# STBP112

## Overvoltage protection device

**Datasheet - production data**

## Features

- Input overvoltage protection up to 28 V
- Integrated high voltage N-channel MOSFET switch - low $R_{DS(on)}$ of 165 mΩ
- Integrated charge pump
- Maximum continuous current of 2 A
- Thermal shutdown
- Soft-start feature to control the inrush current
- Enable input ($\overline{EN}$)
- Fault indication output ($\overline{FLT}$)
- IN input ESD protection: ±15 kV air discharge, ±8 kV contact discharge (with 1 µF input capacitor), ±2 kV HBM (standalone device)
- Certain overvoltage options compliant with the China Communications Standard YD/T 1591-2006 (overvoltage protection only)
- Small, RoHS compliant 2 x 2 x 0.75 mm TDFN 8-lead package with thermal pad.

TDFN 8-lead (2 x 2 x 0.75 mm)

## Applications

- Smart phones
- Digital cameras
- PDA and palmtop devices
- MP3 players
- Low power handheld devices.

# 1 Description

The STBP112 device provides overvoltage protection for input voltage up to +28 V. Its low $R_{DS(on)}$ N-channel MOSFET switch protects the systems connected to the OUT pin against failures of the DC power supplies in accordance with the China MII Communications Standard YD/T 1591-2006.

In the event of an input overvoltage condition, the device immediately disconnects the DC power supply by turning off an internal low $R_{DS(on)}$ N-channel MOSFET to prevent damage to protected components.

In addition, the device also monitors its own junction temperature and switches off the internal MOSFET if the junction temperature exceeds the specified limit.

The device can be controlled by the microcontroller and can also provide status information about fault conditions.

The STBP112 is offered in a small, RoHS-compliant 8-lead TDFN (2 mm x 2 mm) package.

**Figure 1. Logic diagram**

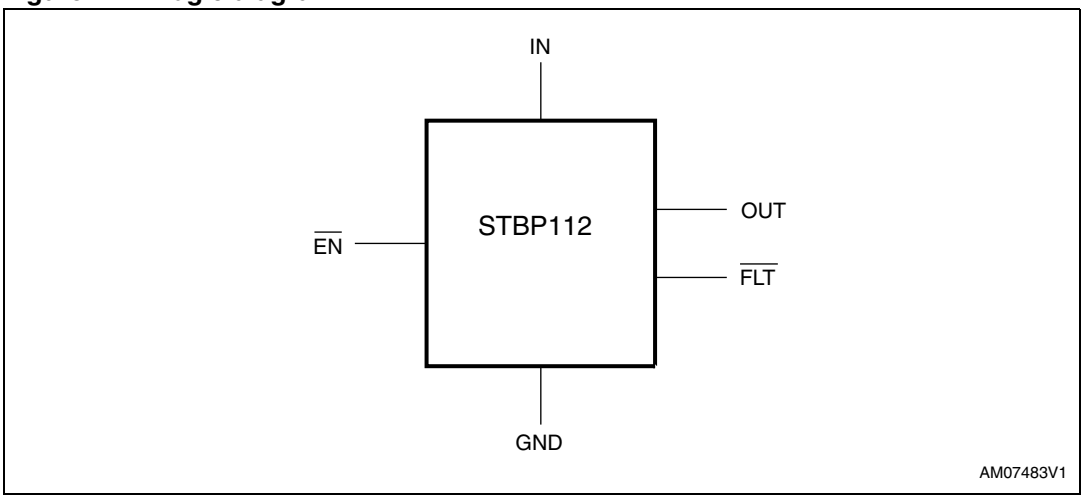

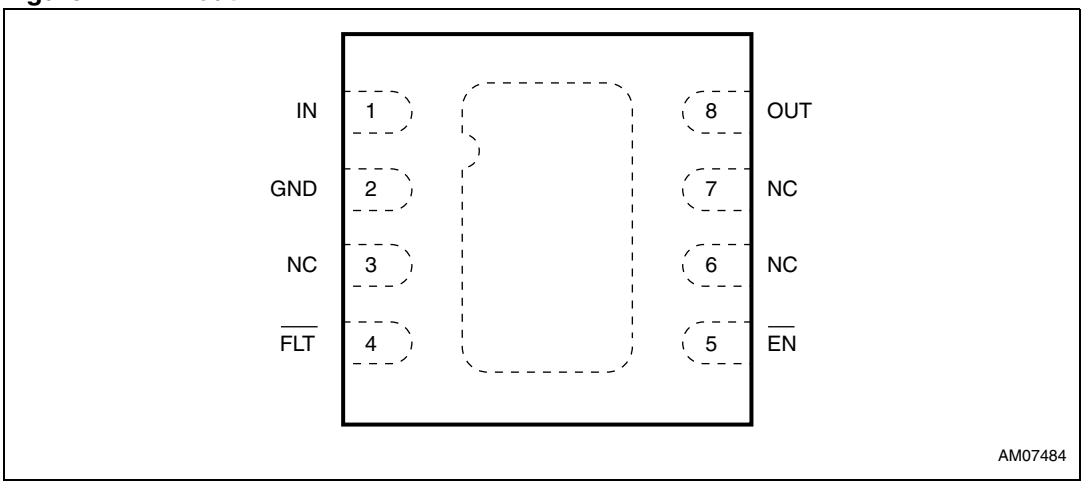

**Figure 2. Pinout**

1. Exposed thermal pad may be tied to GND.

# 2 Pin description

## 2.1 Input (IN)

Input voltage (IN) pin. The IN pin is connected to the DC power supply. An external low ESR ceramic capacitor of minimum value 1 µF must be connected between IN and GND. This capacitor is needed for decoupling and also protects the IC against fast voltage spikes and ESD events. This capacitor should be located as close to the IN pin as possible.

## 2.2 Output (OUT)

Output voltage (OUT) pin. The OUT pin is connected to the input through a low $R_{DS(on)}$ N-channel MOSFET switch.

If no fault is detected and the STBP112 is enabled by the $\overline{EN}$ input, this switch is turned on and the output voltage follows the input voltage.

The output is disconnected from the input when the input voltage is under the UVLO threshold or above the OVLO threshold, when the junction temperature is above the thermal shutdown threshold or when the device is disabled by the $\overline{EN}$ input.

After the input voltage or junction temperature returns to the specified range, there is a recovery delay, $t_{rec}$, and the power output is then connected to the input (see *Figure 8 on page 13*).

The switch turn-on time is intentionally prolonged to limit the inrush current and voltage drop caused, for example, by charging output capacitors (soft-start feature).

## 2.3 Fault indication output ($\overline{FLT}$)

The active low, open-drain fault indication output provides information on the STBP112 state to the application controller. The $\overline{FLT}$ is asserted (i.e. driven low), if the STBP112 is in the overvoltage condition or thermal shutdown mode is active.

As the $\overline{FLT}$ output is of the open-drain type, it may be pulled up by an external resistor $R_{PU}$ to the controller supply voltage (see *Figure 4*). If there is no need to use this output, it may be left disconnected. The suitable $R_{PU}$ resistor value is in the range of 10 kΩ to 1 MΩ.

To improve safety and to prevent damage to application circuits in the event of extreme voltage or current conditions, an optional protective resistor $R_{FLT}$ can be connected between the $\overline{FLT}$ output and the controller input (see *Figure 4*). The suitable $R_{FLT}$ resistor value is in the range of 10 kΩ to 100 kΩ.

The $\overline{FLT}$ output is in Hi-Z (high impedance) state when the device is disabled by $\overline{EN}$ input or when the input voltage is lower than the UVLO threshold.

## 2.4 Enable input ($\overline{EN}$)

This active low logical input can be used to enable or disable the device. When the $\overline{EN}$ input is driven high, the STBP112 is in shutdown mode and the power output is disconnected from the input (see *Figure 8 on page 13*). When the $\overline{EN}$ input is driven low and all operating conditions are within specified limits, the power output is connected to the input.

The $\overline{EN}$ input is equipped with an internal pull-down resistor of 250 kΩ (typical value). If there is no need to use this input, it may be left floating or, preferably, connected to GND.

For $V_{IN}$ lower than 2.5 V (max.), the pull-down resistor is internally disconnected to lower the $\overline{EN}$ pin input current in case the external AC adapter is not connected, the application is running from an internal battery and the STBP112 device is disabled.

To improve safety and to prevent damage to application circuits in the event of extreme voltage or current conditions, an optional protective resistor $R_{EN}$ can be connected between the $\overline{EN}$ input and the controller output (see *Figure 4*). The protective resistor forms a voltage divider with the internal pull-down resistor, which limits the maximum possible $R_{EN}$ value with respect to the $V_{IH(\overline{EN})}$ threshold of $\overline{EN}$ input and the controller's output voltage for logic high, $V_{OH}$. For the worst case, the highest protective resistor value is

$R_{ENmax} = R_{PD(\overline{EN})min} \times (V_{OH} / V_{IH(\overline{EN})} - 1)$,

where $R_{PD(\overline{EN})min}$ is 100 kΩ and $V_{IH(\overline{EN})}$ is 1.2 V.

For most cases, an $R_{EN}$ value of 10 kΩ to 100 kΩ is adequate.

The $\overline{FLT}$ output is in Hi-Z state when the device is disabled by $\overline{EN}$ input.

## 2.5 No connect (NC)

Pin 3, 6, and 7 are no connect (NC). They may be left floating or connected to GND.

## 2.6 Ground (GND)

Ground terminal. All voltages are referenced to GND. The exposed thermal pad is internally connected to GND.

**Table 1. Pin description and signal names**

| Pin | Name | Type | Function |
|---|---|---|---|
| 1 | IN | Input/supply | Input voltage |
| 2 | GND | Supply | Ground |
| 3, 6, 7 | NC | - | Not connected |
| 4 | $\overline{FLT}$ | Output | Fault indication output (open-drain) |
| 5 | $\overline{EN}$ | Input | Enable input (pull-down resistor to GND) |
| 8 | OUT | Output | Output voltage |

**Figure 3. Block diagram**

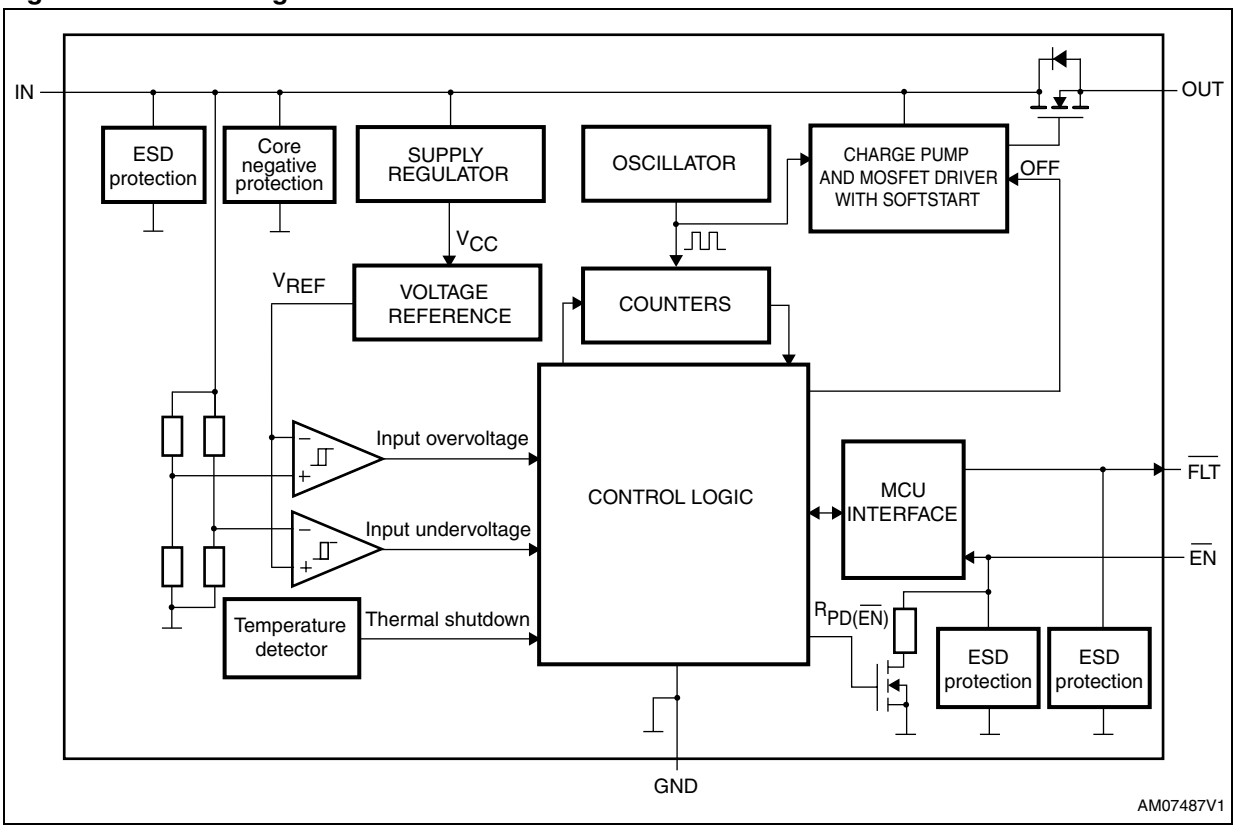

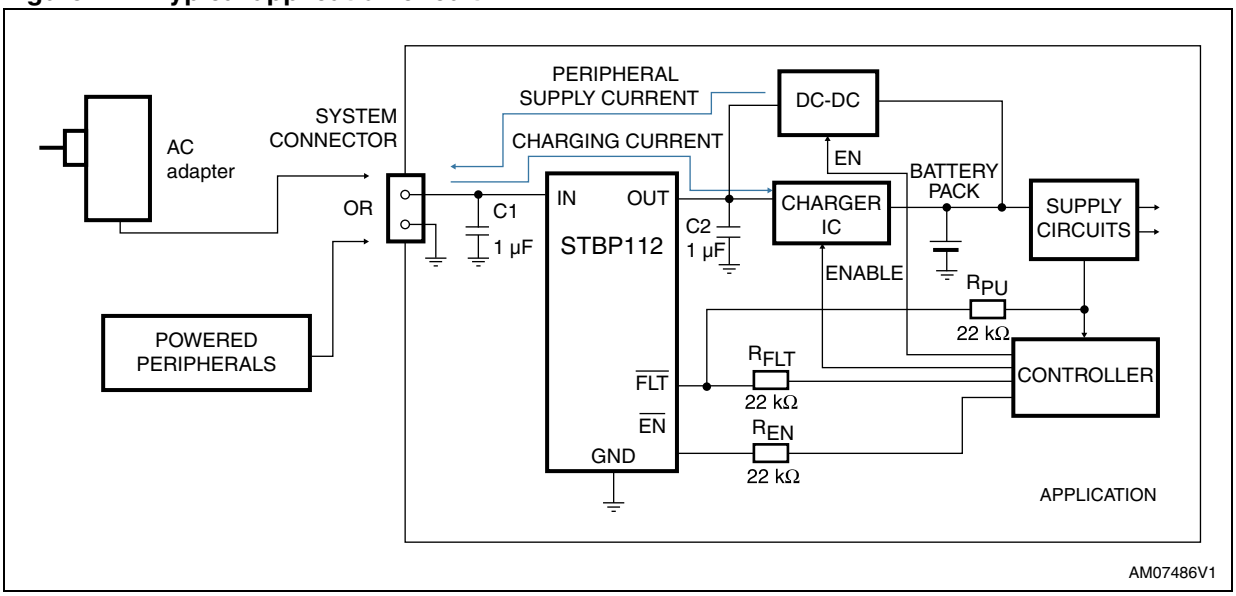

**Figure 4. Typical application circuit**

1. Optional resistors $R_{EN}$ and $R_{FLT}$ prevent damage to the controller under extreme voltage or current conditions and are not required. Low ESR ceramic capacitor C1 is necessary to ensure proper function of the STBP112. Capacitor C2 is not necessary for STBP112 but may be required by the charger IC.
2. The STBP112 MOSFET switch topology allows the current to flow also in a reverse direction, i.e. from OUT to IN, which can be useful for powering external peripherals from the system connector. If the reverse current (supply current) is undesirable, it may be prevented by connecting an external Schottky diode in series with the OUT pin. The voltage drop between IN and the charger is then increased by the voltage drop across the diode.

# 3 Operation

The STBP112 provides overvoltage protection for positive input voltage up to 28 V using a built-in low $R_{DS(on)}$ N-channel MOSFET switch.

## 3.1 Power-up

At power-up, with $\overline{EN}$ = low, the MOSFET switch is turned on after the startup delay, $t_{on}$, after the input voltage exceeds the UVLO threshold to ensure the input voltage is stabilized (see *Figure 5*).

## 3.2 Normal operation

The device continuously monitors the input voltage and its own internal temperature so the output voltage is kept within the specified range. The internal MOSFET switch is turned on and the $\overline{FLT}$ output is deasserted.

The STBP112 enters normal operation state if the input voltage returns to the interval between $V_{UVLO}$ and $V_{OVLO}$ - $V_{HYS(OVLO)}$ and the junction temperature falls below $T_{off}$ - $T_{HYS(off)}$. The internal MOSFET is turned on after the $t_{rec}$ delay to ensure that the conditions have stabilized and the $\overline{FLT}$ output is deasserted.

*Note: The STBP112 MOSFET switch topology allows the current to flow also in a reverse direction, i.e. from OUT to IN, which can be useful for powering external peripherals from the system connector (see the supply current in Figure 4). At first, the current flows through the MOSFET body diode. If the voltage that appears on the IN terminal is above the UVLO threshold, the MOSFET is (after the startup delay) turned on so the voltage drop across STBP112 is significantly reduced.*
*If the reverse current is undesirable, it may be prevented by connecting an external, properly rated low drop Schottky diode in series with the OUT pin. The voltage drop between IN and charger is increased by the voltage drop across the diode.*

## 3.3 Undervoltage lockout (UVLO)

To ensure proper operation under any condition, the STBP112 has an undervoltage lockout (UVLO) threshold. When the input voltage is rising, the output remains disconnected from input until the $V_{IN}$ voltage exceeds the $V_{UVLO}$ threshold. This circuit is equipped with hysteresis, $V_{HYS(UVLO)}$, to improve noise immunity under transient conditions.

## 3.4 Overvoltage lockout (OVLO)

If the input voltage $V_{IN}$ rises above the threshold level $V_{OVLO}$, the MOSFET switch is immediately turned off. At the same time, the fault indication output $\overline{FLT}$ is activated (i.e. driven low), see *Figure 6*. This device is equipped with hysteresis, $V_{HYS(OVLO)}$, to improve noise immunity under transient conditions.

## 3.5 Thermal shutdown

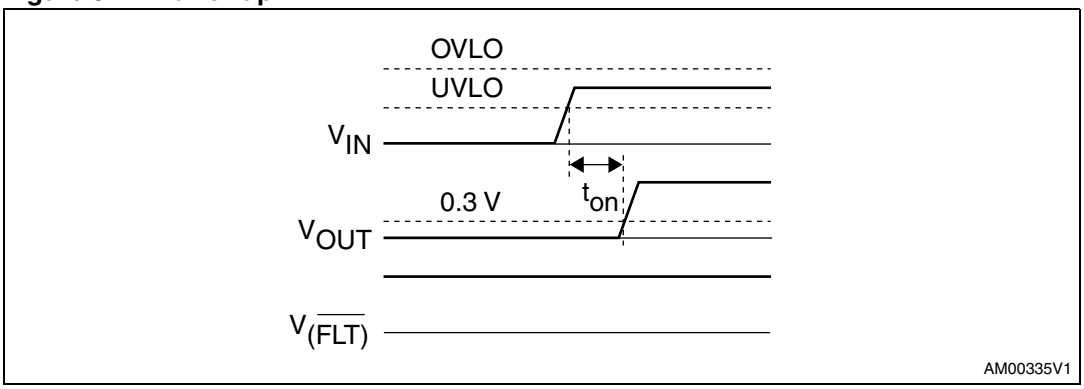

If the STBP112 internal junction temperature exceeds the $T_{off}$ threshold, the internal MOSFET switch is turned off and the fault indication output $\overline{FLT}$ is driven low.

To improve thermal robustness, this circuit has a 20 °C hysteresis, $T_{HYS(off)}$.

Due to the internal reverse diode, the thermal shutdown is not functional for the reverse current.

# 6 Maximum rating

Stressing the device above the rating listed in *Table 2* may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in *Section 3 on page 10* of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability. Refer also to the STMicroelectronics™ SURE program and other relevant documentation.

**Table 2. Absolute maximum ratings**

| Symbol | Parameter | | Value | Unit |
|---|---|---|---|---|
| $T_{STG}$ | Storage temperature ($V_{IN}$ off) | | -55 to 150 | °C |
| $T_{SLD}$(1) | Lead solder temperature for 10 seconds | | 260 | °C |
| $T_J$ | Operating junction temperature range (internally limited to $T_{off}$) | | -40 to 150 | °C |
| $V_{IN}$ | IN pin input voltage | | -0.3 to 30 | V |
| $V_{OUT}$ | OUT pin input/output voltage | | -0.3 to 12 | V |
| $V_{IO}$ | Input/output voltage (other pins) | | -0.3 to 7 | V |
| $I_{LOAD}$ | Load current (IN to OUT) | $T_A \leq 50$ °C | 2000 | mA |
| | | $T_A = 85$ °C | 1500 | mA |
| $I_{REVERSE}$ | Reverse diode current (OUT to IN) | | 500 | mA |
| $I_{SINK(\overline{FLT})}$ | $\overline{FLT}$ pin sink current | | 15 | mA |
| $V_{ESD}$ | ESD withstand voltage (IEC 61000-4-2, IN pin only)(2) | | ±15 (air), ±8 (contact) | kV |
| | Human body model (HBM), model = 2(3) | | 2000 | V |
| | Machine model (MM), model = B(4) | | 200 | V |

1. Reflow at peak temperature of 260 °C. The time above 255 °C must not exceed 30 seconds.
2. System-level value (see typical application circuit, C1 ≥ 1 µF low ESR ceramic capacitor).
3. Human body model, 100 pF discharged through a 1.5 kΩ resistor according to the JESD22/A114 specification.
4. Machine model, 200 pF discharged through all pins according to the JESD22/A115 specification.

**Table 3. Thermal data**

| Symbol | Parameter | Value | Unit |
|---|---|---|---|
| $R_{thJA}$ | Thermal resistance (junction-to-ambient) | 59(1) | °C/W |
| $R_{thJC}$ | Thermal resistance (junction-to-case) | 5.9 | °C/W |

1. The package was mounted on a 4-layer JEDEC test board with 2 thermal vias connecting from the thermal land to the first buried plane. The 4-layer PCB (2S2P) was constructed based on JESD 51-7 specifications and vias based on JESD 51-5.

# 7 DC and AC parameters

This section summarizes the operating measurement conditions, and the DC and AC characteristics of the device. The parameters in *Table 5* are derived from tests performed under the measurement conditions summarized in *Table 4*. Designers should check that the operating conditions in their circuit match the operating conditions when relying on the quoted parameters.

**Table 4. Operating and AC measurement conditions**

| Parameter | Value | Unit |
|---|---|---|
| Input voltage ($V_{IN}$) | 5 | V |
| Ambient operating temperature ($T_A$) | -40 to 85 | °C |
| Junction operating temperature ($T_J$) | -40 to 125 | °C |
| Logical input rise and fall times | 5 | ns |

**Table 5. DC and AC characteristics**

| Symbol | Description | Test condition(1) | Min. | Typ. | Max. | Unit |

| $V_{IL(\overline{EN})}$ | $\overline{EN}$ low level input voltage | | | | 0.4 | V |

**Table 5. DC and AC characteristics (continued)**

| Symbol | Description | Test condition(1) | Min. | Typ. | Max. | Unit |
|---|---|---|---|---|---|---|
| $V_{IH(\overline{EN})}$ | $\overline{EN}$ high level input voltage | | 1.2 | | | V |
| $R_{PD(\overline{EN})}$ | $\overline{EN}$ internal pull-down resistor(3) | $V_{IN}$ > 2.5 V, $V_{(\overline{EN})}$ = 5 V | 100 | 250 | 400 | kΩ |
| **Timing parameters** | | | | | | |
| $t_{on}$ | Startup delay(4) | Time measured from $V_{IN}$ > $V_{UVLO}$ to $V_{OUT}$ = 0.3 V (no load on the output). | | 8 | | ms |
| $t_{off}$(5) | Output turn-off time | Time measured from $V_{IN}$ > $V_{OVLO}$ to $V_{OUT}$ ≤ 0.3 V. $V_{IN}$ increasing from 5.0 V to 8.0 V at 3.0 V/µs, $R_{LOAD}$ = 5 Ω, $C_{LOAD}$ = 0. | | | 1 | µs |
| $t_{dis}$(5) | Disable time | Time measured from $V_{(\overline{EN})}$ ≥ 1.2 V to $V_{OUT}$ < 0.3 V, $R_{LOAD}$ = 5 Ω, $C_{LOAD}$ = 0. | | 1 | 5 | |
| $t_{rec}$ | Recovery delay from UVLO, OVLO, or thermal shutdown(4) | Time measured to $V_{OUT}$ = 0.3 V (no load on the output) | | 8 | | ms |
| **Thermal shutdown** | | | | | | |
| $T_{off}$ | Thermal shutdown threshold temperature | | | 140 | 150 | °C |
| $T_{HYS(off)}$ | Thermal shutdown hysteresis | | | 20 | | °C |

1. Test conditions described in *Table 4* (except where noted).
2. Hysteresis of 60 mV typ. available upon request.
3. Version without pull-down resistor or with permanently connected pull-down resistor available upon request.
4. Delays of 16, 32, and 64 ms available upon request.
5. Guaranteed by design. Not tested in production.

# 8 Application information

## 8.1 Calculating the power dissipation

The worst case power dissipation of the STBP112 internal power MOSFET can be calculated using the following formula:

**Equation 1**

$P_D = I_{LOAD}^2 \times R_{DS(on)(max)}$,

where $I_{LOAD}$ is the load current and $R_{DS(on)(max)}$ is the maximum value of MOSFET resistance.

**Example 1**

$V_{IN}$ = 5 V, $R_{LOAD}$ = 5 Ω, $R_{DS(on)(max)}$ = 280 mΩ

$I_{LOAD} = V_{IN} / (R_{DS(on)(max)} + R_{LOAD}) = 5 / (5 + 0.280) = 0.95$ A

$P_D = 0.95^2 \times 0.28 = 0.25$ W

The power dissipation of the reverse diode in powering accessories mode can be estimated as $P_D = (V_{OUT} - V_{IN}) \times I_{REVERSE} \approx 0.7 \times I_{REVERSE}$.

## 8.2 Calculating the junction temperature

The maximum junction temperature for given power dissipation, ambient temperature, and thermal resistance junction-to-ambient can be calculated as:

**Equation 2**

$T_J = T_A + 1.15 \times P_D \times R_{thJA} = T_A + 1.15 \times I_{LOAD}^2 \times R_{DS(on)(max)}) \times R_{thJA}$,

where $T_J$ is junction temperature, $T_A$ is given ambient temperature, 1.15 is a derating factor, and $R_{thJA}$ is a junction-to-ambient thermal resistance, depending on PCB design. The junction temperature may not exceed 125 °C (see *Table 4*) to stay within the specified range.

Maximum allowed MOSFET current for ambient temperature $T_A$ = 85 °C and various $R_{thJA}$ values are listed in *Figure 9 on page 14*.

**Example 2**

For conditions listed in the previous example, with a well designed PCB (ensuring $R_{thJA}$ = 59 °C/W) and $T_A$ = 85 °C, the maximum junction temperature is:

**Equation 3**

$T_J = 85 + 1.15 \times 0.25 \times 59 = 102$ °C,

which is a safe value (below 125 °C).

## 8.3 PCB layout recommendations

- Input capacitor C1 should be located as close as possible to the STBP112 device. It should be a low-ESR ceramic capacitor. Also the protective resistors $R_{FLT}$ and $R_{EN}$ (if used) should be located close to the STBP112 (see *Figure 4 on page 9*).
- For good thermal performance, it is preferred to couple the STBP112 exposed thermal pads with the PCB ground plane. In most designs, this requires thermal vias between the copper pads on the PCB and the ground plane.

# 9 Package information

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK® packages, depending on their level of environmental compliance. ECOPACK specifications, grade definitions and product status are available at: *www.st.com*. ECOPACK is an ST trademark.

# 11 Part numbering

**Table 10. Ordering information scheme**

**STBP112 A T DJ 6 F**

**Device type**

STBP112

**Overvoltage threshold**

A = 5.375 V

B = 5.50 V

C = 5.90 V

D = 6.02 V

E = 6.40 V

F = 6.80 V

G = 7.20 V

**Undervoltage threshold**

T = 2.70 V

U = 3.00 V

V = 3.25 V

**Package**

DJ = TDFN8 2 x 2 x 0.75 mm

**Temperature range**

6 = -40 to +85 °C

**Shipping method**

F = ECOPACK® package, tape and reel

*Note: Please check device version availability on www.st.com. Please contact local ST sales office for new device version request.*

# 12 Package marking information

**Table 11. Marking description**

| Part number[1], [2] | Overvoltage threshold (V) | Undervoltage threshold (V) | Topside marking |
|---|---|---|---|
| STBP112ATxxxx | 5.375 | 2.70 | 12A |
| STBP112BTxxxx | 5.50 | 2.70 | 12B |
| STBP112CTxxxx | 5.90 | 2.70 | 12C |
| STBP112DTxxxx | 6.02 | 2.70 | 12D |
| STBP112ETxxxx | 6.40 | 2.70 | 12E |
| STBP112FTxxxx | 6.80 | 2.70 | 12F |
| STBP112GTxxxx | 7.20 | 2.70 | 12H |
| STBP112AUxxxx | 5.375 | 3.00 | 12K |
| STBP112BUxxxx | 5.50 | 3.00 | 12L |
| STBP112CUxxxx | 5.90 | 3.00 | 12M |
| STBP112DUxxxx | 6.02 | 3.00 | 12N |
| STBP112EUxxxx | 6.40 | 3.00 | 12P |
| STBP112FUxxxx | 6.80 | 3.00 | 12Q |
| STBP112GUxxxx | 7.20 | 3.00 | 12R |
| STBP112AVxxxx | 5.375 | 3.25 | 12T |
| STBP112BVxxxx | 5.50 | 3.25 | 12U |
| **STBP112CVxxxx** | 5.90 | 3.25 | 12V |
| STBP112DVxxxx | 6.02 | 3.25 | 12W |
| STBP112EVxxxx | 6.40 | 3.25 | 12X |
| STBP112FVxxxx | 6.80 | 3.25 | 12Y |
| STBP112GVxxxx | 7.20 | 3.25 | 12Z |

1. Please check device version availability on www.st.com. Please contact local ST sales office for new device version request.
2. Currently available part numbers are marked bold in *Table 11*. For other options, or for more information on any aspect of this device, please contact the nearest ST sales office.

# 13 Revision history

**Table 12. Document revision history**

| Date | Revision | Changes |
|---|---|---|
| 22-Jun-2012 | 1 | Initial release. |
| 17-Oct-2012 | 2 | Updated *Features* (modified $R_{DS(on)}$).<br>Added *Section : Typical operating characteristics (STBP112CV)* (*Figure 11* to *Figure 34*).<br>Updated *Table 5* (modified typ. $R_{DS(on)}$).<br>Minor corrections throughout document. |
| 07-Dec-2012 | 3 | Updated *Table 11* (STBP112CVxxxx par number marked bold, reformatted Note *1.*, added Note *2.*) |

**Please Read Carefully:**
