

SRAM MODULE 1Mbyte (256K x 32-Bit)
Part No. HMS25632M8, HMS25632Z8

GENERAL DESCRIPTION

The HMS25632M8G/Z8 is a high-speed static random access memory (SRAM) module containing 262,144 words organized in a x32-bit configuration. The module consists of eight 256K x 4 SRAMs mounted on a 64-pin, double-sided, FR4-printed circuit board.

PD0 and PD1 identify the module’s density allowing interchangeable use of alternate density, industry- standard modules. Four chip enable inputs, (/CE1, /CE2, /CE3 and /CE4) are used to enable the module’s 4 bytes independently. Output enable (/OE) and write enable (/WE) can set the memory input and output.

Data is written into the SRAM memory when write enable (/WE) and chip enable (/CE) inputs are both LOW. Reading is accomplished when /WE remains HIGH and /CE and output enable (/OE) are LOW.

For reliability, this SRAM module is designed as multiple power and ground pin. All module components may be powered from a single +5V DC power supply and all inputs and outputs are fully TTL-compatible.

FEATURES

- ◆ Part Identification
 - HMS25632M8G : 64Pin SIMM Design, Gold Plate Lead
 - HMS25632Z8 : 64Pin ZIP Design
 - Pin-Compatible with the HMS25632M8G
- ◆ Access times: 8, 10, 12, 15and 20ns
- ◆ High-density 1MByte design
- ◆ High-reliability, high-speed design
- ◆ Single + 5V ±0.5V power supply
- ◆ Easy memory expansion with /CE and /OE functions
- ◆ All inputs and outputs are TTL-compatible
- ◆ Industry-standard pinout

- Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operating section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

TIMING DIAGRAMS

TIMING WAVEFORM OF READ CYCLE(Address Controlled) (/CE = /OE = V_{IL} , /WE = V_{IH})

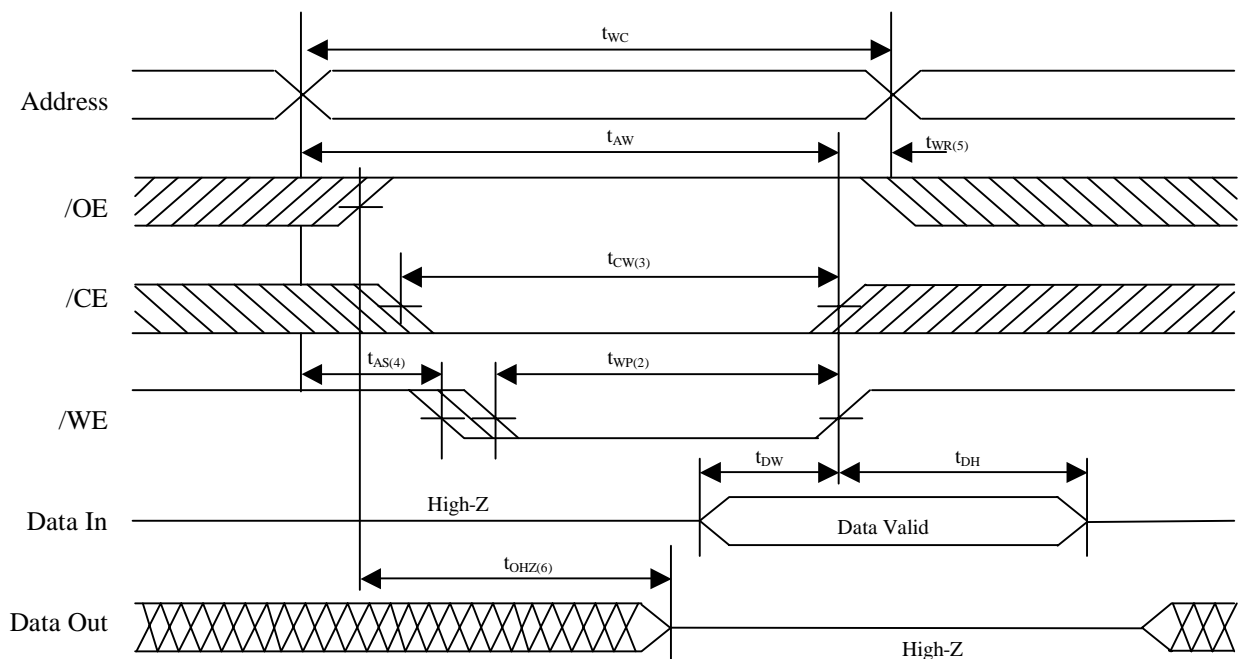

TIMING WAVEFORM OF READ CYCLE (/CE Controlled)

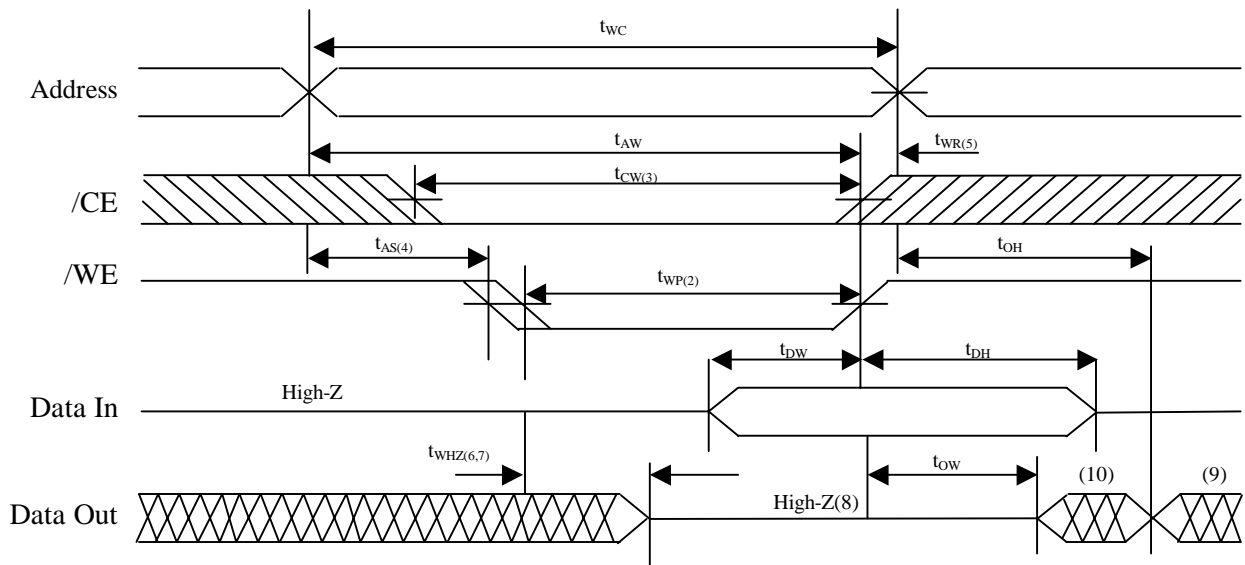

Notes (Read Cycle)

1. /WE is high for read cycle.
2. All read cycle timing is referenced from the last valid address to first transition address.
3. t_{HZ} and t_{OHZ} are defined as the time at which the outputs achieve the open circuit condition and are not referenced to V_{OH} or V_{OL} levels.
4. At any given temperature and voltage condition, t_{HZ} (max.) is less than t_{LZ} (min.) both for a given device and from device to device.
5. Transition is measured $\pm 200mV$ from steady state voltage with Load (B). This parameter is sampled and not 100% tested.
6. Device is continuously selected with $/CE = V_{IL}$.
7. Address valid prior to coincident with /CE transition low.

TIMING WAVEFORM OF WRITE CYCLE (/OE = Clock)

TIMING WAVEFORM OF WRITE CYCLE (/OE Low Fixed)

Notes (Write Cycle)

1. All write cycle timing is referenced from the last valid address to the first transition address.
2. A write occurs during the overlap of a low /CE and a low /WE. A write begins at the latest transition among /CE going low and /WE going low; A write ends at the earliest transition among /CE going high and /WE going high. t_{WP} is measured from the beginning of write to the end of write.
3. t_{CW} is measured from the later of /CE going low to the end of write.
4. t_{AS} is measured from the address valid to the beginning of write.
5. t_{WR} is measured from the end of write to the address change. t_{WR} applied in case a write ends as /CE, or /WE going high.
6. If /OE, /CE and /WE are in the read mode during this period, the I/O pins are in the output low-Z state. Inputs of opposite phase of the output must not be applied because bus contention can occur.
7. For common I/O applications, minimization or elimination of bus contention conditions is necessary during read and write cycle.
8. If /CE goes low simultaneously with /WE going low or after /WE going low, the outputs remain high impedance state.
9. D_{OUT} is the read data of the new address.
10. When /CE is low: I/O pins are in the output state. The input signals in the opposite phase leading to the output should not be applied.
