

**Features**

- 1T Cell, PSRAM Architecture
- High speed: 70 ns
- Wide Voltage range:
 - **V_{CC} range: 2.7V to 3.3V**
- Low active power
 - **Typical active current: 2 mA @ f = 1 MHz**
 - **Typical active current: 13 mA @ f = f_{MAX}**
- Low standby power
- Automatic power-down when deselected

Functional Description^[1]

The WCMC1616V9X is a high-performance CMOS pseudo static RAMs (PSRAM) organized as 1M words by 16 bits that supports an asynchronous memory interface. This device features advanced circuit design to provide ultra-low active current. This is ideal for providing More Battery Life™

1Mb x 16 Pseudo Static RAM

(MoBL®) in portable applications such as cellular telephones. The device can be put into standby mode reducing power consumption by more than 99% when deselected using CE LOW, CE₂ HIGH or both BHE and BLE are HIGH. The input/output pins (I/O₀ through I/O₁₅) are placed in a high-impedance state when: deselected (CE HIGH, CE₂ LOW OE is deasserted HIGH), or during a write operation (Chip Enable and Write Enable WE LOW). The device also has an automatic power-down feature that significantly reduces power consumption by 99% when addresses are not toggling even when the chip is selected (Chip Enable CE LOW, CE₂ HIGH and both BHE and BLE are LOW). Reading from the device is accomplished by asserting the Chip Enables (CE LOW and CE₂ HIGH) and Output Enable (OE) LOW while forcing the Write Enable (WE) HIGH. If Byte Low Enable (BLE) is LOW, then data from the memory location specified by the address pins will appear on I/O₀ to I/O₇. If Byte High Enable (BHE) is LOW, then data from memory will appear on I/O₈ to I/O₁₅. See the Truth Table for a complete description of read and write modes.

Pin Configuration^[2, 3, 4]

Note:

2. DNU pins are to be left floating or tied to V_{SS}.
3. Ball H6 is the address expansion pin for the 32Mb density.
4. NC "no connect" - not connected internally to the die.

Notes:

- V_{IH(MAX)} = V_{CC} + 0.5V for pulse durations less than 20ns.
- V_{IL(MIN)} = -0.5V for pulse durations less than 20ns.
- Overshoot and undershoot specifications are characterized and are not 100% tested.
- Typical values are included for reference only and are not guaranteed or tested. Typical values are measured at V_{CC} = V_{CC} (typ) and T_A = 25°C
- V_{CC} must be at minimal operational levels before inputs are turned ON.

Notes:

- Test conditions assume signal transition time of 1V/ns or higher, timing reference levels of $V_{CC(typ)}/2$, input pulse levels of 0V to $V_{CC(typ)}$, and output loading of the specified I_{OL}/I_{OH} and 30-pF load capacitance
- t_{HZOE} , t_{HZCE} , t_{HZBE} and t_{HZWE} transitions are measured when the outputs enter a high-impedance state.
- The internal write time of the memory is defined by the overlap of $\overline{WE}$, $CE = V_{IL}$, $\overline{BHE}$ and/or $\overline{BLE} = V_{IL}$. All signals must be ACTIVE to initiate a write and any of these signals can terminate a write by going INACTIVE. The data input set-up and hold timing should be referenced to the edge of the signal that terminates the write
- High-Z and Low-Z parameters are characterized and are not 100% tested.

Write Cycle No. 2 ($\overline{\text{CE}}$ Controlled)^[13, 14, 16, 17, 18]

Notes:

16. Data I/O is high impedance if $\overline{OE} = V_H$.
17. If Chip Enable goes INACTIVE simultaneously with $\overline{WE}$ HIGH, the output remains in a high-impedance state.
18. During the DON'T CARE period in the DATA I/O waveform, the I/Os are in output state and input signals should not be applied.
