TMP86PM47U

The TMP86PM47 is a OTP type MCU which includes 32 Kbyte One-time PROM. It is a pin compatible with a mask ROM product of the TMP86C845/847/H47/M47. Writing the program to built-in PROM, the TMP86PM47 operates as the same way as the TMP86C847/H47/M47. About elaboration, please refer to later "Difference between TMP86C845 and TMP86Cx47". Using the Adapter socket, you can write and verify the data for the TMP86PM47 with a general-purpose PROM programmer same as TC57100D/AD.

Operation

This section describes the functions and basic operational blocks of TMP86PM47.

The TMP86PM47 has PROM in place of the mask ROM which is included in the TMP86C845/847/H47/M47. The configuration and function are the same as the TMP86C847/H47/M47. For TMP86C845, however, some functions have been partially changed or deleted. For the functions of TMP86PM47 in details, see the section of TMP86C845/847/H47/M47.

1. Operating Mode

The TMP86PM47 has MCU mode and PROM mode.

1.1 MCU Mode

The MCU mode is set by fixing the TEST/VPP pin to the low level.

In the MCU mode, the operation is the same as the TMP86C845/847/H47/M47 (TEST/VPP pin cannot be used open because it has no built-in pull-down resistor).

1.1.1 Program memory

The TMP86PM47 has a 32-Kbyte built-in one time PROM (addresses 8000 to FFFF_H in the MCU mode, addresses 0000 to 7FFF_H in the PROM mode).

When using TMP86PM47 for evaluation of TMP86C845/847/H47/M47, the program is written in the program storing area shown in Figure 1-1.

Figure 1-1. Program Memory Area

Note: The area that is not in use should be set data to FFH, or a general-purpose PROM programmer should be set only in the program memory area to access.

Note: The absolute maximum ratings are rated values which must not be exceeded during operation, even for an instant. Any one of the ratings must not be exceeded. If any absolute maximum rating is exceeded, a device may break down or its performance may be degraded, causing it to catch fire or explode resulting in injury to the user. Thus, when designing products which include this device, ensure that no absolute maximum rating value will ever be exceeded.

Note: The recommended operating conditions for a device are operating conditions under which it can be guaranteed that the device will operate as specified. If the device is used under operating conditions other than the recommended operating conditions (supply voltage, operating temperature range, specified AC/DC values etc.), malfunction may occur. Thus, when designing products which include this device, ensure that the recommended operating conditions for the device are always adhered to.

When voltage of range outside is input, conversion value becomes unsettled and gives affect to other channel conversion value.

Note 4: Analog Reference Voltage Range: ΔV_{AREF} = V_{AREF} – V_{SS}

Note 5: When AD is used with V_{DD} < 2.7 V, the guaranteed temperature range varies with the operating voltage.

Note 2: The pulling up/down device on the condition of $V_{PP} = 12.75\text{ V} \pm 0.25\text{ V}$ causes a damage for the device. Do not pull up/down at programming.

Note 3: Use the recommended adapter (see 1.2.2 (1)) and mode (see 1.2.2 (3) i). Using other than the above condition may cause the trouble of the writing.
