# Media Resistant Integrated Silicon Pressure Sensor for Measuring Absolute Pressure, On-Chip Signal Conditioned, Temperature Compensated and Calibrated

## MPXHZ6401A Series

50 to 400 kPa (7.25 to 58.02 psi)  
0.5 to 4.5 V Output

The MPXHZ6401A series pressure sensor integrates on-chip, bipolar op amp circuitry and thin film resistor networks to provide a high output signal and temperature compensation. The sensor's packaging has been designed to provide resistance to high humidity conditions as well as common automotive media. The small form factor and high reliability of on-chip integration make this sensor a logical and economical choice for the system designer.

The MPXHZ6401A series piezoresistive transducer is a state-of-the-art, monolithic, signal conditioned, silicon pressure sensor. This sensor combines advanced micromachining techniques, thin film metallization, and bipolar semiconductor processing to provide an accurate, high level analog output signal that is proportional to applied pressure.

### Features

- Resistant to High Humidity and Common Automotive Media
- Improved Accuracy at High Temperature
- 1.5% Maximum Error over 0°C to 85°C
- Temperature Compensated from -40°C to +125°C
- Durable Thermoplastic (PPS) Surface Mount Package (SSOP) with Optional Axial Port
- Ideally Suited for Microprocessor or Microcontroller-Based Systems

### ORDERING INFORMATION

| Device Name                                            | Device Type   | Options                | Package Options | Case No. | Device Marking |
|--------------------------------------------------------|---------------|------------------------|-----------------|----------|----------------|
| <b>Super Small Outline Package (MPXHZ6401A Series)</b> |               |                        |                 |          |                |

## Operating Characteristics

**Table 1. Operating Characteristics** ( $V_S = 5.1$  Vdc,  $T_A = 25^\circ\text{C}$  unless otherwise noted,  $P_1 > P_2$ ).

| Characteristic                                                | Symbol    | Min   | Typ   | Max   | Unit        |
|---------------------------------------------------------------|-----------|-------|-------|-------|-------------|
| Pressure Range                                                | $P_{OP}$  | 50    | —     | 400   | kPa         |
| Supply Voltage <sup>(1)</sup>                                 | $V_S$     | 4.75  | 5.0   | 5.25  | Vdc         |
| Supply Current                                                | $I_o$     | —     | 6.0   | 10    | mAdc        |
| Minimum Pressure Offset<br>@ $V_S = 5.0$ Volts <sup>(2)</sup> | $V_{off}$ | 0.437 | 0.5   | 0.563 | Vdc         |
| Full Scale Output<br>@ $V_S = 5.0$ Volts <sup>(3)</sup>       | $V_{FSO}$ | 4.438 | 4.501 | 4.563 | Vdc         |
| Full Scale Span                                               | $V_{FSS}$ | —     | 4.0   | —     | V           |
| Sensitivity                                                   | $V/P$     | —     | 11.43 | —     | mV/kPa      |
| Accuracy <sup>(4)</sup>                                       | —         | -1.58 | —     | 1.58  | % $V_{FSS}$ |

1. Device is ratiometric within this specified excitation range.
2. Offset ( $V_{off}$ ) is defined as the output voltage at the minimum rated pressure.
3. Full Scale Span ( $V_{FSS}$ ) is defined as the algebraic difference between the output voltage at full rated pressure and the output voltage at the minimum rated pressure.
4. Accuracy (error budget) is the deviation in actual output from nominal output over the entire pressure range and temperature range as a percent of  $V_{FSS}$  at  $25^\circ\text{C}$  due to all sources of error including the following:
  - Linearity: Output deviation from a straight line relationship with pressure over the specified pressure range.
  - Temperature Hysteresis: Output deviation at any temperature within the operating temperature range, after the temperature is cycled to and from the minimum or maximum operating temperature points, with zero differential pressure applied.
  - Pressure Hysteresis: Output deviation at any pressure within the specified range, when this pressure is cycled to and from the minimum or maximum rated pressure, at  $25^\circ\text{C}$ .
  - Offset Stability: Output deviation, after 1000 temperature cycles,  $-40^\circ\text{C}$  to  $125^\circ\text{C}$  and 1.5 million pressure cycles, with minimum rated pressure applied.
  - TcSpan: Output deviation over the temperature range of  $0^\circ\text{C}$  to  $85^\circ\text{C}$ , relative to  $25^\circ\text{C}$ .
  - TcOffset: Output deviation with minimum rated pressure applied, over the temperature range of  $0^\circ\text{C}$  to  $85^\circ\text{C}$ , relative to  $25^\circ\text{C}$ .

## Maximum Ratings

**Table 2. Maximum Ratings<sup>(1)</sup>**

| Rating                                                       | Symbol           | Value         | Units |
|--------------------------------------------------------------|------------------|---------------|-------|
| Maximum Pressure (P1 > P2)                                   | $P_{\max}$       | 1200          | kPa   |
| Storage Temperature                                          | $T_{\text{stg}}$ | -40° to +125° | °C    |
| Operating Temperature                                        | $T_A$            | -40° to +125° | °C    |
| Output Source Current @ Full Scale Output <sup>(2)</sup>     | $I_{O+}$         | +0.5          | mAdc  |
| Output Sink Current @ Minimum Pressure Offset <sup>(2)</sup> | $I_{O-}$         | -0.5          | mAdc  |

1. Exposure beyond the specified limits may cause permanent damage or degradation to the device.
2. Maximum Output Current is controlled by effective impedance from  $V_{\text{OUT}}$  to Gnd or  $V_{\text{OUT}}$  to  $V_S$  in the application circuit.

Figure 1 shows a block diagram of the internal circuitry integrated on a pressure sensor chip.

**Figure 1. Fully Integrated Pressure Sensor Schematic**

## On-chip Temperature Compensation and Calibration

The performance over temperature is achieved by integrating the shear-stress strain gauge, temperature compensation, calibration, and signal conditioning circuitry onto a single monolithic chip.

Figure 2 illustrates the configuration in the basic chip carrier (case 1317) prior to porting. A gel die coat isolates the die surface and wire bonds from the environment, while allowing the pressure signal to be transmitted to the sensor diaphragm. The gel die coat and durable thermoplastic package provide a media resistant barrier that allows the sensor to operate reliably in high humidity conditions as well as common automotive media.

**NOTE:** The MPXHZ6401A series pressure sensor's operating characteristics, internal reliability and qualification

tests are based on use of air as the pressure media. Media, other than air, may have adverse effects on sensor performance and long-term reliability. Contact the factory for information regarding media compatibility in your application.

Figure 3 shows the recommended decoupling circuit for interfacing the integrated sensor to the A/D input of a microprocessor or microcontroller. Proper decoupling of the power supply is recommended.

Figure 4 shows the sensor output signal relative to pressure input. Typical, minimum, and maximum output curves are shown for operation over a temperature range of 0°C to 85°C using the decoupling circuit shown in Figure 3. The output will saturate outside of the specified pressure range.

## MINIMUM RECOMMENDED FOOTPRINT FOR SUPER SMALL PACKAGES

Surface mount board layout is a critical portion of the total design. The footprint for the semiconductor package must be the correct size to ensure proper solder connection interface between the board and the package. With the correct pad geometry, the packages will self-align when subjected to a

solder reflow process. It is always recommended to fabricate boards with a solder mask layer to avoid bridging and/or shorting between solder pads, especially on tight tolerances and/or tight layouts.

**Figure 5. SSOP Footprint (Case 1317)**
