FEMTOCLOCKS™ CRYSTAL-TO- HSTL CLOCK GENERATOR

GENERAL DESCRIPTION

The ICS842031I-01 is an Ethernet Clock Generator and a member of the HiPerClockS™ family of high performance devices from ICS. The ICS842031I-01 uses an 18pF parallel resonant crystal over the range of 19.6MHz - 27.2MHz. For Ethernet applications, a 25MHz crystal is used to generate 312.5MHz. The ICS842031I-01 has excellent <1ps phase jitter performance, over the 1.875MHz - 20MHz integration range. The ICS842031I-01 is packaged in a small 8-pin TSSOP, making it ideal for use in systems with limited board space.

POWER SUPPLY FILTERING TECHNIQUES

As in any high speed analog circuitry, the power supply pins are vulnerable to random noise. The ICS842031I-01 provides separate power supplies to isolate any high switching noise from the outputs to the internal PLL. V_{DD} and V_{DDA} should be individually connected to the power supply plane through vias, and bypass capacitors should be used for each pin. To achieve optimum jitter performance, power supply isolation is required. *Figure 1* illustrates how a 10Ω resistor along with a $10\mu F$ and a $.01\mu F$ bypass capacitor should be connected to each V_{DDA} pin.

FIGURE 1. POWER SUPPLY FILTERING

CRYSTAL INPUT INTERFACE

The ICS842031I-01 has been characterized with 18pF parallel resonant crystals. The capacitor values, C1 and C2, shown in *Figure 2* below were determined using a 25MHz, 18pF parallel

resonant crystal and were chosen to minimize the ppm error. The optimum C1 and C2 values can be slightly adjusted for different board layouts.
