

DS91M040 125 MHz Quad M-LVDS Transceiver

General Description

The DS91M040 is a quad M-LVDS transceiver designed for driving / receiving clock or data signals to / from up to four multipoint networks.

M-LVDS (Multipoint LVDS) is a new family of bus interface devices based on LVDS technology specifically designed for multipoint and multidrop cable and backplane applications. It differs from standard LVDS in providing increased drive current to handle double terminations that are required in multipoint applications. Controlled transition times minimize reflections that are common in multipoint configurations due to unterminated stubs. M-LVDS devices also have a very large input common mode voltage range for additional noise margin in heavily loaded and noisy backplane environments.

A single DS91M040 channel is a half-duplex transceiver that accepts LVTTTL/LVC MOS signals at the driver inputs and converts them to differential M-LVDS signal levels. The receiver inputs accept low voltage differential signals (LVDS, BLVDS, M-LVDS, LVPECL and CML) and convert them to 3V LVC-MOS signals. The DS91M040 supports both M-LVDS type 1 and type 2 receiver inputs.

Features

- DC - 125 MHz / 250 Mbps low jitter, low skew, low power operation
- Wide Input Common Mode Voltage Range allows up to $\pm 2V$ of GND noise
- Conforms to TIA/EIA-899 M-LVDS Standard
- Pin selectable M-LVDS receiver type (1 or 2)
- Controlled transition times (2.0 ns typ) minimize reflections
- 8 kV ESD on M-LVDS I/O pins protects adjoining components
- Flow-through pinout simplifies PCB layout
- Small 5 mm x 5 mm LLP-32 space saving package

Applications

- Multidrop / Multipoint clock and data distribution
- High-Speed, Low Power, Short-Reach alternative to TIA/EIA-485/422
- Clock distribution in AdvancedTCA (ATCA) and MicroTCA (μ TCA) backplanes

Typical Application

30042202

Pin Descriptions

Number	Name	I/O, Type	Description
1, 3, 5, 7	RO	O, LVCMOS	Receiver output pin.
26, 28, 13, 15	$\overline{RE}$	I, LVCMOS	Receiver enable pin: When $\overline{RE}$ is high, the receiver is disabled. When $\overline{RE}$ is low, the receiver is enabled. There is a 300 k Ω pullup resistor on this pin.
25, 27, 14, 16	DE	I, LVCMOS	Driver enable pin: When DE is low, the driver is disabled. When DE is high, the driver is enabled. There is a 300 k Ω pulldown resistor on this pin.
2, 4, 6, 8	DI	I, LVCMOS	Driver input pin.
31, DAP	GND	Power	Ground pin and pad.
17, 19, 21, 23	A	I/O, M-LVDS	Non-inverting driver output pin/Non-inverting receiver input pin
18, 20, 22, 24	B	I/O, M-LVDS	Inverting driver output pin/Inverting receiver input pin
11, 12, 29, 30	V _{DD}	Power	Power supply pin, +3.3V $\pm$ 0.3V
32	FSEN1	I, LVCMOS	Failsafe enable pin with a 300 k Ω pullup resistor. This pin enables Type 2 receiver on inputs 0 and 2. FSEN1 = L --> Type 1 receiver inputs FSEN1 = H --> Type 2 receiver inputs
9	FSEN2	I, LVCMOS	Failsafe enable pin with a 300 k Ω pullup resistor. This pin enables Type 2 receiver on inputs 1 and 3. FSEN2 = L --> Type 1 receiver inputs FSEN2 = H --> Type 2 receiver inputs
10	MDE	I, LVCMOS	Master enable pin. When MDE is H, the device is powered up. When MDE is L, the device overrides all other control and powers down.

M-LVDS Receiver Types

The EIA/TIA-899 M-LVDS standard specifies two different types of receiver input stages. A type 1 receiver has a conventional threshold that is centered at the midpoint of the input amplitude, $V_{ID}/2$. A type 2 receiver has a built in offset that is 100mV greater than $V_{ID}/2$. The type 2 receiver offset acts as a failsafe circuit where open or short circuits at the input will always result in the output stage being driven to a low logic state.

Absolute Maximum Ratings (Note 4)

If Military/Aerospace specified devices are required, please contact the National Semiconductor Sales Office/ Distributors for availability and specifications.

Power Supply Voltage	-0.3V to +4V
LVC MOS Input Voltage	-0.3V to ($V_{DD} + 0.3V$)
LVC MOS Output Voltage	-0.3V to ($V_{DD} + 0.3V$)
M-LVDS I/O Voltage	-5.5V to +5.5V
M-LVDS Output Short Circuit Current Duration	Continuous
Junction Temperature	+140°C
Storage Temperature Range	-65°C to +150°C
Lead Temperature Range	
Soldering (4 sec.)	+260°C
Maximum Package Power Dissipation @ +25°C	
SQ Package	833 mW
Derate SQ Package	6.67 mW/°C above +25°C
Package Thermal Resistance	
θ_{JA}	+150°C/W
θ_{JC}	+63.8°C/W

ESD Susceptibility

HBM (Note 1)	≥8 kV
MM (Note 2)	≥250V
CDM (Note 3)	≥1250V

Note 1: Human Body Model, applicable std. JESD22-A114C

Note 2: Machine Model, applicable std. JESD22-A115-A

Note 3: Field Induced Charge Device Model, applicable std. JESD22-C101-C

Recommended Operating Conditions

	Min	Typ	Max	Units
Supply Voltage, V_{DD}	3.0	3.3	3.6	V
Voltage at Any Bus Terminal (Separate or Common-Mode)	-1.4		+3.8	V
Differential Input Voltage V_{ID}			2.4	V
LVTTL Input Voltage High V_{IH}	2.0		V_{DD}	V
LVTTL Input Voltage Low V_{IL}	0		0.8	V
Operating Free Air Temperature T_A	-40	+25	+85	°C

I _{CCZ}	TRI-STATE Supply Current	DE = L, $\overline{RE}$ = H		22	26	mA
I _{CCR}	Receiver Supply Current	DE = L, $\overline{RE}$ = L		32	38	mA
I _{CCPD}	Power Down Supply Current	MDE = L		3	5	mA

Note 4: "Absolute Maximum Ratings" indicate limits beyond which damage to the device may occur, including inoperability and degradation of device reliability and/or performance. Functional operation of the device and/or non-degradation at the Absolute Maximum Ratings or other conditions beyond those indicated in the Recommended Operating Conditions is not implied. The Recommended Operating Conditions indicate conditions at which the device is functional and the device should not be operated beyond such conditions.

Note 5: The Electrical Characteristics tables list guaranteed specifications under the listed Recommended Operating Conditions except as otherwise modified or specified by the Electrical Characteristics Conditions and/or Notes. Typical specifications are estimations only and are not guaranteed.

Note 6: Current into device pins is defined as positive. Current out of device pins is defined as negative. All voltages are referenced to ground except V_{OD} and ΔV_{OD} .

Note 7: Typical values represent most likely parametric norms for $V_{DD} = +3.3V$ and $T_A = +25^\circ C$, and at the Recommended Operation Conditions at the time of product characterization and are not guaranteed.

Note 8: Output short circuit current (I_{OS}) is specified as magnitude only, minus sign indicates direction only.

Note 9: C_L includes fixture capacitance and C_D includes probe capacitance.

Switching Characteristics (Notes 10, 11, 17)

Over recommended operating supply and temperature ranges unless otherwise specified.

GENERIC AC SPECIFICATIONS						
t _{WKUP}	Wake Up Time (Note 12) (Master Device Enable (MDE) time)				500	ms
f _{MAX}	Maximum Operating Frequency (Note 12)		125			MHz

Note 10: The Electrical Characteristics tables list guaranteed specifications under the listed Recommended Operating Conditions except as otherwise modified or specified by the Electrical Characteristics Conditions and/or Notes. Typical specifications are estimations only and are not guaranteed.

Note 11: Typical values represent most likely parametric norms for $V_{DD} = +3.3\text{V}$ and $T_A = +25^\circ\text{C}$, and at the Recommended Operation Conditions at the time of product characterization and are not guaranteed.

Note 12: Specification is guaranteed by characterization and is not tested in production.

Note 13: t_{SKD1} , $t_{PLHD} - t_{PHLD}$, Pulse Skew, is the magnitude difference in differential propagation delay time between the positive going edge and the negative going edge of the same channel.

Note 14: t_{SKD2} , Channel-to-Channel Skew, is the difference in propagation delay (t_{PLHD} or t_{PHLD}) among all output channels.

Note 15: t_{SKD3} , Part-to-Part Skew, is defined as the difference between the minimum and maximum differential propagation delays. This specification applies to devices at the same V_{DD} and within 5°C of each other within the operating temperature range.

Note 16: t_{SKD4} , Part-to-Part Skew, is the differential channel-to-channel skew of any event between devices. This specification applies to devices over recommended operating temperature and voltage ranges, and across process distribution. t_{SKD4} is defined as $I_{Max} - I_{Min}$ differential propagation delay.

Note 17: C_L includes fixture capacitance and C_D includes probe capacitance.

Note 18: Measured on a clock edge with a histogram and an accumulation of 1500 histogram hits. Input stimulus jitter is subtracted geometrically.

LIFE SUPPORT POLICY

NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS PRIOR WRITTEN APPROVAL OF THE CHIEF EXECUTIVE OFFICER AND GENERAL COUNSEL OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

Life support devices or systems are devices which (a) are intended for surgical implant into the body, or (b) support or sustain life and whose failure to perform when properly used in accordance with instructions for use provided in the labeling can be reasonably expected to result in a significant injury to the user. A critical component is any component in a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system or to affect its safety or effectiveness.
