## 1.8V 4K/8K/16K x 16 and 8K/16K x 8 MoBL<sup>®</sup> Dual-Port Static RAM

### Features

- True dual-ported memory cells which allow simultaneous access of the same memory location
- 4/8/16K x 16 and 8/16K x 8 organization
- High-speed access: 35 ns
- Ultra Low operating power
  - Active:  $I_{CC} = 15$  mA (typical) at 55 ns
  - Active:  $I_{CC} = 25$  mA (typical) at 35 ns
  - Standby:  $I_{SB3} = 2$   $\mu$ A (typical)
- Small footprint: Available in a 6x6 mm 100-pin Lead(Pb)-free fBGA
- Supports 1.8V, 2.5V, and 3.0V I/Os
- Full asynchronous operation
- Automatic power-down
- Pin select for Master or Slave
- Expandable data bus to 32 bits with Master/Slave chip select when using more than one device
- On-chip arbitration logic
- Semaphores included to permit software handshaking between ports
- Input Read Registers and Output Drive Registers
- INT flag for port-to-port communication
- Separate upper-byte and lower-byte control
- Industrial temperature ranges

### Selection Guide for 1.8V

**Notes:**

3. A12L and A12R are NC pins for CYDM064A16.
4. IRR functionality is not supported for the CYDM256A16 device.
5. This pin is A13L for CYDM256A16 device.
6. This pin is A13R for CYDM256A16 device.
7. Leave this pin unconnected. No trace or power component can be connected to this pin.
8. IRR functionality not supported for the CYDM256A16 device. Connect this pin to V<sub>CC</sub>.

## Functional Description

The CYDM256A16, CYDM128A16, CYDM064A16, CYDM128A08, CYDM064A08 are low-power CMOS 4K, 8K, 16K x 16, and 8/16K x 8 dual-port static RAMs. Arbitration schemes are included on the devices to handle situations when multiple processors access the same piece of data. Two ports are provided, permitting independent, asynchronous access for reads and writes to any location in memory. The devices can be utilized as standalone 16-bit dual-port static RAMs or multiple devices can be combined in order to function as a 32-bit or wider master/slave dual-port static RAM. An M/S pin is provided for implementing 32-bit or wider memory applications without the need for separate master and slave devices or additional discrete logic. Application areas include interprocessor/multiprocessor designs, communications status buffering, and dual-port video/graphics memory.

Each port has independent control pins: Chip Enable ( $\overline{CE}$ ), Read or Write Enable (R/W), and Output Enable ( $\overline{OE}$ ). Two flags are provided on each port (BUSY and INT). BUSY signals that the port is trying to access the same location currently being accessed by the other port. The Interrupt flag (INT) permits communication between ports or systems by means of a mail box. The semaphores are used to pass a flag, or token, from one port to the other to indicate that a shared resource is in use. The semaphore logic is comprised of eight shared latches. Only one side can control the latch (semaphore) at any time. Control of a semaphore indicates that a shared resource is in use. An automatic power-down feature is controlled independently on each port by a Chip Enable (CE) pin.

The CYDM256A16, CYDM128A16, CYDM064A16, CYDM128A08, CYDM064A08 are available in 100-ball 0.5-mm Pitch Ball Grid Array (BGA) packages.

### Power Supply

The core and I/O voltages will be 1.8V/2.5V LVCMOS/3.0V LVTTTL depending on the user's supply voltage. The supply voltage controls both the Core and I/O voltages.

### Write Operation

Data must be set up for a duration of  $t_{SD}$  before the rising edge of R/W in order to guarantee a valid write. A write operation is controlled by either the R/W pin (see Write Cycle No. 1 waveform) or the CE pin (see Write Cycle No. 2 waveform). Required inputs for non-contention operations are summarized in Table 1.

If a location is being written to by one port and the opposite port attempts to read that location, a port-to-port flowthrough delay must occur before the data is read on the output; otherwise the data read is not deterministic. Data will be valid on the port  $t_{DD}$  after the data is presented on the other port.

### Read Operation

When reading the device, the user must assert both the  $\overline{OE}$  and CE pins. Data will be available  $t_{ACE}$  after CE or  $t_{DOE}$  after OE is asserted. If the user wishes to access a semaphore flag, then the SEM pin must be asserted instead of the CE pin, and OE must also be asserted.

### Interrupts

The upper two memory locations may be used for message passing. The highest memory location (FFF for the CYDM064A16, 1FFF for the CYDM128A16 and CYDM064A08,

3FFF for the CYDM256A16 and CYDM128A08) is the mailbox for the right port and the second-highest memory location (FFE for the CYDM064A16, 1FFE for the CYDM128A16 and CYDM064A08, 3FFE for the CYDM256A16 and CYDM128A08) is the mailbox for the left port. When one port writes to the other port's mailbox, an interrupt is generated to the owner. The interrupt is reset when the owner reads the contents of the mailbox. The message is user-defined.

Each port can read the other port's mailbox without resetting the interrupt. The active state of the busy signal (to a port) prevents the port from setting the interrupt to the winning port. Also, an active busy to a port prevents that port from reading its own mailbox and, thus, resetting the interrupt to it.

If an application does not require message passing, do not connect the interrupt pin to the processor's interrupt request input pin. On power up, an initialization program should be run and the interrupts for both ports must be read to reset them.

The operation of the interrupts and their interaction with Busy are summarized in *Table 2*.

### Busy

The CYDM256A16, CYDM128A16, CYDM064A16, CYDM128A08, CYDM064A08 provide on-chip arbitration to resolve simultaneous memory location access (contention). If both ports' CEs are asserted and an address match occurs within  $t_{PS}$  of each other, the busy logic will determine which port has access. If  $t_{PS}$  is violated, one port will definitely gain permission to the location, but it is not predictable which port will get that permission. BUSY will be asserted  $t_{BLA}$  after an address match or  $t_{BLC}$  after CE is taken LOW.

### Master/Slave

A  $\overline{M/\overline{S}}$  pin is provided in order to expand the word width by configuring the device as either a master or a slave. The BUSY output of the master is connected to the BUSY input of the slave. This will allow the device to interface to a master device with no external components. Writing to slave devices must be delayed until after the BUSY input has settled ( $t_{BLC}$  or  $t_{BLA}$ ), otherwise, the slave chip may begin a write cycle during a contention situation. When tied HIGH, the  $\overline{M/\overline{S}}$  pin allows the device to be used as a master and, therefore, the BUSY line is an output. BUSY can then be used to send the arbitration outcome to a slave.

### Input Read Register

The Input Read Register (IRR) captures the status of two external input devices that are connected to the Input Read pins.

The contents of the IRR read from address x0000 from either port. During reads from the IRR, DQ0 and DQ1 are valid bits and DQ<15:2> are don't care. Writes to address x0000 are not allowed from either port.

Address x0000 is not available for standard memory accesses when  $SFEN = V_{IL}$ . When  $SFEN = V_{IH}$ , address x0000 is available for memory accesses.

The inputs will be 1.8V/2.5V LVCMOS/3.0V LVTTTL depending on the user's supply voltage. Refer to *Table 3* for Input Read Register operation.

### Output Drive Register

The Output Drive Register (ODR) determines the state of up to five external binary state devices by providing a path to  $V_{SS}$  for the external circuit. These outputs are Open Drain.

The five external devices can operate at different voltages ( $1.5V \leq V_{DDIO} \leq 3.5V$ ) but the combined current cannot exceed 40 mA (8 mA max for each external device). The status of the ODR bits are set using standard write accesses from either port to address x0001 with a "1" corresponding to on and "0" corresponding to off.

The status of the ODR bits can be read with a standard read access to address x0001. When  $SFEN = V_{IL}$ , the ODR is active and address x0001 is not available for memory accesses. When  $SFEN = V_{IH}$ , the ODR is inactive and address x0001 can be used for standard accesses.

During reads and writes to ODR DQ<4:0> are valid and DQ<15:5> are don't care. Refer to *Table 4* for Output Drive Register operation.

### Semaphore Operation

The CYDM256A16, CYDM128A16, CYDM064A16, CYDM128A08, CYDM064A08 provide eight semaphore latches, which are separate from the dual-port memory locations. Semaphores are used to reserve resources that are shared between the two ports. The state of the semaphore indicates that a resource is in use. For example, if the left port wants to request a given resource, it sets a latch by writing a zero to a semaphore location. The left port then verifies its success in setting the latch by reading it. After writing to the semaphore, SEM or OE must be deasserted for  $t_{SOP}$  before attempting to read the semaphore. The semaphore value will be available  $t_{SWRD} + t_{DOE}$  after the rising edge of the semaphore write. If the left port was successful (reads a zero), it assumes control of the shared resource, otherwise (reads a one) it assumes the right port has control and continues to poll the semaphore. When the right side has relinquished control of the semaphore (by writing a one), the left side will succeed in gaining control of the semaphore. If the left side no longer requires the semaphore, a one is written to cancel its request.

Semaphores are accessed by asserting  $\overline{SEM}$  LOW. The  $\overline{SEM}$  pin functions as a chip select for the semaphore latches (CE must remain HIGH during  $\overline{SEM}$  LOW).  $A_{0-2}$  represents the semaphore address. OE and R/W are used in the same manner as a normal memory access. When writing or reading a semaphore, the other address pins have no effect.

When writing to the semaphore, only I/O<sub>0</sub> is used. If a zero is written to the left port of an available semaphore, a one will appear at the same semaphore address on the right port. That semaphore can now only be modified by the side showing zero (the left port in this case). If the left port now relinquishes control by writing a one to the semaphore, the semaphore will be set to one for both sides. However, if the right port had requested the semaphore (written a zero) while the left port had control, the right port would immediately own the semaphore as soon as the left port released it. *Table 5* shows sample semaphore operations.

When reading a semaphore, all sixteen/eight data lines output the semaphore value. The read value is latched in an output register to prevent the semaphore from changing state during a write from the other port. If both ports attempt to access the semaphore within  $t_{SPS}$  of each other, the semaphore will definitely be obtained by one side or the other, but there is no

guarantee which side will control the semaphore. On power-up, both ports should write "1" to all eight semaphores.

## Architecture

The CYDM256A16, CYDM128A16, CYDM064A16, CYDM128A08, CYDM064A08 consist of an array of 4K, 8K, or 16K words of 16 dual-port RAM cells, I/O and address lines, and control signals ( $\overline{CE}$ ,  $\overline{OE}$ , R/W). The CYDM064A08 and CYDM128A08 consist of an array of 8K and 16K words of 8 each of dual-port RAM cells, I/O and address lines, and control signals ( $\overline{CE}$ ,  $\overline{OE}$ , R/W). These control pins permit independent

access for reads or writes to any location in memory. To handle simultaneous writes/reads to the same location, a BUSY pin is provided on each port. Two Interrupt (INT) pins can be utilized for port-to-port communication. Two Semaphore (SEM) control pins are used for allocating shared resources. With the M/S pin, the devices can function as a master (BUSY pins are outputs) or as a slave (BUSY pins are inputs). The devices also have an automatic power-down feature controlled by  $\overline{CE}$ . Each port is provided with its own output enable control ( $\overline{OE}$ ), which allows data to be read from the device.

**Table 1. Non-Contending Read/Write**

| Inputs |                                                                                     |    |    |    |     | Outputs                             |                    | Operation                                  |
|--------|-------------------------------------------------------------------------------------|----|----|----|-----|-------------------------------------|--------------------|--------------------------------------------|
| CE     | R/W                                                                                 | OE | UB | LB | SEM | I/O <sub>8-15</sub> <sup>[14]</sup> | I/O <sub>0-7</sub> |                                            |

| L    | L  | H   | L  | X  | L  | x0000     | VALID <sup>[21]</sup> | X                     | IRR Read               |

### Notes:

14. This column applies to x16 devices only.
15. See Interrupts Functional Description for specific highest memory locations by device.
16. If  $\overline{BUSY}_R = L$ , then no change.
17. If  $\overline{BUSY}_L = L$ , then no change.
18. See Functional Description for specific addresses by device.
19. SFEN = VIL for IRR reads
20. UB or LB = VIL. If LB = VIL, then DQ<7:0> are valid. If UB = VIL then DQ<15:8> are valid.
21. LB must be active (LB = VIL) for these bits to be valid.
22. SFEN active when either  $\overline{CE}_L = VIL$  or  $\overline{CE}_R = VIL$ . It is inactive when  $\overline{CE}_L = \overline{CE}_R = VIH$ .

| Left port writes 1 to semaphore  | 1                                        | 0                                         | Right port obtains semaphore token                     |
| Left port writes 0 to semaphore  | 1                                        | 0                                         | No change. Left port has no write access to semaphore  |
| Right port writes 1 to semaphore | 0                                        | 1                                         | Left port obtains semaphore token                      |
| Left port writes 1 to semaphore  | 1                                        | 1                                         | Semaphore-free                                         |
| Right port writes 0 to semaphore | 1                                        | 0                                         | Right port has semaphore token                         |
| Right port writes 1 to semaphore | 1                                        | 1                                         | Semaphore free                                         |
| Left port writes 0 to semaphore  | 0                                        | 1                                         | Left port has semaphore token                          |
| Left port writes 1 to semaphore  | 1                                        | 1                                         | Semaphore-free                                         |

**Notes:**

23.  $\overline{UB}$  or  $\overline{LB} = V_{IL}$ . If  $\overline{LB} = V_{IL}$ , then DQ<7:0> are valid. If  $\overline{UB} = V_{IL}$  then DQ<15:8> are valid.

24.  $\overline{LB}$  must be active ( $\overline{LB} = V_{IL}$ ) for these bits to be valid.

25. SFEN =  $V_{IL}$  for ODR reads and writes.

26. Output enable must be low ( $\overline{OE} = V_{IL}$ ) during reads for valid data to be output.

27. During ODR writes data will also be written to the memory

## Maximum Ratings<sup>[28]</sup>

(Above which the useful life may be impaired. For user guidelines, not tested.)

Storage Temperature ..... -65°C to +150°C

Ambient Temperature with

Power Applied ..... -55°C to +125°C

Supply Voltage to Ground Potential ..... -0.5V to +3.3V

DC Voltage Applied to

Outputs in High-Z State ..... -0.5V to  $V_{CC} + 0.5V$

DC Input Voltage<sup>[29]</sup> ..... -0.5V to  $V_{CC} + 0.5V$

Output Current into Outputs (LOW) ..... 90 mA

Static Discharge Voltage ..... > 2000V

Latch-up Current ..... > 200 mA

## Operating Range

| Range      | Ambient Temperature | $V_{CC}$                                        |
|------------|---------------------|-------------------------------------------------|
| Commercial | 0°C to +70°C        | 1.8V ± 100 mV<br>2.5V ± 100 mV<br>3.0V ± 300 mV |
| Industrial | -40°C to +85°C      | 1.8V ± 100 mV<br>2.5V ± 100 mV<br>3.0V ± 300 mV |

### Notes:

28. The voltage on any input or I/O pin can not exceed the power pin during power-up.

29. Pulse width < 20 ns.

30.  $f_{MAX} = 1/t_{RC}$  = All inputs cycling at  $f = 1/t_{RC}$  (except output enable).  $f = 0$  means no address or control lines change. This applies only to inputs at CMOS level standby  $I_{SB3}$ .

**Electrical Characteristics for 2.5V** Over the Operating Range

**Capacitance<sup>[31]</sup>**

| Parameter | Description        | Test Conditions                                                            | Max. | Unit |
|-----------|--------------------|----------------------------------------------------------------------------|------|------|
| $C_{IN}$  | Input Capacitance  | $T_A = 25^\circ\text{C}$ , $f = 1 \text{ MHz}$ ,<br>$V_{CC} = 3.0\text{V}$ | 9    | pF   |
| $C_{OUT}$ | Output Capacitance |                                                                            | 10   | pF   |

**AC Test Loads and Waveforms**

**(a) Normal Load (Load 1)**

|    | 3.0V/2.5V     | 1.8V           |
|----|---------------|----------------|
| R1 | 1022 $\Omega$ | 13500 $\Omega$ |
| R2 | 792 $\Omega$  | 10800 $\Omega$ |

**(b) Thévenin Equivalent (Load 1)**

ALL INPUT PULSES

**(c) Three-State Delay (Load 2)**

(Used for  $t_{LZ}$ ,  $t_{HZ}$ ,  $t_{HZWE}$ , and  $t_{LZWE}$  including scope and jig)

**Note:**

31. Tested initially and after any design or process changes that may affect these parameters.

**Notes:**

32. Test conditions assume signal transition time of 3 ns or less, timing reference levels of  $V_{DD}/2$ , input pulse levels of 0 to  $V_{DD}$ , and output loading of the specified  $I_{OL}/I_{OH}$  and 30-pF load capacitance.

33. To access RAM,  $\overline{CE} = L$ ,  $\overline{UB} = L$ ,  $\overline{SEM} = H$ . To access semaphore,  $\overline{CE} = H$  and  $\overline{SEM} = L$ . Either condition must be valid for the entire  $t_{SCE}$  time.

34. At any given temperature and voltage condition for any given device,  $t_{HZCE}$  is less than  $t_{LZCE}$  and  $t_{HZOE}$  is less than  $t_{LZOE}$ .

35. Test conditions used are Load 3.

36. This parameter is guaranteed but not tested. For information on port-to-port delay through RAM cells from writing port to reading port, refer to Read Timing with Busy waveform.

37. For information on port-to-port delay through RAM cells from writing port to reading port, refer to Read Timing with Busy waveform.

38. Test conditions used are Load 2.

**Switching Waveforms**

**Read Cycle No.1 (Either Port Address Access)<sup>[40, 41, 42]</sup>**

**Read Cycle No.2 (Either Port  $\overline{CE}/\overline{OE}$  Access)<sup>[40, 43, 44]</sup>**

**Notes:**

40. R/W is HIGH for read cycles.  
 41. Device is continuously selected  $\overline{CE} = V_{IL}$  and  $\overline{UB}$  or  $\overline{LB} = V_{IL}$ . This waveform cannot be used for semaphore reads.  
 42.  $\overline{OE} = V_{IL}$ .  
 43. Address valid prior to or coincident with  $\overline{CE}$  transition LOW.  
 44. To access RAM,  $\overline{CE} = V_{IL}$ ,  $\overline{UB}$  or  $\overline{LB} = V_{IL}$ ,  $\overline{SEM} = V_{IH}$ . To access semaphore,  $\overline{CE} = V_{IH}$ ,  $\overline{SEM} = V_{IL}$ .

## Switching Waveforms (continued)

### Read Cycle No. 3 (Either Port)<sup>[40, 42, 45, 46]</sup>

### Write Cycle No.1: R/W Controlled Timing<sup>[45, 46, 47, 48, 49, 50]</sup>

#### Notes:

45. R/W must be HIGH during all address transitions.
46. A write occurs during the overlap ( $t_{SCE}$  or  $t_{PWE}$ ) of a LOW  $\overline{CE}$  or  $\overline{SEM}$  and a LOW  $\overline{UB}$  or  $\overline{LB}$ .
47.  $t_{HA}$  is measured from the earlier of CE or R/W or (SEM or R/W) going HIGH at the end of write cycle.
48. If OE is LOW during a R/W controlled write cycle, the write pulse width must be the larger of  $t_{PWE}$  or ( $t_{HZWE} + t_{SD}$ ) to allow the I/O drivers to turn off and data to be placed on the bus for the required  $t_{SD}$ . If OE is HIGH during an R/W controlled write cycle, this requirement does not apply and the write pulse can be as short as the specified  $t_{PWE}$ .
49. To access RAM,  $\overline{CE} = V_{IL}$ ,  $\overline{SEM} = V_{IH}$ .
50. To access upper byte,  $\overline{CE} = V_{IL}$ ,  $\overline{UB} = V_{IL}$ ,  $\overline{SEM} = V_{IH}$ .  
To access lower byte,  $\overline{CE} = V_{IL}$ ,  $\overline{LB} = V_{IL}$ ,  $\overline{SEM} = V_{IH}$ .
51. Transition is measured  $\pm 0$  mV from steady state with a 5-pF load (including scope and jig). This parameter is sampled and not 100% tested.
52. During this period, the I/O pins are in the output state, and input signals must not be applied.

## Switching Waveforms (continued)

### Write Cycle No. 2: $\overline{\text{CE}}$ Controlled Timing<sup>[45, 46, 47, 52]</sup>

### Semaphore Read After Write Timing, Either Side<sup>[53, 54]</sup>

#### Notes:

53. If the  $\overline{\text{CE}}$  or  $\overline{\text{SEM}}$  LOW transition occurs simultaneously with or after the  $\overline{\text{R/W}}$  LOW transition, the outputs remain in the high-impedance state.  
54.  $\overline{\text{CE}}$  = HIGH for the duration of the above timing (both write and read cycle).

## Switching Waveforms (continued)

Timing Diagram of Semaphore Contention<sup>[55, 56]</sup>

Timing Diagram of Read with  $\overline{BUSY}$  ( $M/\overline{S} = \text{HIGH}$ )<sup>[57]</sup>

### Notes:

55.  $I/O_{0R} = I/O_{0L} = \text{LOW}$  (request semaphore);  $\overline{CE}_R = \overline{CE}_L = \text{HIGH}$ .

56. If  $t_{SPS}$  is violated, the semaphore will definitely be obtained by one side or the other, but which side will get the semaphore is unpredictable.

57.  $\overline{CE}_L = \overline{CE}_R = \text{LOW}$ .

## Switching Waveforms (continued)

### Write Timing with Busy Input ( $\overline{M/\overline{S}} = \text{LOW}$ )

### Busy Timing Diagram No.1 ( $\overline{CE}$ Arbitration)

#### $\overline{CE}_L$ Valid First<sup>[58]</sup>

#### $\overline{CE}_R$ Valid First

#### Note:

58. If  $t_{PS}$  is violated, the busy signal will be asserted on one side or the other, but there is no guarantee to which side  $\overline{BUSY}$  will be asserted.

## Switching Waveforms (continued)

### Busy Timing Diagram No.2 (Address Arbitration)<sup>[58]</sup>

#### Left Address Valid First

#### Right Address Valid First

## Switching Waveforms (continued)

### Interrupt Timing Diagrams

#### Left Side Sets $\overline{\text{INT}}_R$ :

#### Right Side Clears $\overline{\text{INT}}_R$ :

#### Right Side Sets $\overline{\text{INT}}_L$ :

#### Left Side Clears $\overline{\text{INT}}_L$ :

#### Notes:

59.  $t_{HA}$  depends on which enable pin ( $\overline{\text{CE}}_L$  or R/ $\overline{\text{W}}_L$ ) is deasserted first.  
60.  $t_{INS}$  or  $t_{INR}$  depends on which enable pin ( $\overline{\text{CE}}_L$  or R/ $\overline{\text{W}}_L$ ) is asserted last.

## Ordering Information
