

#### features

- Direct replacement for E26 (North American Standard)
- BA22 (UK) and E27 (Europe) versions also available
- 20 LED cluster
- Optional polycarbonate, water clear lens
- Pack Quantity = 1 Piece

## specifications

#### Ordering information and typical characteristics (Ta = 25°C)

Part	Colour	Voltage	Current	Luminous	Wave	Operating	Storage	De-rating
Number		Vac/dc	c/dc (mA) (mcd)	(nm) (	(°C)	C) (°C)	Graphs	
218-501-22-65	Red	24 Vdc	75	2800	660	-40 - +85	-40 - +85	A
218-501-75-65	Red	110 Vac	22	2800	660	-40 - +85	-40 - +85	A
218-521-75-65	Yellow	110 Vac	22	6100	580-590	-40 - +80	-40 - +120	D
218-997-75-65	White	110 Vac	22	27000	* See below	-30 - +85	-40 - +100	I

\* = Voltage for 20mA product is Vf at 20mA, not Vopr

- Products must be de-rated according to the de-rating information. Each de-rating graph refers to

specific LEDs. Please refer to graphs on page 2.

- Luminous intensity is measured at 20mA on a discrete LED unless otherwise stated.

# design considerations

### Single-Chip LEDs

All devices feature water clear high intensity LEDs as standard. In devices where discrete LEDs are used, the single chip LED devices have been modified by the removal of the domed portion of the encapsulation (flat-topped) to provide even illumination of switches and annunciators. Non flat topped versions are also available. Flat-topping does not apply to devices using surface-mounted device (SMD) LEDs.

### **Product Evaluation**

Filament replacement LEDs have been specifically designed to meet the primary objective of providing improved reliability. As this product range is suitable for both new-build and retro-fit, (sometimes in very old systems), a wide range of illuminated push button switches and lamp holders can be encountered. Due to subjectivity, evaluation of the LED type is recommended, (samples of all standard models are available). Care should be taken to correctly simulate operating ambient light conditions to ensure that the correct device has been selected to maximise viewing characteristics such as viewing angle, colour compatibility and on/ off contrast ratio.

## Electro-Static Discharge (ESD)

Build up of electro-static discharge occurs in many situations involving people moving and handling products. The range of possible situations is very diverse but voltage levels as high as several thousand volts can and do arise in many individual situations. When an operator charged up to these levels handles a static sensitive device, there is a very probable likelihood that the device will be irreversibly damaged. It is essential that precautions are taken at all stages during manufacture and assembly of these products. Although LEDs were never considered to be static sensitive devices, changes in manufacturing technology and materials used to produce higher intensity products over a large range of the wavelength spectrum have changed this. Marl has an approved system of ESD control from goods in, through production and into final packing and despatch. Marl recommend all users of LED based products follow the guidelines of BS 100015.

### **Power De-Rating**

The forward voltage/ current value of an LED is dependent upon the ambient temperature of the environment in which it is operated. Therefore, care must be taken to operate the LED at the correct voltage/ current values, depending upon the ambient temperature. Consequently, a recommendation regarding operating voltages and currents is given in order to address these temperature effects. This recommendation is termed 'de-rating'. It is usual for forward voltages and currents to be specified for ambient temperature of 25°C. However, because the values of these qualities vary with temperature, marl should be contacted if the device is to be operated at a temperature significantly higher than 25°C. Marl accept no liability for any product that is operated higher than the stated voltage.
