

IS41C16128

128K x 16 (2-MBIT) DYNAMIC RAM WITH EDO PAGE MODE

AUGUST 1998

FEATURES

- Extended Data-Out (EDO) Page Mode access cycle
- TTL compatible inputs and outputs
- Refresh Interval: 512 cycles/8 ms
- Refresh Mode : $\overline{\text{RAS}}$ -Only, $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$ (CBR), and Hidden
- JEDEC standard pinout
- Single +5V \pm 10% power supply
- Byte Write and Byte Read operation via two $\overline{\text{CAS}}$
- Available in 40-pin SOJ and TSOP (Type II)
- Industrial temperature available

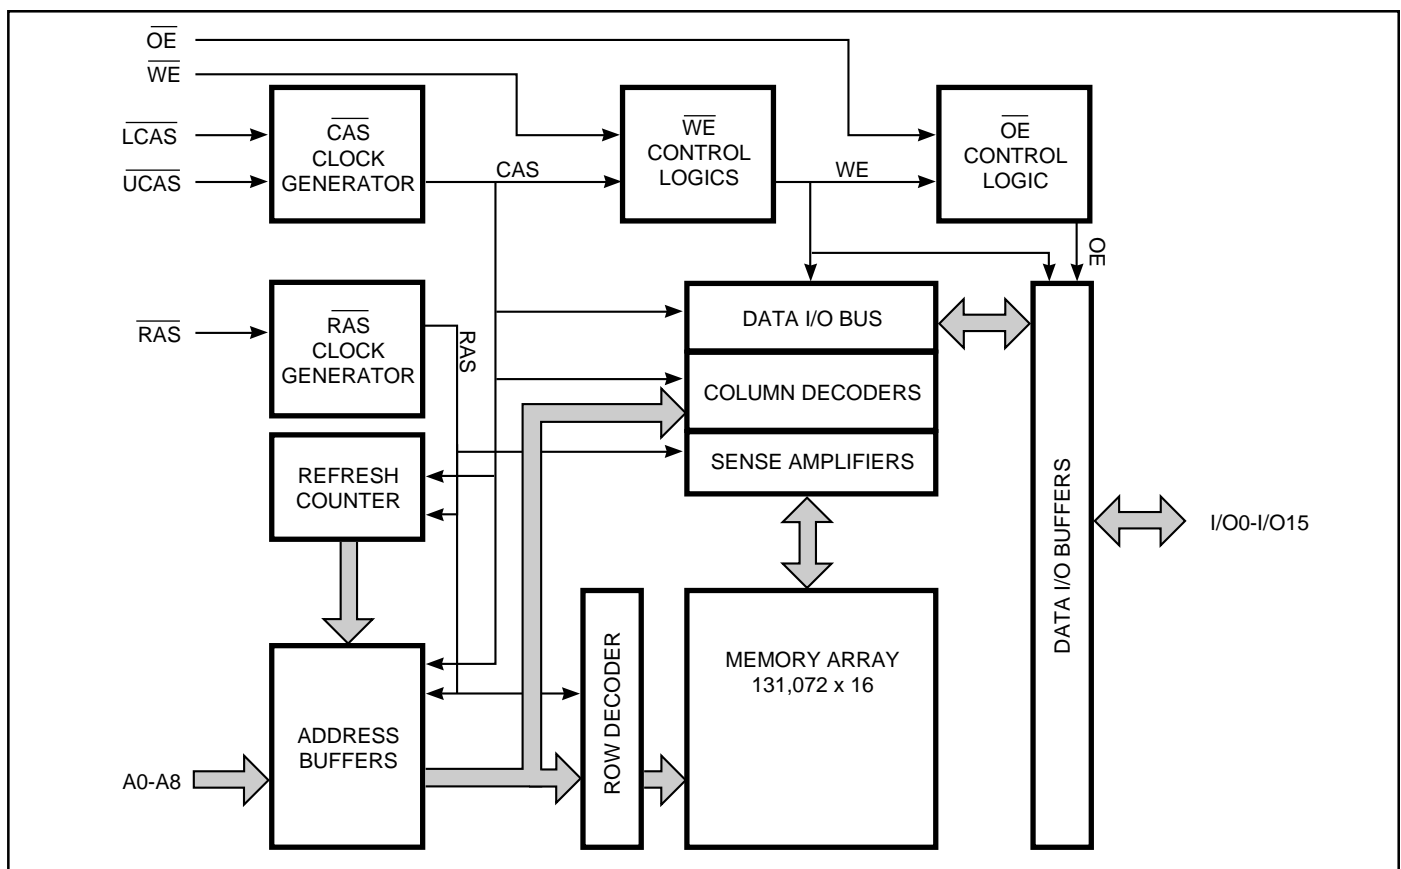

DESCRIPTION

The *ISSI* IS41C16128 is a 131,072 x 16-bit high-performance CMOS Dynamic Random Access Memory. The IS41C16128 offers an accelerated cycle access called EDO Page Mode. EDO Page Mode allows 256 random accesses within a single row with access cycle time as short as 12 ns per 16-bit word. The Byte Write control, of upper and lower byte, makes the IS41C16128 ideal for use in 16-, 32-bit wide data bus systems.

These features make the IS41C16128 ideally suited for high band-width graphics, digital signal processing, high-performance computing systems, and peripheral applications.

The IS41C16128 is packaged in a 40-pin 400-mil SOJ and TSOP (Type II).

FUNCTIONAL BLOCK DIAGRAM

Notes:

1. These WRITE cycles may also be BYTE WRITE cycles (either \overline{LCAS} or \overline{UCAS} active).
2. These READ cycles may also be BYTE READ cycles (either \overline{LCAS} or \overline{UCAS} active).
3. At least one of the two CAS signals must be active (\overline{LCAS} or \overline{UCAS}).

Functional Description

The IS41C16128 is a CMOS DRAM optimized for high-speed bandwidth, low power applications. During READ or WRITE cycles, each bit is uniquely addressed through the 17 address bits. The row address is latched by the Row Address Strobe (\overline{RAS}). The column address is latched by the Column Address Strobe (\overline{CAS}). \overline{RAS} is used to latch the first nine bits and \overline{CAS} is used to latch the latter nine bits.

The IS41C16128 has two \overline{CAS} controls, \overline{LCAS} and \overline{UCAS} . The \overline{LCAS} and \overline{UCAS} inputs internally generates a \overline{CAS} signal functioning in an identical manner to the single \overline{CAS} input on the other 128K x 16 DRAMs. The key difference is that each \overline{CAS} controls its corresponding I/O tristate logic (in conjunction with \overline{OE} and \overline{WE} and \overline{RAS}). \overline{LCAS} controls I/O0 through I/O7 and \overline{UCAS} controls I/O8 through I/O15.

The IS41C16128 \overline{CAS} function is determined by the first \overline{CAS} (\overline{LCAS} or \overline{UCAS}) transitioning LOW and the last transitioning back HIGH. The two \overline{CAS} controls give the IS41C16128 both BYTE READ and BYTE WRITE cycle capabilities.

Memory Cycle

A memory cycle is initiated by bring \overline{RAS} LOW and it is terminated by returning both \overline{RAS} and \overline{CAS} HIGH. To ensure proper device operation and data integrity any memory cycle, once initiated, must not be ended or aborted before the minimum t_{RAS} time has expired. A new cycle must not be initiated until the minimum precharge time t_{RP} , t_{CP} has elapsed.

Read Cycle

A read cycle is initiated by the falling edge of \overline{CAS} or \overline{OE} , whichever occurs last, while holding \overline{WE} HIGH. The column address must be held for a minimum time specified by t_{AR} . Data Out becomes valid only when t_{RAC} , t_{AA} , t_{CAC} and t_{OEA} are all satisfied. As a result, the access time is dependent on the timing relationships between these parameters.

Write Cycle

A write cycle is initiated by the falling edge of \overline{CAS} and \overline{WE} , whichever occurs last. The input data must be valid at or before the falling edge of \overline{CAS} or \overline{WE} , whichever occurs last.

Refresh Cycle

To retain data, 512 refresh cycles are required in each 8 ms period. There are two ways to refresh the memory.

1. By clocking each of the 512 row addresses (A0 through A8) with \overline{RAS} at least once every 8 ms. Any read, write, read-modify-write or \overline{RAS} -only cycle refreshes the addressed row.
2. Using a \overline{CAS} -before- \overline{RAS} refresh cycle. \overline{CAS} -before- \overline{RAS} refresh is activated by the falling edge of \overline{RAS} , while holding \overline{CAS} LOW. In \overline{CAS} -before- \overline{RAS} refresh cycle, an internal 9-bit counter provides the row addresses and the external address inputs are ignored.

\overline{CAS} -before- \overline{RAS} is a refresh-only mode and no data access or device selection is allowed. Thus, the output remains in the High-Z state during the cycle.

Extended Data Out Page Mode

EDO page mode operation permits all 256 columns within a selected row to be randomly accessed at a high data rate.

In EDO page mode read cycle, the data-out is held to the next \overline{CAS} cycle's falling edge, instead of the rising edge. For this reason, the valid data output time in EDO page mode is extended compared with the fast page mode. In the fast page mode, the valid data output time becomes shorter as the \overline{CAS} cycle time becomes shorter. Therefore, in EDO page mode, the timing margin in read cycle is larger than that of the fast page mode even if the \overline{CAS} cycle time becomes shorter.

In EDO page mode, due to the extended data function, the \overline{CAS} cycle time can be shorter than in the fast page mode if the timing margin is the same.

The EDO page mode allows both read and write operations during one \overline{RAS} cycle, but the performance is equivalent to that of the fast page mode in that case.

Power-On

After application of the V_{CC} supply, an initial pause of 200 μ s is required followed by a minimum of eight initialization cycles (any combination of cycles containing a \overline{RAS} signal).

During power-on, it is recommended that \overline{RAS} track with V_{CC} or be held at a valid V_{IH} to avoid current surges.

ABSOLUTE MAXIMUM RATINGS⁽¹⁾

Symbol	Parameters		Rating	Unit
V _T	Voltage on Any Pin Relative to GND		-1.0 to +7.0	V
V _{CC}	Supply Voltage		-1.0 to +7.0	V
I _{OUT}	Output Current		50	mA
P _D	Power Dissipation		1	W
T _A	Operation Temperature	Com.	0 to +70	°C
		Ind.	-40 to +85	
T _{STG}	Storage Temperature		-55 to +125	°C

Note:

1. Stress greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

RECOMMENDED OPERATING CONDITIONS (Voltages are referenced to GND.)

Symbol	Parameter		Min.	Typ.	Max.	Unit
V _{CC}	Supply Voltage		4.5	5.0	5.5	V
V _{IH}	Input High Voltage		2.4	—	V _{CC} + 1.0	V
V _{IL}	Input Low Voltage		-1.0	—	+0.8	V
T _A	Ambient Temperature	Com.	0	—	+70	°C
		Ind.	-40	—	+85	

CAPACITANCE^(1,2)

Symbol	Parameter		Max.	Unit
C _{IN1}	Input Capacitance: A0-A8		5	pF
C _{IN2}	Input Capacitance: RAS, UCAS, LCAS, WE, OE		7	pF
C _{IO}	Data Input/Output Capacitance: I/O0-I/O15		7	pF

Notes:

1. Tested initially and after any design or process changes that may affect these parameters.
2. Test conditions: T_A = 25°C, f = 1 MHz, V_{CC} = 5.0V ± 10%.

ELECTRICAL CHARACTERISTICS⁽¹⁾ (Recommended Operation Conditions unless otherwise noted.)

			-40	—	130	
			-45	—	120	
			-50	—	100	
			-60	—	100	
I _{CC6}	Refresh Current: CBR ^(2,3,5) Average Power Supply Current	$\overline{RAS}, \overline{LCAS}, \overline{UCAS}$ Cycling t _{RC} = t _{RC} (min.)	-35	—	230	mA
			-40	—	130	
			-45	—	120	
			-50	—	100	
			-60	—	100	

Notes:

1. An initial pause of 200 μs is required after power-up followed by eight \overline{RAS} refresh cycles (\overline{RAS} -Only or CBR) before proper device operation is assured. The eight \overline{RAS} cycles wake-up should be repeated any time the t_{REF} refresh requirement is exceeded.
2. Dependent on cycle rates.
3. Specified values are obtained with minimum cycle time and the output open.
4. Column-address is changed once each EDO page cycle.
5. Enables on-chip refresh and address counters.

t _T	Transition Time (Rise or Fall) ^(2, 3)	1	50	1	50	1	50	1	50	1	50	ns

Notes:

1. An initial pause of 200 μ s is required after power-up followed by eight $\overline{\text{RAS}}$ refresh cycle ($\overline{\text{RAS}}$ -Only or CBR) before proper device operation is assured. The eight $\overline{\text{RAS}}$ cycles wake-up should be repeated any time the t_{REF} refresh requirement is exceeded.
2. V_{IH} (MIN) and V_{IL} (MAX) are reference levels for measuring timing of input signals. Transition times, are measured between V_{IH} and V_{IL} (or between V_{IL} and V_{IH}) and assume to be 1 ns for all inputs.
3. In addition to meeting the transition rate specification, all input signals must transit between V_{IH} and V_{IL} (or between V_{IL} and V_{IH}) in a monotonic manner.
4. If $\overline{\text{CAS}}$ and $\overline{\text{RAS}} = V_{\text{IH}}$, data output is High-Z.
5. If $\overline{\text{CAS}} = V_{\text{IL}}$, data output may contain data from the last valid READ cycle.
6. Measured with a load equivalent to one TTL gate and 50 pF.
7. Assumes that $t_{\text{RCD}} \leq t_{\text{RCD}} (\text{MAX})$. If t_{RCD} is greater than the maximum recommended value shown in this table, t_{RAC} will increase by the amount that t_{RCD} exceeds the value shown.
8. Assumes that $t_{\text{RCD}} \geq t_{\text{RCD}} (\text{MAX})$.
9. If $\overline{\text{CAS}}$ is LOW at the falling edge of $\overline{\text{RAS}}$, data out will be maintained from the previous cycle. To initiate a new cycle and clear the data output buffer, $\overline{\text{CAS}}$ and $\overline{\text{RAS}}$ must be pulsed for t_{CP} .
10. Operation with the $t_{\text{RCD}} (\text{MAX})$ limit ensures that $t_{\text{RAC}} (\text{MAX})$ can be met. $t_{\text{RCD}} (\text{MAX})$ is specified as a reference point only; if t_{RCD} is greater than the specified $t_{\text{RCD}} (\text{MAX})$ limit, access time is controlled exclusively by t_{CAC} .
11. Operation within the $t_{\text{RAD}} (\text{MAX})$ limit ensures that $t_{\text{RCD}} (\text{MAX})$ can be met. $t_{\text{RAD}} (\text{MAX})$ is specified as a reference point only; if t_{RAD} is greater than the specified $t_{\text{RAD}} (\text{MAX})$ limit, access time is controlled exclusively by t_{AA} .
12. Either t_{RCH} or t_{RRH} must be satisfied for a READ cycle.
13. $t_{\text{OFF}} (\text{MAX})$ defines the time at which the output achieves the open circuit condition; it is not a reference to V_{OH} or V_{OL} .
14. t_{WCS} , t_{RWD} , t_{AWD} and t_{CWD} are restrictive operating parameters in LATE WRITE and READ-MODIFY-WRITE cycle only. If $t_{\text{WCS}} \geq t_{\text{WCS}} (\text{MIN})$, the cycle is an EARLY WRITE cycle and the data output will remain open circuit throughout the entire cycle. If $t_{\text{RWD}} \geq t_{\text{RWD}} (\text{MIN})$, $t_{\text{AWD}} \geq t_{\text{AWD}} (\text{MIN})$ and $t_{\text{CWD}} \geq t_{\text{CWD}} (\text{MIN})$, the cycle is a READ-WRITE cycle and the data output will contain data read from the selected cell. If neither of the above conditions is met, the state of I/O (at access time and until $\overline{\text{CAS}}$ and $\overline{\text{RAS}}$ or $\overline{\text{OE}}$ go back to V_{IH}) is indeterminate. $\overline{\text{OE}}$ held HIGH and $\overline{\text{WE}}$ taken LOW after $\overline{\text{CAS}}$ goes LOW result in a LATE WRITE ($\overline{\text{OE}}$ -controlled) cycle.
15. Output parameter (I/O) is referenced to corresponding $\overline{\text{CAS}}$ input, I/O0-I/O7 by $\overline{\text{LCAS}}$ and I/O8-I/O15 by $\overline{\text{UCAS}}$.
16. During a READ cycle, if $\overline{\text{OE}}$ is LOW then taken HIGH before $\overline{\text{CAS}}$ goes HIGH, I/O goes open. If $\overline{\text{OE}}$ is tied permanently LOW, a LATE WRITE or READ-MODIFY-WRITE is not possible.
17. Write command is defined as $\overline{\text{WE}}$ going low.
18. LATE WRITE and READ-MODIFY-WRITE cycles must have both t_{OD} and $t_{\text{OE}} (\text{HIGH})$ met ($\overline{\text{OE}}$ HIGH during WRITE cycle) in order to ensure that the output buffers will be open during the WRITE cycle. The I/Os will provide the previously written data if $\overline{\text{CAS}}$ remains LOW and $\overline{\text{OE}}$ is taken back to LOW after $t_{\text{OE}} (\text{HIGH})$ is met.
19. The I/Os are in open during READ cycles once t_{OD} or t_{OFF} occur.
20. The first $\chi\overline{\text{CAS}}$ edge to transition LOW.
21. The last $\chi\overline{\text{CAS}}$ edge to transition HIGH.
22. These parameters are referenced to $\overline{\text{CAS}}$ leading edge in EARLY WRITE cycles and $\overline{\text{WE}}$ leading edge in LATE WRITE or READ-MODIFY-WRITE cycles.
23. Last falling $\chi\overline{\text{CAS}}$ edge to first rising $\chi\overline{\text{CAS}}$ edge.
24. Last rising $\chi\overline{\text{CAS}}$ edge to next cycle's last rising $\chi\overline{\text{CAS}}$ edge.
25. Last rising $\chi\overline{\text{CAS}}$ edge to first falling $\chi\overline{\text{CAS}}$ edge.
26. Each $\chi\overline{\text{CAS}}$ must meet minimum pulse width.
27. Last $\chi\overline{\text{CAS}}$ to go LOW.
28. I/Os controlled, regardless $\overline{\text{UCAS}}$ and $\overline{\text{LCAS}}$.
29. The 3 ns minimum is a parameter guaranteed by design.
30. Enables on-chip refresh and address counters.

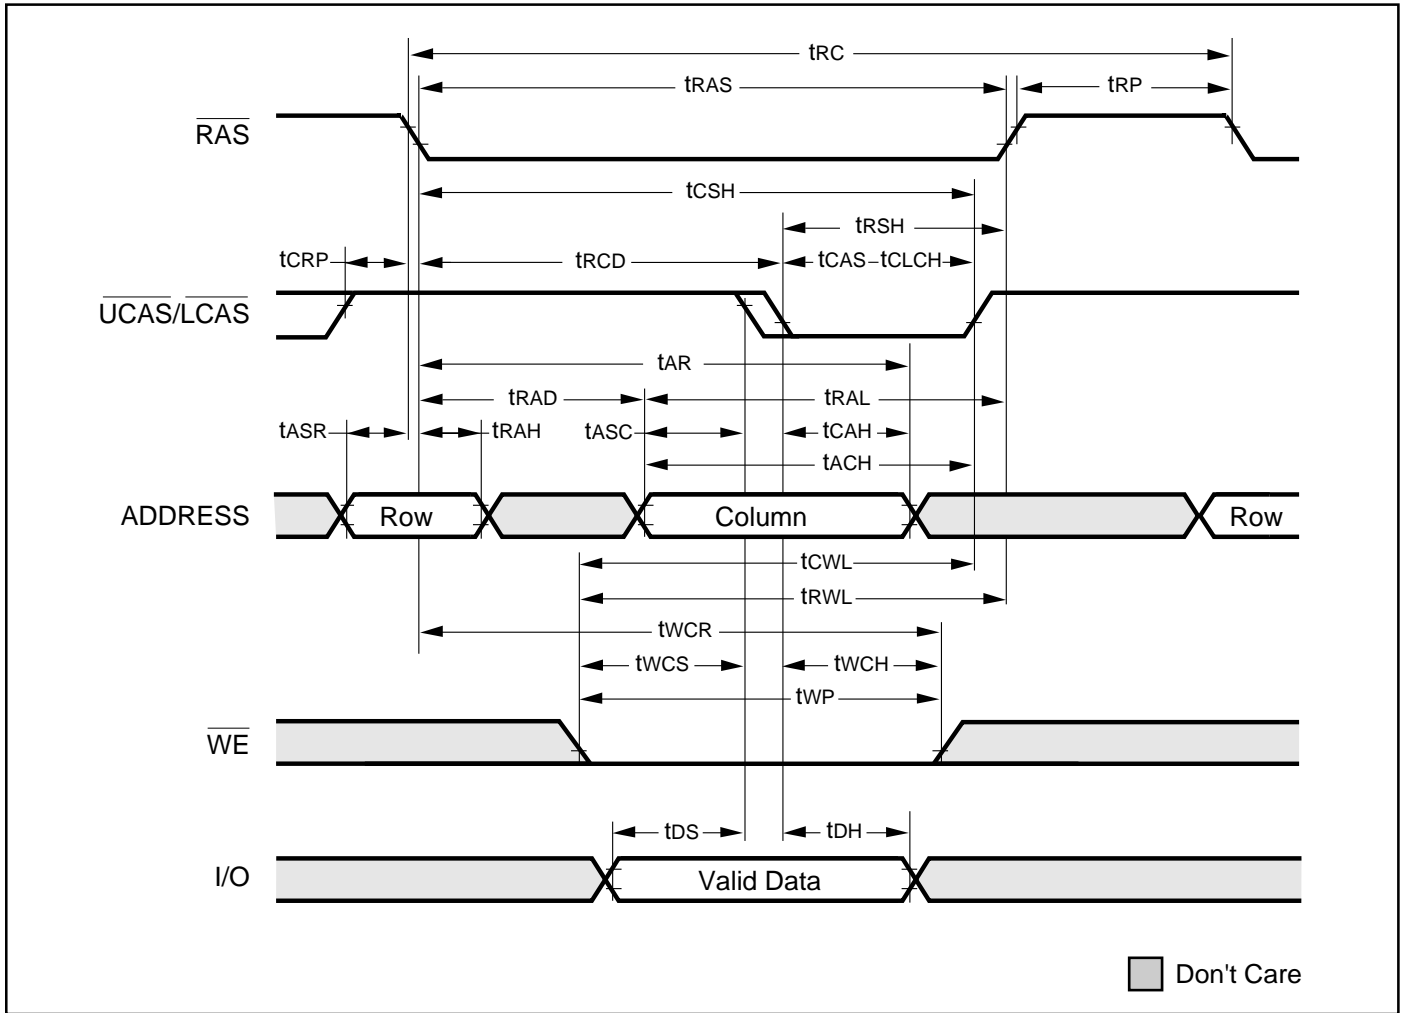

READ CYCLE

Note:

1. t_{OFF} is referenced from rising edge of \overline{RAS} or \overline{CAS} , whichever occurs last.

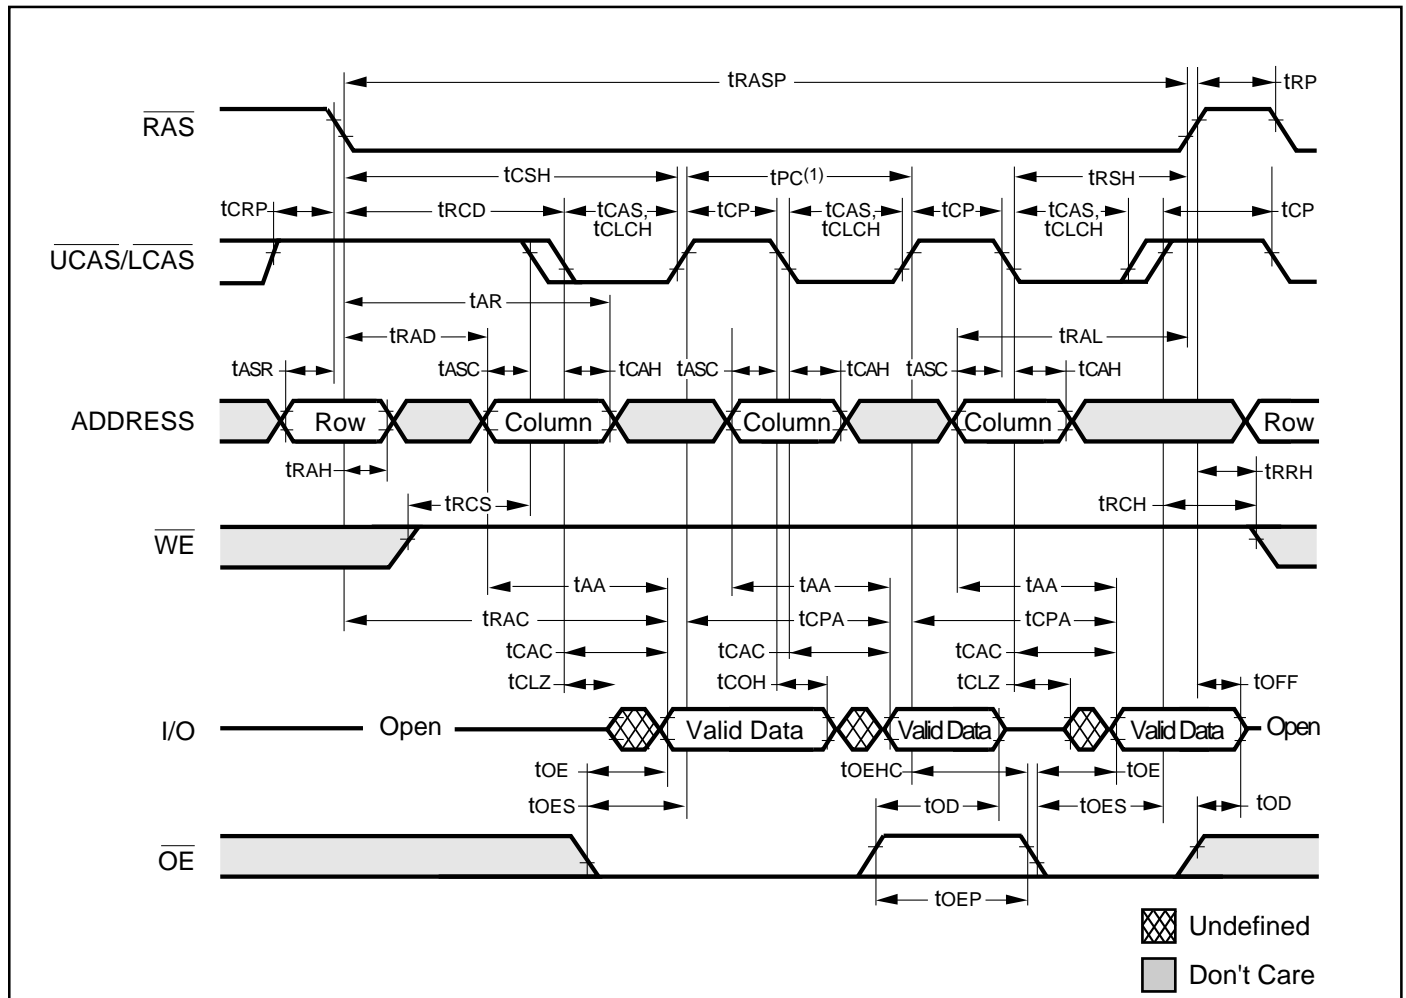

EARLY WRITE CYCLE (\overline{OE} = DON'T CARE)

READ WRITE CYCLE (LATE WRITE and READ-MODIFY-WRITE Cycles)

EDO-PAGE-MODE READ CYCLE

Note:

1. t_{pc} can be measured from falling edge of $\overline{\text{CAS}}$ to falling edge of $\overline{\text{CAS}}$, or from rising edge of $\overline{\text{CAS}}$ to rising edge of $\overline{\text{CAS}}$. Both measurements must meet the t_{pc} specifications.

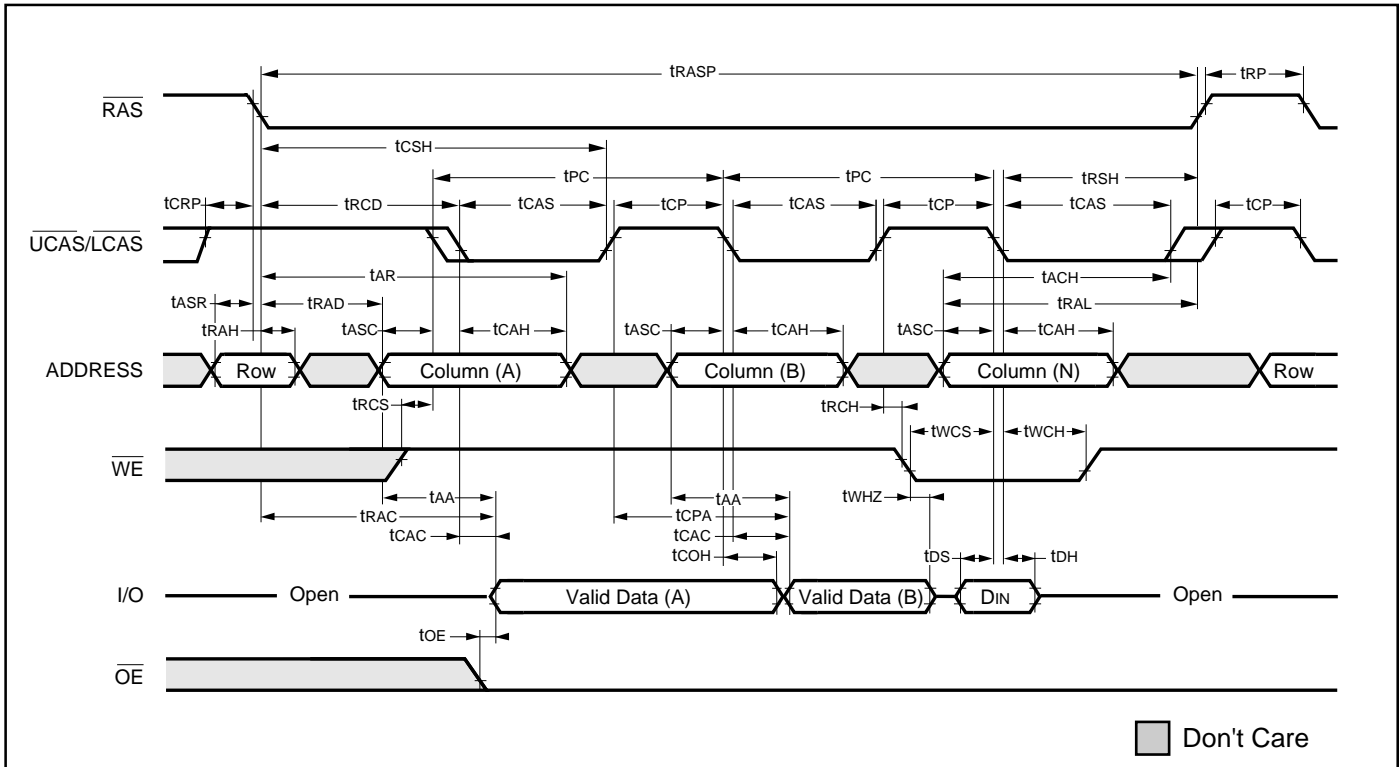

EDO-PAGE-MODE READ-WRITE CYCLE (LATE WRITE and READ-MODIFY WRITE Cycles)

Note:

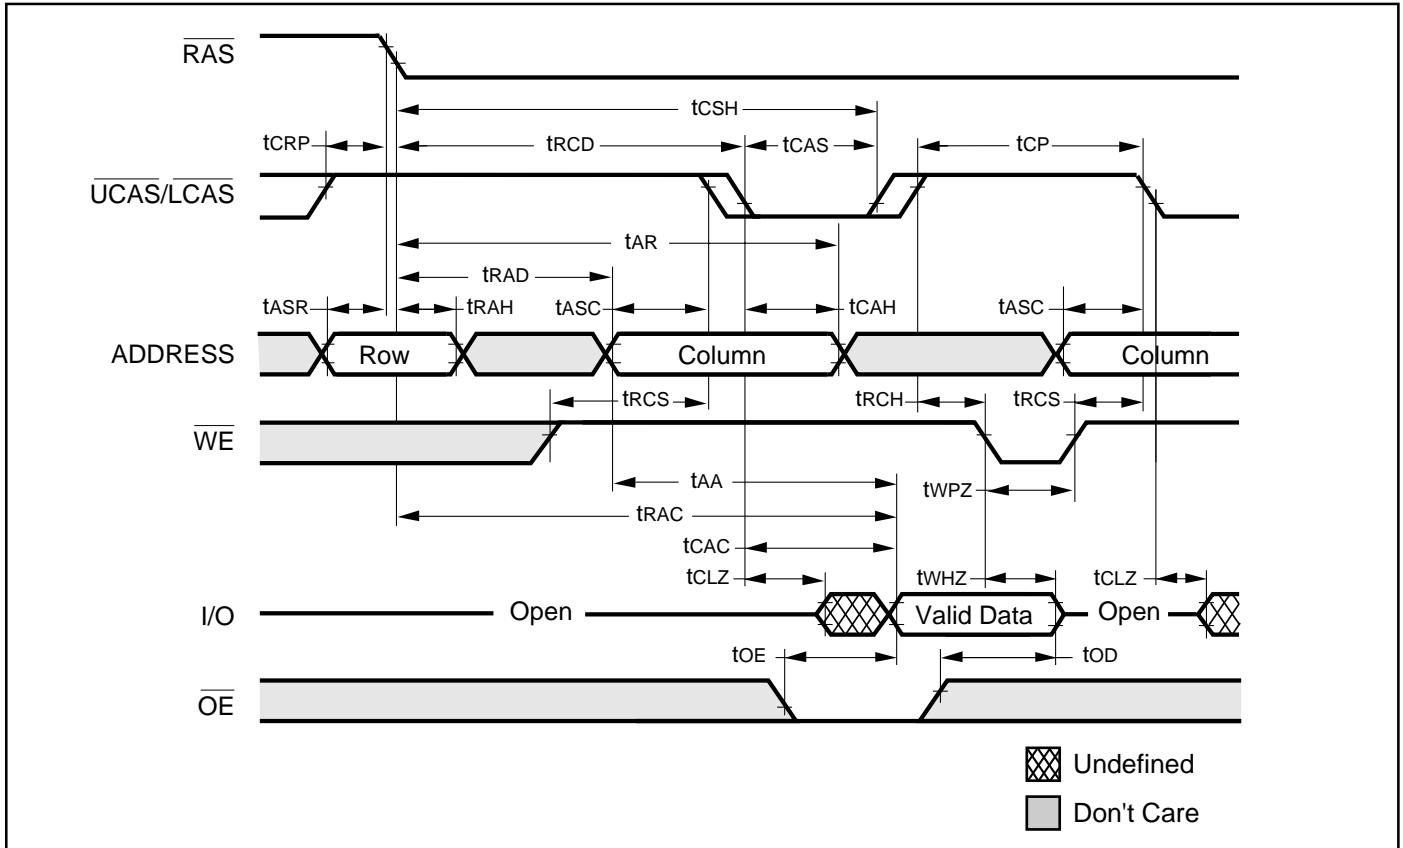

1. t_{pc} can be measured from falling edge of \overline{CAS} to falling edge of \overline{CAS} , or from rising edge of \overline{CAS} to rising edge of \overline{CAS} . Both measurements must meet the t_{pc} specifications.

EDO-PAGE-MODE READ-EARLY-WRITE CYCLE (Pseudo READ-MODIFY WRITE)

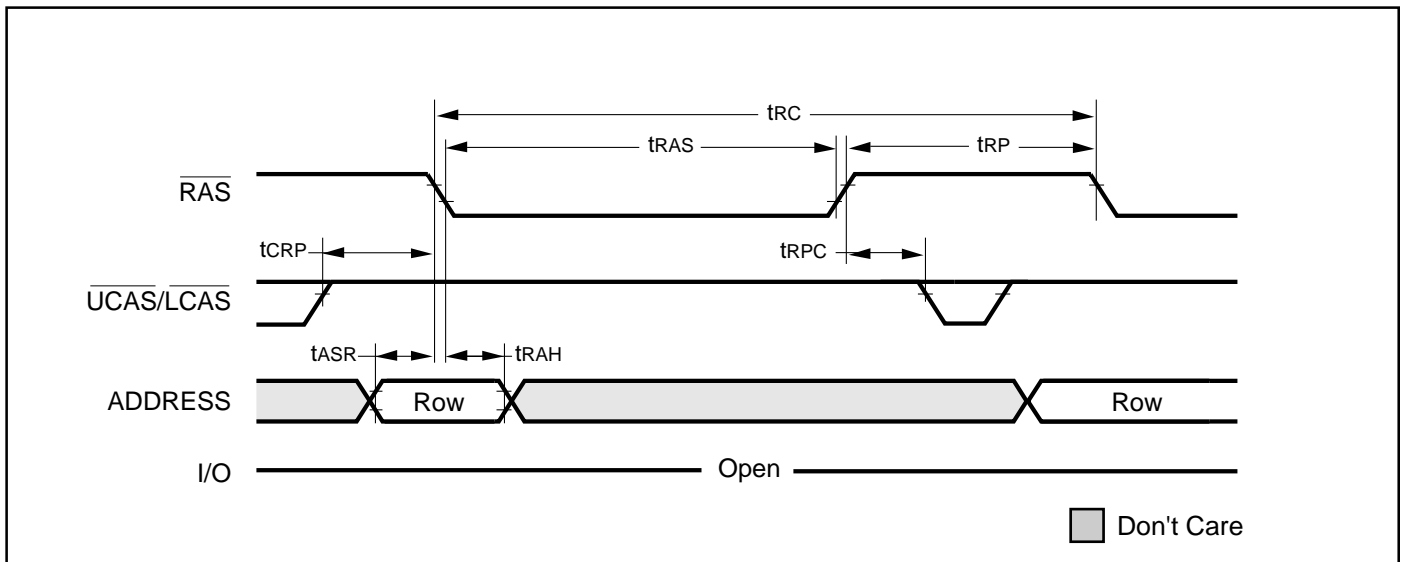

AC WAVEFORMS

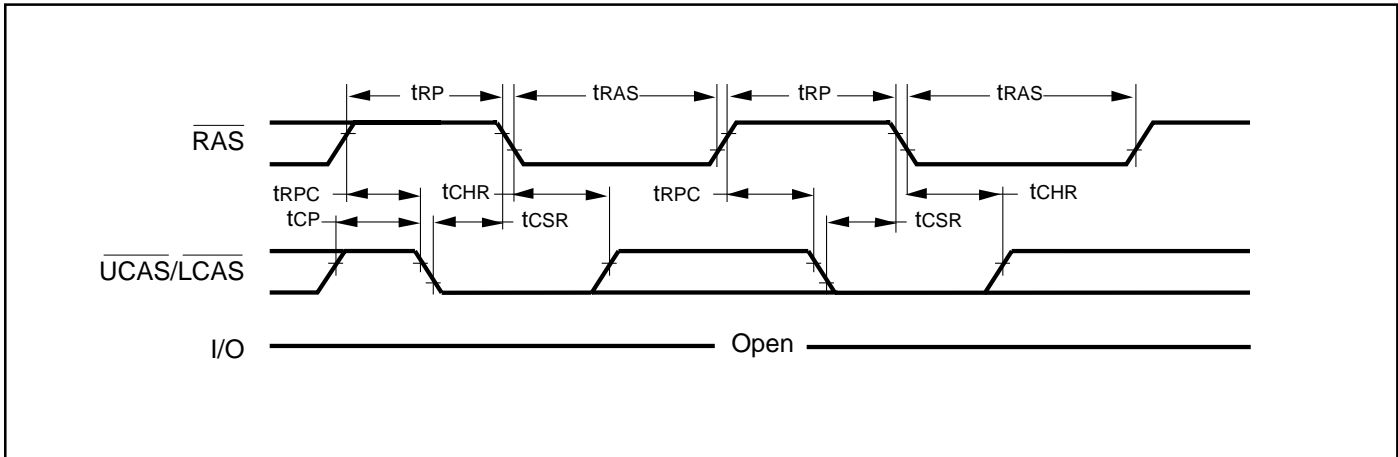

READ CYCLE (With \overline{WE} -Controlled Disable)

\overline{RAS} -ONLY REFRESH CYCLE (\overline{OE} , \overline{WE} = DON'T CARE)

CBR REFRESH CYCLE (Addresses; \overline{WE} , \overline{OE} = DON'T CARE)

HIDDEN REFRESH CYCLE (\overline{WE} = HIGH; \overline{OE} = LOW)⁽¹⁾

Notes:

1. A Hidden Refresh may also be performed after a Write Cycle. In this case, \overline{WE} = LOW and \overline{OE} = HIGH.
2. t_{off} is referenced from rising edge of RAS or CAS, whichever occurs last.

400-MIL PLASTIC SOJ

Package Code: K

400-mil Plastic SOJ (K)					
	Inches		Millimeters		
Symbol	Min	Max	Min	Max	
Ref. Std.					
N	40				
A	—	0.144	—	3.66	
A1	0.025	—	0.66	—	
A2	0.082	—	2.08	—	
B	0.015	0.019	0.38	0.48	
b	0.026	0.032	0.66	0.81	
C	0.007	0.013	0.18	0.33	
D	1.020	1.030	25.91	26.16	
E	0.430	0.450	10.92	11.43	
E1	0.395	0.405	10.03	10.28	
E2	0.346	0.386	8.79	9.80	
e	0.050 BSC		1.27 BSC		

Notes:

1. Controlling dimension: inches, unless otherwise specified.
2. BSC = Basic lead spacing between centers.
3. Dimensions D and E1 do not include mold flash protrusions and should be measured from the bottom of the package.
4. Formed leads shall be planar with respect to one another within 0.004 inches at the seating plane.

PLASTIC TSOP

Package Code: T (Type 2)

Plastic TSOP (T - Type II)				
Symbol	Inches		Millimeters	
	Min	Max	Min	Max
Ref. Std.				
N	40/44
