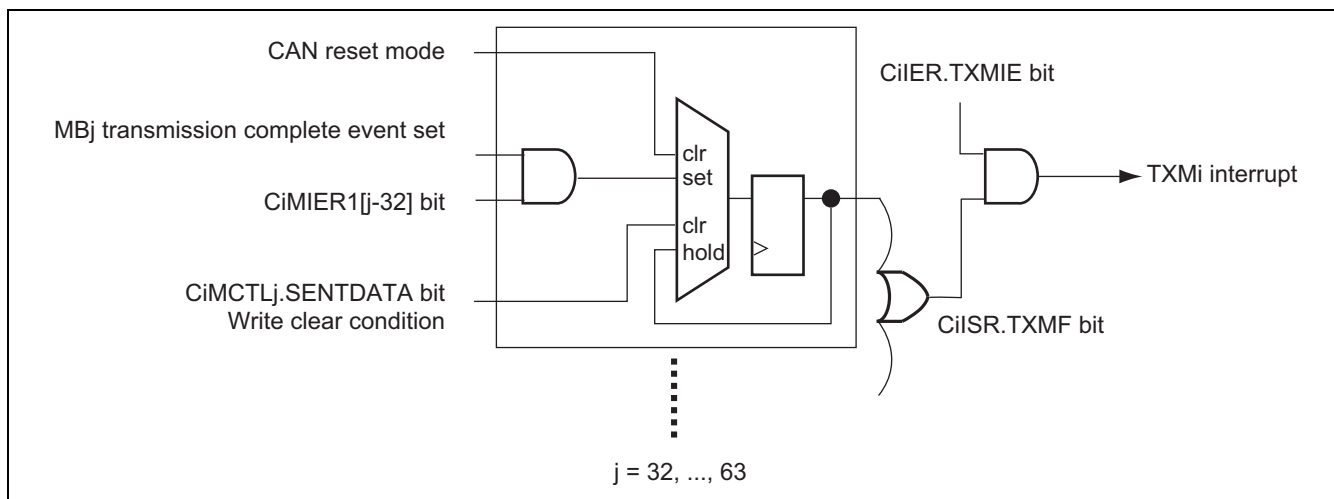

**Figure 38.22 Block Diagram of CANi Reception Complete Interrupt (Mailbox 1 to 63) [RXM1i]**

**(3) CANi transmission complete interrupt (mailbox 32 to 63) [TXMi]**

If the CiMCTLj.SENTDATA bit is set by the completion of transmission, the CiISR.TXMF bit is set to "1" when the CiMIER1 register bit corresponding to mailbox j has been set to "1". When the mailbox 32 to 63 transmission complete (TXM) interrupt has been enabled, the TXM interrupt is requested to the interrupt controller.

To clear the TXM interrupt, clear the CiMCTLj.SENTDATA bit in the TXM interrupt handling routine. To change the CiIER.TXMIE bit to disabled after having set the bit, make the change while no TXM interrupt is generated or during the TXM interrupt handling routine. This also applies to CiMIER1[j-32] (j = 32 to 63).

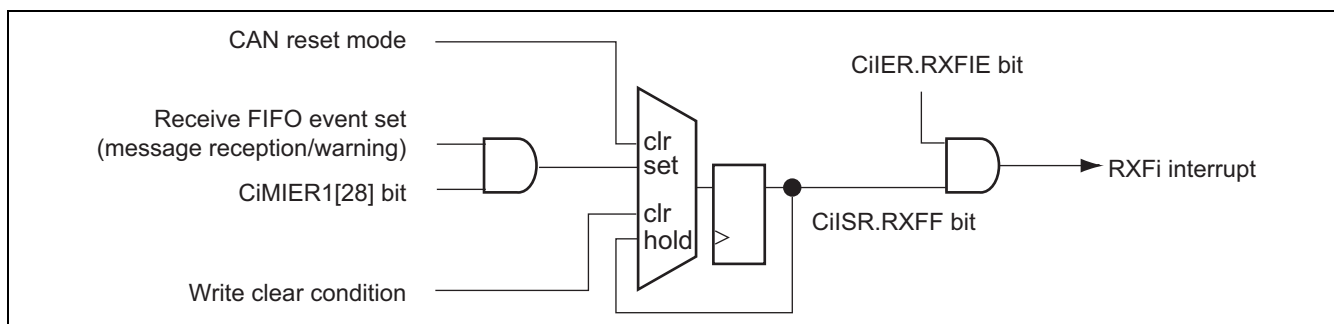

**Figure 38.23 Block Diagram of CANi Transmission Complete Interrupt (Mailbox 32 to 63) [TXMi]**

**(4) CANi receive FIFO interrupt [RXFi]**

If CiRFCR[6:5] are set by the reception of a receive FIFO message or by a warning with the settings of CiMIER1[29:28], the CiISR.RXFF bit is set to "1". When the receive FIFO (RXF) interrupt has been enabled with the CiIER.RXFIE bit, the RXF interrupt is requested to the interrupt controller.

To clear the RXF interrupt, clear the CiISR.RXFF bit in the RXF interrupt handling routine. To change the CiIER.RXFIE bit to disabled after having set the bit, make the change while no RXF interrupt is generated or during the RXF interrupt handling routine. This also applies to CiMIER1[28].

**Figure 38.24 Block Diagram of CANi Receive FIFO Interrupt [RXFi]**

**(5) CANi transmit FIFO interrupt [TXFi]**

When the transmission of a transmit FIFO message is counted for the specified number of times with the settings of CiMIER1 [25:24], the CiISR.TXFF bit is set to "1". When the transmit FIFO (TXF) interrupt has been enabled with the CiIER.TXFIE bit, the TXF interrupt is requested to the interrupt controller.

To clear the TXF interrupt, clear the CiISR.TXFF bit in the TXF interrupt handling routine. To change the CiIER.TXFIE bit to disabled after having set the bit, make the change while no TXF interrupt is generated or during the TXF interrupt handling routine. This also applies to CiMIER1[24].

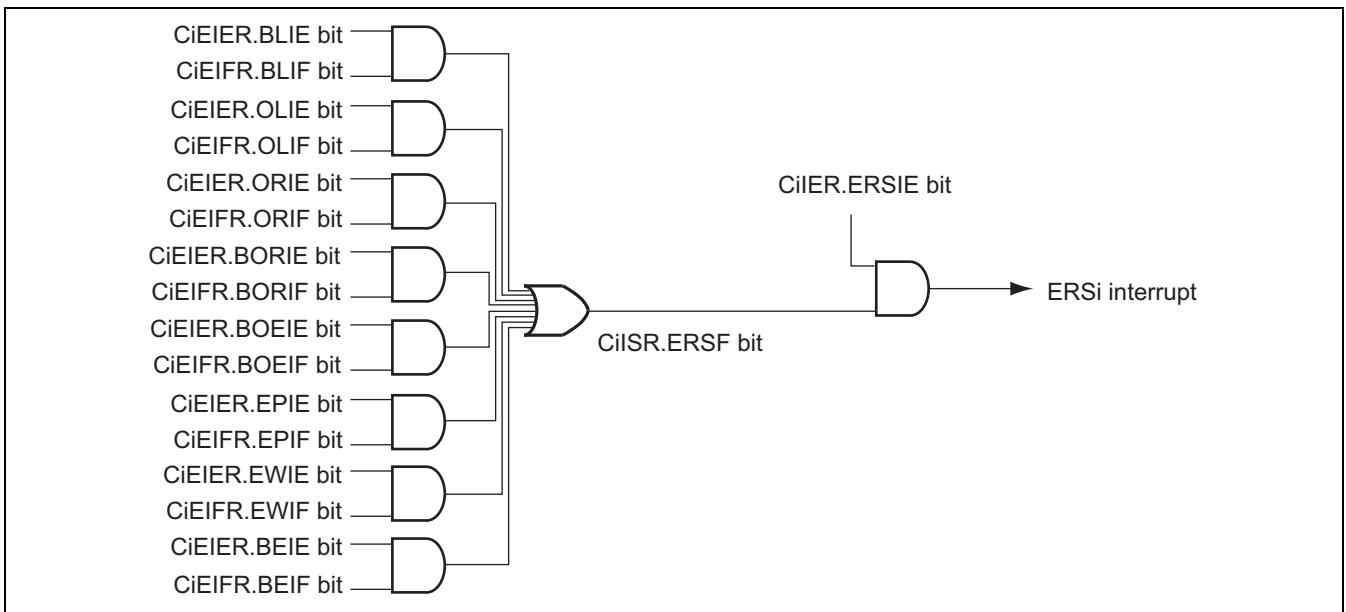

**Figure 38.25 Block Diagram of CANi Transmit FIFO Interrupt [TXFi]**

**(6) CANi error interrupt [ERSi]**

If CiEIFR[j] is set by a communication error, the CiISR.ERSF bit is set to "1" when the corresponding CiEIER[j] has been set to "1". When the error (ERS) interrupt has been enabled with the CiIER.ERSIE bit, the ERS interrupt is requested to the interrupt controller.

To clear the ERS interrupt, clear each CiEIFR[j] register bit in the ERS interrupt handling routine. To change the CiIER.ERSIE bit to disabled after having set the bit, make the change while no ERS interrupt is generated or during the ERS interrupt handling routine. This also applies to CiEIER[j] (j = 7 to 0).

**Figure 38.26 Block Diagram of CANi Error Interrupt [ERSi]**

## 39. PCIEC

RZ/G1H

RZ/G1N

RZ/G1M

RZ/G1E

### 39.1 Overview

This module performs PCIEC controls, and transfers data between this LSI internal bus (AXI bus) and the PCI devices connected to the PCIEC. This module facilitates the design of systems using the PCI Express while at the same time permitting high-speed data transfers in a compact system.

This module functions as a bus bridge connecting the PCI Express to this LSI internal bus (AXI bus), and provides transfer channels between PCI Express devices and devices connected to the LSI internal bus (AXI bus).

This LSI incorporates a PCI Express physical module that supports one lane ( $\times 1$ ).

This module has two modes: a Root Port and an Endpoint and can operate as a Root Port or Endpoint that is defined in the PCI Express specification.

#### 39.1.1 Features

This module has the following features.

- Functions as a bridge that connects the PCI Express to the LSI internal bus (AXI bus)
  - Generates a PCIe packet from the AXI bus transaction to the PCI area
  - Generates a AXI bus transaction from a PCI Express packet
- Supports high-speed data transfer between PCI Express devices and internal bus (AXI bus) via the internal DMAC
- Supports the subset of PCI Express Base Specification Revision 2.0 (Dec. 20, 2006)
- Operates as a PCI Express Endpoint or a PCI Express Root Port
- Supports the requester and completer functions for the PCIe transaction
- Incorporates configuration registers and the following capability structures
  - Power management capability structure
  - MSI capability structure (supports masking function and pending bits.)
  - PCI Express capability structure
  - Virtual channel capability structure
- Supports interrupts by INTx and MSI
- Supports one lane ( $\times 1$ )
- Supports multiple speeds (2.5 GT/s and 5.0 GT/s).
- Automatically performs link training and link configurations
- Supports the D+/D-line automatic swap function (lane polarity inversion)
- Achieves QoS through transaction ordering.
- Automatically performs flow control by managing six types of credits
- Automatic handling function by hardware
- Buffer for holding error packet headers and error indication status provided
- Supports the link power control function (L0, L0s, and L1 states)
- Supports device power control function (D0, D3<sub>hot</sub>, and D3<sub>cold</sub> states).
- Supports 128-byte max payload size.
- Supports completion timeout disable.

Note: This module does not support the following PCI Express functions.

- Expansion ROM for system boot
- Card bus

- Phantom function
- Power-management event (PME) handling by hardware
- Slot function (including Hot Plug)
- AER function
- BIST function
- Surprise Down error function
- ARI forwarding function
- Port arbitration function
- Peer-to-peer transfer

### 39.1.2 Block Diagram

Figure 39.1 shows a block diagram of the PCIEC.

The PCIEC comprises a bridge, PCIEC controller, and PCIEC physical unit.

The bridge provides the bridge function of connecting the internal bus (AXI bus) to the PCI Express controller.

The PCIEC controller is a block that controls the PCI Express packet transmission and reception, and it implements the functions of transaction and data link layers that are defined by the PCI Express standards. The configuration registers defined by the PCI Express standards are installed in this block.

The PCIEC physical unit is a block that controls PCI Express transmission paths, and implements the physical layer function that is defined by the PCI Express standards.

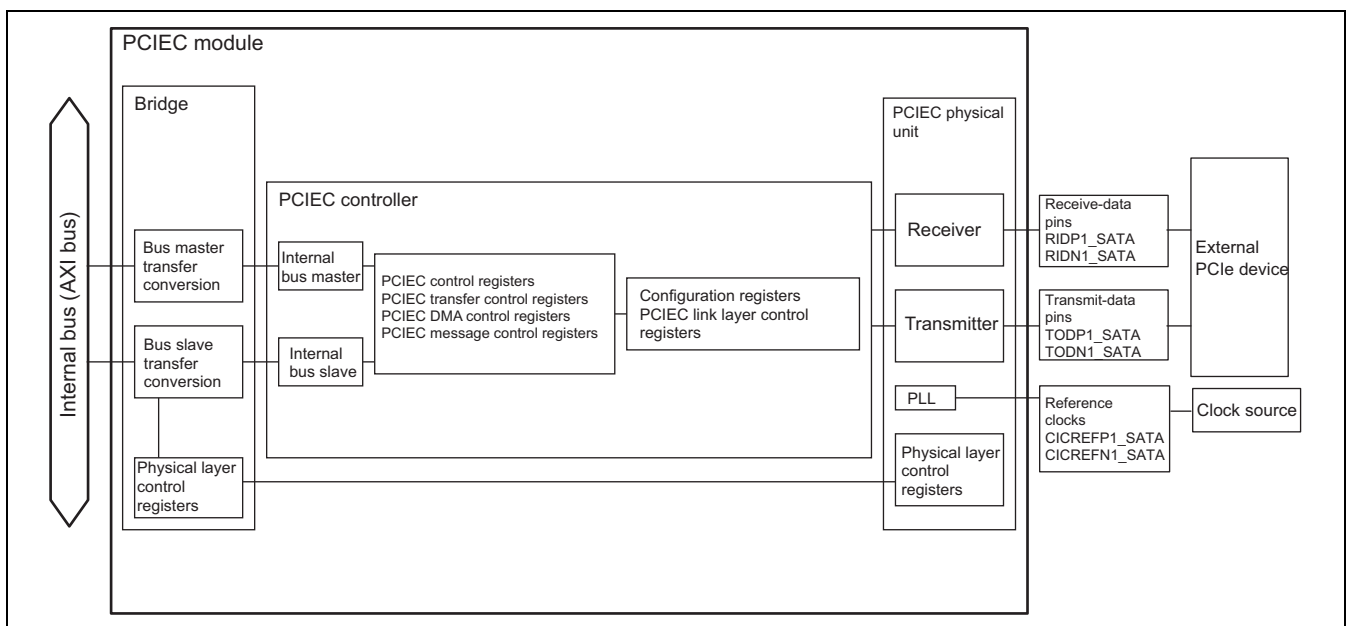

Figure 39.1 Block Diagram

### 39.1.3 External Pins

Table 39.1 shows the pin configuration.

**Table 39.1 Pin Configuration**

Signal Name	Signal Conforming to PCI Standard	I/O	Description	RZ/G Series Products			
				RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
CICREFP1_SATA CICREFN1_SATA	REFCLK+ REFCLK-	Input	Reference clock inputs to the PLL incorporated in the PCIEC module (differential inputs). 100-MHz clock should be applied.	√	√	√	—
AMON1_SATA	—	Input /Output	Debug pins for PCIEC; do not use these pins usually. Nothing must be connected to these pins on the board (NC).	√	√	√	—
TODP1_SATA TODN1_SATA	PETp0 PETn0	Output	Transmit data pins used by a physical module, where 2.5- or 5.0-GHz signals are propagated. (Differential output)	√	√	√	—
RIDP1_SATA RIDN1_SATA	PERp0 PERn0	Input	Receive data pins used by a physical module, where 2.5- or 5.0-GHz signals are propagated. (Differential input)	√	√	√	—

### 39.1.4 Register Configuration

Table 39.3 shows the PCIEC registers. In this table, the Address Offset columns show an offset for each register from the PCIEC base address. The actual access address is obtained by adding each offset to the PCIEC base address. Table 39.2 shows the PCIEC base address. These registers should be accessed through the AXI bus. Only the little endian mode can be used for this module.

**Table 39.2 PCIEC Base Address**

PCI Express	
Base Address	H'FE00_0000

Notes: 1. AX: AXI bus (internal bus)

PCI: PCI local bus

'—' in R/W column: Access prohibited.

For details of R/W attribute for each bit, see section 39.2, Register Description.

2. Depends on the setting of the local address mask register 0.

3. Depends on the setting of the local address mask register 1.
4. Depends on the setting of the local address mask register 2.
5. Depends on the setting of the local address mask register 3.
6. Depends on the setting of the local address mask register 4.
7. Depends on the setting of the local address mask register 5.

Do not write to any addresses other than listed above. Operations cannot be guaranteed if writing is attempted. Values read from addresses other than those listed above are undefined.

## 39.2 Register Description

[Legend for the Register Description]

A bit assignment figure is shown for each register. The initial value and R/W attribute are indicated for each bit.

Bit: Bit number or bit range

Bit Name: Bit name or field name

Initial value: Register value after a reset

—: Undefined value

R/W: Readable/writable. The written value can be read.

RWC1: Readable/writable. The bit is initialized when 1 is written. Writing 0 is ignored.

R: Read-only. The write value should always be 0. (If there is a direction on a read or write value in the Description column, set the bit as directed.)

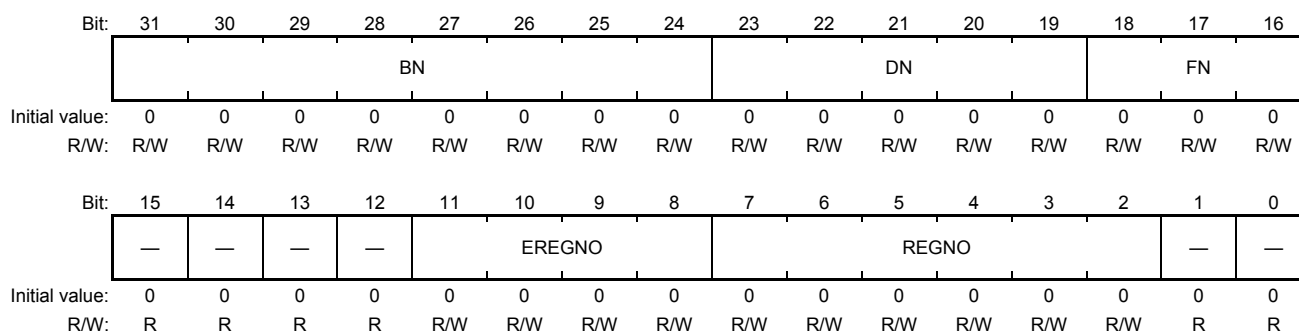

RWS\*: Sticky-read write bit. Readable/writable. The bit is not initialized by a hot reset.

RW1CS\*: Sticky-read-only status bit. The bit is initialized when 1 is written. Writing 0 is ignored. The bit is not initialized by a hot reset.

Note: \* RWS and RW1CS are only used for the configuration registers. For details, see section 39.4.1, Write/Read Attributes of Configuration Registers.

### 39.2.1 Configuration Transmission Address Register (PCIECAR)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	—

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	BN	H'00	R/W	<b>Bus Number</b> Specifies the number of the bus to be accessed when a configuration request is issued.
23 to 19	DN	00000	R/W	<b>Device Number</b> Specifies the number of the device to be accessed when a configuration request is issued.  Note: A type 0 configuration request can be issued only to device #0; do not send a type 0 configuration request to the device with the other number.
18 to 16	FN	000	R/W	<b>Function Number</b> Specifies the number of the function to be accessed when a configuration request is issued.
15 to 12	—	All 0	R	<b>Reserved</b> These bits are always read as 0. The write value should always be 0.
11 to 8	EREGNO	H'0	R/W	<b>Extended Register No.</b> Specifies the number of the extended register to be accessed when a configuration request is issued.
7 to 2	REGNO	H'00	R/W	<b>Register No.</b> Specifies the number of the register to be accessed when a configuration request is issued.
1, 0	—	All 0	R	<b>Reserved</b> These bits are always read as 0. The write value should always be 0.

### 39.2.2 Configuration Transmission Control Register (PCIECCTLR)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	—

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	CCIE	0	R/W	<p>Configuration Send Enable</p> <p>Enables issuance of a configuration request.</p> <p>Set to 1 when the configuration transmission address register and configuration transmission data register are used to issue the configuration cycle.</p>
30 to 22	—	All 0	R	<p>Reserved</p> <p>These bits are always read as 0. The write value should always be 0.</p>
21	WUR	0	RW1C	<p>Write Unsupported Request</p> <p>Indicates that an unsupported request has been received.</p> <p>This bit is set to 1 when a completion with the unsupported request status is received in response to the configuration write request transmitted.</p>
20	WCRS	0	RW1C	<p>Write CRS</p> <p>Indicates that CRS (configuration retry status) has been received.</p> <p>This bit is set to 1 when a completion with the CRS status is received in response to the configuration write request transmitted.</p>
19, 18	—	All 0	R	<p>Reserved</p> <p>These bits are always read as 0. The write value should always be 0.</p>
17	RUR	0	RW1C	<p>Read Unsupported Request</p> <p>Indicates that an unsupported request has been received.</p> <p>This bit is set to 1 when a completion with the unsupported request status is received in response to the configuration read request transmitted.</p>
16	RCRS	0	RW1C	<p>Read CRS</p> <p>Indicates that CRS (configuration retry status) has been received.</p> <p>This bit is set to 1 when a Completion with the CRS status is received in response to the configuration read request transmitted.</p>
15 to 9	—	All 0	R	<p>Reserved</p> <p>These bits are always read as 0. The write value should always be 0.</p>

Bit	Bit Name	Initial Value	R/W	Description
8	TYPE	0	R/W	<p>TYPE</p> <p>Specifies the type of a configuration request issued by accessing the PCIECDR register.</p> <p>0: Type 0 configuration request 1: Type 1 configuration request</p> <p>Note: A type 0 configuration request can be issued only to device #0; do not send a type 0 configuration request to the device with the other number.</p>
7 to 0	—	All 0	R	<p>Reserved</p> <p>These bits are always read as 0. The write value should always be 0.</p>

### 39.2.3 Configuration Transmission Data Register (PCIECDR)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	—

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CDR	—	R/W	<p>Configuration Data Register</p> <p>Allows a configuration request to be issued.</p> <p>A write access to this field allows issuance of a configuration write request containing the information written to this field as data.</p> <p>A read access to this field allows issuance of a configuration read request and reading of the data contained in the response.</p> <p>When the peer device returns an unsupported request response, the read value is H'FFFFFFFF.</p> <p>When EXPCAP7[4].CRSVISE = 0:</p> <p>When the peer device returns a CRS response, the read value is H'FFFFFFFF (error response).</p> <p>When EXPCAP7[4].CRSVISE = 1:</p> <p>Until the peer device returns a response other than a CRS response, the first access to the peer device should be a read access to register address 0.</p> <p>When the peer device returns a CRS response, the read value is H'FFF0001.</p> <p>In Endpoint mode, this field must not be accessed.</p> <p>Except when PCIECCTLR.CCIE = 1 and PCIETCTLR.CFINIT = 1, the read value is H'FFFFFFFF.</p>

### 39.2.4 Mode Setting Register (PCIEMSR)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	—

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PEM
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	PEM	1	R/W	PCI Express Mode Sets operating mode of the PCI Express. 0: Operates as a PCI Express Endpoint. 1: Operates as a PCI Express Root Port.

### 39.2.5 Unlock Transmission Control Register (PCIEUNLOCKCR)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	—

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ASTUN LOCK
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	ASTUNLOCK	0	R/W	Assert Unlock Specifies issuance of an unlock message. Writing 1 to this bit allows issuance of an unlock message (message code = B'0000_0000; routing = B'011). Transmission of an unlock message through a write access to this bit can be used only in Root Port mode. Transmission of an unlock message from an Endpoint is prohibited by the standard. While a link is not established, do not write 1 to this bit. This bit is always read as 0.

### 39.2.6 INTx Register (PCIEINTXR)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	—

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ASTINT X
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	INTDE	INTCE	INTBE	INTAE	—	—	—	—	INTD	INTC	INTB	INTA
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	ASTINTX	0	R/W	Assert INTx Specifies generation of an INTx interrupt. Writing 1 to this bit asserts the INTx interrupt specified by the PCICONF15[15:8].Interrupt Pin bits and writing 0 deasserts the INTx interrupt. When generating an INTx interrupt using this bit, the PCICONF1[10].INTDIS bit must be 0. This bit is cleared if the PCICONF1[10].Interrupt Disable bit is set to 1 while this bit is 1. When MSI is used, an INTx interrupt cannot be used. Therefore, when the MSICAP0[16].MSI Enable bit is 1, 1 cannot be written to this bit. This bit is cleared if the MSICAP0[16].MSI Enable bit is set to 1 while this bit is 1. This bit is valid only in Endpoint mode. When a link goes down, this bit is cleared. A write access is ignored while a link is down.
15 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11	INTDE	0	R/W	INTD Enable Enables generation of an interrupt by INTD assertion. This bit is valid only in Root Port mode.
10	INTCE	0	R/W	INTC Enable Enables generation of an interrupt by INTC assertion. This bit is valid only in Root Port mode.
9	INTBE	0	R/W	INTB Enable Enables generation of an interrupt by INTB assertion. This bit is valid only in Root Port mode.
8	INTAE	0	R/W	INTA Enable Enables generation of an interrupt by INTA assertion. This bit is valid only in Root Port mode.

Bit	Bit Name	Initial Value	R/W	Description
7 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3	INTD	0	R	Indicates that INTD has been asserted by a PCI Express interrupt. This bit is asserted upon reception of an Assert_INTD message and deasserted upon reception of a Deassert_INTD message. When this bit is asserted while PCICONF15[7:0].Interrupt Line is not H'FF and PCIEINTXR[11].INTDE is 1, the interrupt is generated. This bit is valid only in Root Port mode.
2	INTC	0	R	Indicates that INTC has been asserted by a PCI Express interrupt. This bit is asserted upon reception of an Assert_INTC message and deasserted upon reception of a Deassert_INTC message. When this bit is asserted while PCICONF15[7:0].Interrupt Line is not H'FF and PCIEINTXR[10].INTCE is 1, the interrupt is generated. This bit is valid only in Root Port mode.
1	INTB	0	R	Indicates that INTB has been asserted by a PCI Express interrupt. This bit is asserted upon reception of an Assert_INTB message and deasserted upon reception of a Deassert_INTB message. When this bit is asserted while PCICONF15[7:0].Interrupt Line is not H'FF and PCIEINTXR[9].INTBE is 1, the interrupt is generated. This bit is valid only in Root Port mode.
0	INTA	0	R	Indicates that INTA has been asserted by a PCI Express interrupt. This bit is asserted upon reception of an Assert_INTA message and deasserted upon reception of a Deassert_INTA message. When this bit is asserted while PCICONF15[7:0].Interrupt Line is not H'FF and PCIEINTXR[8].INTAE is 1, the interrupt is generated. This bit is valid only in Root Port mode.

R/W:	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9	PM_PME	0	R/W	Specifies issuance of a PM_PME message. Writing 1 to this bit allows issuance of a PM_PME Message (message code = B'0001_1000; routing = B'000). This bit is always read as 0. Transmission of a PM_PME message through a write access to this bit can be used only in Endpoint mode. Transmission of a PM_PME message from a Root Port is prohibited by the standard. While a link is not established, do not write 1 to this bit.
8 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

### 39.2.10 Physical Layer Status Register (PCIEPHYSR)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	—

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	PHYRDYCE	0	R/W	PHYRDY Change Enable Enables generation of an INT_PCISC interrupt upon change of PHYRDY.
23 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	PHYRDYC	0	RW1C	PHYRDY Change Indicates that PHYRDY has changed.
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	PHYRDY	0	R	0: Indicates that the clock supplied by the physical layer has not been stabilized and that it is not ready to be used. 1: Indicates that the clock supplied by the physical layer has been stabilized and that it is ready to be used.

### 39.2.11 MSI Transmission Register (PCIEMSITXR)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	—

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MSIE	—	—	—	—	—	—	—	—	—	—	MMENUM				
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MSIPC LR	—	—	—	—	—	—	—	—	—	—	MSIAST				
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	MSIE	0	R	MSI Enable Indicates the MSICAP0[16]. MSIE value.
30 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20 to 16	MMENUM	0_0000	R	Multiple Message Enable Number Indicates the number of sources specified with MSICAP0[22:20].MMESE. 0_0000: 1 source (only source number 0 is available) 0_0001: 2 sources (source numbers 0 and 1 are available) 0_0011: 4 sources (source numbers 0 to 3 are available) 0_0111: 8 sources (source numbers 0 to 7 are available) 0_1111: 16 sources (source numbers 0 to 15 are available) 1_1111: 32 sources (source numbers 0 to 31 are available)
15	MSIPC LR	0	R/W	MSI Pending Clear Forcibly clears the MSI interrupt sources to be transmitted. If the MSI source is canceled because of the user side reason (internal source), set the information of the MSI interrupt to be cleared to the MSI Assert field, and simultaneously write 1 to this bit. In the other cases, hold this bit to 0. This bit is always read as 0.
14 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

---

Bit	Bit Name	Initial Value	R/W	Description
4 to 0	MSIAST	0_0000	R/W	<p>MSI Assert</p> <p>Specifies generation of an MSI interrupt.</p> <p>This field is valid only when the MSI is enabled in Endpoint mode.</p> <p>A write access to this field allows setting of the relevant bits to 1 in MSICAP5.Message Pending. After that, among the MSI interrupts whose corresponding bits are 0 in MSICAP4.Message Mask, the MSI interrupts are allowed to be generated one by one in ascending order of the assigned number.</p> <p>The maximum source number that may be written to this field is indicated by the Multiple Message Enable Number field.</p> <p>These bits are always read as 0.</p> <p>While communication with the connection destination device is not established, do not write to this field.</p>

---

### 39.2.12 Transfer Control Register (PCIETCLR)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	—

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	DL_DOWN	—	—	CF_INIT
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3	DL_DOWN	1	R	DL_DOWN Indicates whether connection in the data link layer is lost. This bit is set to 1 after cancellation of a reset. This bit is cleared to 0 when a connection with the target device is established, and set to 1 when a connection in the data link layer is lost due to communication failure.
2, 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	CFINIT	0	R/W	Configuration Initialization Specifies initialization of registers to establish a PCI Express link. Set this bit to 1 after setting the appropriate values in the following registers. PCIELAR0 to PCIELAR 5 PCIELAMR0 to PCIELAMR5 The above registers must not be written to while this bit is 1. Setting this bit starts PCI Express link establishment process. Only writing 1 to this bit is valid; writing 0 is invalid. Write 1 at initialization only once and do not write any value to this bit after that. 0: Initialization has not yet been done. 1: Initialization has been completed. In Endpoint mode: Triggered by this bit, hardware sets the BARn registers based on PCIELAMRn.

### 39.2.13 Transfer Status Register (PCIETSTR)

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	RW1C	RW1C	R	R	RW1C	RW1C	R	RW1C	RW1C	RW1C	R	R	RW1C	RW1C

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	IBERR	0	RW1C	IBERR Indicates that a transfer error has occurred on the internal bus.
27	MTLP	0	RW1C	MTLP Indicates that a malformed TLP has been received.
26	UR	0	RW1C	UR Indicates that an unsupported request has been received.
25	PTLP	0	RW1C	PTLP Indicates that a poisoned TLP has been received.
24 to 22	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
21	POVF	0	RW1C	POVF Indicates that the posted request packet reception buffer has overflowed.
20	NPOVF	0	RW1C	NPOVF Indicates that the non-posted request packet reception buffer has overflowed.
19 to 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13	RCVCP LLK	0	RW1C	Receive Completion Lock Indicates that a completion lock (without data) has been received. This completion is returned when memory locking of the device supporting memory lock has failed.
12	UNEXP CPL	0	RW1C	Unexpected Completion Indicates that an unexpected completion has been received.

Bit	Bit Name	Initial Value	R/W	Description
11, 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9	RCVSZECPL	0	RW1C	Receive Size Error Completion Indicates that the size of the completion received is different from the requested size.
8	CPLTOUT	0	RW1C	CPL Timeout Indicates that a completion timeout has occurred.
7	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
6	RCVCRSCPL	0	RW1C	Receive Configuration Retry Status Completion Indicates that a completion with the configuration retry status has been received.
5	RCVCACPL	0	RW1C	Receive Completion Abort Status Completion Indicates that a completion with the completion abort status has been received.
4	RCVURCPL	0	RW1C	Receive Unsupported Request Status Completion Indicates that a completion with the unsupported request status has been received.
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	SENDCACPL	0	RW1C	Send Completion Abort Status Completion Indicates that a completion with the completion abort status has been transmitted.
0	SENDURCPL	0	RW1C	Send Unsupported Request Status Completion Indicates that a completion with the unsupported request status has been transmitted.

### 39.2.17 Error Interrupt Enable Register (PCIEERRFER)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	—

This register determines whether to reflect the occurrence of errors to PCIEINTR.INT\_PCISERR.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R	R	R/W	R/W	R	R	R/W	R/W	R	R/W	R/W	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	IBERRE	0	R/W	IBERRE Enables generation of the INT_PCISERR interrupt upon occurrence of a transfer error on the internal bus.
27 to 22	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
21	POVFE	0	R/W	POVFE Enables generation of the INT_PCISERR interrupt upon overflow of a posted request packet reception buffer.
20	NPOVFE	0	R/W	NPOVFE Enables generation of the INT_PCISERR interrupt upon overflow of a non-posted request packet reception buffer.
19 to 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13	RCVCP LLKE	0	R/W	Receive Completion Lock Enables generation of the INT_PCISERR interrupt upon reception of the completion lock (without data).
12	UNEXP CPLE	0	R/W	Unexpected Completion Enabled Enables generation of the INT_PCISERR interrupt upon reception of the unexpected completion.
11, 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9	RCVSZ ECPLE	0	R/W	Receive Size Error Completion Enabled Enables generation of the INT_PCISERR interrupt upon reception of the completion whose size is different from the requested size.

Bit	Bit Name	Initial Value	R/W	Description
8	CPLTOUTE	0	R/W	Completion Timeout Interrupt Enable Enables generation of the INT_PCISERR interrupt upon detection of a completion timeout.
7	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
6	RCVCRSCPLE	0	R/W	Configuration Retry Status Completion Receive Interrupt Enable Enables generation of the INT_PCISERR interrupt upon reception of a completion with the configuration retry status.
5	RCVCACPLE	0	R/W	Completion Abort Status Completion Receive Interrupt Enable Enables generation of the INT_PCISERR interrupt upon reception of a completion with the completion abort status.
4	RCVURCPLE	0	R/W	Unsupported Request Status Completion Receive Interrupt Enable Enables generation of the INT_PCISERR interrupt upon reception of a completion with the unsupported request status.
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	SENDACPLE	0	R/W	Send Completion Abort Status Completion Interrupt Enable Enables generation of the INT_PCISERR interrupt upon transmission of a completion with the completion abort status.
0	SENDURCPLE	0	R/W	Send Unsupported Request Status Completion Interrupt Enable Enables generation of the INT_PCISERR interrupt upon transmission of a completion with the unsupported request status.

### 39.2.18 Error Factor Register 2 (PCIEERRFR2)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	—

R/W:	RW1C	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
29	DLLPE	0	RW1C	Data Link Layer Protocol Error Indicates that a data link layer protocol error has occurred.
28	RTO	0	RW1C	Replay Timeout Indicates that a replay timeout has occurred.
27	RNR	0	RW1C	Replay Number Rollover Indicates that a replay number rollover has occurred.
26	BADTLP	0	RW1C	Bad TLP Indicates that a Bad TLP has been detected.
25	BADDLLP	0	RW1C	Bad DLLP Indicates that a Bad DLLP has been detected.
24 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15	RE	0	RW1C	Receiver Error Indicates that a receiver error has been detected.
14 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

### 39.2.19 Transfer Interrupt Enable Register (PCIETIER)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	—

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	MSIEC E	—	—	—	—	—	—	—	—	—	—	—	DLLAC TCE

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	PSTCE	0	R/W	Power State Change Enable Enables generation of the INT_PCISC interrupt upon change of PST. This bit is valid only in Endpoint mode.
23 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

### 39.2.22 MSIF Register (PCIEMSIFR)

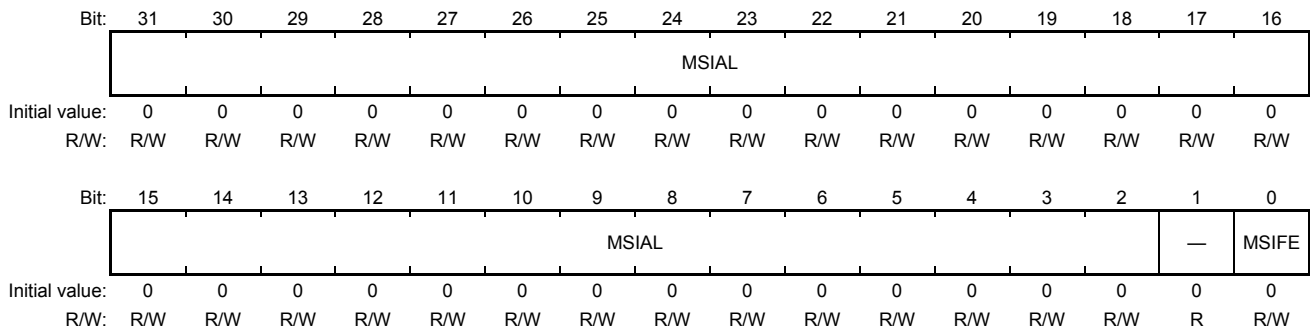

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	—

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	MSIF	All 0	RW1C	<p>MSIF</p> <p>Indicates that an MSI interrupt has occurred.</p> <p>This field is valid only when PCIEMSIALR.MSIFE = 1 in Root Port mode.</p> <p>A write from the internal bus is interpreted as interrupt cancellation thus clearing the bit to 0 to which 1 has been written. A read from the internal bus is processed as a normal read.</p> <p>A 1DW write to the address specified with PCIEMSAUR and PCIEMSIALR from the PCI Express side is interpreted as an MSI interrupt.</p> <p>This IP sets 1 to the bit determined by the sum of the values in bits [4:0] and [12:8] in the write data in order to convert the MSI message data into a flag. Set the function appropriately so that the interrupt should not be reflected to the same bit. A read from the address specified with PCIEMSAUR and PCIEMSIALR from the PCI Express side is processed as a normal read.</p>

**39.2.23 MSI Address Lower Register (PCIEMSIALR)**

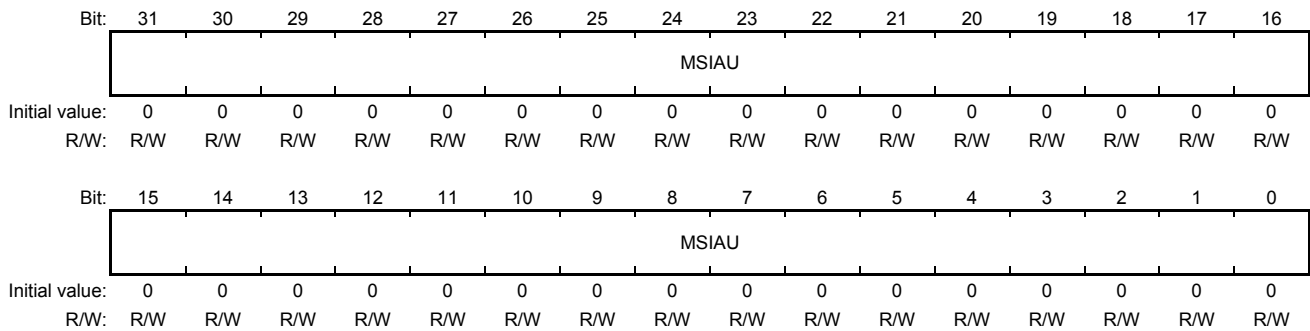

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	—

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	MSIAL	All 0	R/W	MSI Address Lower Specifies the lower address bits [31:2] of the memory write by MSI in the PCI space in Root Port mode. (Refer to section 39.3.3 (6), MSI Reception.) This field is invalid when PCIEMSIALR.MSIFE = 0.
1	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
0	MSIFE	0	R/W	MSIF Enable Enables address decoding of the MSI interrupt. Be sure to set this bit to 0 in Endpoint mode.

**39.2.24 MSI Address Upper Register (PCIEMSIUR)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	—

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	MSIAU	All 0	R/W	MSI Address Upper Specifies the upper address bits [63:32] of the memory write by MSI in the PCI space in Root Port mode. (Refer to section 39.3.3 (6), MSI Reception.) This field is invalid when PCIEMSIUR.MSIFE = 0.

**39.2.25 MSI Interrupt Enable Register (PCIEMSIER)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	—

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	MSIIE	All 0	R/W	MSI Interrupt Enable Individually enables the interrupts by MSI in Root Port mode. This field is invalid when PCIEMSIALR.MSIFE = 0.

### 39.2.26 PCI Express Root Port Address Register 0 to 5 (PCIEPRAR0 to PCIEPRAR5)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	—

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	PRAn	All 0	R/W	<p>PCI Express Root Port Address n</p> <p>Specifies the PCI Express address for transferring a transaction from the PCI Express to the internal bus in Root Port mode.</p> <p>This field is invalid in Endpoint mode.</p> <p>Set the appropriate value corresponding to the local address registers and local address mask registers. Modify this field only when no access should occur to the corresponding PCI Express, for example, while a link is down and the master enable of the peer is off.</p>

**39.2.27 Local Address Register 0 to 5 (PCIELAR0 to PCIELAR5)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	—

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	LAn	All 0	R/W	<p>Local Address n</p> <p>Indicates the local (internal bus) address for transferring a transaction from the PCI Express to the internal bus.</p> <p>When the addresses in the space allocated by the BARn of the PCI Express are translated into the internal bus space addresses, this field is used as the upper address bits. The lower address bits of the PCI Express packets are used as the lower address bits. The boundary between upper and lower bits is determined by PCIELAMR0 to PCIELAMR5.</p> <p>Writing to this field is prohibited while PCIETCTLR.CFINIT is 1.</p> <p>When a 64-bit access is enabled with PCIELAMR0 to PCIELAMR5, write 0 to all the bits in PCIELARn + 1.</p> <p>The write value for bits 1 and 0 should always be 0.</p>

### 39.2.28 Local Address Mask Register 0 to 5 (PCIELAMR0 to PCIELAMR5)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	—

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	LAMn	All 0	R/W	<p>Local Address Mask n</p> <p>Masks the local (internal bus) addresses when transactions are transferred from PCI Express to the internal bus.</p> <p>When the addresses in the space allocated by the BARn of the PCI Express are translated into the internal bus space addresses, the PCIELARn.LAn value is used as the upper bits while the address in the PCI Express packet header is used as the lower bits. This field determines the boundary between upper and lower bits. Therefore, this field also determines the size of the space to be allocated to the PCI Express space.</p> <p>B'0000_0000_0000_0000_0000_0000_0000: 4, 8, or 16 bytes            B'0000_0000_0000_0000_0000_0000_0001: 32 bytes            B'0000_0000_0000_0000_0000_0000_0011: 64 bytes            B'0000_0000_0000_0000_0000_0000_0111: 128 bytes            B'0000_0000_0000_0000_0000_0000_1111: 256 bytes            (Omitted)            B'0000_1111_1111_1111_1111_1111_1111: 256 Mbytes            B'0001_1111_1111_1111_1111_1111_1111: 512 Mbytes            B'0011_1111_1111_1111_1111_1111_1111: 1 Gbyte            B'0111_1111_1111_1111_1111_1111_1111: 2 Gbytes            B'1111_1111_1111_1111_1111_1111_1111: 4 Gbytes</p> <p>This field must not be set to any value other than those given above.</p> <p>Writing to this field is prohibited when PCIETCTLR.CFINIT is 1.</p> <p>When using the space as a memory space, set a size of 128 bytes or more with BAR.</p> <p>When setting a 4-Gbyte space, set 64M_IOLAMB2 to 1.</p> <p>When 64-bit addresses are used with PCIELAMRn, PCIELAMRn + 1 is used as the upper address of PCIELAMRn, and so PCIELAMRn cannot be used as an independent space. In this case, set this field as follows.</p> <p>B'0000_0000_0000_0000_0000_0000_0000: 4 Gbytes or less</p>

Bit	Bit Name	Initial Value	R/W	Description
3	PMIOLAMnB3	0	R/W	<p>Prefetchable Memory or IO Local Address Mask n Bit 3</p> <ul style="list-style-type: none"> <li>When IO indicator is 0: <ul style="list-style-type: none"> <li>Specifies memory space prefetch.</li> <li>0: A non-prefetchable memory space is allocated.</li> <li>1: A prefetchable memory space is allocated.</li> </ul> </li> <li>When IO indicator is 1: <ul style="list-style-type: none"> <li>Masks bit 3 as an extension of local address mask n.</li> <li>0: A space of 4 or 8 bytes is allocated.</li> <li>1: A space of 16 bytes or more is allocated.</li> </ul> </li> </ul> <p>Writing to this field is prohibited when PCIETCTLR.CFINIT is 1.</p> <p>When 64-bit addresses are used with PCIELAMRn, PCIELAMRn + 1 is used as the upper address of PCIELAMRn, and so PCIELAMRn cannot be used as an independent space. Set all the bits to 0.</p>
2	64MIOLAMnB2	0	R/W	<p>64-bit Access Space Memory or IO Local Address Mask n Bit 2</p> <ul style="list-style-type: none"> <li>When IO indicator is 0: <ul style="list-style-type: none"> <li>Specifies the width of the addresses to define BAR in the memory space.</li> <li>0: Indicates that 32-bit addresses are used with PCIELAMRn.</li> <li>1: Indicates that 64-bit addresses are used with PCIELAMRn.</li> </ul> </li> <li>When IO indicator is 1: <ul style="list-style-type: none"> <li>Masks bit 2 as an extension of local address mask n.</li> <li>0: A space of 4 bytes is allocated.</li> <li>1: A space of 8 bytes or more is allocated.</li> </ul> </li> </ul> <p>Writing to this field is prohibited when PCIETCTLR.CFINIT is 1.</p> <p>When 64-bit addresses are used with PCIELAMRn, PCIELAMRn + 1 is used as the upper address of PCIELAMRn, and so PCIELAMRn cannot be used as an independent space. Set all the bits to 0.</p>
1	LAREn	0	R/W	<p>Local Address Enable</p> <p>Enables local address.</p> <p>Setting this field to 1 enables transaction transfer in the area specified by PCIELARn and PCIELAMRn. Set this field to 1 to enable address translation by LAn and LAMn.</p> <p>Writing to this field is prohibited when PCIETCTLR.CFINIT is 1.</p> <p>When 64-bit addresses are used with PCIELAMRn, PCIELAMRn + 1 is used as the upper address of PCIELAMRn, and so PCIELAMRn cannot be used as an independent space. Set all the bits to 0.</p>

Bit	Bit Name	Initial Value	R/W	Description
0	IOIND	0	R/W	IO Indicator Specifies the type of space on the PCI Express side allocated for transaction transfer from the PCI Express to the internal bus. 0: Memory space 1: IO space Writing to this field is prohibited when PCIETCTLR.CFINIT is 1. When 64-bit addresses are used with PCIELAMRn, PCIELAMRn + 1 is used as the upper address of PCIELAMRn, and so PCIELAMRn cannot be used as an independent space. Set all the bits to 0.

Note: Setting the memory space type of 1 Mbyte or less (defined in the PCI Express standard 2.2 and the earlier versions) is not supported.

### 39.2.29 PCIEC Address Lower Register 0 to 3 (PCIEPALR0 to PCIEPALR3)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	—

Bit	Bit Name	Initial Value	R/W	Description
31 to 7	PALn	All 0	R/W	PCI Express Address Lower Sets the PCI Express address (lower) for PIO transfer from the internal bus to the PCI Express.
6 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

**39.2.30 PCIEC Address Upper Register 0 to 3 (PCIEPAUR0 to PCIEPAUR3)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	—

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	PAUn	All 0	R/W	PCI Express Address Upper Sets the PCI Express address (upper) for PIO transfer from the internal bus to the PCI Express.

### 39.2.31 PCIEC Address Mask Register 0 to 3 (PCIEPAMR0 to PCIEPAMR3)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	—

Bit	Bit Name	Initial Value	R/W	Description
31 to 7	PAMn	All 0	R/W	<p>PCI Express Address Mask</p> <p>Masks the PCI Express addresses.</p> <p>When the packet accessing the internal bus space n is converted to the PCI Express packet, PAUn and PALn are used as the upper bits while the address on the internal bus packet is used as the lower bits. Here, PAMn determines the boundary between them. That is, the packet address addr[31:0] on the PCI Express is generated as follows.</p> <p>Addr[31:7] = PALn[31:7] when the corresponding bit in PAMn[31:7] is 0, and Addr[31:7] = internal bus - addr[31:7] when the corresponding bit in PAMn[31:7] is 1.</p> <p>Addr[6:0] = internal bus - addr[6:0]</p> <p>According to the setting of this field, the size of the space to which the PCI Express side transactions is transferred is determined as follows.</p> <p>B'0000 0000 0000 0000 0000 0000_0: 128 bytes            B'0000 0000 0000 0000 0000 0000_1: 256 bytes            B'0000 0000 0000 0000 0000 0001_1: 512 bytes            B'0000 0000 0000 0000 0000 0011_1: 1 Kbyte            B'0000 0000 0000 0000 0000 0111_1: 2 Kbytes</p> <p style="text-align: center;">(Omitted)</p> <p>B'0000 0111 1111 1111 1111 1111_1: 128 Mbytes            B'0000 1111 1111 1111 1111 1111_1: 256 Mbytes            B'0001 1111 1111 1111 1111 1111_1: 512 Mbytes            B'0011 1111 1111 1111 1111 1111_1: 1 Gbyte            B'0111 1111 1111 1111 1111 1111_1: 2 Gbytes</p> <p>The area size exceeding the size defined in the address map must not be set.</p> <p>Any value other than those given above must not be set.</p>
6 to 0	—	All 0	R	<p>Reserved</p> <p>These bits are always read as 0. The write value should always be 0.</p>

### 39.2.32 PCIEC Conversion Control Register 0 to 3 (PCIEPTCLR0 to PCIEPTCLR3)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	—

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PARE	—	—	—	—	—	—	—	—	TCn		—	—	—	—	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	LOCKn	—	—	—	SPCn	—	—	—	ZLR	—	—	ATTRn	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	PARE	0	R	PAR Enable Indicates that the PCI Express address upper and lower registers are enabled.
30 to 23	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
22 to 20	TCn	All 0	R/W	Traffic Class Specifies the traffic class (TC) of the PCI Express packet to be transferred.
19 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12	LOCKn	0	R/W	LOCK Sets the lock of PCI Express packets to be transmitted. When this bit is set, locked transactions are transmitted. In Endpoint mode, this bit must not be set. Before making access requiring exclusive processing, confirm that the locked transaction has not caused an error.
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	SPCn	0	R/W	SPC Specifies a transfer destination space. 0: Memory 1: IO (A request cannot be issued to the IO space in Endpoint mode.) When issuing a request to the IO space, be sure to separate the accesses at 1DW boundaries.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
4	ZLR	0	R/W	<p>ZLR</p> <p>Sets the zero-length read.</p> <p>0: A read access to this space is output as a read access as is.</p> <p>1: A 1DW read access to this space is output after converted to a zero-length read.</p> <p>Do not make any read access other than 1DW read access when this bit is set.</p> <p>The read value depends on the dummy data used by PCI Express for zero-length read.</p> <p>According to the standard, the value is undefined.</p> <p>Setting this bit has no effect for write access.</p>
3, 2	—	All 0	R	<p>Reserved</p> <p>These bits are always read as 0. The write value should always be 0.</p>
1, 0	ATTRn	All 0	R/W	<p>ATTR</p> <p>Specifies the attribute of the PCI Express packet to be transferred.</p> <p>ATTR[0]: No snoop</p> <p>ATTR[1]: Relaxed ordering</p> <p>Setting ATTR[0] (no snoop bit) to 1 disables snooping in the transfer destination.</p> <p>Setting ATTR[1] (relaxed ordering bit) to 1 relaxes ordering in the transfer destination.</p>

**39.2.33 PCIEC DMAC DMA Operation Register (PCIEDMAOR)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	—

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	DMAE	0	R/W	DMA Enable Enables DMA function. Set this bit to 1 to use DMA function. This bit must not be cleared to 0 during DMA transfer (PCIEDMCHCR0-7.CHE = 1).
30 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	DMAACT	0	R	DMA Active Indicates whether there is a currently operating DMA channel. 0: No DMA channel is currently operating. 1: At least one DMA channel is currently operating.
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	ABT	0	R/W	Arbitration Specifies the method of arbitration among the channels. 0: CH0 > CH1 > CH2 > CH3 > CH4 > CH5 > CH6 > CH7 1: Round robin mode

**39.2.34 PCIEC DMAC PCIEC Address Lower Register 0 to 7 (PCIEDMPALR0 to PCIEDMPALR 7)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	—

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	PADRLn	All 0	R/W	PCI Express Address Lower Sets the lower 32 bits of the PCI Express address for DMA transfer. Only an 8-byte boundary address can be set.
2 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

**39.2.35 PCIEC DMAC PCIEC Address Upper Register 0 to 7 (PCIEDMPAUR0 to PCIEDMPAUR7)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	—

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	PADRU <sub>n</sub>	All 0	R/W	PCI Express Address Upper Sets the upper 32 bits of the PCI Express address for DMA transfer.

### 39.2.36 PCIEC DMAC Internal Bus Address Register 0 to 7 (PCIEDMIAR0 to PCIEDMIAR7)

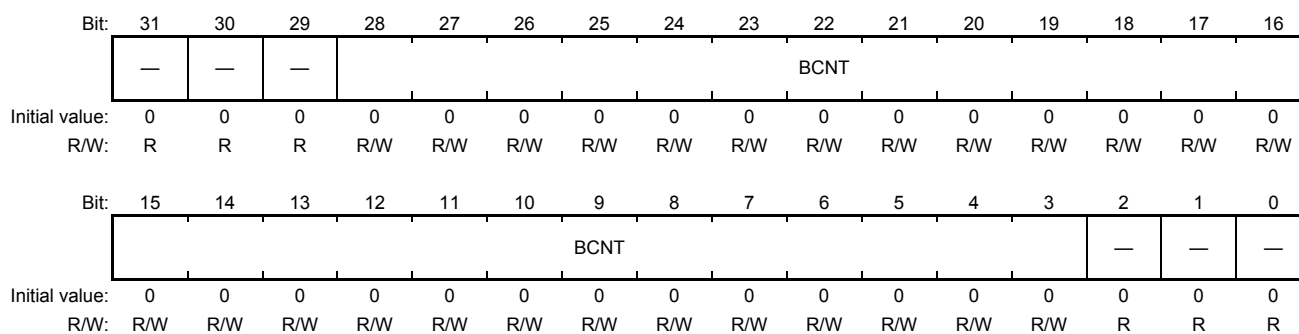

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	—

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	IADRn	All 0	R/W	Internal Address Lower Sets the internal bus address for DMA transfer. Only an 8-byte boundary address can be set. Internal bus addresses for registers or PIO transfer must not be set.
2 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

### 39.2.37 PCIEC DMAC Byte Count Register 0 to 7 (PCIEDMBCNTR0 to PCIEDMBCNTR7)

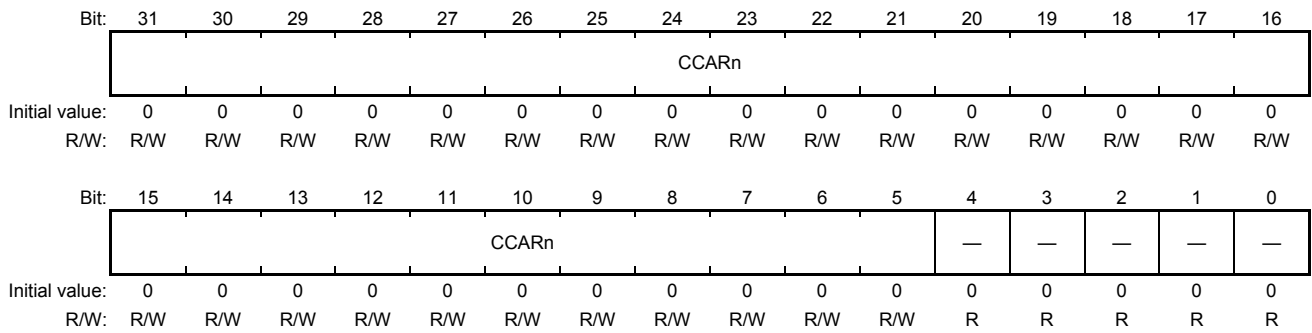

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	—

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28 to 3	BCNT	All 0	R/W	Byte Count Specifies the transfer byte count. Only a multiple of 8 can be specified. In this field, set one-eighth of the number to be specified (omit the lower three bits from the number). When 0 is set, 2 <sup>29</sup> bytes are transferred. Note: If the transfer direction is changed after a transfer, the byte count read value will be undefined until the next transfer byte count is set (written). Be sure to write the byte count after initialization or completion of the previous transfer and before the start of the next transfer. The value before modification cannot be referenced or used.
2 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

**39.2.38 PCIEC DMAC Command Chain Address Register 0 to 7 (PCIEDMCCAR0 to PCIEDMCCAR7)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	—

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	CCARn	All 0	R/W	Command Chain Address Specifies a command chain address for DMA transfer. Only a 32-byte boundary address can be set.
4 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

### 39.2.39 PCIEC DMAC Channel Control Register 0 to 7 (PCIEDMCHCR0 to PCIEDMCHCR7)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	—

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31	DPE	0	RW1C	Detected Parity Error Indicates that a parity error has been detected on the secondary bus side. This bit is set to 1 upon reception of a poisoned TLP.
30	RSE	0	RW1C	Received System Error Indicates that a system error has been detected. This bit is set to 1 upon reception of an ERR_FATAL/NON_FATAL message.
29	RMA	0	RW1C	Received Master Abort Indicates that a master abort has been detected on the secondary bus side. This bit is set to 1 upon reception of a completion with the unsupported request completion status.
28	RTA	0	RW1C	Received Target Abort Indicates that a target abort has been detected on the secondary bus side. This bit is set to 1 upon reception of a completion with the completer abort completion status.
27	STA	0	RW1C	Signaled Target Abort Indicates that a target abort has been transmitted to the secondary bus side. This bit is set to 1 upon transmission of a completion with the completer abort completion status.
26, 25	DEVSELT	All 0	R	DEVSEL Timing Fixed to 0. These bits are not used for PCI Express.
24	MDPE	0	RW1C	MDPE Indicates that a master data parity error has occurred on the secondary bus side. This bit is set when either of the following conditions is satisfied while PCICONF15[16].PERS is 1. 1. A poisoned completion has been received. 2. A poisoned request has been transmitted.
23	FBTCA	0	R	Fast Back to Back Transaction Capable Fixed to 0. This bit is not used for PCI Express.
22	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
21	66MCAP	0	R	66 MHz Capable This bit is always read as 0. The write value should always be 0. This bit is not used for PCI Express.
20 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 12	IOLEA	All 0	R/W	IO Limit End Address According to the PCI standard, sets the address[15:12] of the upper limit address of the IO transaction to be transferred to the primary bus. In this IP, this field has no effect on the hardware.
11 to 8	IOLT	All 0	R/W	IO Limit Type According to the PCI standard, indicates the upper limit address decoding format of the IO transactions to be transferred to the primary bus. H'0: 16-bit I/O address H'1: 32-bit I/O address In this IP, this field has no effect on the hardware.
7 to 4	IOBEA	All 0	R/W	IO Base End Address According to the PCI standard, sets the address[15:12] of the base address of the IO transaction to be transferred to the primary bus. In this IP, this field has no effect on the hardware.
3 to 0	IOBT	All 0	R/W	IO Base Type According to the PCI standard, indicates the base address decoding format of the IO transactions to be transferred to the primary bus. H'0: 16-bit I/O address H'1: 32-bit I/O address In this IP, this field has no effect on the hardware.

**Header TYPE00**

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31 to 0	Card Bus CIS Pointer	All 0	R	R	Card Bus CIS Pointer According to the PCI standard, indicates the value of the card bus CIS pointer. This IP does not support the card bus CIS pointer. Fixed to 0.

**Header TYPE01**

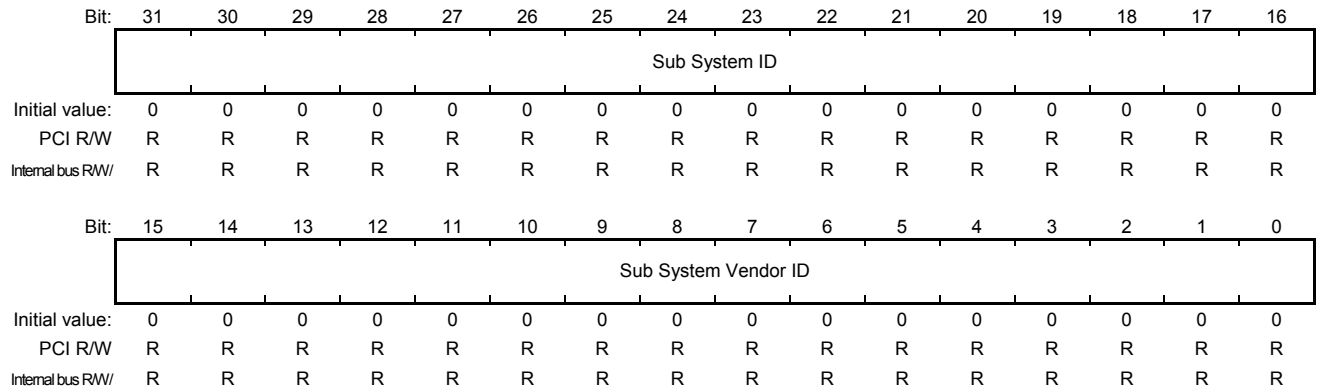

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 0	Prefetchable Memory Base Upper32	All 0	R/W	Prefetchable Memory Base Upper 32 According to the PCI standard, sets the upper limit address of the prefetchable memory performing transfer between the primary IF and the secondary IF. This field corresponds to address[63:32]. This field is valid when PCICONF9[3:0].PM BASE TYPE = H'1 (64-bit address decode format). In this IP, this field has no effect on the hardware.

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 28	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
27	DTSEE	0	R	Discard Timer SERR Enable This bit is always read as 0. The write value should always be 0. This bit is not used for PCI Express.
26	DTSTS	0	R	Discard Timer Status This bit is always read as 0. The write value should always be 0. This bit is not used for PCI Express.
25	SECDT	0	R	Secondary Discard Timer This bit is always read as 0. The write value should always be 0. This bit is not used for PCI Express.
24	PRDT	0	R	Primary Discard Timer This bit is always read as 0. The write value should always be 0. This bit is not used for PCI Express.
23	FBBTCAP	0	R	Fast Back to Back Transaction Capable This bit is always read as 0. The write value should always be 0. This bit is not used for PCI Express.
22	SECBRST	0	R/W	Secondary Bus Reset Resets the secondary IF. Setting this bit to 1 causes the LTSSM to make a transition to the hot reset state. Clearing this bit cancels the hot reset state of LTSSM.
21	MABMD	0	R	Master Abort Mode This bit is always read as 0. The write value should always be 0. This bit is not used for PCI Express.
20	VGA16DEC	0	R/W	VGA 16-bit Decode According to the PCI standard, enables VGA IO decoding. In this IP, this field has no effect on the hardware.
19	VGAE	0	R/W	VGA Enable According to the PCI standard, enables VGA address translation. In this IP, this field has no effect on the hardware.
18	ISAE	0	R/W	ISA Enable According to the PCI standard, enables ISA IO address translation. In this IP, this field has no effect on the hardware.

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
17	SERRE	0	R/W	<p>SERR Enable</p> <p>Enables ERR_FATAL/ERR_NONFATAL/ERR_COR message transfer (notification) from the secondary IF to the primary IF.</p> <p>1: Enables error message transfer (notification). 0: Disables error message transfer (notification).</p>
16	PERS	0	R/W	<p>Parity Error Response</p> <p>Enables setting of the PCICONF7[24].MDPE bit.</p>
15 to 8	Interrupt Pin	All 0	R/W	<p>Interrupt Pin</p> <p>Specifies a legacy interrupt message to be used by the device. When no legacy interrupts are used, set 0.</p>
7 to 0	Interrupt Line	H'FF	R/W	<p>Interrupt Line</p> <p>According to the PCI standard, indicates information on legacy interrupt routing.</p> <p>According to this IP, the set values are defined as follows.</p> <p>H'00 - H'FE: INTx interrupt is reported to INTC. H'FF: INTx interrupt is not reported to INTC.</p>

#### Header TYPE00

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
PCI R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
PCI R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31 to 0	—	All 0	R	R	Reserved These bits are always read as 0. The write value should always be 0.

#### Header TYPE01

- Root capabilities register

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

- Root control register

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	CRSVIS	0	RW	CRS Software Visibility Indicates whether Root Port has the function of returning Configuration Retry Status to the upper software. Set the device function at initialization.

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
15 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	CRSVISE	0	RW	CRS Software Visibility Enable Enables Root Port to return Configuration Retry Status to the upper software. Before setting this bit to 1, the CRSVIS bit should be set. If these bits are set at the same time, CRSVISE is not set to 1. Setting this bit to 1 changes Configuration access behavior. For details, see section 39.3.2, Configuration Cycle.
3	PMEINTE	0	RW	PME Interrupt Enable Enables Root Port to generate the interrupt to the upper software upon reception of a PME message. 0: If a PM_PME has been received when another PM_PME is received, EXPCAP8[15:0].PME_RequesterID is overwritten. 1: If a PM_PME has been received when another PM_PME is received, EXPCAP8[15:0].PM_RequesterID is not overwritten. PM_RequesterID of the PM_PME received later is placed in the pending state. At this time, all the receive operations are stopped. Thus, always clear EXPCAP8[16].PMEST.
2	SERRFEE	0	RW	System Error on Fatal Error Enable Enables Root Port to generate the interrupt to the upper software upon reception of an ERR_FATAL message or occurrence of an error reported by Root Port itself.
1	SERRNFEE	0	RW	System Error on Non-fatal Error Enable Enables Root Port to generate the interrupt to the upper software upon reception of an ERR_NONFATAL message or occurrence of an error reported by Root Port itself.
0	SERRCEE	0	RW	System Error on Correctable Error Enable Enables Root Port to generate the interrupt to the upper software upon reception of an ERR_COR message or occurrence of an error reported by Root Port itself.

## 39.2.74 PCI Express Capability Register 8 (EXPCAP8)

PCI R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31 to 0	—	All 0	R	R	Reserved These bits are always read as 0. The write value should always be 0.

## Header TYPE01

- Root status register

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PMEPD	PMEST
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW1C

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PME Requester ID															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 18	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
17	PMEPD	0	R	PME Pending Indicates that another PME is pending when this bit is 1. If the PME status is cleared by the upper software with PMEPD = 1 and PMEST = 1, PMEST is set to 1 again and the pending requester ID is set in the PME Requester ID bits.

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
16	PMEST	0	RW1C	PME Status Indicates that PME has been received from the requester indicated by the PME Requester ID bits. This bit is set to 1 when the PME is received and cleared to 0 when the upper software writes 1 to this bit.
15 to 0	PME Requester ID	All 0	R	PME Requester ID Indicates the requester ID having issued the PME. This field sets the requester ID on reception of PME.

Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31 to 0	Device Serial Number 2nd	All 0	R	R	Device Serial Number 2nd Indicates the serial number of the device. This field reflects the value of the DSERSETR1 field.

**39.2.91 ID Setting Register 0 (IDSETR0)**

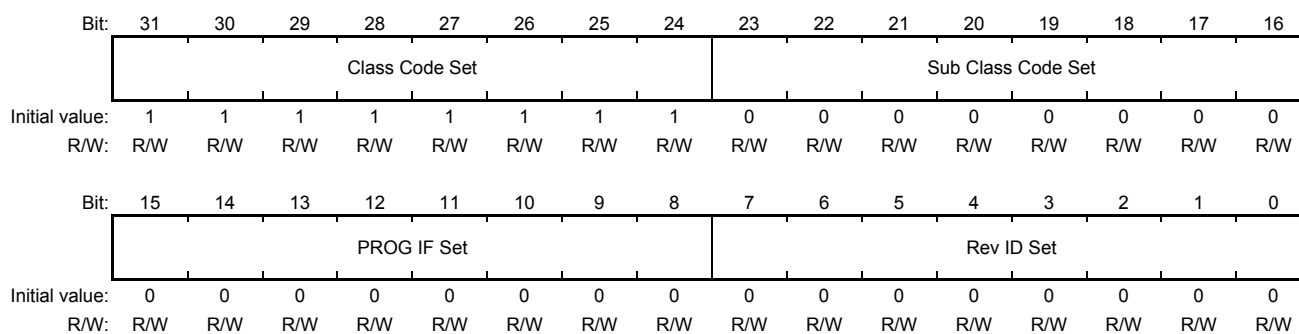

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	—

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	Device ID Set	H'001F	R/W	Device ID Set Indicates the device ID. The value of this field is reflected to PCICONF0[31:16].Device ID.
15 to 0	Vendor ID Set	H'1912	R/W	Vendor ID Set Indicates the PCI device vendor ID. The value of this field is reflected to PCICONF0[15:0].Vendor ID.

### 39.2.92 ID Setting Register 1 (IDSETR1)

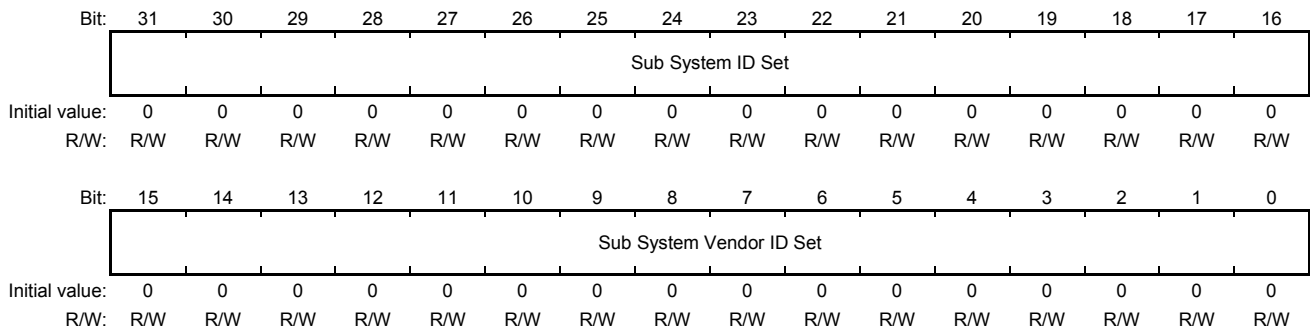

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	—

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	Class Code Set	H'FF	R/W	Class Code Set Set the class code at initialization. The value of this field is reflected to PCICONF2[31:24].Class Code.
23 to 16	Sub Class Code Set	H'00	R/W	Sub Class Code Set Set the sub-class code at initialization. The value of this field is reflected to PCICONF2[23:16].Sub Class Code.
15 to 8	PROG IF Set	H'00	R/W	PROG IF Set Set the programming IF code at initialization. The value of this field is reflected to PCICONF2[15:8].PROG IF.
7 to 0	Rev ID Set	H'00	R/W	Rev ID Set Set the revision ID at initialization. The value of this field is reflected to PCICONF2[7:0].Revision ID.

**39.2.93 SUBID Setting Register (SUBIDSETR)**

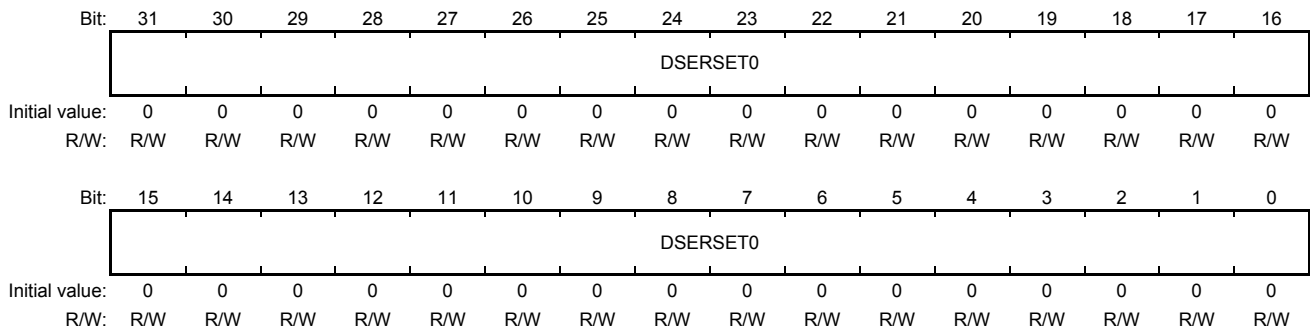

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	—

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	Sub System ID Set	H'0000	R/W	Sub System ID Set Sets the sub-system ID. Set the sub-system device ID allocated to the PCI device vendor at initialization. The value of this field is reflected to PCICONF11[31:16].Sub System ID.
15 to 0	Sub System Vendor ID Set	H'0000	R/W	Sub System Vendor ID Set Sets the sub-system vendor ID. Set the sub-system vendor ID allocated to the PCI device vendor at initialization. The value of this field is reflected to PCICONF11[15:0].Sub System Vendor ID.

**39.2.94 Device Serial Number Setting Register 0 (DSERSETR0)**

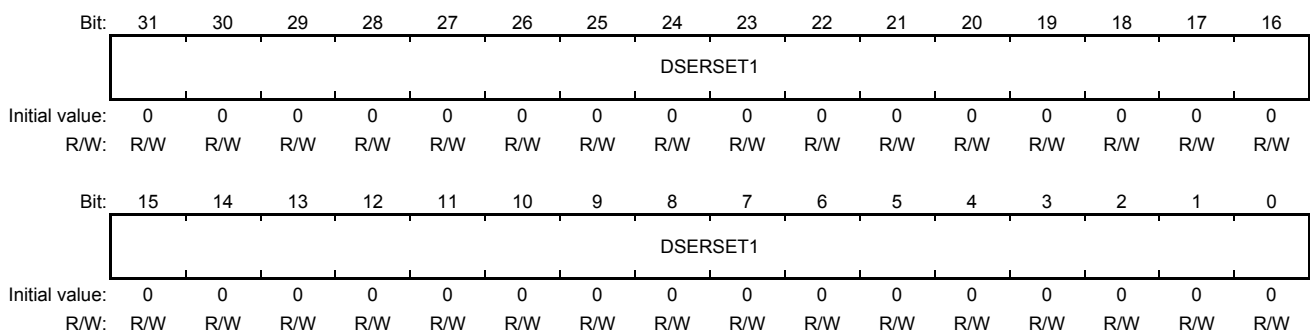

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	—

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DSERSET0	All 0	R/W	DSERSET0 Set 4 bytes of 1stDW of the device serial number at initialization. The value of this field is reflected to SERNUMCAP1.Device Serial Number 1st.

**39.2.95 Device Serial Number Setting Register 1 (DSERSETR1)**

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	—

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DSERSET1	All 0	R/W	DSERSET1 Set 4 bytes of 2ndDW of the device serial number at initialization. The value of this field is reflected to SERNUMCAP2.Device Serial Number 2nd.

### 39.2.96 TL Control Register (TLCTLR)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E

R/W:	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R	

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	Bus Number	H'00	R/W	<p>Bus Number</p> <p>The value of this field is used as the bus number at issuance of a request.</p> <p>The value of this field is used for checking the transaction ID bus number part within this IP on reception of Completion.</p> <p>Root Port:</p> <p>Set the device bus number.</p> <p>Endpoint:</p> <p>This field is always updated on reception of a Type0 Configuration Write request.</p>
23 to 19	Device Number	H'00	R/W	<p>Device Number</p> <p>The value of this field is used as the device number at issuance of a request.</p> <p>The value of this field is used for checking the transaction ID device number part within this IP on reception of Completion.</p> <p>Root Port:</p> <p>Set the device number.</p> <p>Endpoint:</p> <p>This field is always updated on reception of a Type0 Configuration Write request.</p>
18 to 14	—	All 0	R	<p>Reserved</p> <p>These bits are always read as 0. The write value should always be 0.</p>
13 to 8	Default Completion Timeout Time	H'00	R/W	<p>Default Completion Timeout Time</p> <p>Sets the Completion Timer timeout time for default setting (unit: ms). If a Completion cannot be received within the time set by this field, it is handled as a Completion timeout. Set a value from 10 to 50 ms.</p>
7 to 0	—	All 0	R	<p>Reserved</p> <p>These bits are always read as 0. The write value should always be 0.</p>

## 39.2.97 MAC Status Register (MACSR)

RZ/G1H	RZ/G1M	RZ/G1N	RZ/G1E
√	√	√	—

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	LKTR	LPBAK 1ST	LPBAK 2ST	DISST	HOTRS TST	Link Width					Link Speed				
Initial value:	—	0	0	0	0	0	0	0	0	11	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	SPCHG SUC	SPCHG FAIL	SPCHG	SPCHG FIN	LOENT	—	—	—
Initial value:	—	—	—	0	—	—	0	0	0	0	0	0	0	0	0	—
R/W:	R	R	R	R	R	R	R	R	RW1C	RW1C	RW1C	RW1C	RW1C	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	—	—	R	Reserved The read value is undefined. The write value should always be 0.
30	LKTR	0	R	Link Training Indicates that MAC LTSSM is in the recovery or configuration state and that link training is in progress. 0: Link training is not in progress. 1: Link training is in progress. The value of this field is reflected to EXPCAP4[27].LKTR.
29	LPBAK1ST	0	R	Loop Back1 State Indicates that the MAC LTSSM is in Per Lane Loop BAK mode. Loopback test can be executed as a loopback master. Note: LTSSM has made a transition to the loopback state without executing Configuration. 0: Not in the Loop Back1 state 1: In the Loop Back1 state
28	LPBAK2ST	0	R	Loop Back2 State Indicates that the MAC LTSSM is in Configured Link Loop BAK mode. Loopback test can be executed as a loopback master. Note: LTSSM has made a transition to the loopback state after executing Configuration. 0: Not in the Loop Back2 state 1: In the Loop Back2 state
27	DISST	0	R	Disabled State Indicates that the MAC LTSSM is in the disabled state. Note: This bit is set only when this IP itself makes a request for link disable (sets 1 to EXPCAP4[4].LKDIS). Therefore, in Endpoint mode, 0 is always read. 0: Not in the disabled state 1: In the disabled state

Bit	Bit Name	Initial Value	R/W	Description
26	HOTRSTST	0	R	Hot Reset State Indicates that the MAC LTSSM is in the Hot Reset state. 0: Not in the Hot Reset state 1: In the Hot Reset state
25 to 20	Link Width	H'04	R	Link Width Indicates the width of the link established by MAC configuration. This field is valid when PCIETSTR.DLLACT = 1. H'01: x1 link width H'02: x2 link width H'04: x4 link width Indicates the same value as the value of EXPCAP4.Negotiated Link Width.
19 to 16	Link Speed	H'0	R	Link Speed Indicates the speed of the link established by the MAC configuration. This field is valid when PCIETSTR.DLLACT = 1. This IP supports the following link speeds: H'1: 2.5 GT/s H'2: 5.0 GT/s Indicates the same value as EXPCAP4.Current Link Speed. When read by firmware, the same value is read from the both fields.
15, 14	—	—	R	Reserved The read value is undefined. The write value should always be 0.
13	—	—	R	Reserved Ignore the value of this bit. The read value is undefined. The write value should always be 0.
12	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
11, 10	—	—	R	Reserved The read value is undefined. The write value should always be 0.
9, 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7	SPCHGSUC	0	RW1C	Speed Change Success Indicates that speed negotiation started by this module has succeeded. Clear this bit by writing 1. Writing 0 is invalid.
6	SPCHGFAIL	0	RW1C	Speed Change Fail Indicates that speed negotiation started by this module has failed. Clear this bit by writing 1. Writing 0 is invalid.

Bit	Bit Name	Initial Value	R/W	Description
5	SPCHG	0	RW1C	<p>Speed Change</p> <p>Indicates that speed has been changed.</p> <p>When this bit is set to 1, write 1 to clear the bit.</p> <p>Writing 0 is invalid.</p>
4	SPCHGFIN	0	RW1C	<p>Speed Change Finish</p> <p>Indicates that speed change processing requested by this IP has been completed.</p> <p>This bit is set to 1 at the same time that MACCTLR.SPCHG is cleared to 0.</p> <p>This bit is not updated if speed change processing is caused by the communication peer. For the usage, see section 39.3.9 (1), Changing Speed.</p> <p>When this bit is set to 1, write 1 to clear the bit.</p> <p>Writing 0 is invalid.</p>
3	LOENT	0	RW1C	<p>L0 Enter</p> <p>This bit is set to 1 when a transition to L0 is made. This bit is cleared by hardware when the MACSR.SPCHGFIN interrupt is generated.</p> <p>For the usage, see section 39.3.9 (1), Changing Speed.</p> <p>When this bit is set to 1, write 1 to clear the bit. However, the bit cannot be cleared in the L0 state.</p> <p>Writing 0 is invalid.</p>
2, 1	—	All 0	R	<p>Reserved</p> <p>These bits are always read as 0. The write value should always be 0.</p>
0	—	—	R	<p>Reserved</p> <p>The read value is undefined. The write value should always be 0.</p>

31	SPCNGRSN	0	R/W	Speed Change Reason Indicates the factor of link speed change. 0: An intentional factor 1: A link reliability problem
30 to 20	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
19 to 16	Target Link Speed	H'2	R/W	Target Link Speed Specifies the speed of the link to be established using the link speed change in Endpoint mode. (In Root Port mode, EXPCAP12[3:0].Target Link Speed is used.) H'1: 2.5 GT/s H'2: 5.0 GT/s
15 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

### 39.3 Operation

RZ/G1H

RZ/G1N

RZ/G1M

RZ/G1E

The following describes the operation of this module.

Note: The following operation flowcharts are each divided in two parts and described. One part covers the H/W, hardware operation of this module and the other covers the S/W, software operation to control this module. The arrows originating from the outside of the figure frame indicate that the event arises from the user program.

In the explanation of the operation flows, interrupt sources are described in the H/W part. The S/W should first verify a given interrupt flag and then clear it.

If generation of interrupt sources is expected, enable each of the interrupt sources referring to Figures 39.31 and 39.32.

#### 39.3.1 Initialization

##### (1) Standby State Cancellation

- After canceling a reset, cancel the module standby state. For the module standby state, refer to section 7A, Module Standby and Software Reset. This module is in the module standby state after a power-on reset is canceled.

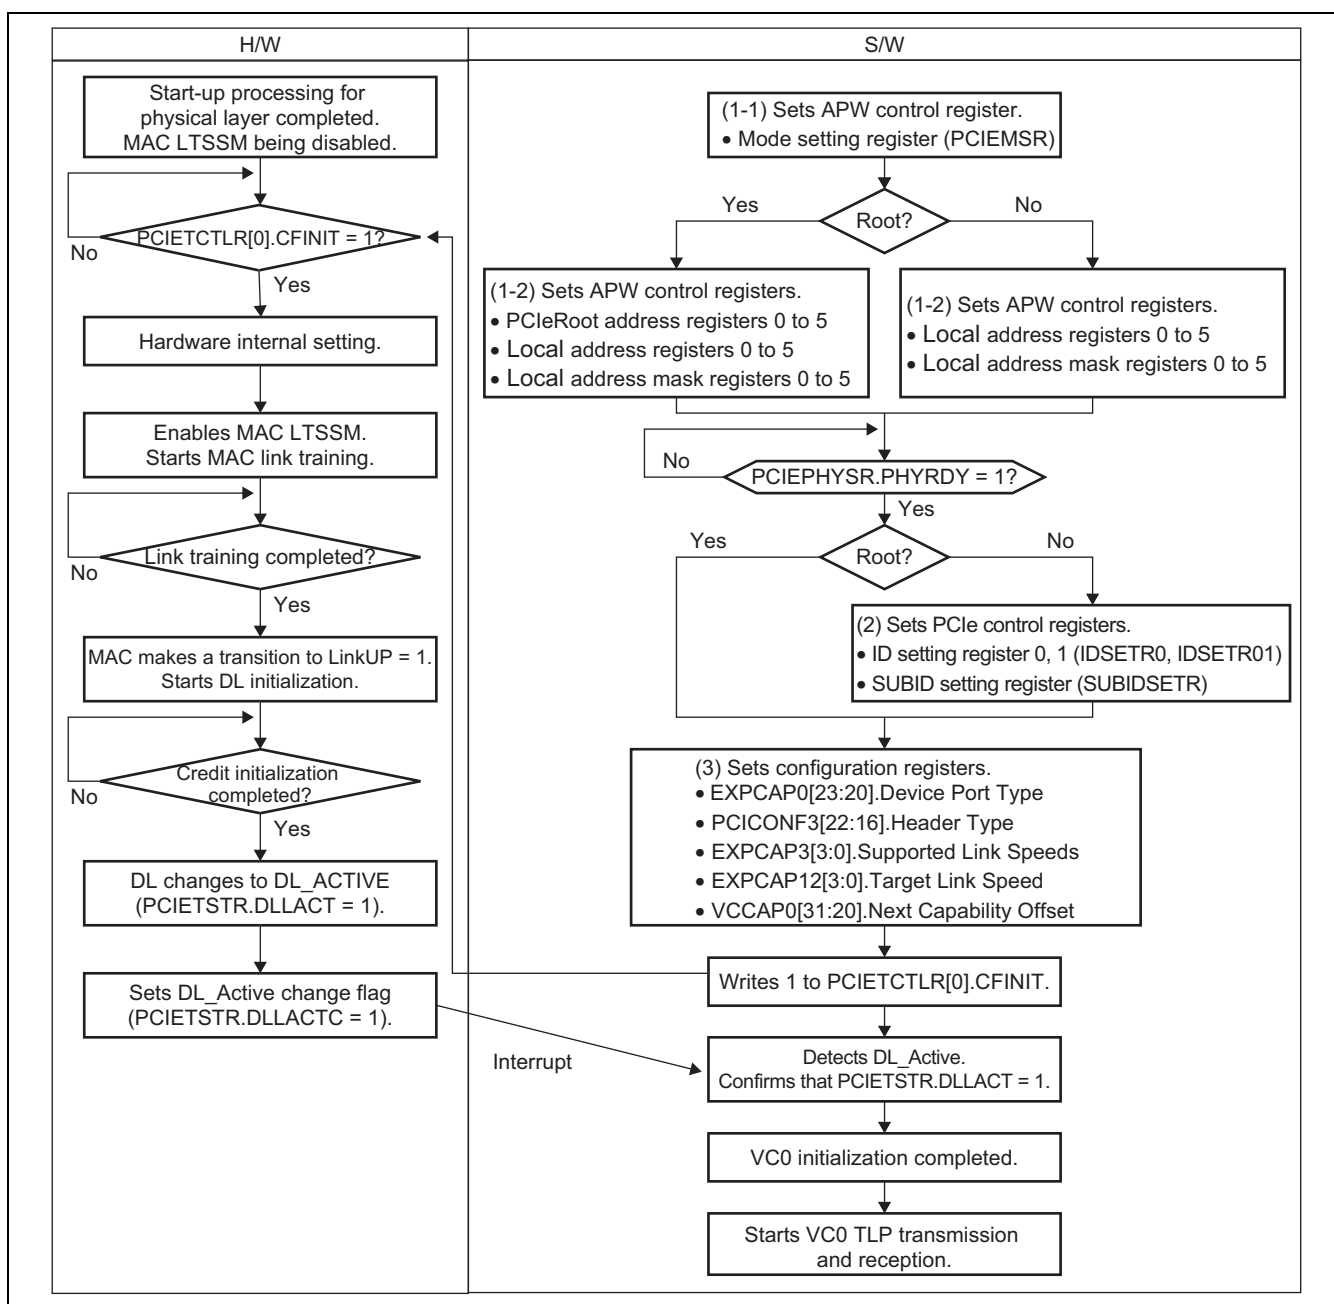

##### (2) Initialization of the Physical Layer

Before using this module, set the parameter values to the address fields as shown in the table below to initialize the physical layer.

Address	Parameter	Access size
H'780	H'000F_0030	32
H'784	H'0038_1203	32
H'78C	H'0000_0001	32
H'78C	H'0000_0006	32
H'780	H'000F_0054	32
H'784	Reference clock setting is AC connection, termination resistor OFF: H'1380_2003 Reference clock setting is DC connection, termination resistor OFF: H'1380_2007 Reference clock setting is AC connection, termination resistor ON: H'1380_200B Reference clock setting is DC connection, termination resistor ON: H'1380_200F	32
H'78C	H'0000_0001	32
H'78C	H'0000_0006	32

**(3) Initial Setting of PCI Express**

- Figure 39.2 shows the PCIEC operation in initial setting.
- After start-up processing for the physical layer is completed, the initial setting is executed to start operation as a PCI Express. Until the initial setting is completed, this module cannot work correctly as a PCI Express device. Therefore, a link is not established immediately after a reset is canceled. When the initial setting is completed, enable the PCIETCTLR.CFINIT to start operation.
- Set the bits in the configuration registers as directed in the related register description, if there is a direction on initialization.
- Set H'000 in the Next Capability Offset[31:20] bits in VCCAP0.
- Be sure to write the initial value (= H'80FF 0000) to MACCTLR before enabling PCIETCTLR.CFINIT.
- When a register is used with the default setting, setting the register is not required.

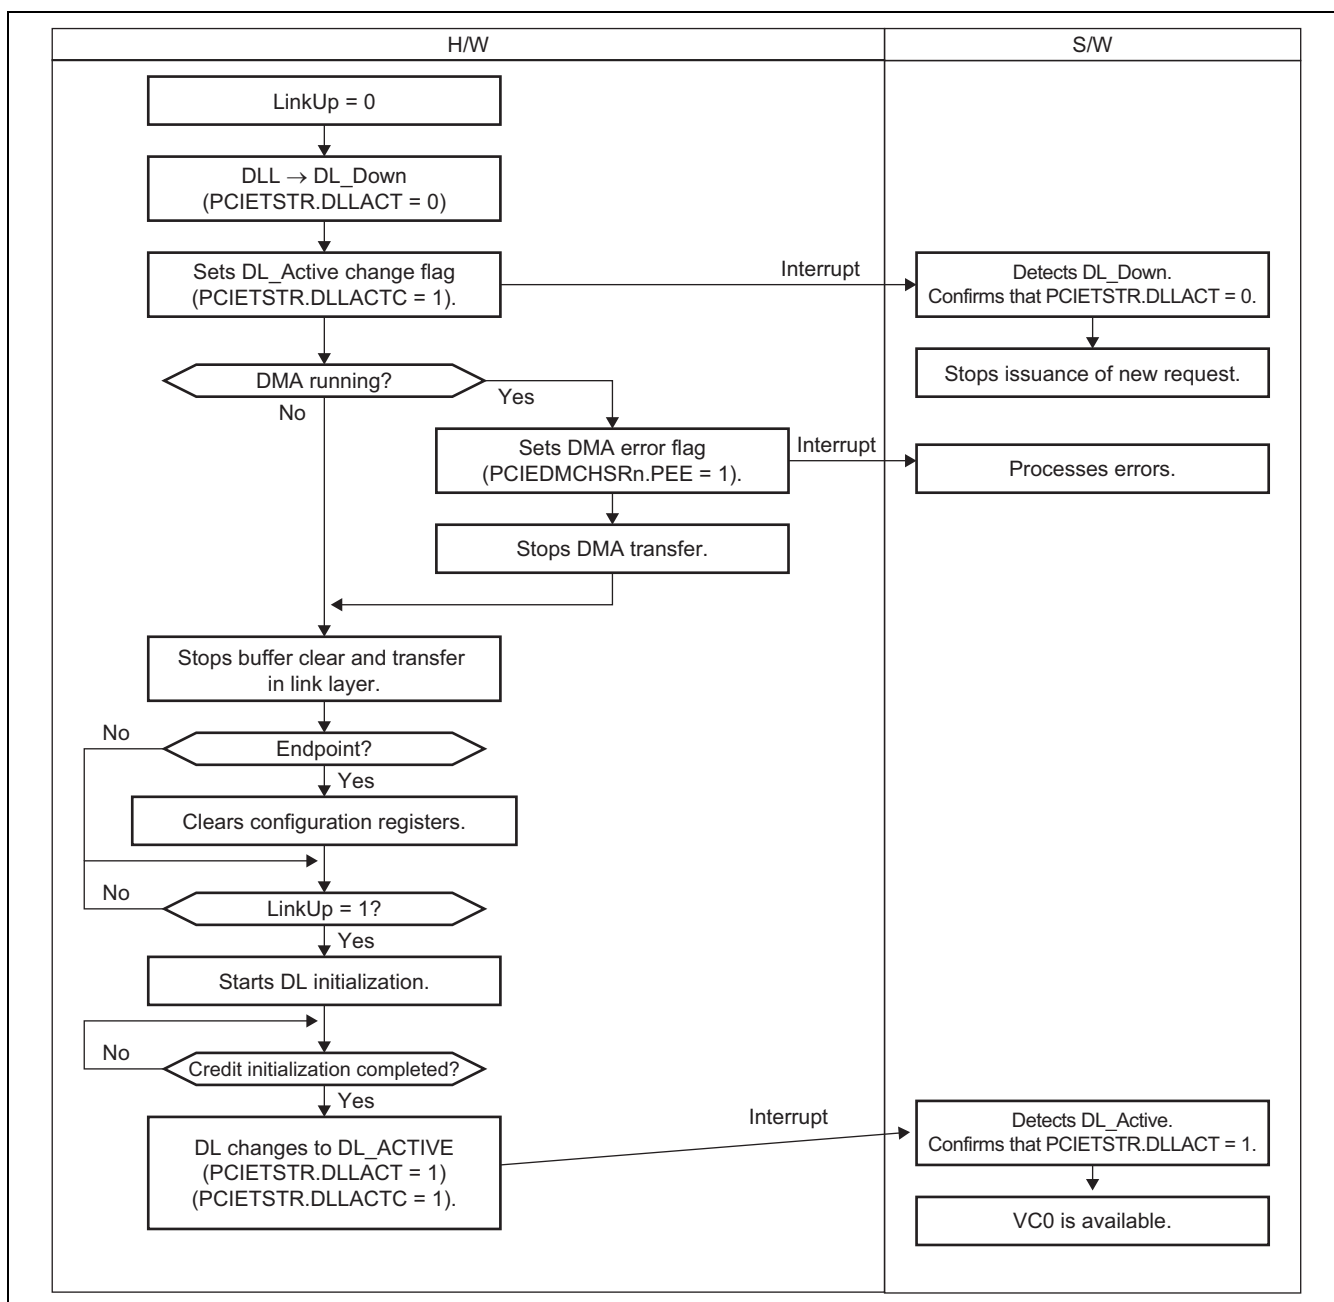

**Figure 39.2 Initial Setting of PCIEC**

**(4) DL\_Down Operation**

Figure 39.3 shows the operation when a link goes down (LinkUP = 0) in the state where a link is established, thus causing DL\_Down. When DL\_Down is caused, PCIETCTLR.DLDOWN is set to 1. Since the current data is invalidated, all the resources of the data transmitter/receiver of this module are initialized.

- Upon DL\_Down, a write to the transmission buffer is disabled thus stopping transmission.
- Upon DL\_Down, the receive buffer is forcibly cleared.
- If a link goes down, transmission and reception are suspended; therefore, data before and after DL\_Down becomes illegal. Since the specific process here differs depending on the application, the operation is simply indicated as “Processes errors.” in the flowchart shown in Figure 39.3.

**Figure 39.3 DL\_Down Operation**

## (5) Hot Reset Operation

### (a) Hot Reset Transmission

In Root Port mode, to send a hot reset to a downstream port, write 1 to the secondary bus reset bit in the configuration register. Before issuing a hot reset, confirm that this module has completed transfer.

### (b) Hot Reset Reception

In Endpoint mode, when a hot reset is received from an upstream port, the LTSSM on the link layer makes a transition to the hot reset state. This causes LinkUp = 0 and then DL\_Down = 1. After this, the same operation is performed as the operation upon the DL\_Down.

## 39.3.2 Configuration Cycle

When using this module as a Root Port, a configuration cycle must be generated to configure the connection-target device. A configuration cycle refers to the process of checking the status of the configuration register of the connection-target Endpoint, switch, or bridge through the use of configuration access, and assigning values to the configuration registers of the Root Port itself and the Endpoint according to the result of the checking. When the Root Port accesses its own configuration register, such access is normally made through the internal bus.

This section describes the transmission (write) and reception (read) operations of the configuration access, and the items to be specified during a configuration cycle.

When this module is used as an Endpoint, it receives a configuration access from a Root Port, and accepts the initialization processing.

### (1) Configuration Read Operation

Figure 39.4 shows a flow of configuration read operation.

With EXPCAP7[4].CRSVISE = 0, an error response is returned when the CRS status is received.

With EXPCAP7[4].CRSVISE = 1, response data is H'FFFF 0001 when the CRS status is received. Therefore, the first access to the peer device from which the CRS status may possibly be returned must be configuration read from register 0. Here, judgment is possible only by the VID that has read that no device is existent (including an unsupported request response) or that a CRS response is received, thus simplifying the procedure for setting the bus number of the PCI bus topology.

Automatic hardware response according to the CRS status is not supported.

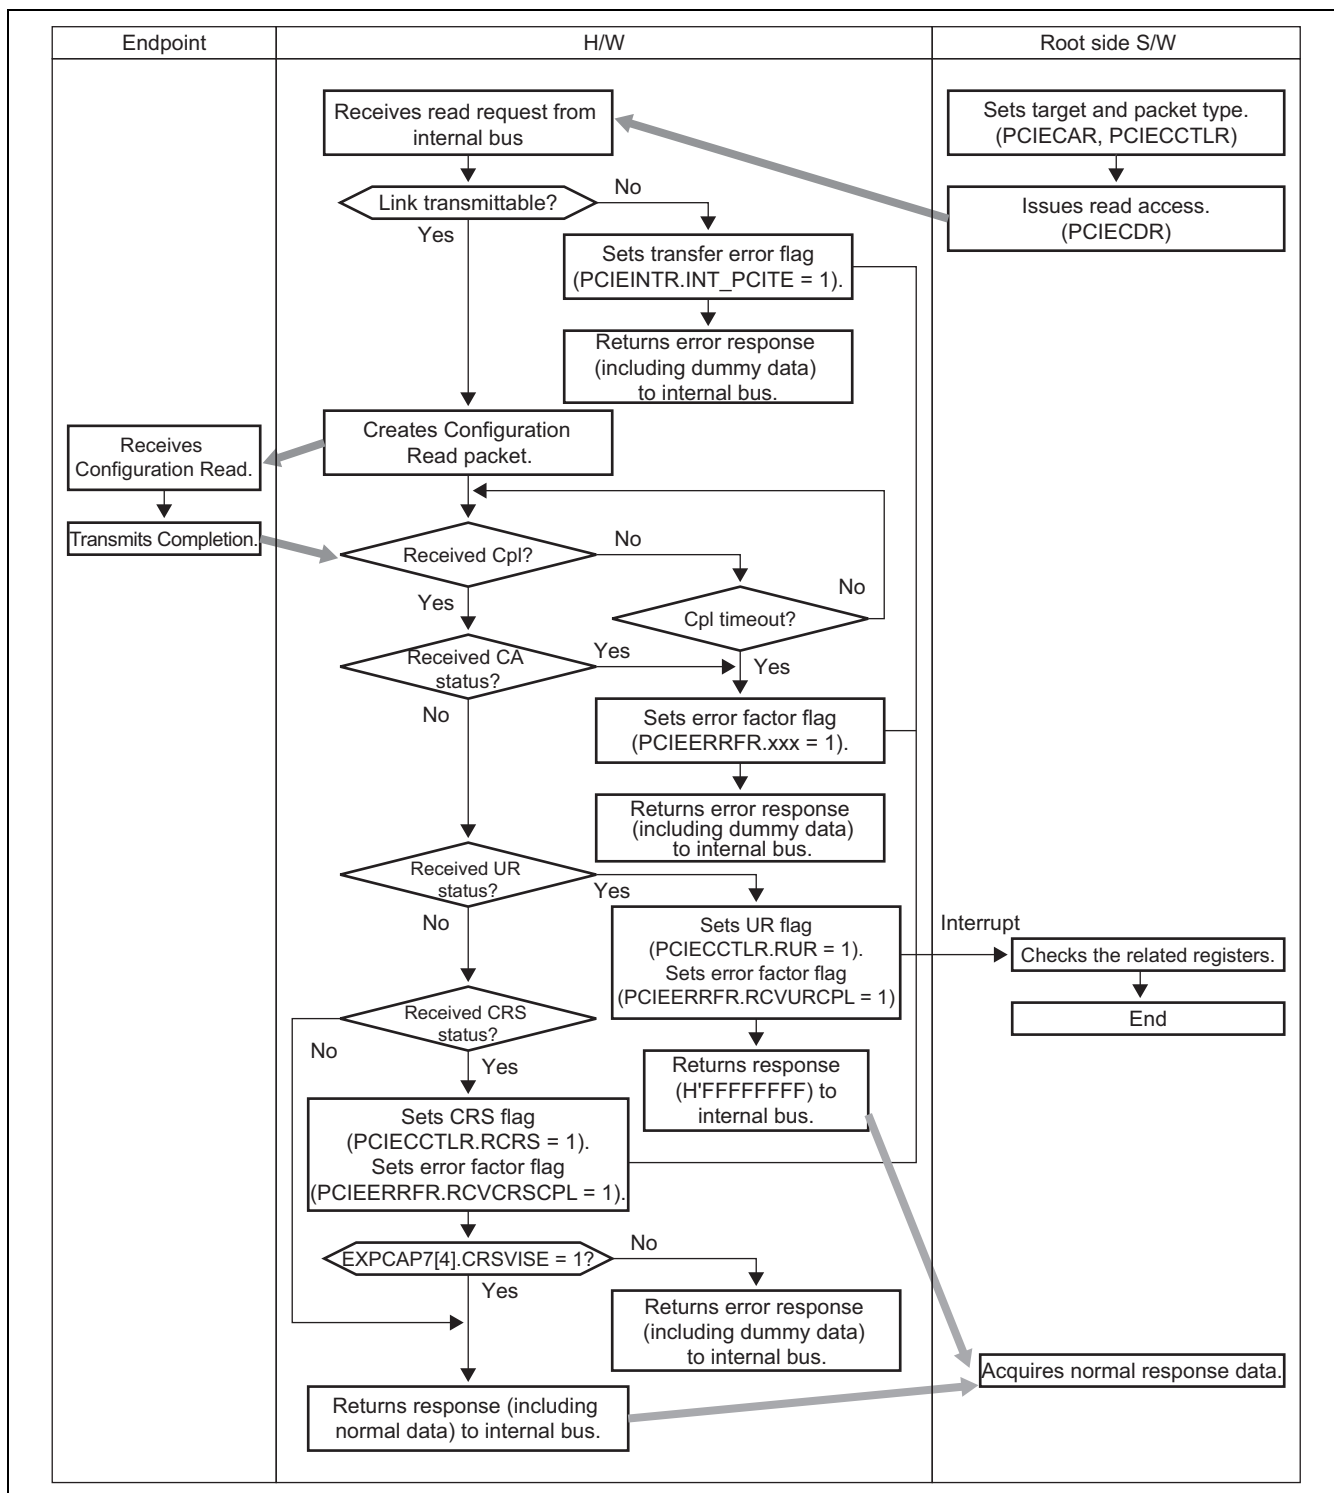

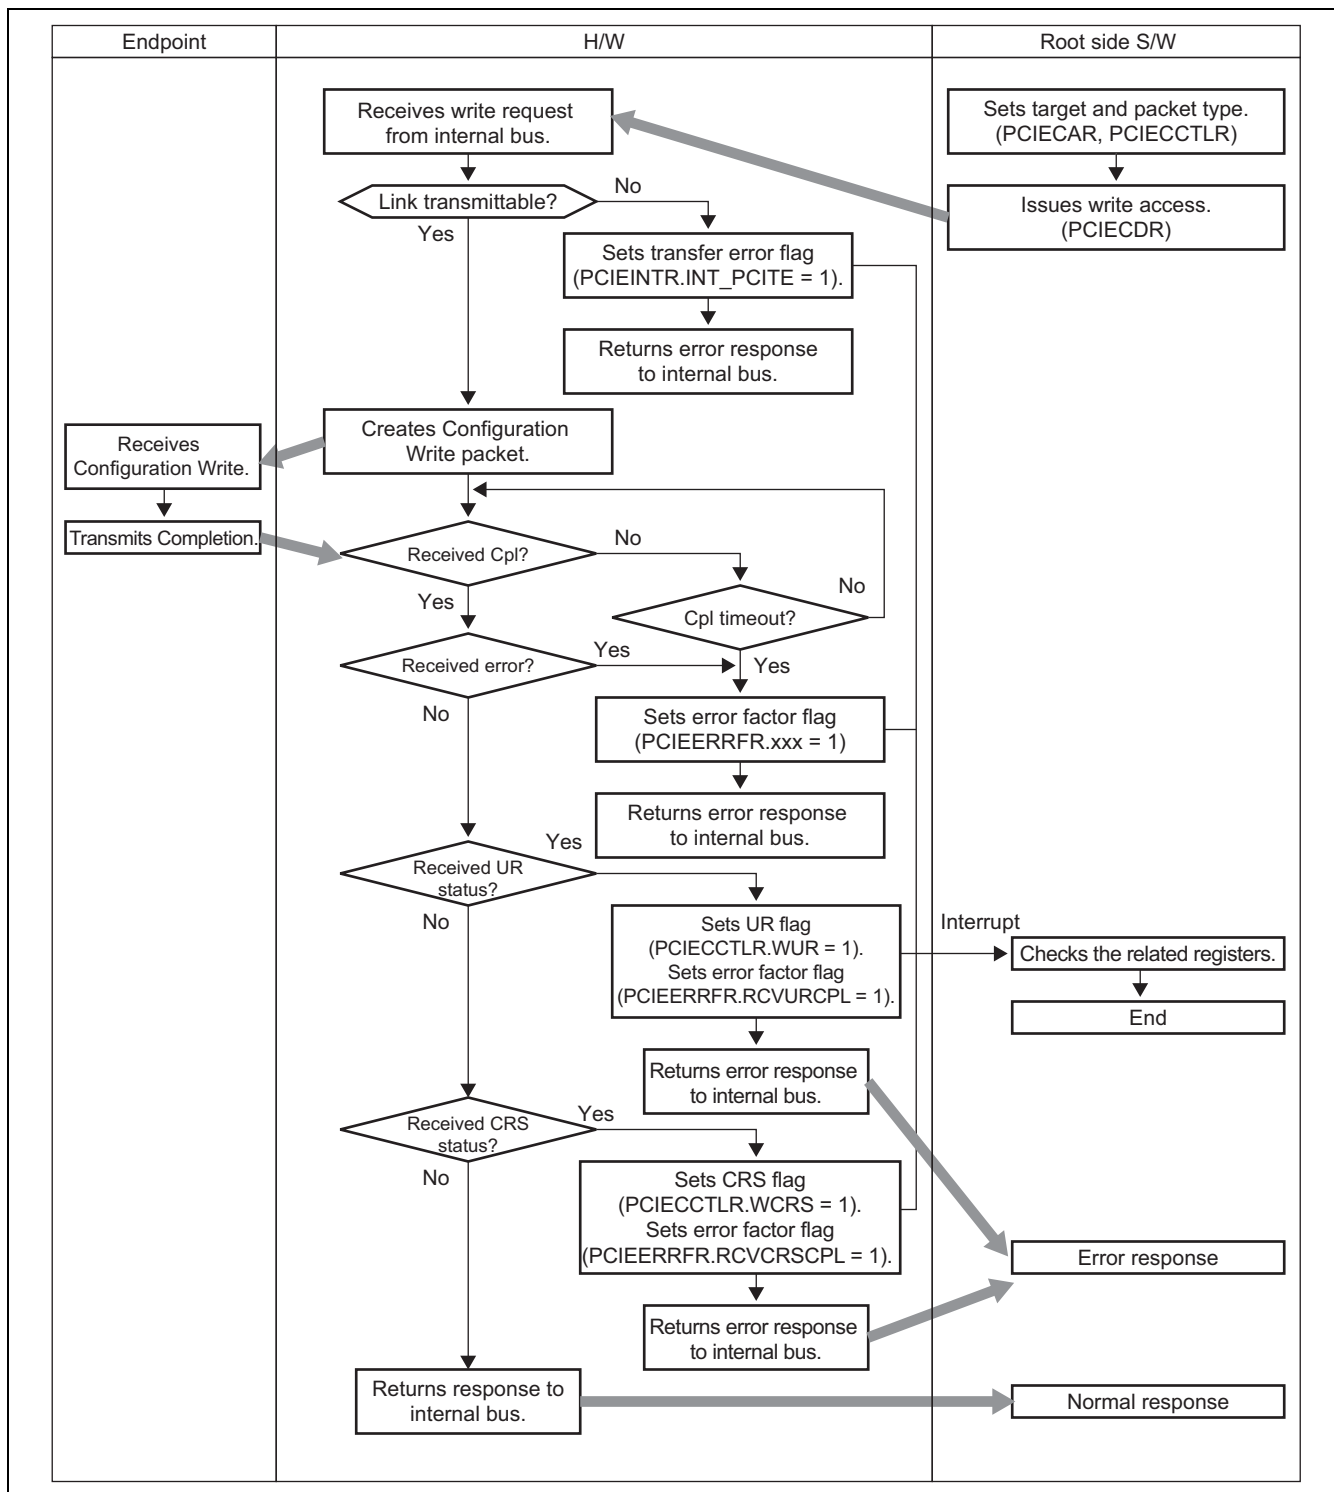

Figure 39.4 Configuration Read Operation

**(2) Configuration Write Operation**

Figure 39.5 shows a flow of configuration write operation.

The peer device should be the function for which configuration read has been succeeded (= the function from which CRS may never be returned).

**Figure 39.5 Configuration Write Operation**

### (3) Initialization of PCIEC in Root Port Mode

In Root Port mode, set all the Endpoints (indicated as system in the flow chart) connected to the PCIEC after link establishment. Figure 39.6 shows a sample setting flowchart.

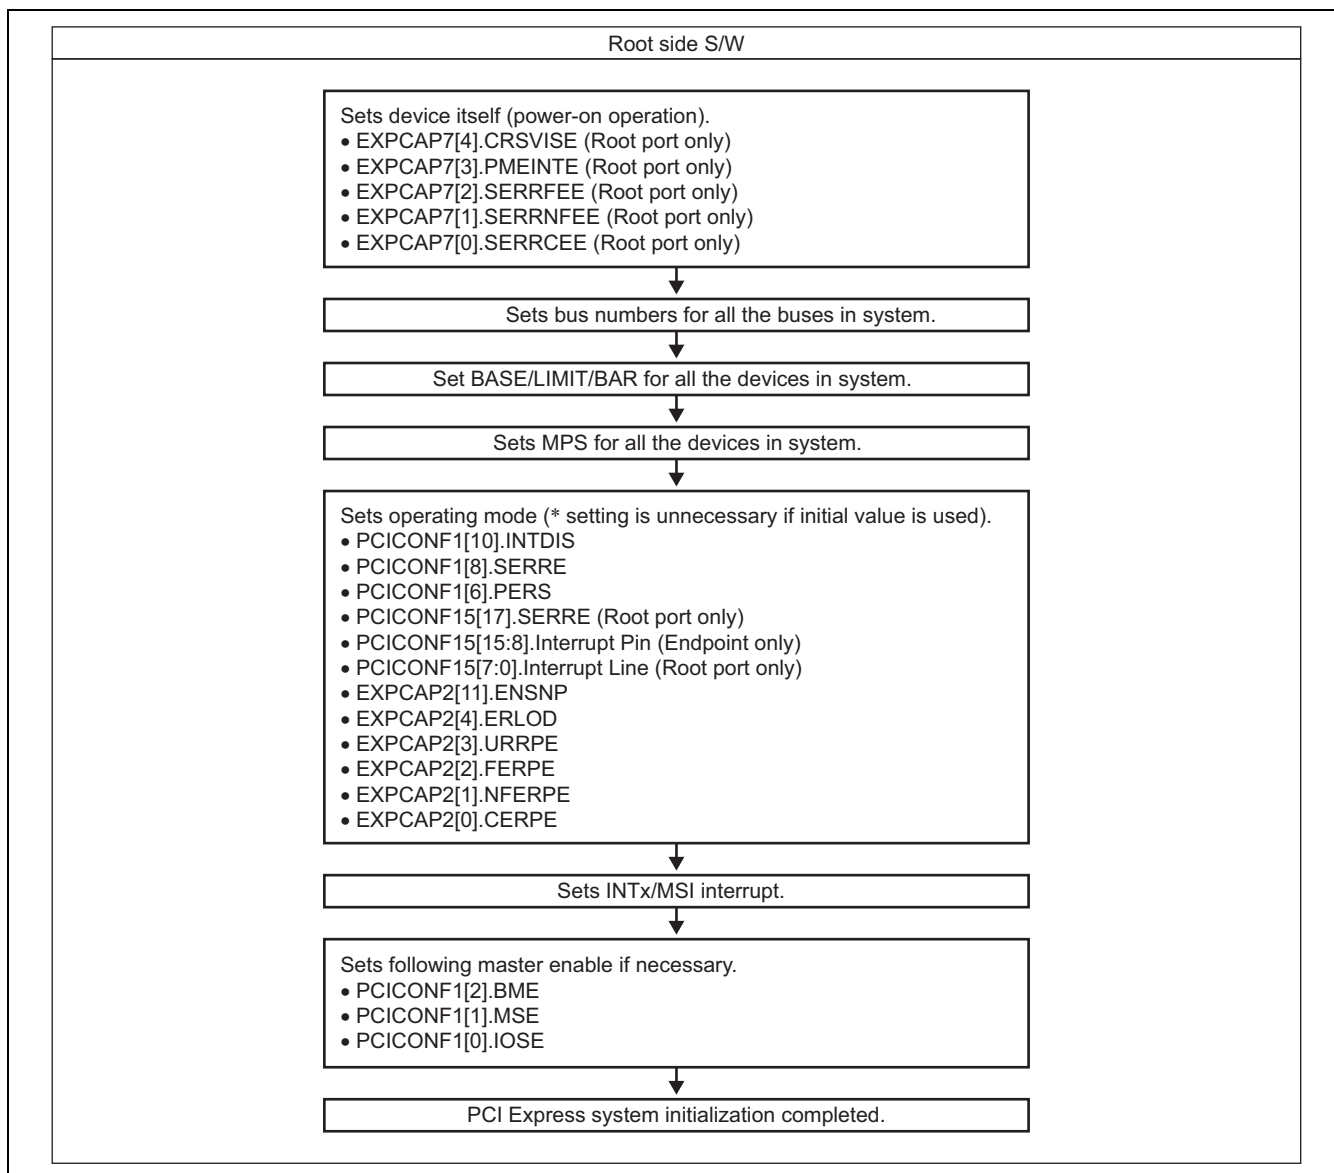

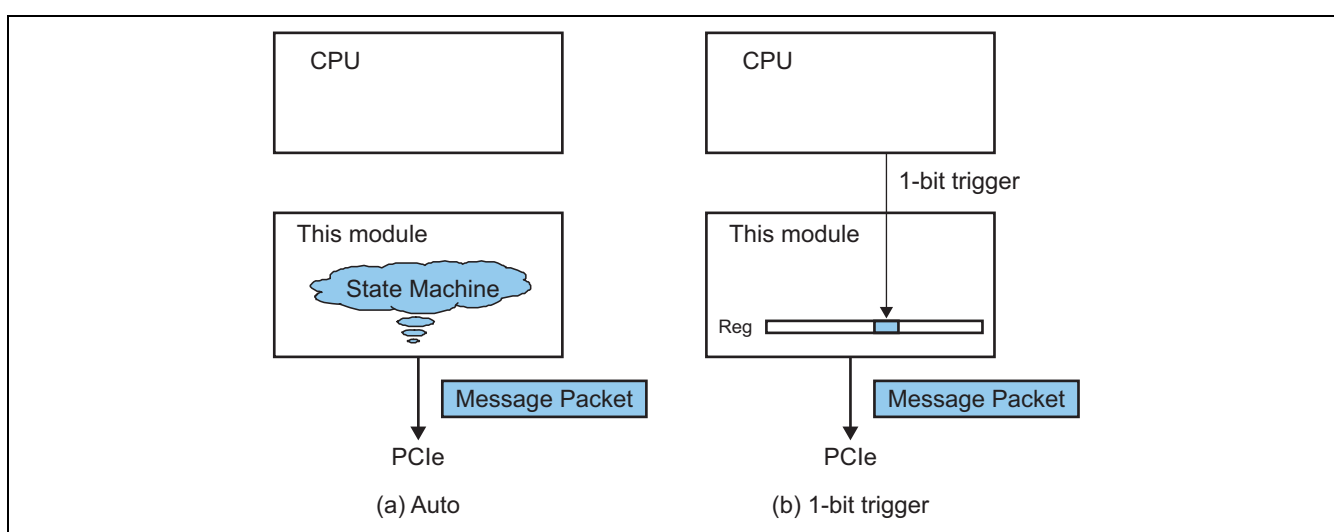

Figure 39.6 PCIEC Initialization in Root Port Mode

### 39.3.3 Messages and MSI

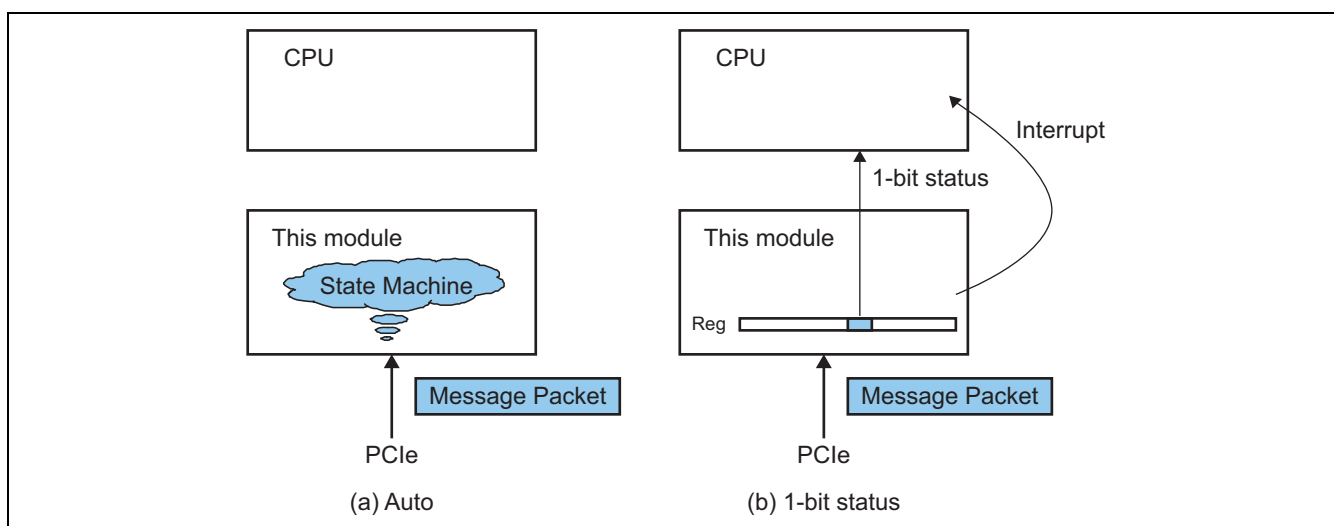

This module supports transmission and reception of the messages and MSI (Message Signaled Interrupt) defined in the PCI Express standard. The messages allow interrupt signaling, power management, error information notification, and unlocking. The MSI is used instead of INTx to signal interrupts. The following sections describe transmission and reception of the messages and MSI.

#### (1) Overview of Messages

This module automatically transmits and receives messages that indicate the error state of a link through hardware (Figures 39.7 (a) and 39.8 (a)). The other types of messages can be transmitted and received only by writing and reading the registers of this module (Figures 39.7 (b) and 39.8 (b)). The PM-related messages and INTx messages have separate 1-bit fields corresponding to the messages and simply writing to the pertinent bit allows this module to create and transmit a message. In message reception, reading the status of the pertinent bit completes reception.

**Figure 39.7 Message Transmission Methods**

**Figure 39.8 Message Reception Methods**

## (2) Message Transmission

Messages can be transmitted by either of the following two methods.

### (a) Automatic Message Transmission by Hardware

This module automatically sends a necessary message when an error occurs. The following messages are automatically sent.

- **ERR\_COR**: When transmission of the correctable error message is enabled, this message is automatically sent if a correctable error occurs.
- **ERR\_NONFATAL**: When transmission of the non-fatal error message is enabled, this message is automatically sent if a non-fatal error occurs.
- **ERR\_FATAL**: When transmission of the fatal error message is enabled, this message is automatically sent if a fatal error occurs.

### (b) Initiation of Message Transmission by 1-bit Writing through Software

This module sends unlock or INTx interrupt messages under control by software. To send these messages, access the following registers.

- **Unlocking (unlock message transmission)**: Writing 1 to PCIEUNLOCKCR[0].ASTUNLOCK allows transmission of the unlock message and unlocking. The unlock messages can be transmitted only by the Root Port.
- **Power management message transmission (PME\_\* message transmission)**: Writing 1 to the bits corresponding to the messages in the power management message transmission control register allows transmission of the messages given below: PME\_TO\_ACK, PME\_TOFF, and PM\_PME.
- **INTx interrupt generation and cancellation (Assert\_INTx/Deassert\_INTx message transmission: x=A, B, C, or D)**: Writing 1 to PCIEINTXR[16].ASTINTX allows transmission of the Assert\_INTx message corresponding to the INTx specified with PCICONF15[15:8].Interrupt Pin thus allowing generation of the INTx interrupt. Writing 0 to PCIEINTXR[16].ASTINTX allows transmission of the Deassert\_INTx message corresponding to the INTx specified with PCICONF15[15:8].Interrupt Pin thus allowing cancellation of the INTx interrupt. The INTx interrupts can be generated and canceled only by the Endpoint.

## (3) Message Reception

In this module, reception of some messages is automatically handled by hardware. For the message reception processes not performed through hardware, refer to the status and process reception through software. Note that the messages except Vendor\_Defined\_Message are required by the PCI Express standard to be transmitted and received with TC0. If such a message is received with the other TC, the PCIEC considers it as a malformed TLP (fatal error) thus performing error processing automatically.

### (a) Automatic Message Reception by Hardware

- **Assert\_INTx (x is A to D)**: When this message is received in Root Port mode, PCIEINTXR[0,1,2,3].INTx are set. The INTx interrupt is generated here when PCICONF15[7:0].Interrupt Line is not H'FF. When received in Endpoint mode, this message is considered as a malformed TLP and error processing is performed.
- **Deassert\_INTx (x is A to D)**: When this message is received in Root Port mode, PCIEINTXR[0,1,2,3].INTx are cleared. The INTx interrupt is canceled here (only in the Root Port) when PCICONF15[7:0].Interrupt Line is not H'FF. When received in Endpoint mode, this message is considered as a malformed TLP and error processing is performed.
- **ERR\_COR**: When this message is received, the appropriate value is set to the configuration register to indicate reception of a correctable error and the INT\_PCICERR interrupt is generated.
- **ERR\_NONFATAL**: When this message is received, the appropriate value is set to the configuration register to indicate reception of a non-fatal error and the INT\_PCINFERR interrupt is generated.
- **ERR\_FATAL**: When this message is received, the appropriate value is set to the configuration register to indicate reception of a fatal error and the INT\_PCIFERR interrupt is generated.

- **Unlock:** The unlock message is discarded since neither the PCI Express Endpoint nor Root Port accepts a lock request.
- **Set\_Slot\_Power\_Limit:** (When this message is received, the power information specified with the message is automatically reflected to the configuration register (EXPCAP1[27:18]) through hardware.)

#### (b) Reception of Messages Requiring Software Processing

The module hardware detects reception of the following messages but does not automatically process them. Reception of these messages must be checked and processed by software as described below.

- PM\_PME

A message reception can be checked via the following registers:

- PCIERMSGR
- PCIERMSGIER
- EXPCAP8

In the PCIERMSGR, bits are defined for each specified message, and 1 is set to a bit corresponding to the received message when a message is received. In this situation, if the corresponding bit in the PCIERMSGIER is set to 1 and if the PCIEINTER[5].INT\_PCIMSE is set to 1, a PCIMES interrupt is generated.

Table 39.4 shows the messages, reception of which is detected by hardware and which are processed by software.

**Table 39.4 Messages Whose Reception can be Detected by the PCIEC**

Register	Bit No.	Register	Bit No.	Receive Message
PCIEINTR	5	PCIERMSGR	12	Set_Slot_Power_Limit
	30	EXPCAP8	17	PM_PME

#### (4) Overview of MSI

This section describes the MSI interrupts.

This module supports MSI interrupts. Whether the PCI Express system should use INTx or MSI interrupts is determined by the Root Port during a configuration cycle. When this module is to be used as a Root Port, whether INTx or MSI interrupt is used should be determined during a configuration cycle, and the results of the determination must be set in the configuration register.

When this module is used as a Root Port, a maximum of 32 interrupt vectors can be used as MSI interrupts. In addition, this module supports both Per Vector Masking and the transmission of 64-bit address messages.

(5) MSI Transmission

MSI can be transmitted only in Endpoint mode. Figure 39.9 shows an MSI transmission flow.

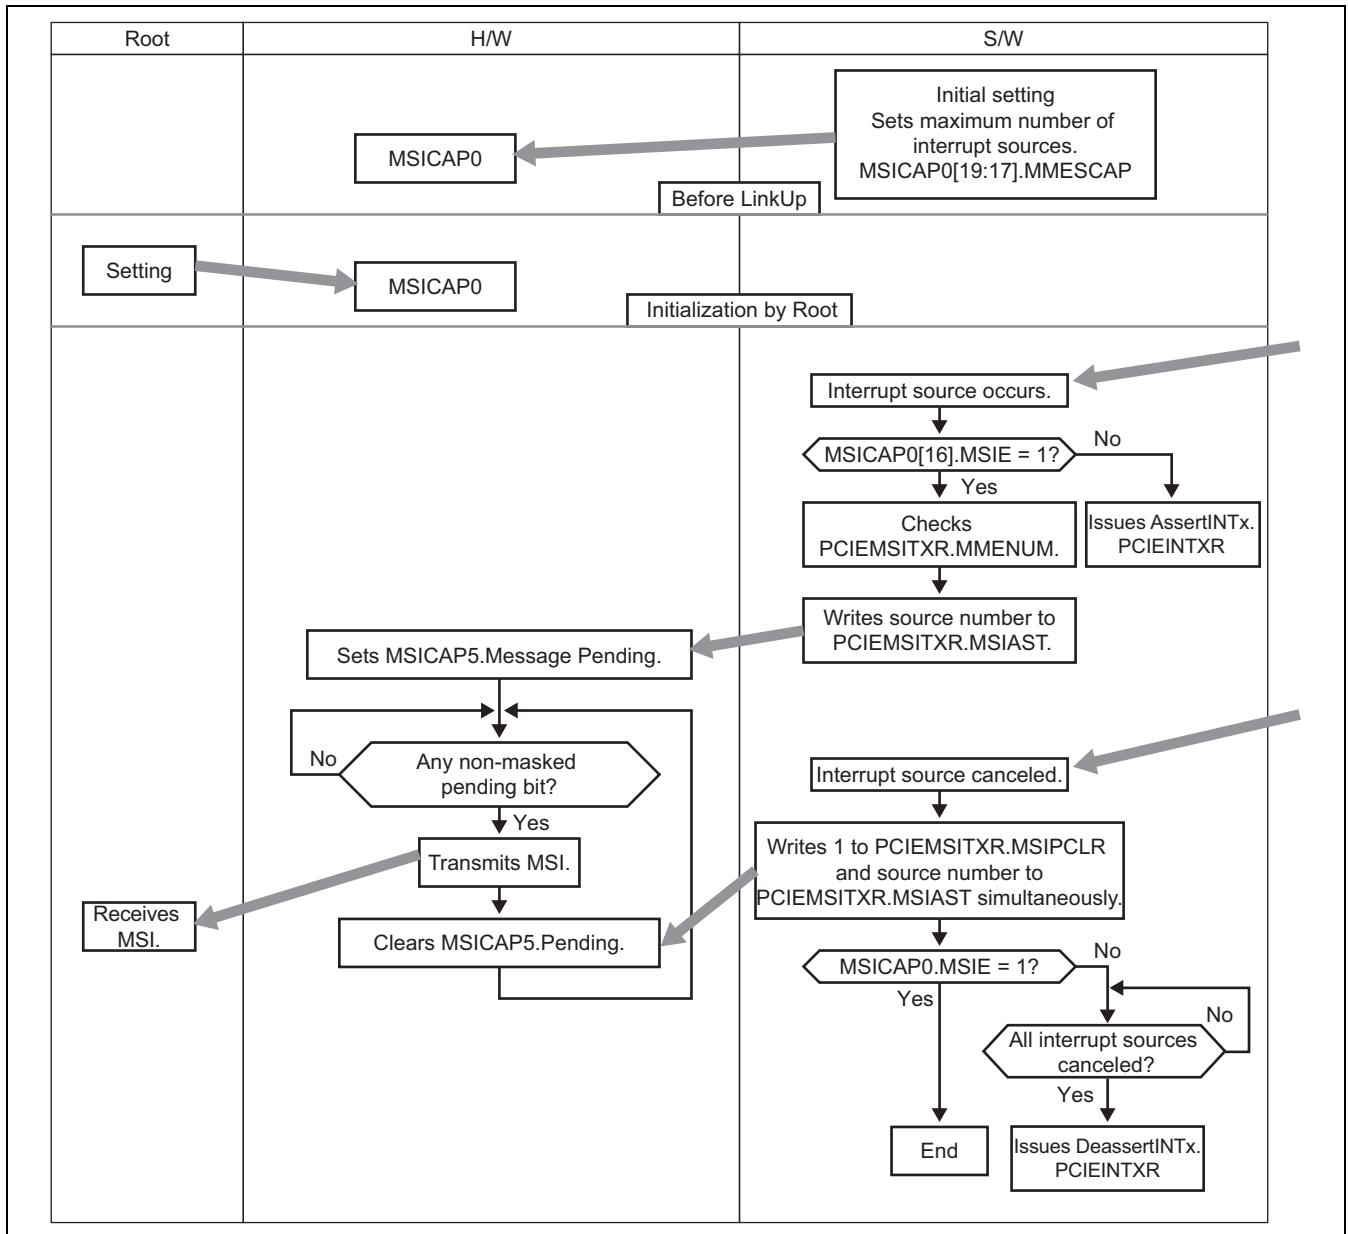

Figure 39.9 MSI Transmission

**(6) MSI Reception**

MSI can be received only in Root Port mode. The following describes a MSI reception flow.

**(a) MSI Interrupt Setting (Root Port)**

When this module is used as a Root Port, whether INTx or MSI interrupts are used should be determined during a configuration cycle. If MSI interrupts are selected, the following settings should be performed.

**(1) Assigning Interrupt Vectors to Endpoints**

Reference the MSICAP0[19:17].MMESCAP of the Endpoint device, and check the number of MSI interrupt vectors required by devices. Based on the result of the checking, the number of vectors to be assigned to the Endpoints is determined so that the number of vectors to be assigned to all devices is 32 or less, the number of vectors assigned to each Endpoint is 1 or greater and less than or equal to the requested number of assignments.

The number of vectors assigned to each Endpoint should be set in the MSICAP0[22:20].MMESE.

**(2) Setting Receive Message Address**

Specify the address to which the MSI is received to PCIEMSI AUR and PCIEMSI ALR and also enable MSI address decoding.

- Notes: 1. When there is a switch or bridge between the Endpoint and this module, set the address so that the memory write request to the address specified by the switch or bridge should be routed to the Root Port, or change the address specified by the switch or bridge and set the address so that the memory write request to the address specified by this module should be routed to the Root Port instead.
- 2. When the specified address falls within the target area, 1DW memory write request to the specified address is not handled as a target transfer, but as an MSI message.

**(3) Setting Endpoint Message Address**

Set the transmission destination address of the MSI message to MSICAP1[31:2].Lower Message Address and MSICAP2[31:0].Upper Message Address of the Endpoint device.

The transmission destination address of MSI message should be the address set to PCIEMSI AUR and PCIEMSI ALR.

**(4) Setting Message Data**

Set the message data for transmission to the MSICAP3[15:0].Message Data of the Endpoint device.

In the 32-bit MSI vectors supported by this module, bits [12:8] in write data must specify the starting vector number of the MSI vectors assigned to the Endpoint, and all other bits must be cleared to 0. Figure 39.10 shows an example of an MSI message data to be set in an Endpoint.

**Figure 39.10 MSI Message Data to be Set in Endpoint**  
**(an example of setting where Vectors 2, 4, 8 and 8 are allocated to Endpoints A, B, C and D, respectively)**

(5) Enabling MSI Interrupts of the Peer Device

Set MSICAP0[16].MSIE of all the devices to 1.

(6) Enabling MSI Interrupts

Set the MSIIE bits.

### 39.3.4 Overview of Transmission and Reception

PCI Express transfers are classified into two types of requests and one type of completion.

The following three methods are provided for PCI Express transactions. For details on each transfer, refer to the following sections.

1. PIO transfer: A request is issued from the internal bus side to a device on the PCI Express.
2. Target transfer: A request is received by the internal bus side from the PCI Express.
3. DMA transfer: A great quantity of data is automatically written and read between the PCI Express and the internal bus without intervention of the CPU.

Table 39.5 shows the relationship between two types of requests and PCI Express transactions and also shows the transaction issuance methods with this module.

**Table 39.5 Relationship between Posted/Non-Posted Requests and PCI Express Transactions**

Transaction Type	Transfer Type	Completion	Device Type that can Issue Transaction	Transaction Issuance Method with This Module	Operation
Memory Write	Posted	Not provided	Root Port &Endpoint	PIO, DMA, (MSI Endpoint only)	Data is written to the memory of the communication peer. 1 byte to 4 Kbytes of data not exceeding MPS* <sup>1</sup> can be written.
Memory Read	Non-Posted	Provided	Root Port &Endpoint	PIO, DMA	A quantity of data not exceeding MRRS* <sup>2</sup> is read from the memory of the communication peer. The read data is returned with a completion separately from this request; no data is included in this request.
I/O Write	Non-Posted	Provided	Root Port only	PIO	Data is written to I/O. Data size is 1 DW. A completion is necessary that indicates whether this request has succeeded.
I/O Read	Non-Posted	Provided	Root Port only	PIO	Data is read from I/O. No data is included. The read data and a completion that indicates whether this request has succeeded are necessary.
Configuration Write	Non-Posted	Provided	Root Port only	PCI Express transfer control register	Configuration write is performed. Data size is 1 DW. A completion is necessary that indicates whether this request has succeeded.
Configuration Read	Non-Posted	Provided	Root Port only	PCI Express transfer control register	Configuration read is performed. No data is included. The read data and a completion that indicates whether this request has succeeded are necessary.
Message	Posted	Not provided	Root Port & Endpoint	Issued by this IP, message transmit register, message transmit module	A message request is transmitted. This is used for power management and interrupt control.

- Notes: 1. MPS: Max Payload Size  
2. MRRS: Max Read Request Size

In Table 39.5, the transactions for which “Provided” is indicated in the “Completion” column, make a response with a completion. The data returned with a completion differs depending on the transaction. Table 39.6 shows the particulars of the completion contents returned. Specifically, the table shows whether completion data for each type of transactions is included or not, the devices that can issue the transaction, and some other related information.

**Table 39.6 Relationship between Completion and PCI Express Transactions**

Transaction Type	Completion Data	Device Type that can Issue Transaction	Transaction Issuance Method with This Module	Operation
Memory Read	Included	Root Port & Endpoint	Automatically issued by this module.	Data requested by memory read request and status are returned.
I/O Write	Not included	Root Port only	Automatically issued by this module.	No data is included. Status in response to I/O write is returned.
I/O Read	Included	Root Port only	Automatically issued by this module.	Data size is 1 DW. The read data and a completion that indicates whether this request has succeeded are returned.
Configuration Write	Not included	Root Port only	Automatically issued by this module.	No data is included. Status in response to configuration write is returned.
Configuration Read	Included	Root Port only	Automatically issued by this module.	Data size is 1 DW. The read data and a completion that indicates whether this request has succeeded are returned.

### 39.3.5 PIO Transfer (Data Transfer from Internal Bus → PCIEC → External Device)

This section describes PIO transfer. PIO transfer here refers to the transfer method to create a PCI Express packet by accessing the memory space assigned to the PCI Express via the internal bus.

#### (1) Overview of PIO Transfer

PIO transfer is the transfer method with which the device on the internal bus transmits a packet to the PCI Express by writing to (or reading from) the space assigned to the PCI Express. When a write access is made, the written data is stored in the data payload of the PCI Express packet. The maximum data size that can be transmitted equals to the maximum data size of an internal bus packet. The type of the PCI Express packet to be transmitted can be specified using the appropriate setting register and either memory read/write or IO read/write can be selected.

Before starting transfer, it is necessary to set the internal bus space that is transferred to the PCIEC and to set the particulars of the packet to be transmitted. Section (2) describes these settings and section (3) describes specific transfer operations.

#### (2) Initial Setting of PIO Transfer

The internal bus address cannot unequivocally define one transfer destination since the address space of the PCI Express, which is the transfer destination, is represented with 64 bits. Therefore, the upper address of the PCI Express space is specified using the PCIEC address upper register  $n$  ( $0 \leq n \leq 3$ ) and PCIEC address lower register  $n$  ( $0 \leq n \leq 3$ ). Set the PCI conversion control register  $n$  (PCIEPTCTLR $n$ ;  $0 \leq n \leq 3$ ) [31].PARE to indicate that such area setting is valid. Set the PCIEC address upper and lower registers at initial setting.

Table 39.7 shows the PIO transfer control registers. The PCIEC memory areas 0 to 3 are mapped to the PCI memory space or I/O space according to the setting of these registers.

**Table 39.7 PIO Transfer Control Registers**

PCIEC address upper registers 0 to 3 (PCIEPAUR0 to PCIEPAUR3)	Address (upper 32 bits) of the PCI address space to which the PCIE memory areas 0 to 3 are to be mapped
PCIEC address lower registers 0 to 3 (PCIEPALR0 to PCIEPALR3)	Address (lower 32 bits) of the PCI address space to which the PCIE memory areas 0 to 3 are to be mapped
PCIEC address mask registers 0 to 3 (PCIEPAMR0 to PCIEPAMR3)	Specify the size in the PCIE memory areas 0 to 3 to be mapped to the PCI address space.
PCIEC conversion control registers 0 to 3 (PCIEPTCLR0 to PCIEPTCLR3)	Specify whether the PCI space is valid or invalid. Specify the transfer destination space (PCI memory space or PCI IO space). Specify attributes (TC, LOCK, ZLR, and ATTR) for conversion.

Table 39.8 shows the PCI Express memory area addresses on the AXI bus space.

**Table 39.8 AXI Bus Space Address Map**

Memory Area	Address	Physical Address Size
PCIEC memory 0	H'00_FE10_0000 to H'00_FE1F_FFFF	1 Mbyte
PCIEC memory 1	H'00_FE20_0000 to H'00_FE3F_FFFF	2 Mbytes
PCIEC memory 2	H'00_3000_0000 to H'00_37FF_FFFF	128 Mbytes
PCIEC memory 3	H'00_3800_0000 to H'00_3FFF_FFFF	128 Mbytes

The following shows the example of mapping the internal bus space to the PCIEC address space.

Example of mapping the internal bus space to the PCIEC address space:

```

PCIEC address lower register 0[31:0] = H'0000 0000
PCIEC address lower register 1[31:0] = H'5640 0000
PCIEC address lower register 2[31:0] = H'2000 0000
PCIEC address lower register 3[31:0] = H'8000 0000
PCIEC address upper register 0[31:0] = H'0000 0000
PCIEC address upper register 1[31:0] = H'0000 0008
PCIEC address upper register 2[31:0] = H'0000 0000
PCIEC address upper register 3[31:0] = H'0000 0000
PCIEC address mask register 0[31:0] = H'0000 FF80
PCIEC address mask register 1[31:0] = H'001F FF80
PCIEC address mask register 2[31:0] = H'1FFF FF80
PCIEC address mask register 3[31:0] = H'1FFF FF80
PCIEC conversion control register 0[31:0] = H'8000 0100
PCIEC conversion control register 1[31:0] = H'8000 0000
PCIEC conversion control register 2[31:0] = H'8000 0000
PCIEC conversion control register 3[31:0] = H'8000 0000

```

Figure 39.11 shows an example of mapping the internal bus space to the PCI Express space with the above setting.

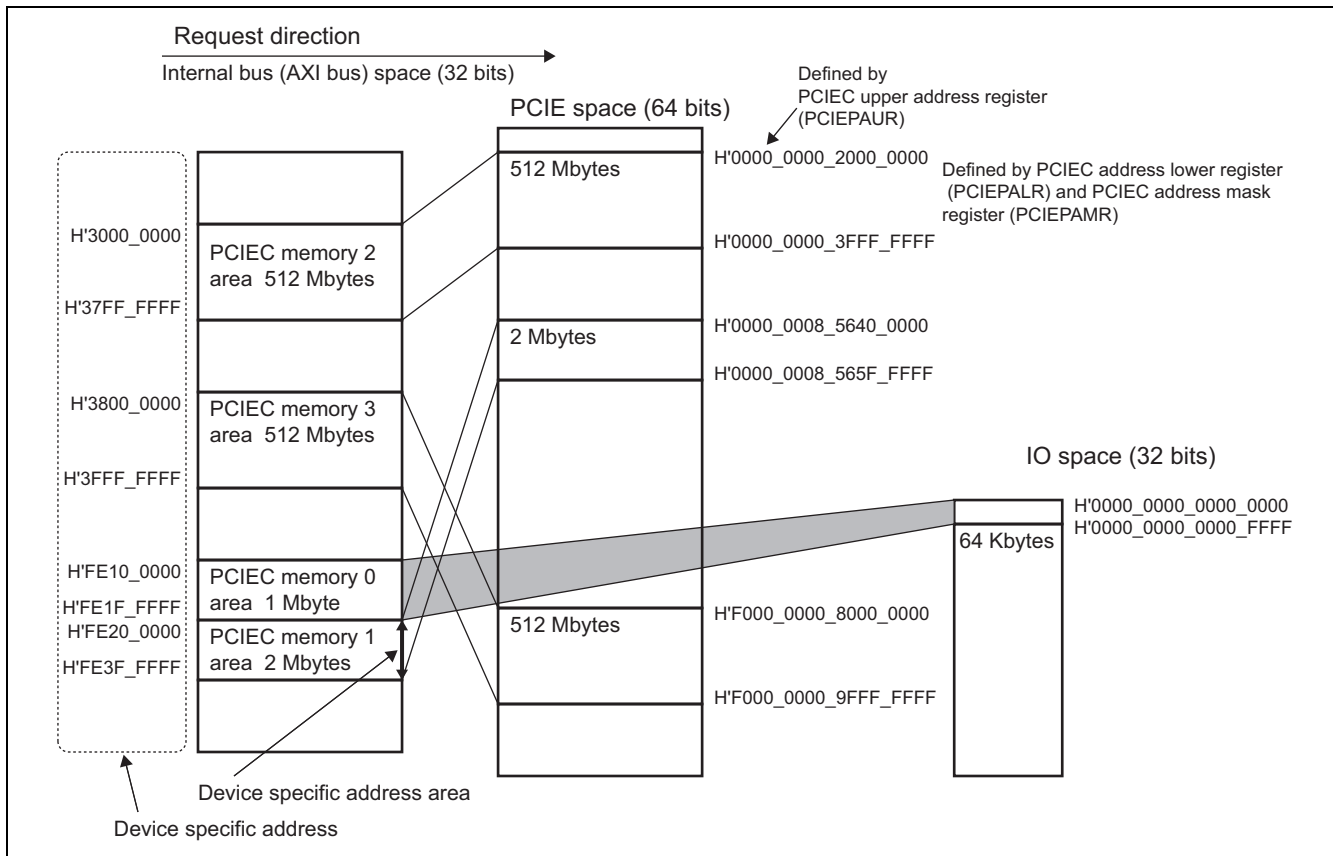

Figure 39.11 Example of Address Mapping for PIO Transfer

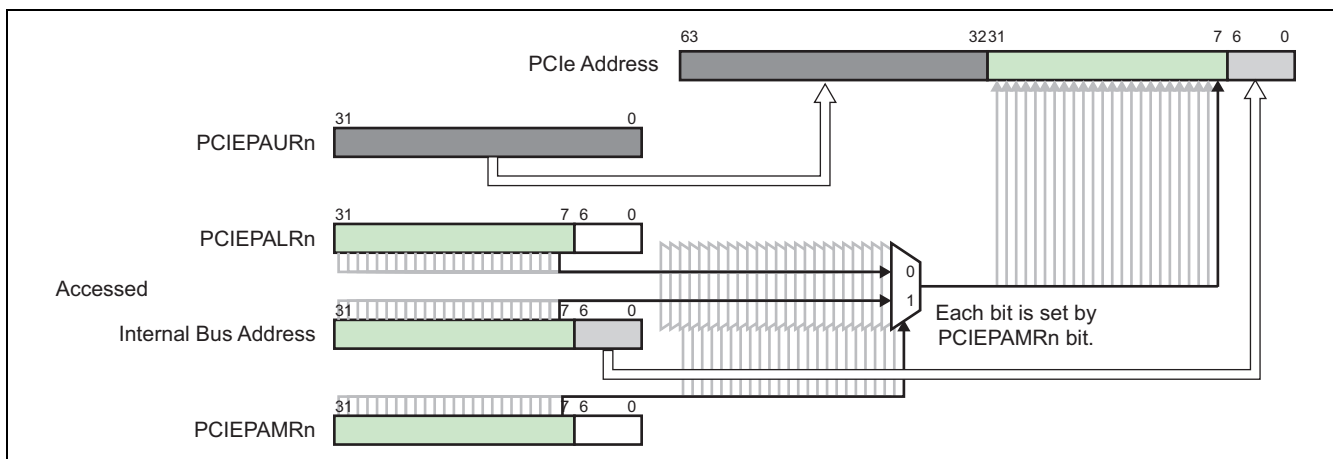

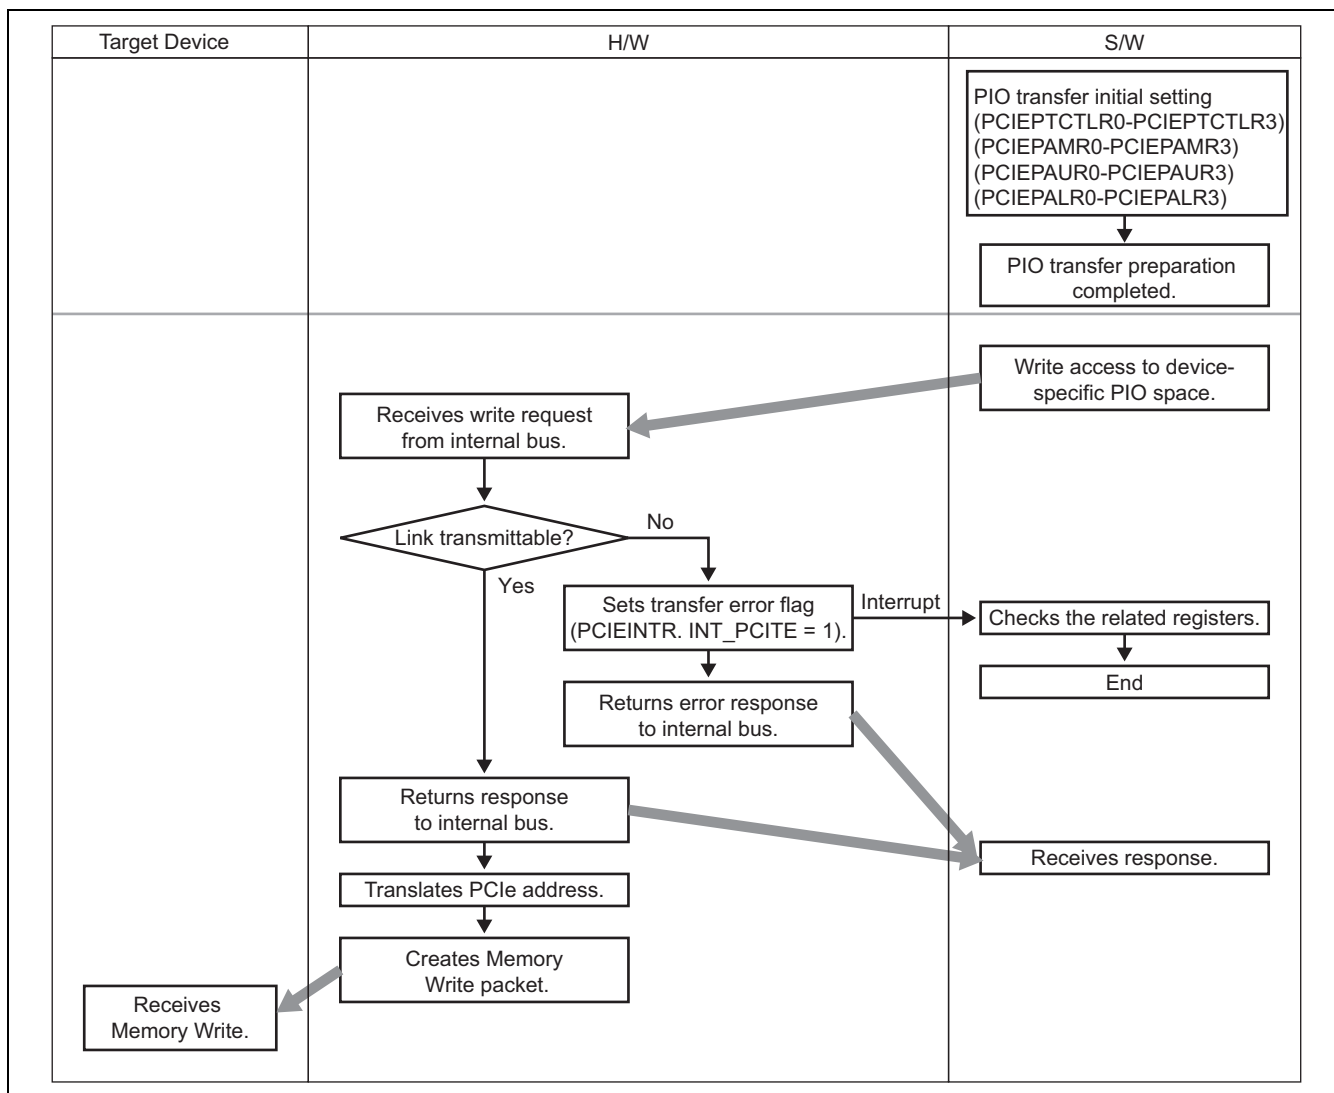

Figure 39.12 Address Translation for PIO Transfer

**(3) PIO Transfer Operation**

PIO transfer performs memory write/read to the corresponding memory/IO space on the PCI Express from the internal bus side. In reading, a read request is issued to the PCI Express, a completion from the device to be read is converted to data (response), and it is written to the area in the internal bus. Figures 39.13 and 39.14 show write and read operations of PIO transfer, respectively. In the figures, the processes for which “Check the related registers.” is indicated are software-dependent; perform appropriate processing for the application.

**Figure 39.13 PIO Transfer Operation (memory write request)**

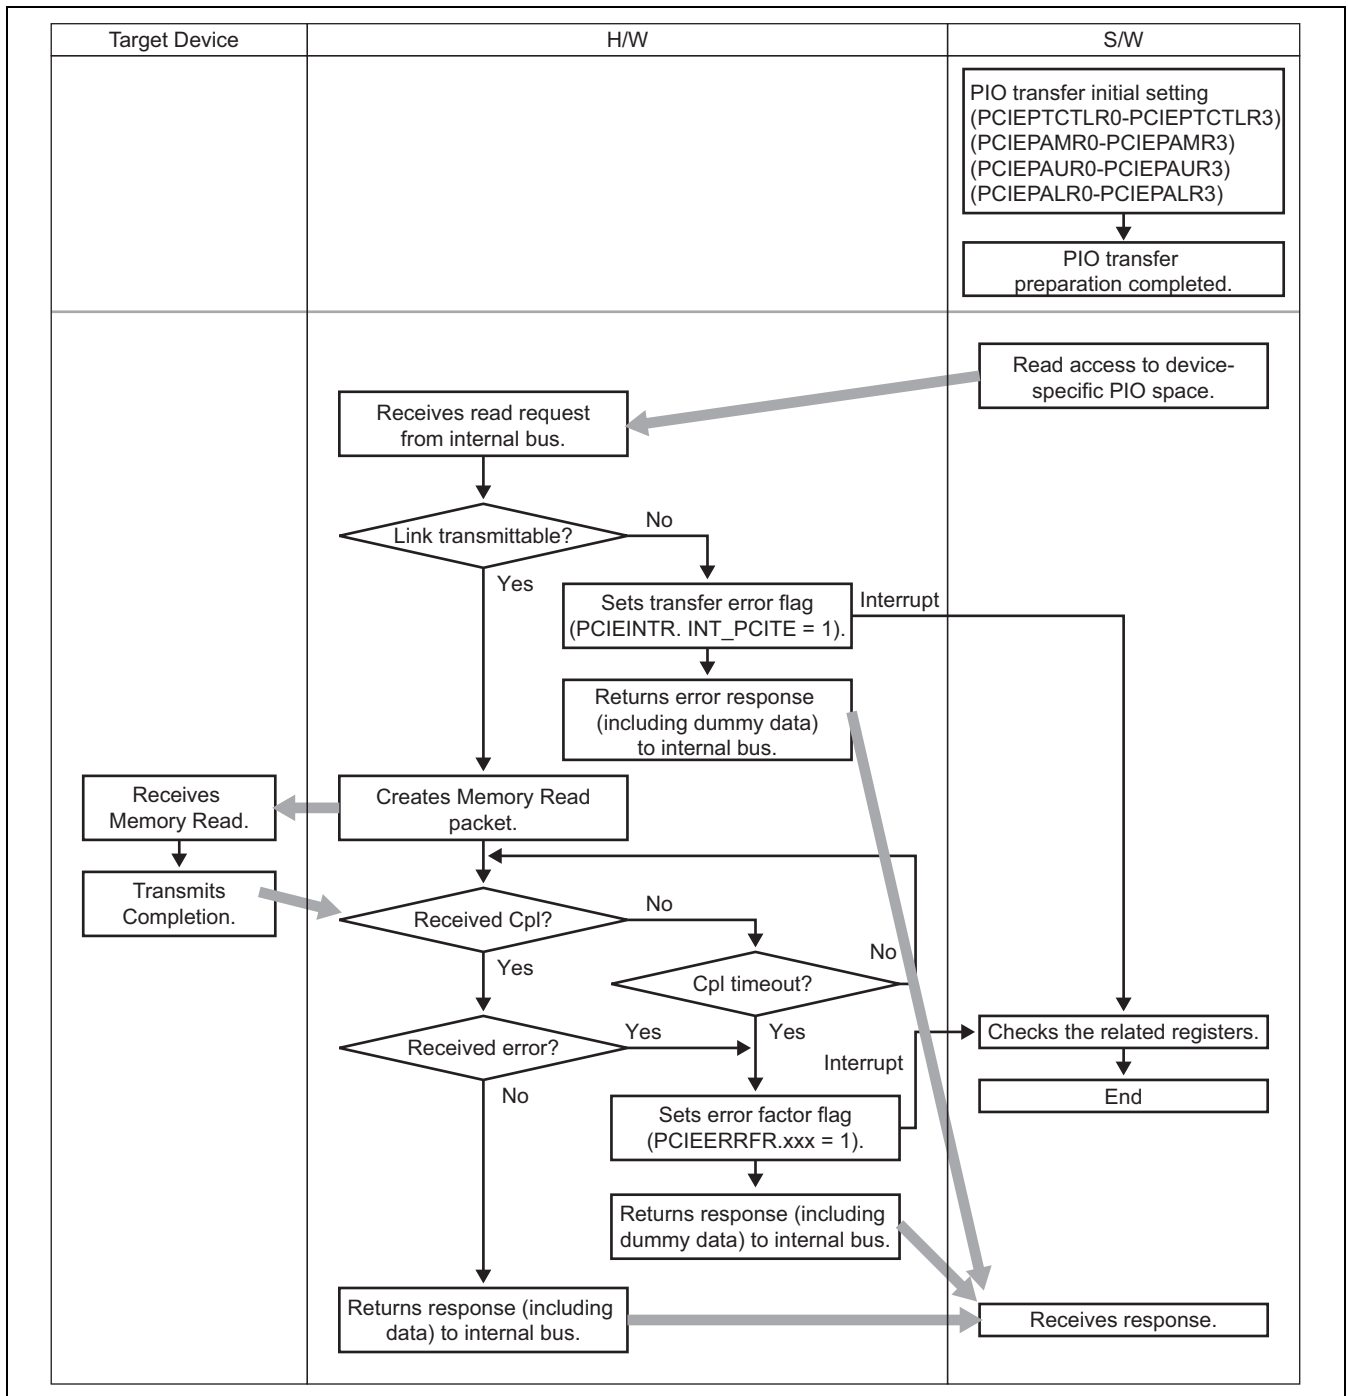

Figure 39.14 PIO Transfer Operation (memory read request)

### 39.3.6 Target Transfer (Data Transfer from External Device → PCIEC → Internal Bus)

With target transfer, the device on the PCI Express accesses the device on the internal bus of this module through a PCI Express request packet.

#### (1) Overview of Target Transfer

Using target transfer, the device on the PCI Express can send packets for memory read/write and I/O read/write to read from and write to the area in the internal bus.

In a target transfer, this module can receive packets of any data length less than or equal to the size specified in the MPS (Max Payload Size).

#### (2) Initial Setting of Target Transfer

The assignment of addresses in the PCI Express space is dynamically determined by the Root Port during a configuration cycle, based on the register settings at initialization. At initialization, the registers are set to specify the parameters such as the sizes of various areas and types of the areas (memory space, I/O space, or the other). When CFINIT is set to 1 and initialization is completed, the initial setting is reflected to BARn (Base Address Register n) of the configuration registers. In Root Port mode, PCIEPRARn is set through software. Here, BAR indicates the area to be released in response to the request from the downstream. In Endpoint mode, the BARn bits of configuration registers are set in the subsequent configuration cycle.

As an area in which memory space is to be allocated, this module supports either 64-bit PCI address space or 32-bit PCI address space (the first 4G area of the 64-bit space). When allocating an area in 32-bit address space, one BARn is used; when allocating an area in 64-bit address space, two contiguous BARn registers (BARn+1/BARn) are used. For this reason, a maximum of three 64-bit address space areas can be allocated.

In I/O space, areas are allocated using one PCIEPRAR or BAR register.

In Root Port mode, set the internal bus side space to be correlated to each of the PCIEPRAR registers in the PCI Express space to the local (internal bus) address registers 0 to 5 (PCIELAR0 to PCIELAR5). Also set the size to be allocated and the space type to the local (internal bus) address mask registers 0 to 5 (PCIELAMR0 to PCIELAMR5). Set these registers before a link is established (before setting CFINIT to 1). Although PCIEPRAR can be modified after a link is established, turn off the Master Enable of the communication peer or take other appropriate measures to prevent issuance of a request to the corresponding area during PCIEPRAR modification.

In Endpoint mode, set the internal bus side space to be correlated to each of the BAR registers in the PCI Express space to the local (internal bus) address registers 0 to 5 (PCIELAR0 to PCIELAR5). Also set the size to be allocated and the space type to the local (internal bus) address mask registers 0 to 5 (PCIELAMR0 to PCIELAMR5). Set these registers before a link is established (before setting CFINIT to 1).

The target transfer area must not be allocated to the internal bus space for the registers of this module or to the internal bus space for PIO transfer.

The following shows the example of mapping the PCI Express address space to the internal bus space.

Example of mapping the PCI Express address space to the internal bus space (Root Port):

Figure 39.15 shows an example of mapping the PCI Express space to the internal bus space (Root Port).

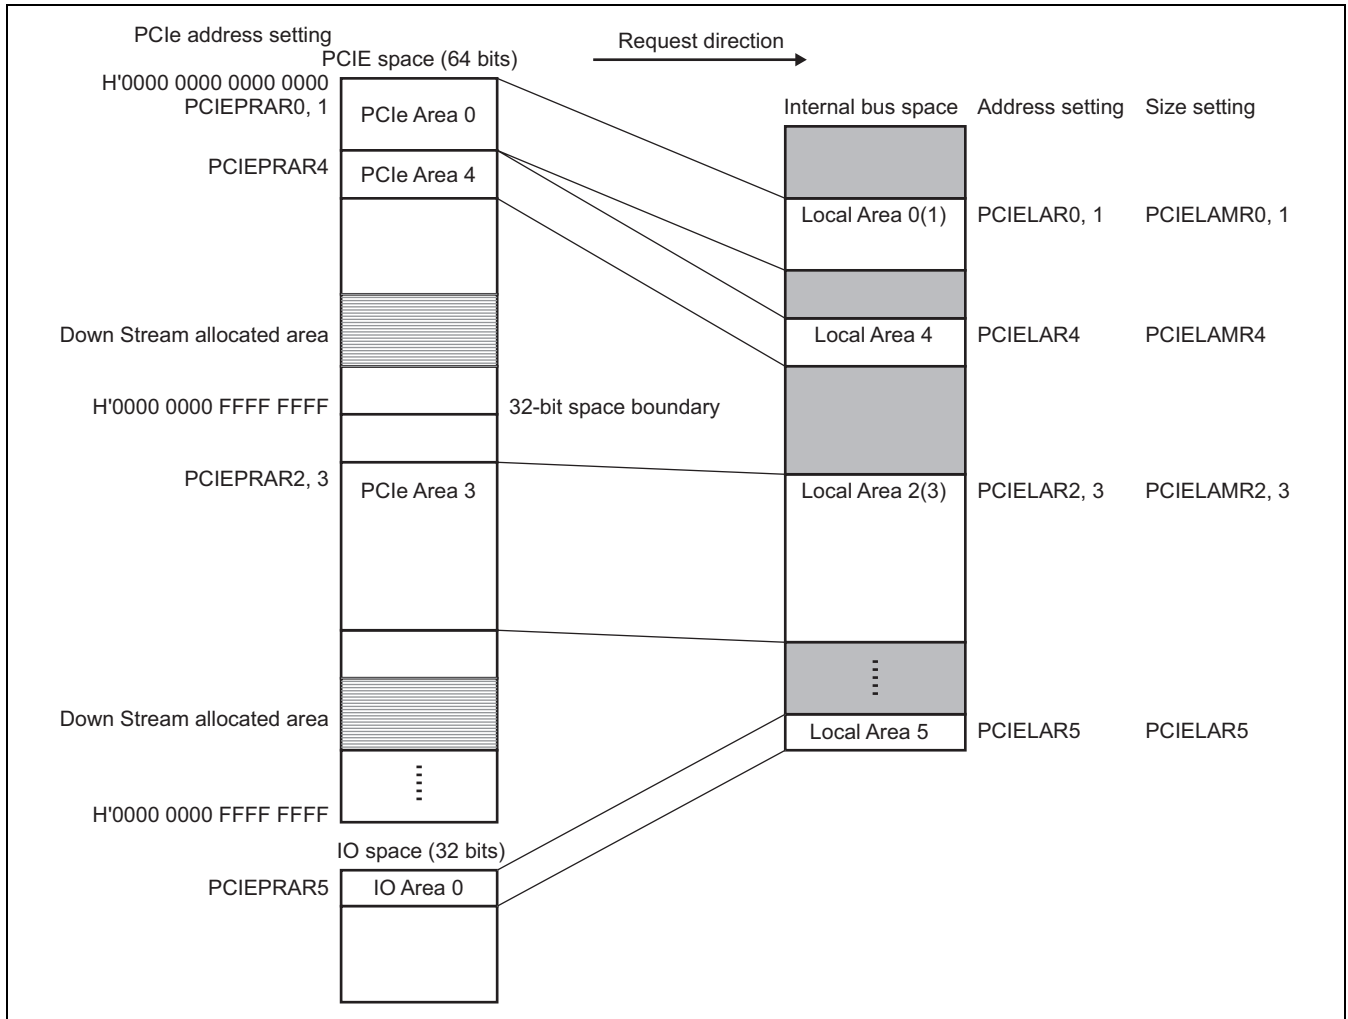

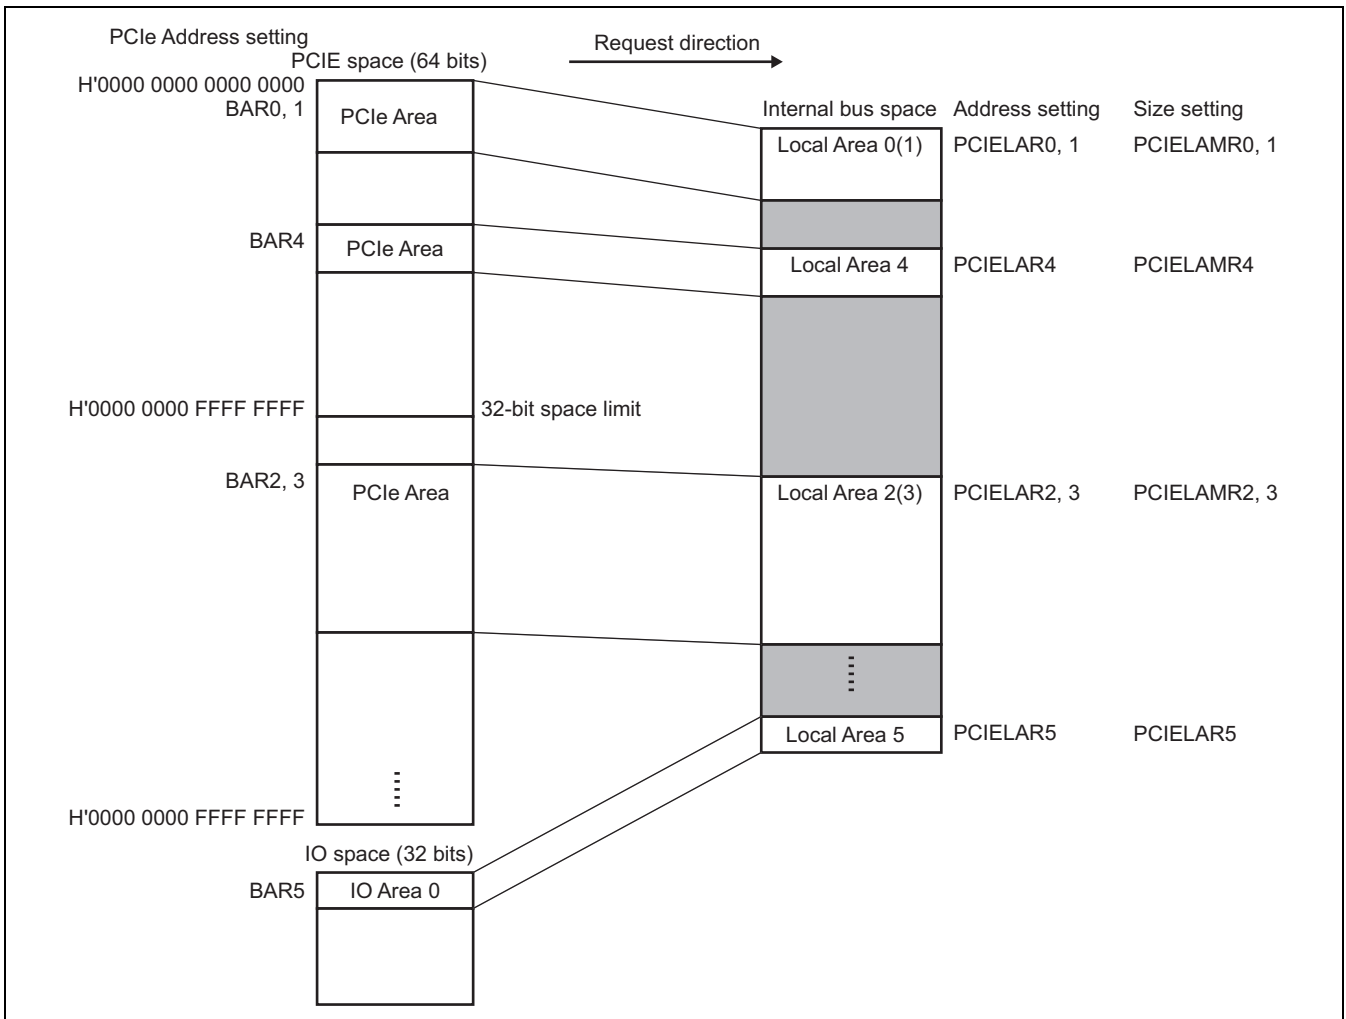

Figure 39.15 Example of Mapping PCI Express Address Space to Internal Bus Space (Root Port)

Example of mapping the PCI Express address space to the internal bus space (Endpoint):

Figure 39.16 shows an example of mapping the PCI Express space to the internal bus space (Endpoint)

**Figure 39.16 Example of Mapping PCI Express Address Space to Internal Bus Space (Endpoint)**

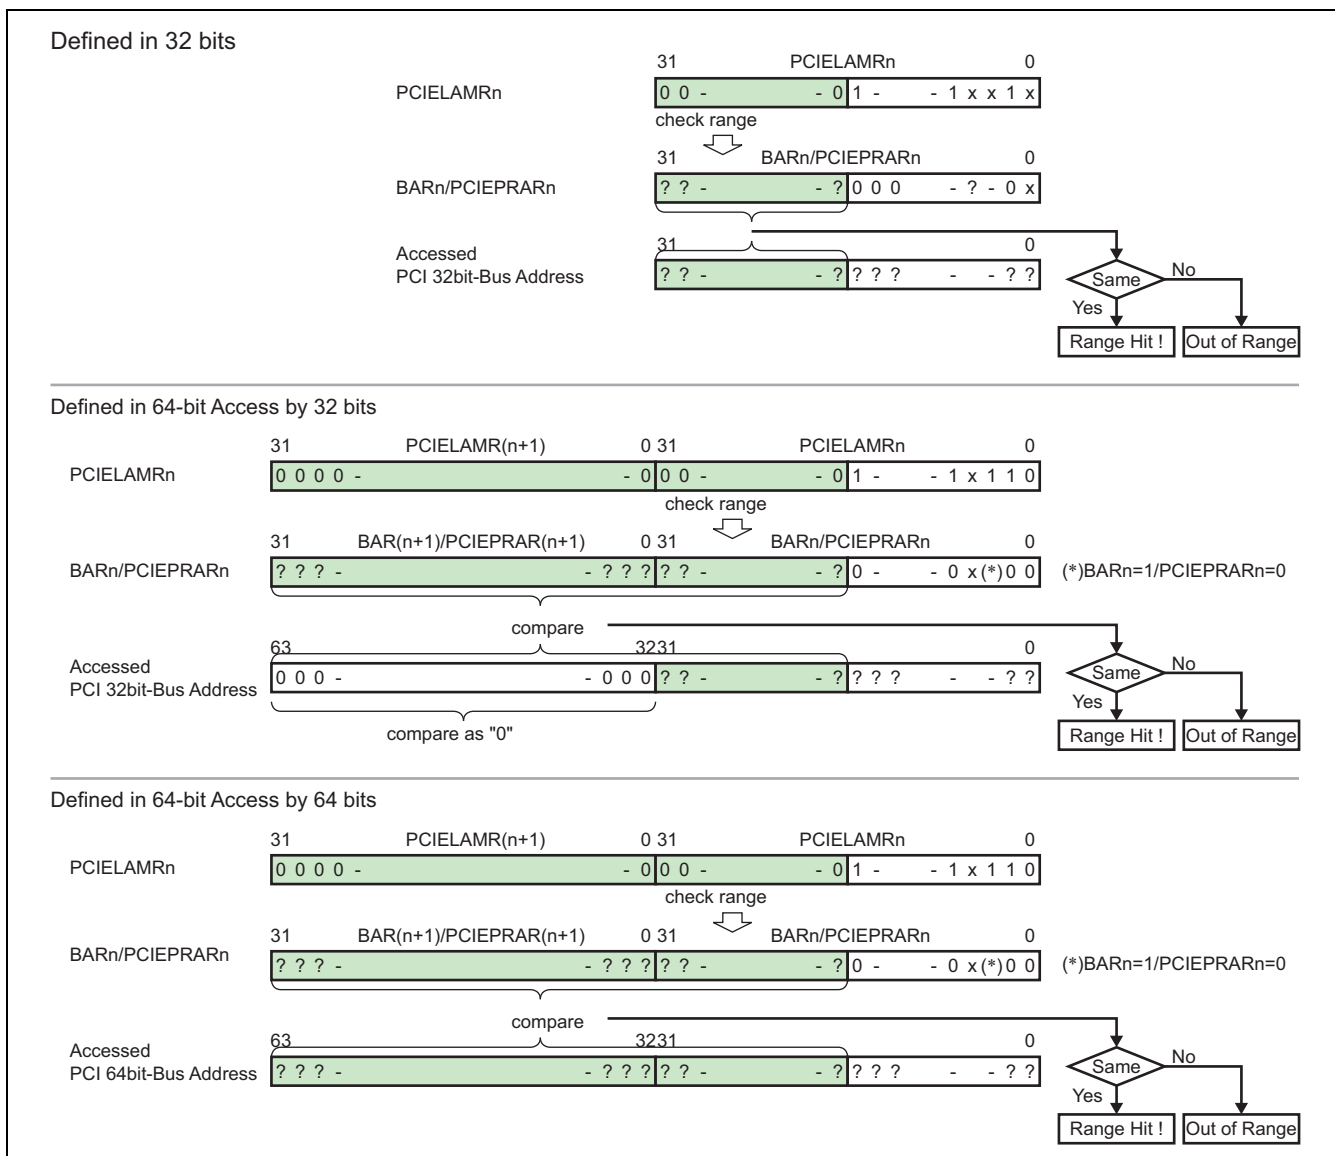

Figure 39.17 Address Comparison for Target Transfer

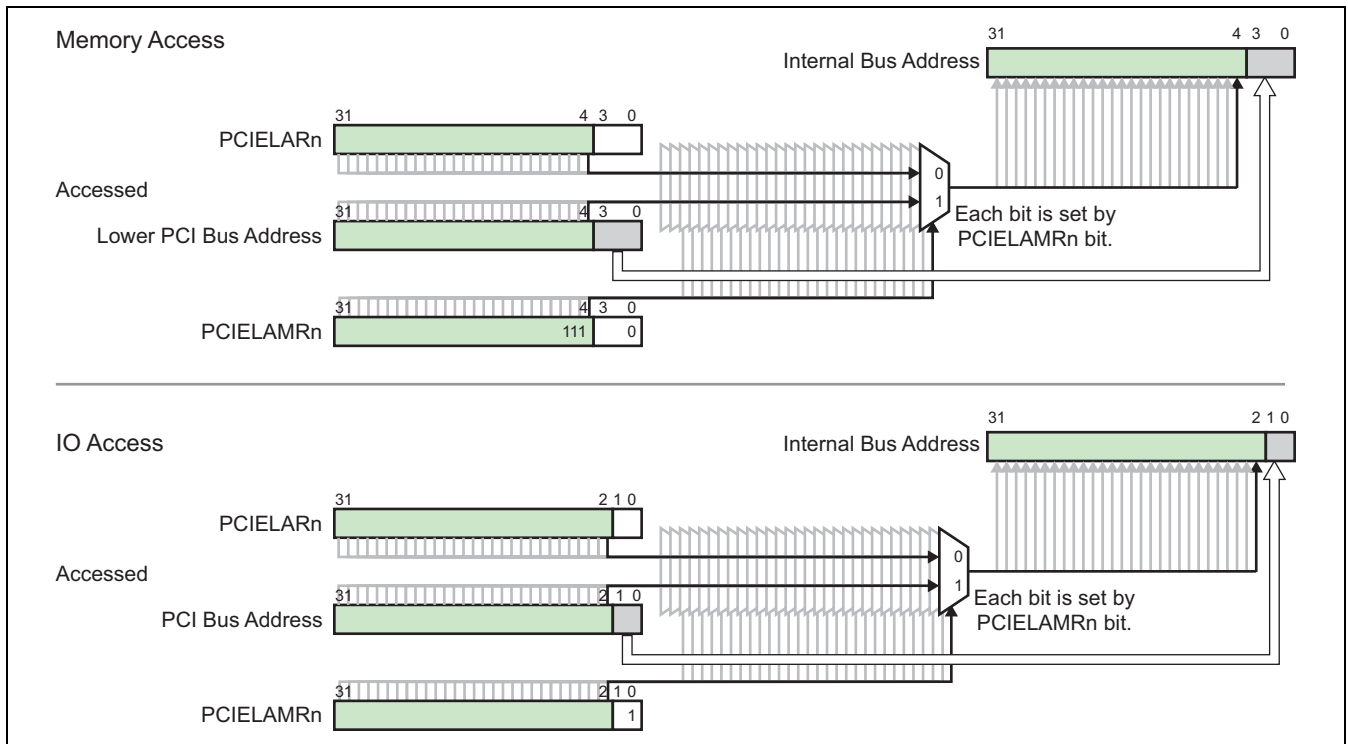

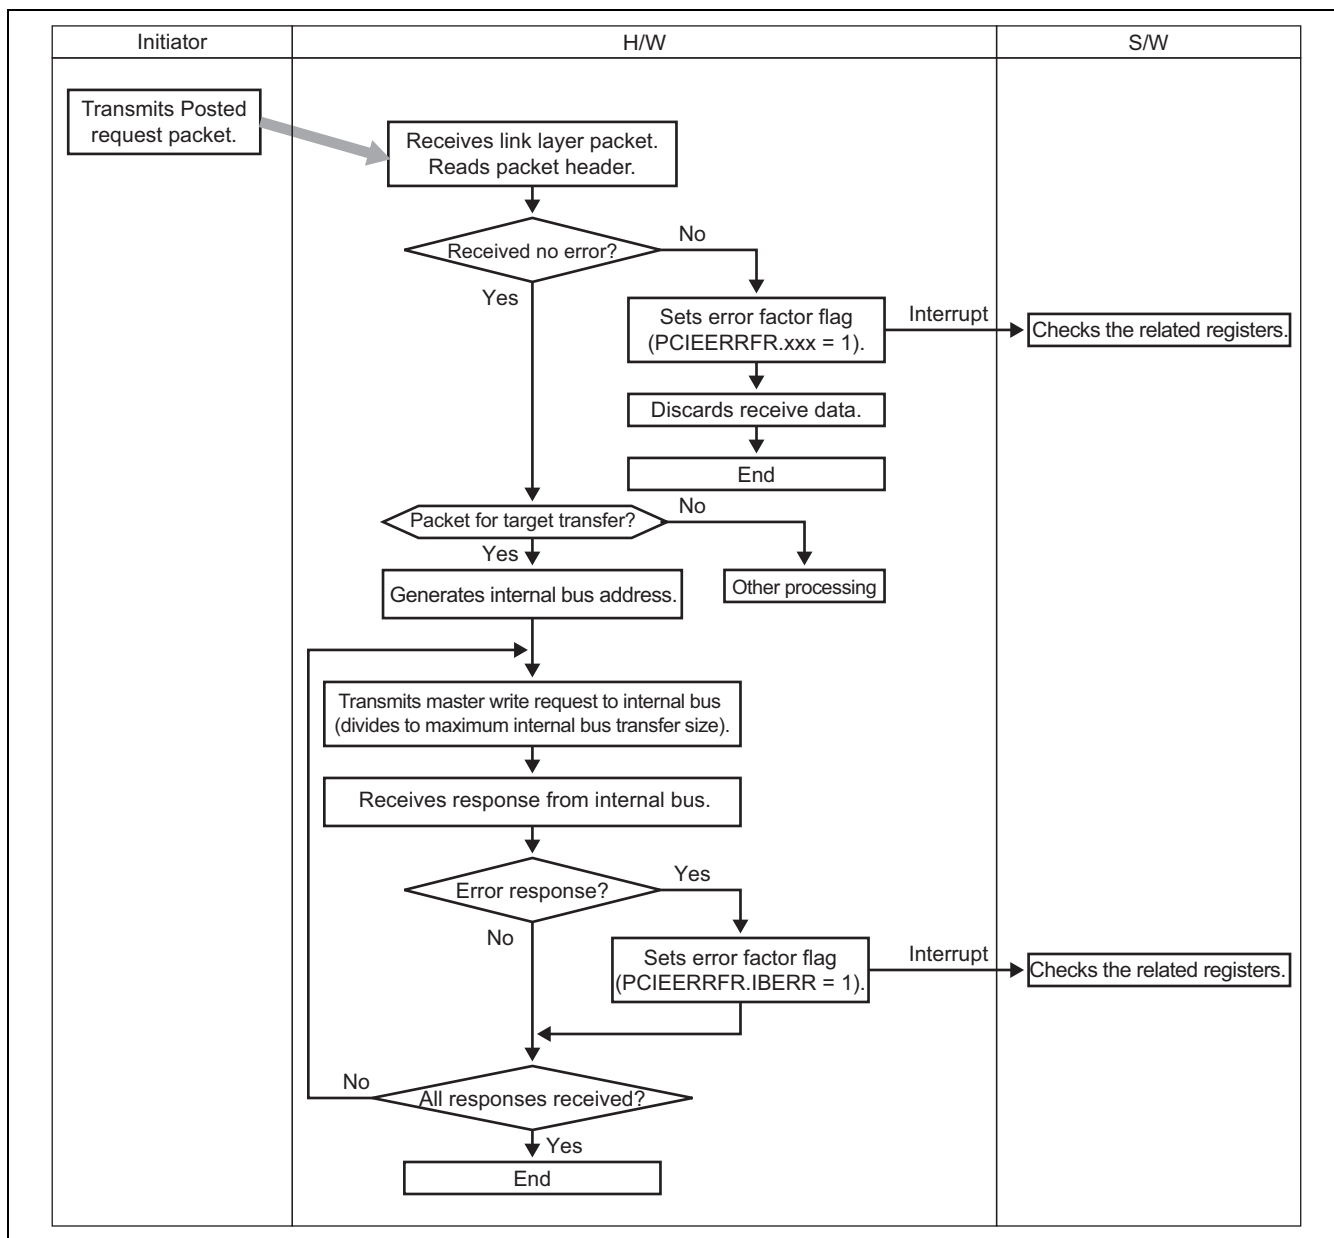

Figure 39.18 Address Translation for Target Transfer

**(3) Target Transfer Operation**

Figures 39.19 and 39.20 show the target transfer operations to receive a memory write request and the other request, respectively. In receiving a memory write request, the received data is written to the corresponding internal bus address. In receiving the other request, the internal bus is accessed, a completion packet is created and returned (note that when the internal bus is read, all the byte lanes are accessed irrespective of the PCIe space setting (prefetchable or non-prefetchable type) since the internal bus does not have a read strobe).

**Figure 39.19 Target Transfer (Reception of a Memory Write Request)**

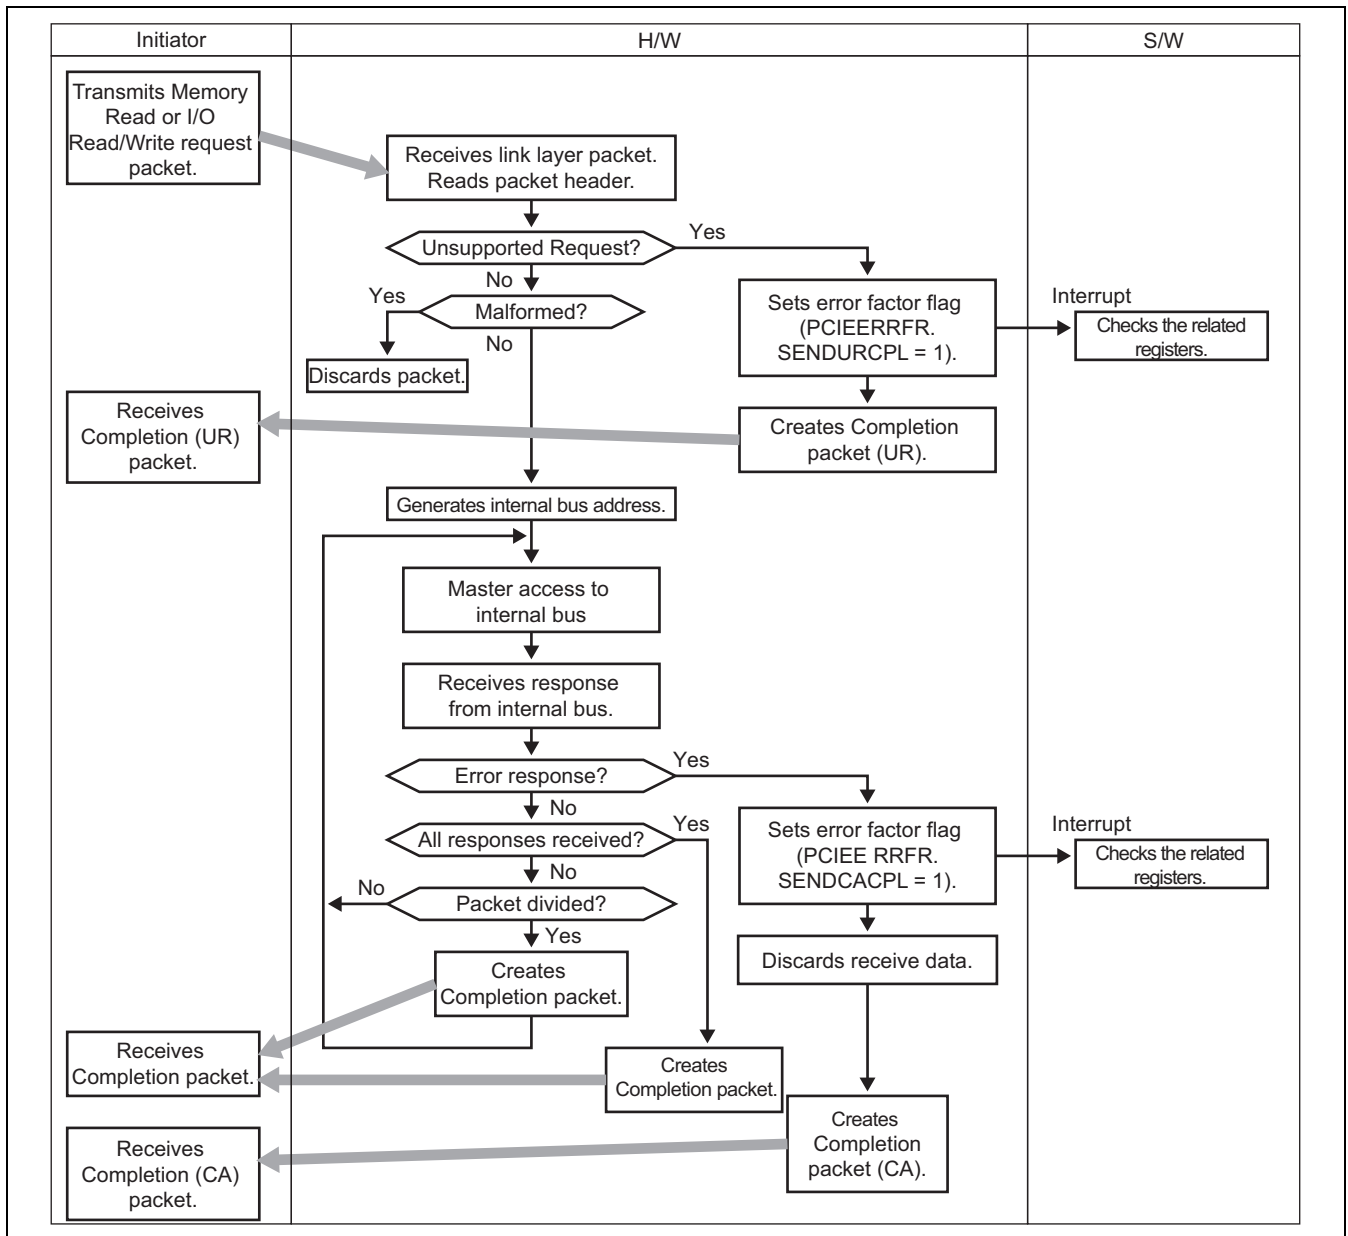

Figure 39.20 Target Transfer (Reception of a Request Other than a Memory Write Request)

### 39.3.7 DMA Transfer

This section describes the DMA transfer using the DMAC (PCIEC-DMAC) incorporated in this module.

#### (1) Overview of DMA Transfer

The PCIEC-DMAC enables effective data transfer between the PCI Express and the internal bus area. The PCIEC-DMAC can perform a maximum of  $2^{29}$  count of transfer without intervention of the CPU.

The PCIEC-DMAC supports the command chain function, which allows consecutive execution of multiple transfer commands. With the command chain function, the DMAC-related setting information, such as the addresses of the transfer destination and source and transfer size, is considered as a command; by reading and executing these commands from the memory one by one, consecutive execution of multiple transfer units is provided without intervention of the CPU.

The PCIEC-DMAC has the following features.

- Number of channels: 8 channels
- Address space: PCI Express = 32/64 bits, internal bus = 32 bits
- Transfer data length: PCI Express = 8 to 128 bytes, internal bus = 8 to 128 bytes
- Maximum transfer count: 536,870,912 ( $2^{29}$ )
- Address mode: Dual address mode
- Transfer request: Started by register control
- Data transfer: Normal mode (continuous transfer), command chain
- Priority: Either channel priority fixed mode or round-robin mode selectable
- Interrupt request: Interrupts can be requested to the INTC when a data transfer has completed or an error has occurred.

#### (2) Initial Setting of DMA Transfer

Set the PCI Express and internal bus addresses, byte count, transfer end interrupt. When the command chain is not used, set the PCIEDMCHCRn.CCE to 0. In the DMA transfer (internal bus side), access to the internal bus space for the registers and access to the internal bus space for PIO transfer are prohibited.

#### (3) DMA Transfer Operation

DMA transfer can be initiated by simultaneously setting the transfer direction and enabling the channels with PCIEDMCHCRn. Transfer end is detected by confirming PCIEDMCHSRn[0].TE = 1 or detecting a transfer end interrupt. After transfer is ended, transfer is completed by setting PCIEDMCHCRn[31].CHE to 0. Simultaneously, PCIEDMCHSRn[0].TE is set to 1 to clear this bit.

Figures 39.21 and 39.22 show DMA transfer from the internal bus to the PCI Express space and from the PCI Express space to the internal bus, respectively.

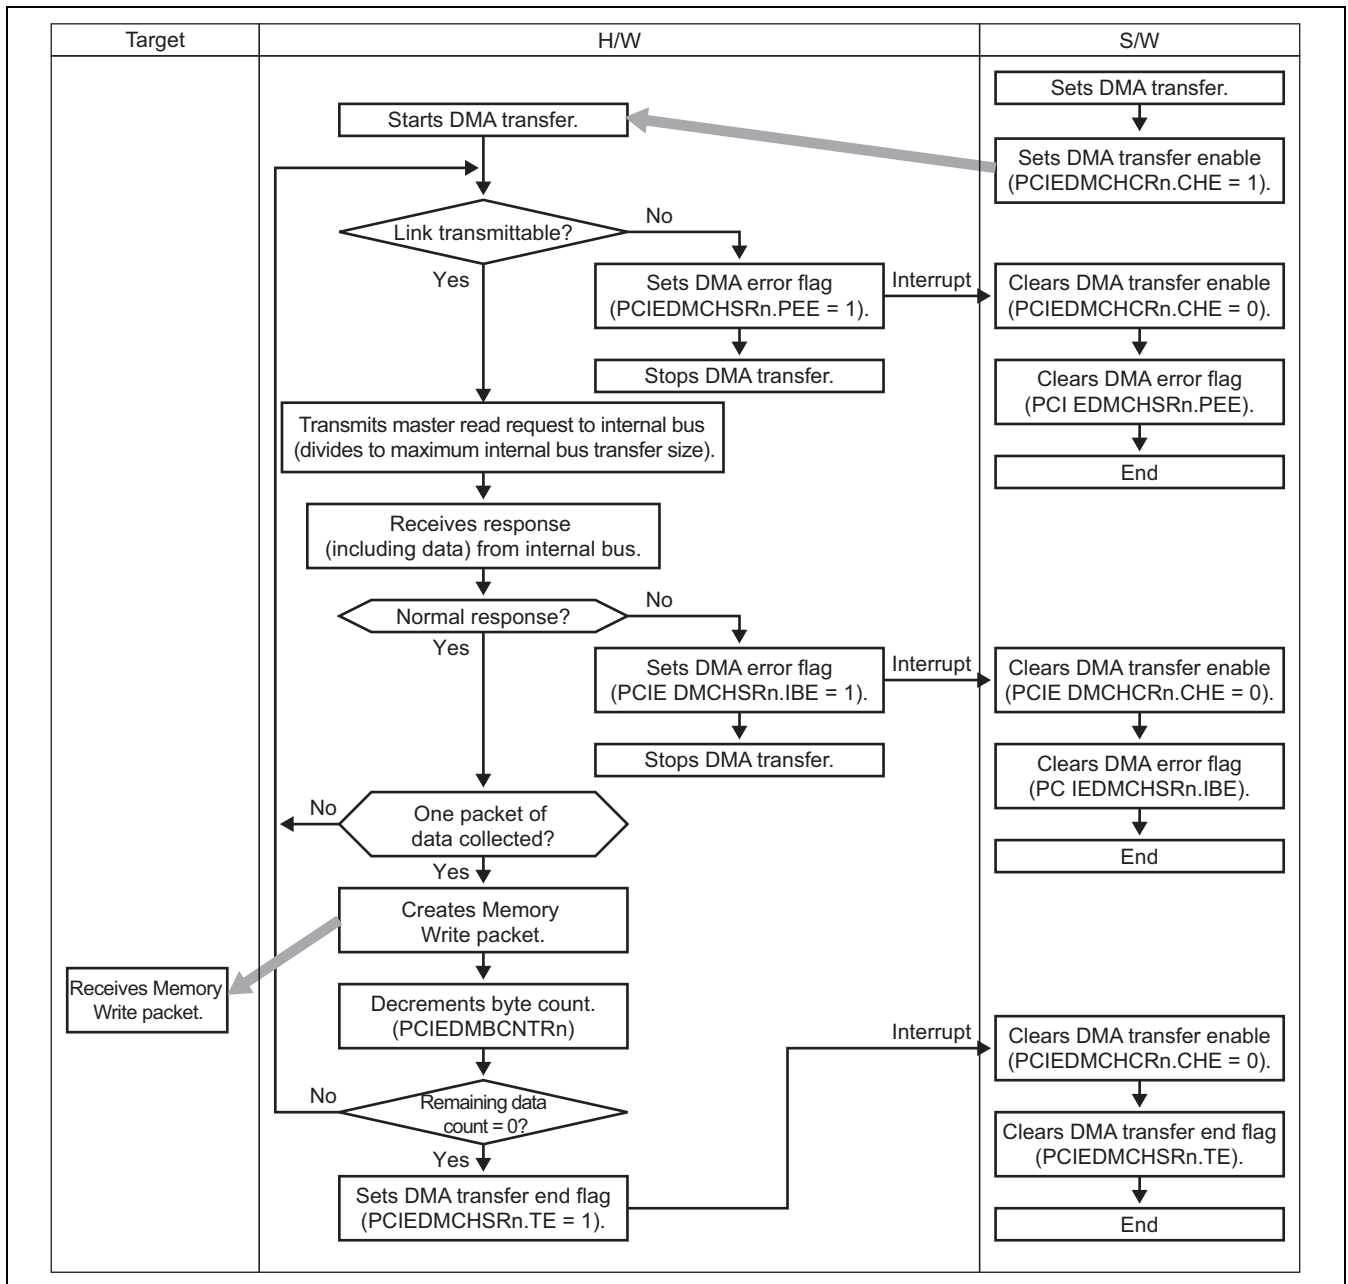

Figure 39.21 DMA Transfer (Internal Bus → PCI Express)

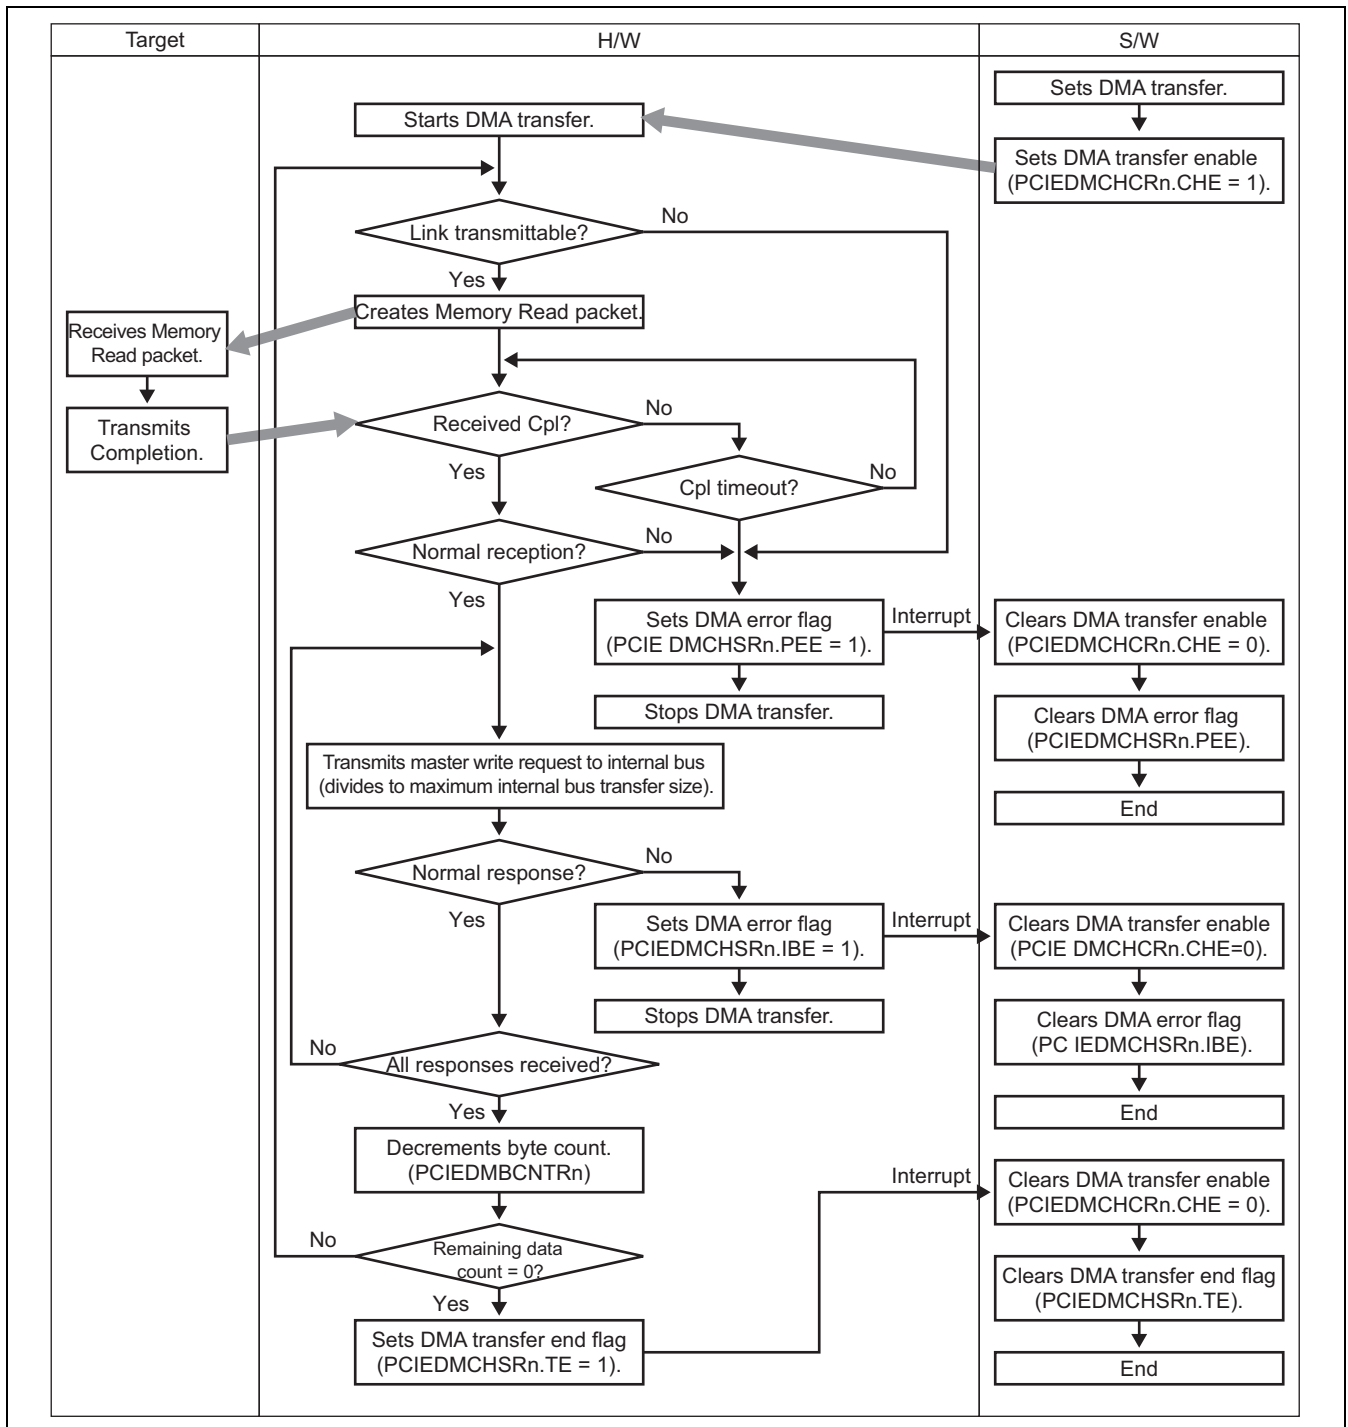

Figure 39.22 DMA Transfer (PCI Express → Internal Bus)

#### (4) DMA Channel Priority

When more than one DMA channel is used simultaneously, they are actually used according to the priority described in this section. The priority can be set with the PCIEDMAOR register. Set the relevant bit at the same time as setting PCIEDMAOR.DMAE to 1.

The channel priority is initialized to CH0 > CH1 > CH2 > CH3 > CH4 > CH5 > CH6 > CH7 while PCIEDMAOR.DMAE = 0.

##### (a) Arbitration Timing between DMA Channels

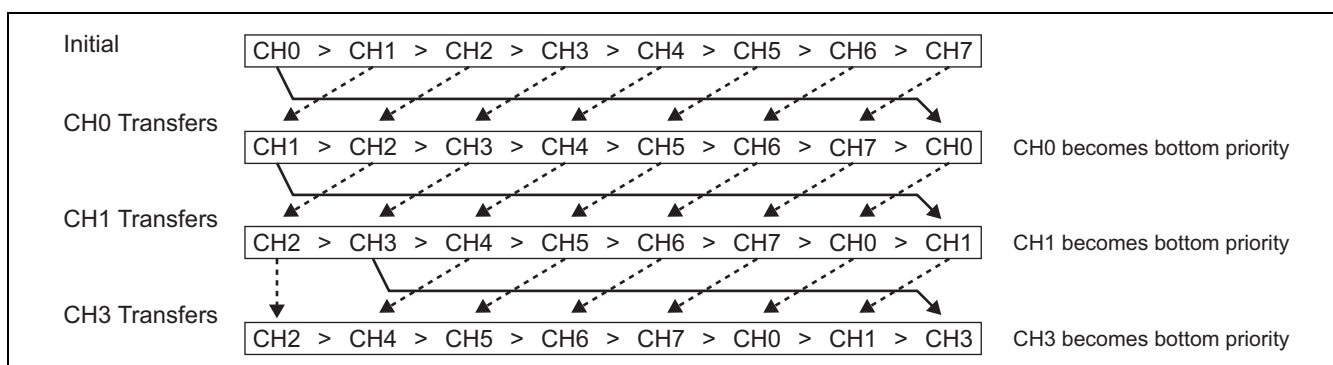

Arbitration is performed every transfer unit (128 bytes max.) of the DMA channel currently transferring data.

##### (b) Fixed Mode

When PCIEDMAOR.ABT is 0, the priority is fixed to the default setting.

##### (c) Round Robin Mode

When PCIEDMAOR.ABT is 1, round robin scheduling is applied to all the channels to determine the priority. When a certain channel completes transfer, the channel is given a bottom priority and the channels that have been given a lower priority than that channel are given a higher priority as shown in Figure 39.23.

**Figure 39.23 Round Robin Scheduling among All the Channels**

#### (5) Dividing Packet at Address Boundary

If the PCI Express side address or internal bus address of a packet crosses the 4-Kbyte boundary, the packet is divided.

#### (6) Command Chain

##### (a) Overview of Command Chain Operation

A command chain allows this module to continuously execute multiple DMAC commands. A DMAC command refers to a set of information related to the PCIEC-DMAC transfer; that is, the information specified by PCIEDMPALR<sub>n</sub>, PCIEDMPAUR<sub>n</sub>, PCIEDMIAR<sub>n</sub>, PCIEDMBCNTR<sub>n</sub>, PCIEDMCCAR<sub>n</sub>, and PCIEDMCHCR<sub>n</sub>. As well as in the PCIEC-DMA control register, the information can also be set in the memory in the format shown in Figure 39.24. With the command chain, each time a DMAC command execution is completed, the next DMAC command is read from memory and the content of the DMAC command is written to the relevant PCIEC-DMA control register, which allows execution of the DMAC command.

By specifying the next DMAC command in the DMAC command to be read, a command chain is created and thus data can be transferred consecutively.

During command chain operation, a DMAC command is read from the memory address indicated by PCIEDMCCAR<sub>n</sub> and the content of the read command is written to the register of the relevant channel to execute the command. If the CCE bit in the read DMAC command is 1, the next command is read from memory again and executed upon completion.

of the current command. If the CCE bit in the read DMAC command is 0, completion of the command completes the command chain operation.

### (b) Initial Setting of Command Chain

To start a command chain on a channel, enable the channel while PCIEDMCHCRn.CCE is set to 1. Before starting a command chain, store a chain of DMAC commands in a memory location accessible from the internal bus, and set the address of the first DMAC command in PCIEDMCCARn.

Note: As the setting (information) of the first transfer of the command chain, the information in the memory specified with PCIEDMCCARn is used; the setting in the PCI Express-DMA control registers is not used (here, any setting other than PCIEDMCCARn is ignored).

### (c) DMAC Command Format

Figure 39.24 shows the format of DMAC commands to be stored in memory. Set each field of the commands as described below and store such commands.

- CHE field: Always set 1.
- CCE field: Set 0 for the command to be executed last; set 1 for the other commands.
- CCA field: Set 0 in all the bits for the command to be executed last; set the address of the next command for the other commands.
- Reserved field: Always set 0.

Offset	Registers	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
00	DMPALR	PADRL																												R			
04	DMPAUR	PADRU

14	-	R																															
18	DMCCAR	CCA																												R			
1C	DMCHCR	CHE	DIR	CCE	R								ATTR	R						TC	R												

R=Reserved

Figure 39.24 Formats of DMAC Commands

### (d) Channel Priority for Command Read

While the command chain operation is in progress on multiple DMA channels, DMAC command read requests are issued from the multiple DMA channels; here, round robin scheduling is applied to all the channels to determine the priority (refer to section 39.3.7 (4)(c), Round Robin Mode).

Note: The channel priority here is different from the priority of the DMA transfer operation specified with PCIEDMAOR.

The channel priority is initialized to CH0 > CH1 > CH2 > CH3 > CH4 > CH5 > CH6 > CH7 while PCIEDMAOR.DMAE = 0.

## (7) Notes on DMA Transfer

### (a) Handling upon DL\_Down → DL\_Active

If a DL\_Down occurs during DMA transfer, it is handled as a transfer error on the PCI Express side and thus transfer is ended after PCIEDMCHSRn.PEE is set. However, if a request is being made to the internal bus when a DL\_Down occurs, a response to the request is first received and then flag is set and transfer is ended. Therefore, not all the operations are stopped immediately after a DL\_Down.

When returned from a DL\_Down to DL\_Active, first read PCIEDMAOR.DMAACT = 0 to confirm that all the channels that have been operating before DL\_Down have stopped operating, and then re-set DMA and perform transfer again.

### 39.3.8 Transfer Priority

This section describes the transfer priority.

#### (1) Arbitration (Transmission to PCI Express)

Accesses to transmit packets to the PCI Express include: DMA transfer, response processing to target transfer, PIO transfer, and Message transfer. The DMAC and the modules controlling PIO transfer output posted and non-posted requests, respectively.

Arbitration between these accesses is performed according to the priority shown below.

(High priority)

- Completion of target transfer (configuration)
- Completion of target transfer (memory, IO)
- PIO transfer (configuration, memory read, IO)
- PIO transfer (memory write)
- Various messages
- DMA transfer (memory read)
- DMA transfer (memory write)

(Low priority)

#### (2) Arbitration (Reception from PCI Express)

The completion receiver and request receiver receive packets from the PCI Express and make reception access requests.

Arbitration between these accesses is performed according to the priority shown below.

(High priority)

- PCIEC completion receiver
- PCIEC request receiver

(Low priority)

The PCIEC link of this module, which processes the PCIe protocol, processes packets received from the PCI Express one by one in order of reception. After that, the processed packets are sequentially distributed to the target receiver, DMA receiver, message receiver, and PIO receiver according to the type of the received packet and then processed one by one there. If the receiver corresponding to the processing target is waiting for a certain process to be completed (for example, waiting for a request to the internal bus or a response), the PCIe link starts the next reception process after completion of the process. Until completion, the next packet is suspended from being processed.

### (3) PCI Express Transmit/Receive Ordering

The following describes the transaction ordering rules of this module.

Table 39.9 shows the transmit transaction ordering rules of this module.

**Table 39.9 Transmit Transaction Ordering Rules of This Module**

Row Pass Column?	1st Posted	1st Non-Posted	1st Completion
2nd posted	No	Yes	Yes
2nd non-posted		No	Yes
2nd completion		Yes	No

Note: Yes: The second transaction can pass the first transaction.

No: The second transaction cannot pass the first transaction.

Table 39.10 shows the receive transaction ordering rules of this module.

**Table 39.10 Receive Transaction Ordering Rules of This Module**

Row Pass Column?		1st Transaction						
		Request					Completion	
		Posted	Non-Posted					
		Memory Write/Message	Memory/IO Read	IO Write	Configuration Write/Read	Read/Write	Memory Read (DMA)	
2nd transaction	Posted	Memory write/message	No*	Yes	Yes	Yes	Yes	Yes
	Non-posted	Memory/IO read	No	Yes	No	Yes	Yes	Yes
		IO write request	No*	Yes	No	Yes	Yes	Yes
		Configuration write/read	No	Yes	Yes	No	Yes	Yes
Completion	Read/write	Yes	Yes	Yes	Yes	No	Yes	
	Memory read (DMA)	Yes	Yes	Yes	Yes	Yes	No	

Notes: Yes: The second transaction can pass the first transaction.

No: The second transaction cannot pass the first transaction.

\* For Memory/IO Write, the second request cannot pass the first request if they are issued to the same BAR space; the second request may pass the first request if issued to the different BAR spaces. For a combination of Memory Write and Message, the second request may pass the first request.

This module applies the ordering rules conforming to the standard to the transmission and reception sides. According to the rules, some packets cannot be passed by (to prevent an undesired influence on the order of sequential processing and such). Therefore, depending on the packet transfer order or combination, processing of a packet may be delayed until the previous packet processing is completed.

**(4) Arbitration (Bus Master Request)**

Accesses to output a master write request to the internal bus include: DMA transfer, target transfer, and message transfer.

Arbitration between these accesses is performed according to the priority shown below.

(High priority)

- Target transfer (reception of memory write and IO write)
- DMA transfer (reception of completion for memory read)

(Low priority)

Accesses to output a master read request to the internal bus include: DMA transfer, target transfer, and message transfer.

Arbitration between these accesses is performed according to the priority shown below.

(High priority)

- Target transfer (reception of memory read and IO read)
- DMA (command read)
- DMA (transmission of memory write)

(Low priority)

### 39.3.9 Link Function

#### (1) Changing Speed

The PCI Express 2.0 standard allows changing of the transfer speed intentionally or to handle the problem related to the link reliability. Figure 39.25 shows a flow of changing the transfer speed to 5.0 GT/s.

- Allow the factor of speed change to be generated while speed change is enabled. (According to the PCI Express 2.0 standard, if speed change is attempted by itself and ends in failure, starting of speed change by itself is prohibited for 200 ms.)
- If speed change is attempted while another speed change is in progress, it is impossible to know which speed change factor is used for judging the end of speed change. For reliable judgment of the end of speed change, do not make any attempt to change a speed during another speed change. (MACCTLR.SPCHG == 0 and MACSR.SPCHGFIN == 0 indicate that speed change has not been set or speed change processing is not in progress.)

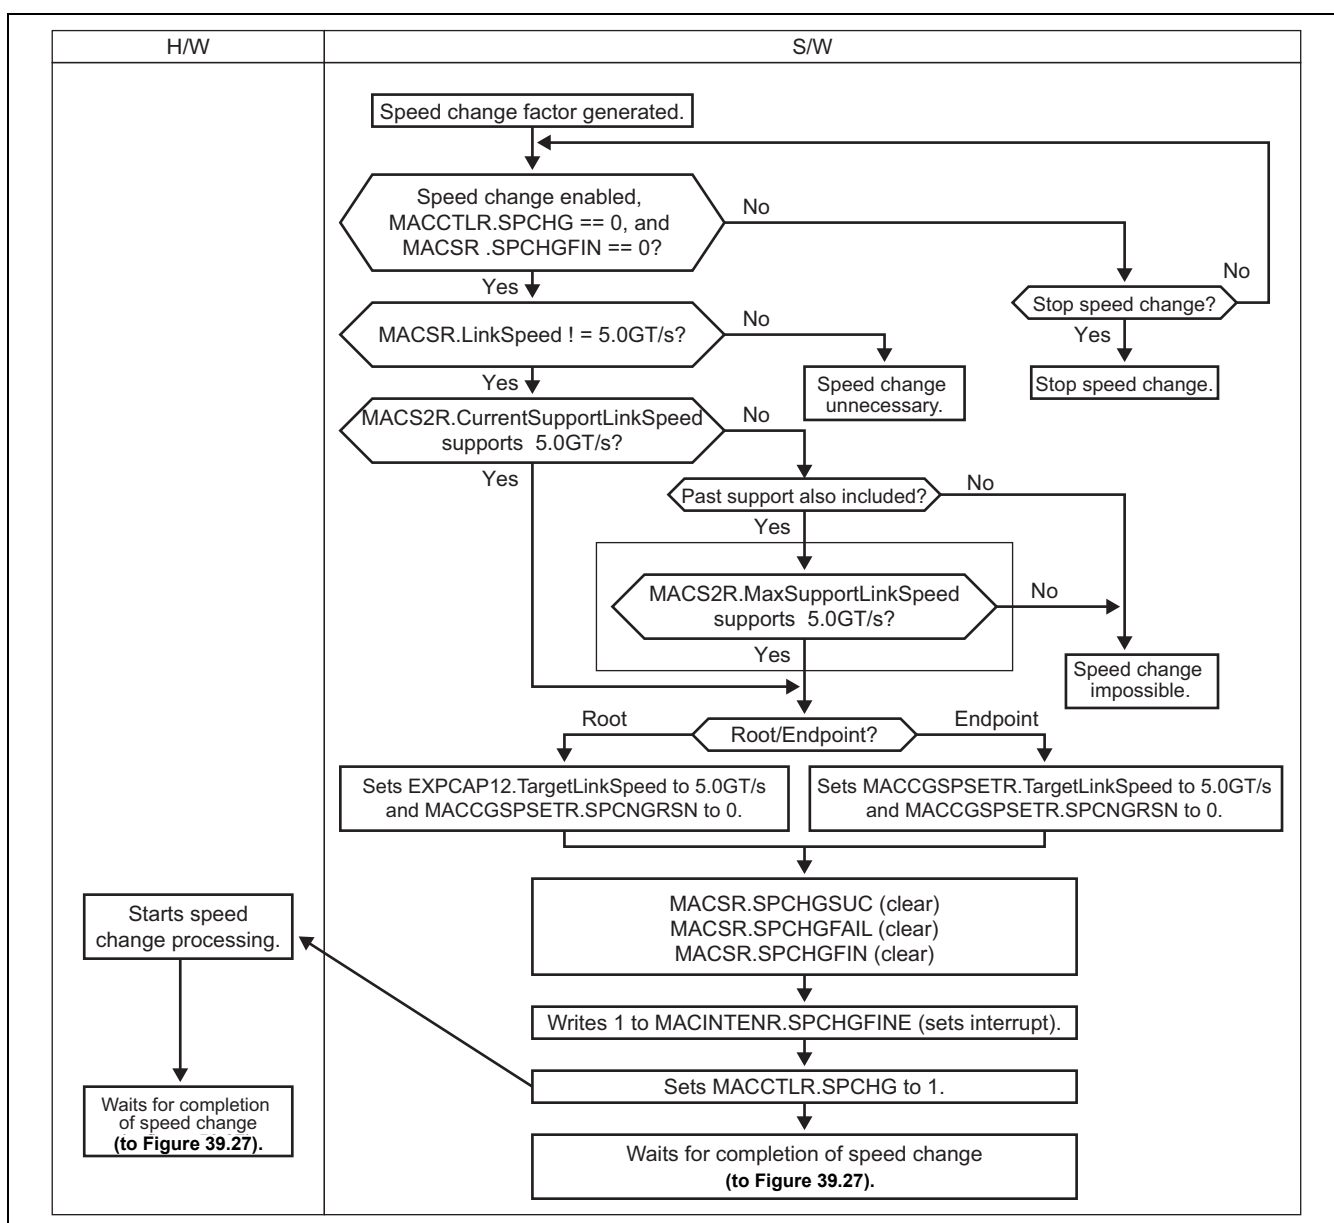

Figure 39.25 Changing Speed to 5.0 GT/s

Figure 39.26 shows a flow of changing the transfer speed to 2.5 GT/s.

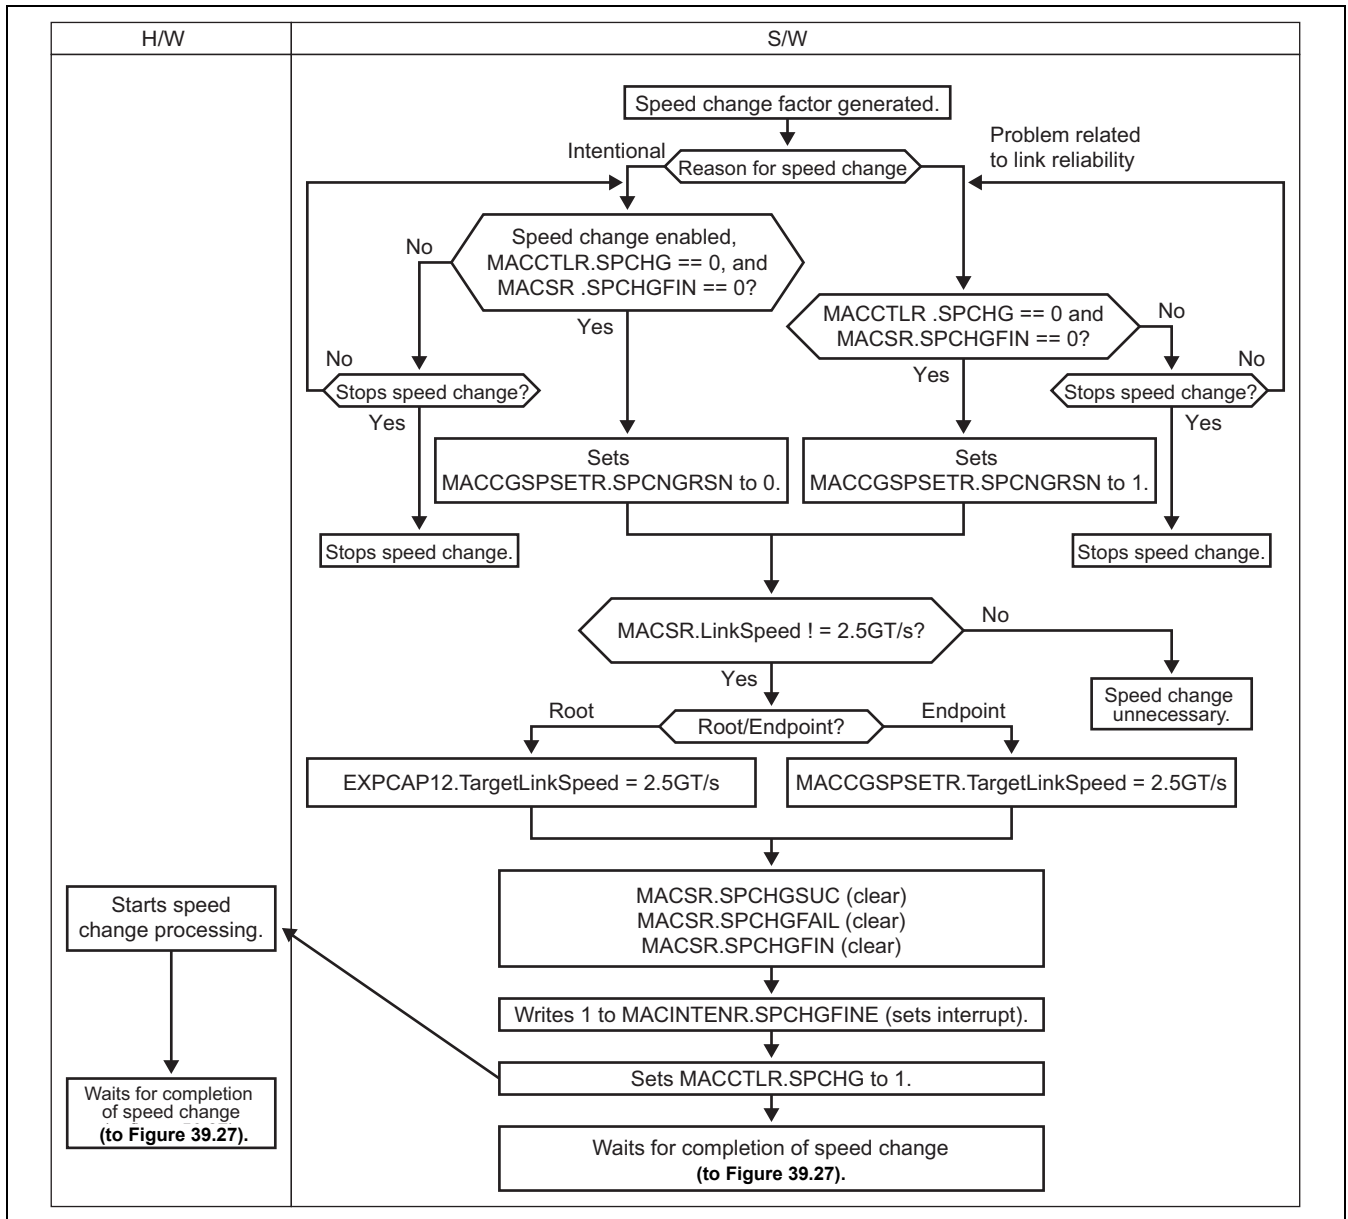

Figure 39.26 Changing Speed to 2.5 GT/s

Figure 39.27 shows a flow of the ending process for the transfer speed change.

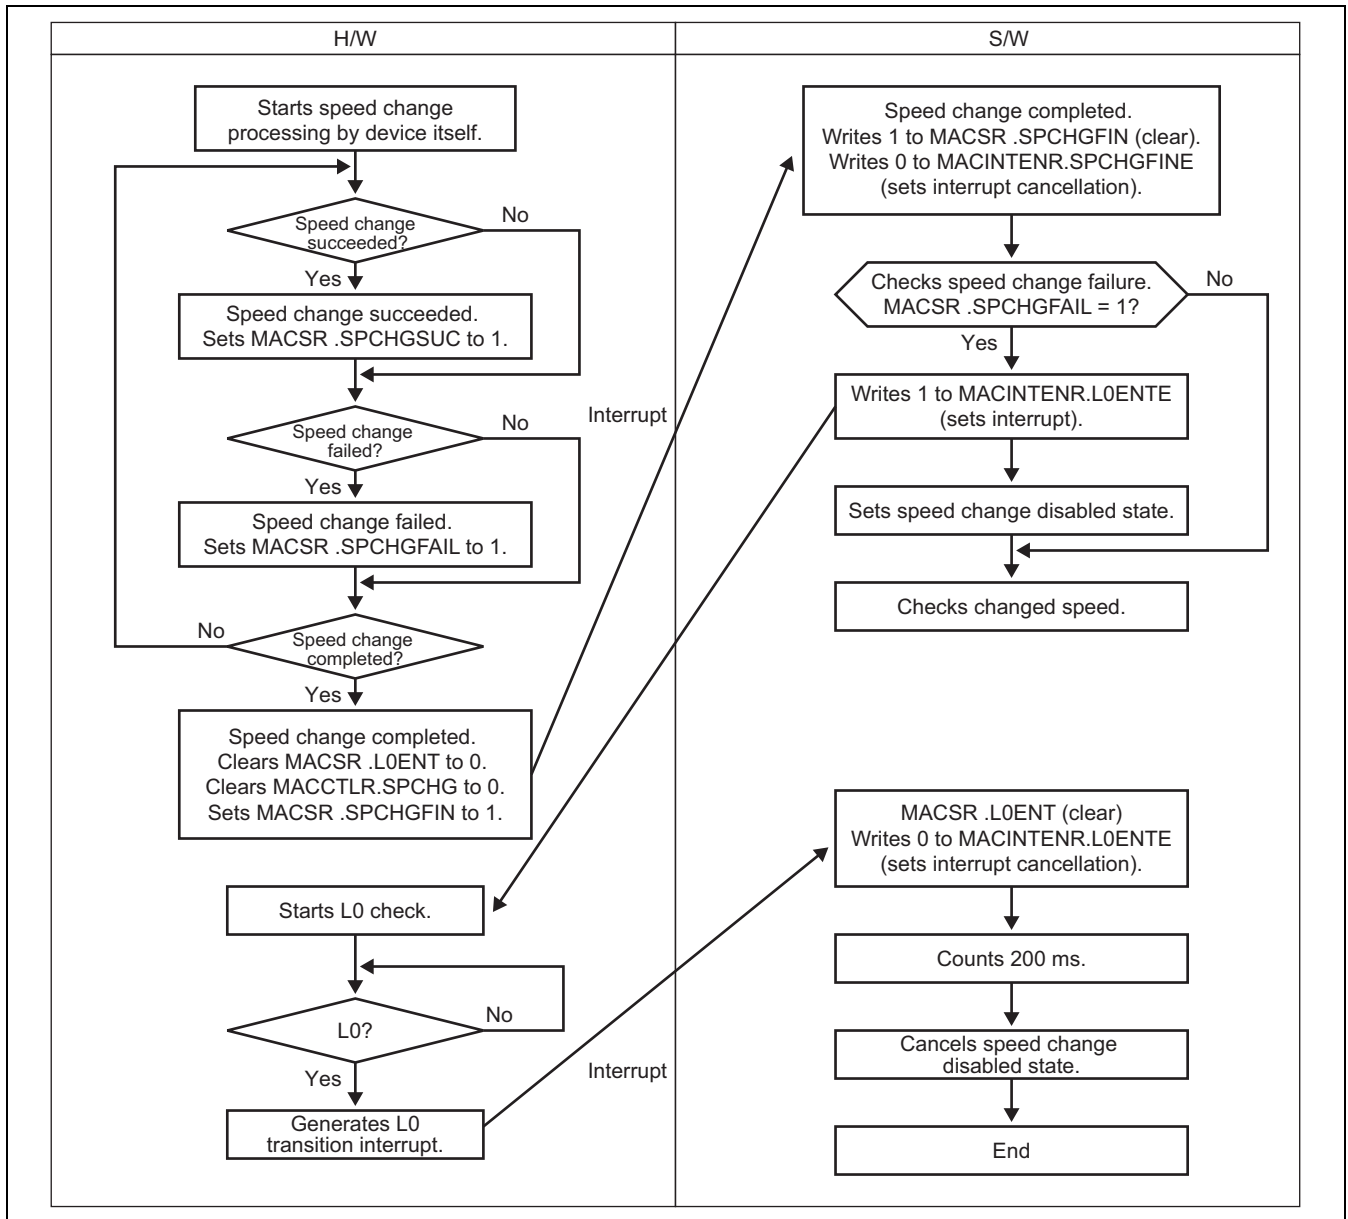

Figure 39.27 Ending Process of Speed Change

### 39.3.10 Power Management

This section describes power management of this module. This module has two power management modes below.

- PCI-PM
- ASPM (L0s)

PCI-PM is PCI-compatible and ASPM is specific to PCI Express. ASPM mode supports L0s only.

#### (1) PCI-PM

This section describes PCI-compatible power management mode. Table 39.11 shows power management operations in PCI-PM mode.

**Table 39.11 PCI-PM Operations**

No.	Transition	Target Device
1	L0 → L1 → L0	Endpoint
2		Root port

#### (a) L0 → L1 → L0 (Endpoint)

After modification of the Power State field, initiate the L1 transition sequence through software according to the flowchart shown in Figure 39.28.

After initiated through software, the L1 transition sequence is performed through hardware according to the following procedure.

1. Prepares for L1 transition.
  2. Processes the handshake with the peer device for L1 transition.
  3. Causes the LTSSM of this module to make an L1 transition.
- Triggered by a write of PMCTLR.L1IATN = 1, hardware initiates the L1 transition sequence. As preparation for causing L1 transition, this module first allows hardware to automatically perform the following. (1) Waits for the minimum amount of credits to be accumulated necessary to transmit the largest TLP for which all the types of credits are configured. (2) Waits for the retry buffer to be empty. (3) Waits for all the TLP to be transmitted.
  - After completion of the above preparation, this module transmits PM\_Enter\_L1 DLLP and receives PM\_Request\_Ack DLLP to process the handshake with the peer device for L1 transition.
  - After completion of the handshake for L1 transition, this module disables TLP/DLLP transmission and directs the LTSSM to make a transition to L1. If directions are given to make a transition to the detect or recovery state before the LTSSM completes L1 transition, this module gives priority to a transition to the detect or recovery state.
  - Hardware clears the PMCTLR.L1IATN bit to 0 when the LTSSM makes a transition to the state other than L0, recovery, and configuration, that is, when the LTSSM makes a transition to L1 (PMSR.PMSTATE = L1) properly or LDn (PMSR.PMSTATE = LDn). Simultaneously, the PMSR.L1FAEG bit is set. Software can confirm that TLP write is again enabled and the transition destination by reading PMSR.L1FAEG = 1 and PMSR.PMSTATE. After confirming PMSR.L1FAEG = 1, write 1 to PMSR.L1FAEG to clear the bit.
  - After initiation of the L1 transition sequence, if transitions are made as L0 → recovery → L0 or L0 → recovery → configuration → L0 before a transition to the L1 state is caused, hardware automatically initiates the L1 transition sequence again. Therefore, software has nothing to process. PMSR.L1FAEG is not set.

The sequence for a recovery from L1 is performed under the following conditions.

1. Cases in which recovery is initiated by this module itself (caused by software)

Software gives directions to transmit the PM\_PME message to prepare for communication again; or an error message is transmitted through software processing.

The message of the error caused by the PM\_PME message is scheduled for transmission by software when the PM\_PME message transmission is supported. Be sure to confirm that a transition to L1 has been properly made (PMSR.L1FAEG = 1 and PMSR.PMSTATE = L1) before scheduling.

2. Cases in which recovery is initiated by the peer

The receive lane becomes no longer electrically idle.

Typical example: The peer issues D0 configuration write for recovery and makes a transition to recovery itself.

3. Cases in which recovery is initiated by this module itself (caused by hardware)

An error message is transmitted through hardware processing.

Depending on the timing, an error message is transmitted after L1 transition and a recovery may be made.

A completion of the TLP received before L1 transition is transmitted.

After a recovery to L0, if the device is in the non-D0 state and there is no TLP to be transmitted, software should confirm that hardware is in the L0 state (PMSR.PMSTATE = L0) and initiate the L1 transition sequence again (write 1 to PMCTLR.L1IATN). In this case, the sequence is: L0 → L1 → L0 recovery → L1 again.

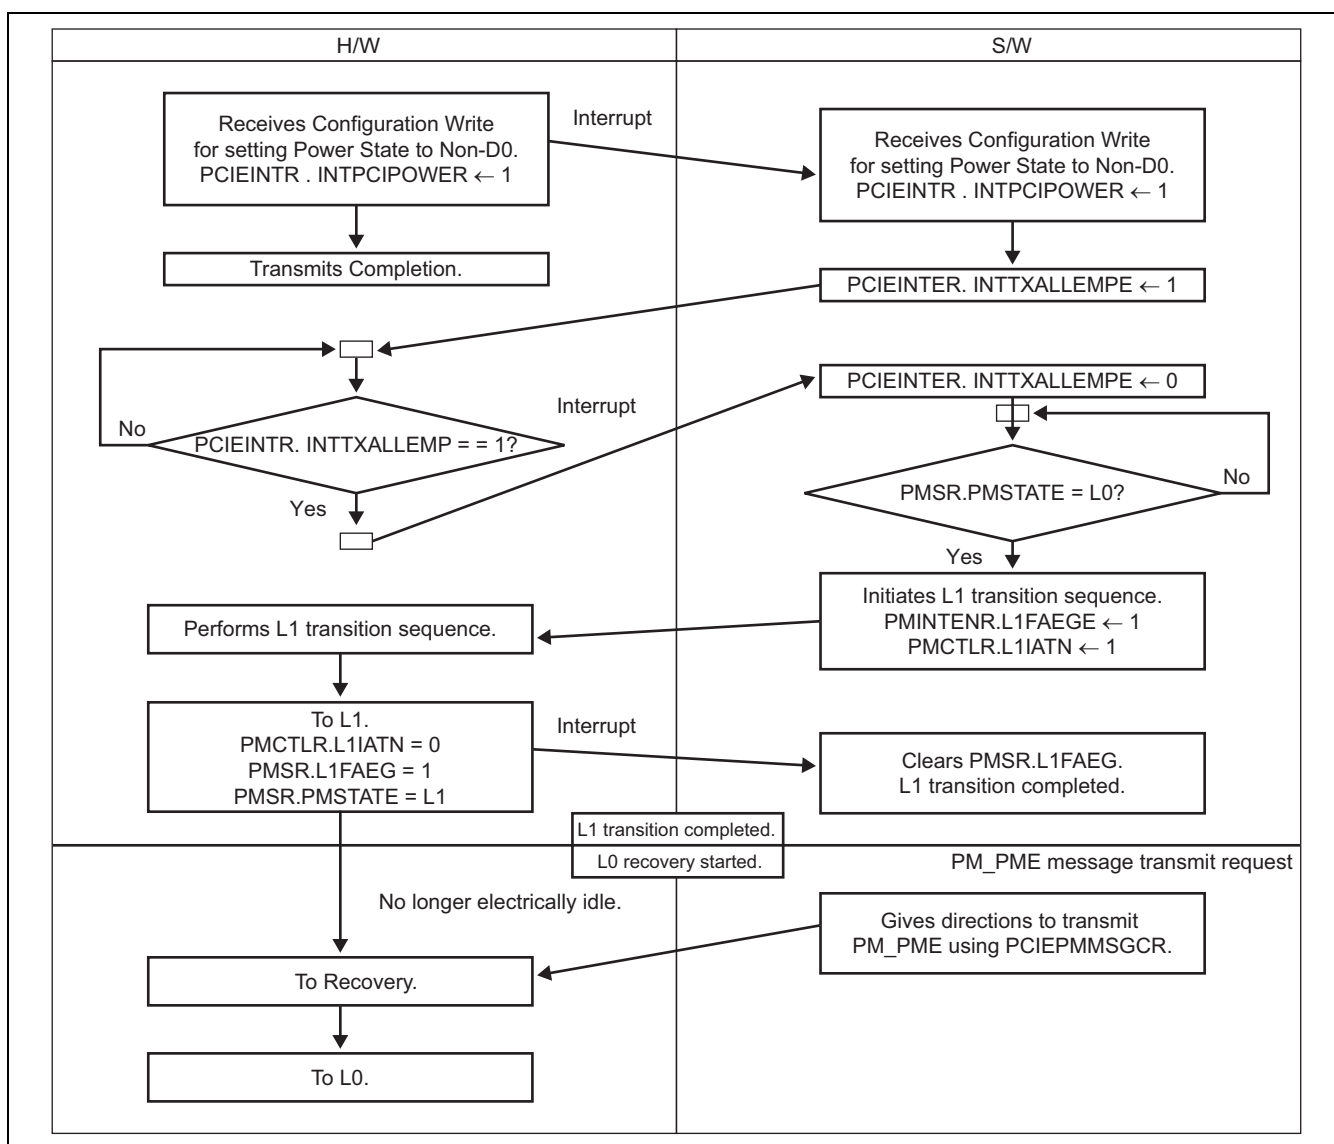

Figure 39.28 Transition from L0 to L1 to L0 (Endpoint)

**(b) L0 → L1 → L0 (Root Port)**

Initiate the L1 transition sequence through software according to the flowchart shown in Figure 39.29.

After initiated through software, the L1 transition sequence is performed through hardware according to the following procedure.

1. Prepares for L1 transition.
  2. Processes the handshake with the peer device for L1 transition.
  3. Causes the LTSSM of this module to make an L1 transition.
- Triggered by a write of PMCTLR.L1IATN = 1, hardware initiates the L1 transition sequence. As preparation for causing L1 transition, this module first allows hardware to automatically perform the following. (1) Waits for the retry buffer to be empty. (2) Waits for all the TLP to be transmitted.
  - After completion of the above preparation, this module transmits PM\_Request\_Ack DLLP and receives the electrical idle ordered set to process the handshake for L1 transition.
  - When having received the electrical idle ordered set on any lane, this module disables TLP/DLLP transmission. If directions are given to make a transition to the Detect or Recovery state before disabling TLP/DLLP transmission, this module gives priority to a transition to the Detect or Recovery state.
  - After completion of the handshake for L1 transition, this module directs the LTSSM to make a transition to L1 and transmits the electrical idle ordered set.
  - Hardware clears the PMCTLR.L1IATN bit to 0 when the LTSSM makes a transition to the state other than L0, Recovery, and Configuration, that is, when the LTSSM makes a transition to L1 (PMSR.PMSTATE = L1) properly or LDn (PMSR.PMSTATE = LDn). Simultaneously, the PMSR.L1FAEG bit is set. Software can confirm that TLP write is again enabled and the transition destination by reading PMSR.L1FAEG = 1 and PMSR.PMSTATE. After confirming PMSR.L1FAEG = 1, write 1 to PMSR.L1FAEG to clear the bit.
  - After initiation of the L1 transition sequence, if transitions are made as L0 → Recovery → L0 or L0 → Recovery → Configuration → L0 before a transition to the L1 state is caused, hardware automatically initiates the L1 transition sequence again. Therefore, software has nothing to process. PMSR.L1FAEG is not set.

The sequence for a recovery from L1 is performed under the following conditions.

1. Cases in which recovery is initiated by this module itself
  - Software performs configuration write to transmit TLP again.
  - The request for configuration write is scheduled for transmission by software. Be sure to confirm that a transition to L1 has been properly made (PMSR.L1FAEG = 1 and PMSR.PMSTATE = L1) before scheduling.
