DIFFERENTIAL-TO-2.5V/3.3V/5V LVPECL/ECL RECEIVER

GENERAL DESCRIPTION

The ICS853017 is a quad 1-to-1, 2.5V/3.3V/5V differential LVPECL/ECL receiver and a member of the HiperClocks™ family of High Performance Clock Solutions from ICS. The ICS853017 operates with a positive or negative power supply at 2.5V, 3.3V or 5V, and can accept both single-ended and differential inputs. For single-ended operation, an internally generated voltage, which is available on output pin V_{BB} , can be used as a switching bias voltage on the unused input of the differential pair. V_{BB} can also be used to rebias AC coupled inputs.

FEATURES

- 4 differential LVPECL / ECL 1:1 receivers
- 4 differential LVPECL clock input pairs
- PCLKx, nPCLKx pairs can accept the following differential input levels: LVPECL, LVDS, CML, SSTL
- Output frequency: >2GHz (typical)
- Translates any single ended input signal to LVPECL levels with resistor bias on nPCLKx input
- Output skew: TBD
- Part-to-part skew: TBD
- Propagation delay: 320ps (typical)
- LVPECL mode operating voltage supply range: $V_{CC} = 2.375V$ to $5.25V$
- ECL mode operating voltage supply range: $V_{CC} = 0V$, $V_{EE} = -5.25V$ to $-2.375V$
- $-40^{\circ}C$ to $85^{\circ}C$ ambient operating temperature
- Pin compatible with MC100LVEL17

WIRING THE DIFFERENTIAL INPUT TO ACCEPT SINGLE ENDED LEVELS

Figure 1 shows how the differential input can be wired to accept single ended levels. The reference voltage $V_{REF} \approx V_{CC}/2$ is generated by the bias resistors R1, R2 and C1. This bias circuit should be located as close as possible to the input pin. The ratio

of R1 and R2 might need to be adjusted to position the V_{REF} in the center of the input voltage swing. For example, if the input clock swing is only 2.5V and $V_{CC} = 3.3V$, V_{REF} should be 1.25V and $R2/R1 = 0.609$.

TERMINATION FOR 3.3V LVPECL OUTPUTS

The clock layout topology shown below is a typical termination for LVPECL outputs. The two different layouts mentioned are recommended only as guidelines.

FOUT and nFOUT are low impedance follower outputs that generate ECL/LVPECL compatible outputs. Therefore, terminating resistors (DC current path to ground) or current sources must be used for functionality. These outputs are designed to drive

50Ω transmission lines. Matched impedance techniques should be used to maximize operating frequency and minimize signal distortion. Figures 2A and 2B show two different layouts which are recommended only as guidelines. Other suitable clock layouts may exist and it would be recommended that the board designers simulate to guarantee compatibility across all printed circuit and clock component process variations.

TERMINATION FOR 2.5V LVPECL OUTPUT

Figure 3A and Figure 3B show examples of termination for 2.5V LVPECL driver. These terminations are equivalent to terminating 50Ω to $V_{CC} - 2V$. For $V_{CC} = 2.5V$, the $V_{CC} - 2V$ is very close to

ground level. The R3 in Figure 3B can be eliminated and the termination is shown in Figure 3C.

LVPECL CLOCK INPUT INTERFACE

The PCLKx/nPCLKx accepts LVPECL, CML, SSTL and other differential signals. Both V_{SWING} and V_{OH} must meet the V_{PP} and V_{CMR} input requirements. *Figures 4A to 4E* show interface examples for the HiPerClockS PCLKx/nPCLKx input driven by the most common driver types. The input interfaces

suggested here are examples only. If the driver is from another vendor, use their termination recommendation. Please consult with the vendor of the driver component to confirm the driver termination requirements.
